The following `list-targets-for-policy` example lists the device certificates to which the specified policy is attached.

```
aws iot list-targets-for-policy \
    --policy-name UpdateDeviceCertPolicy
```

Output:

```
{
    "targets": [
```

```
        "arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
        "arn:aws:iot:us-west-2:123456789012:cert/
d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be"
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListTargetsForPolicy in *AWS CLI Command Reference*.

`list-targets-for-security-profile`

The following code example shows how to use `list-targets-for-security-profile`.

AWS CLI

To list the targets to which a security profile is applied

The following `list-targets-for-security-profile` example lists the targets to which the AWS IoT Device Defender security profile named `PossibleIssue` is applied.

```
aws iot list-targets-for-security-profile \
    --security-profile-name Testprofile
```

Output:

```
{
    "securityProfileTargets": [
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:all/unregistered-things"
        },
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:all/registered-things"
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListTargetsForSecurityProfile in *AWS CLI Command Reference*.

`list-thing-groups-for-thing`

The following code example shows how to use `list-thing-groups-for-thing`.

AWS CLI

To list the groups that a thing belongs to

The following `list-thing-groups-for-thing` example lists the groups to which the specified thing belongs.

```
aws iot list-thing-groups-for-thing \
    --thing-name MyLightBulb
```

Output:

```
{
    "thingGroups": [
        {
            "groupName": "DeadBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/DeadBulbs"
        },
        {
            "groupName": "LightBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingGroupsForThing in *AWS CLI Command Reference*.

`list-thing-groups`

The following code example shows how to use `list-thing-groups`.

AWS CLI

To list the thing groups defined in your AWS account

The following `list-thing-groups` example lists all thing groups defined in your AWS account.

```
aws iot list-thing-groups
```

Output:

```
{
    "thingGroups": [
        {
            "groupName": "HalogenBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs"
        },
        {
            "groupName": "LightBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingGroups in *AWS CLI Command Reference*.

`list-thing-principals`

The following code example shows how to use `list-thing-principals`.

AWS CLI

To list the principals associated with a thing

The following `list-thing-principals` example lists the principals (X.509 certificates, IAM users, groups, roles, Amazon Cognito identities, or federated identities) associated with the specified thing.

```
aws iot list-thing-principals \
    --thing-name MyRaspberryPi
```

Output:

```
{
    "principals": [
```

```
        "arn:aws:iot:us-
west-2:123456789012:cert/33475ac865079a5ffd5ecd44240640349293facc760642d7d8d5dbb6b4c86893"
    ]
}
```

For more information, see Attach a thing or policy to a client certificate in the *AWS IoT Core Developer Guide*.

- For API details, see ListThingPrincipals in *AWS CLI Command Reference*.

`list-thing-types`

The following code example shows how to use `list-thing-types`.

AWS CLI

To list the defined thing types

The following `list-thing-types` example displays a list of thing types defined in your AWS account.

```
aws iot list-thing-types
```

Output:

```
{
    "thingTypes": [
        {
            "thingTypeName": "LightBulb",
            "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/
LightBulb",
            "thingTypeProperties": {
                "thingTypeDescription": "light bulb type",
                "searchableAttributes": [
                    "model",
                    "wattage"
                ]
            },
            "thingTypeMetadata": {
            "deprecated": false,
            "creationDate": 1559772562.498
            }
```

```
        }
    ]
}
```

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see ListThingTypes in *AWS CLI Command Reference*.

`list-things-in-billing-group`

The following code example shows how to use `list-things-in-billing-group`.

AWS CLI

To list the things in a billing group

The following `list-things-in-billing-group` example lists the things that are in the specified billing group.

```
aws iot list-things-in-billing-group \
    --billing-group-name GroupOne
```

Output:

```
{
    "things": [
        "MyOtherLightBulb",
        "MyLightBulb"
    ]
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingsInBillingGroup in *AWS CLI Command Reference*.

`list-things-in-thing-group`

The following code example shows how to use `list-things-in-thing-group`.

AWS CLI

To list the things that belong to a group

The following `list-things-in-thing-group` example lists the things that belong to the specified thing group.

```
aws iot list-things-in-thing-group \
    --thing-group-name LightBulbs
```

Output:

```
{
    "things": [
        "MyLightBulb"
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingsInThingGroup in *AWS CLI Command Reference*.

`list-things`

The following code example shows how to use `list-things`.

AWS CLI

Example 1: To list all things in the registry

The following `list-things` example lists the things (devices) that are defined in the AWS IoT registry for your AWS account.

```
aws iot list-things
```

Output:

```
{
    "things": [
        {
            "thingName": "ThirdBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/ThirdBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
```

```
            },
            "version": 2
        },
        {
            "thingName": "MyOtherLightBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 3
        },
        {
            "thingName": "MyLightBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 1
        },
        {
        "thingName": "SampleIoTThing",
        "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/SampleIoTThing",
        "attributes": {},
        "version": 1
        }
    ]
}
```

Example 2: To list the defined things that have a specific attribute

The following `list-things` example displays a list of things that have an attribute named `wattage`.

```
aws iot list-things \
    --attribute-name wattage
```

Output:

```
{
```

```
    "things": [
        {
            "thingName": "MyLightBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 1
        },
        {
            "thingName": "MyOtherLightBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 3
        }
    ]
}
```

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see ListThings in *AWS CLI Command Reference*.

`list-topic-rule-destinations`

The following code example shows how to use `list-topic-rule-destinations`.

AWS CLI

To list your topic rule destinations

The following `list-topic-rule-destinations` example lists all topic rule destinations that you have defined in the current AWS Region.

```
aws iot list-topic-rule-destinations
```

Output:

```
{
    "destinationSummaries": [
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "status": "ENABLED",
            "httpUrlSummary": {
                "confirmationUrl": "https://example.com"
            }
        }
    ]
}
```

For more information, see HTTP action destinations in the *AWS IoT Developer Guide*.

- For API details, see ListTopicRuleDestinations in *AWS CLI Command Reference*.

`list-topic-rules`

The following code example shows how to use `list-topic-rules`.

AWS CLI

To list your rules

The following `list-topic-rules` example lists all rules that you have defined.

```
aws iot list-topic-rules
```

Output:

```
{
    "rules": [
        {
            "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/
MyRPiLowMoistureAlertRule",
            "ruleName": "MyRPiLowMoistureAlertRule",
            "topicPattern": "$aws/things/MyRPi/shadow/update/accepted",
            "createdAt": 1558624363.0,
            "ruleDisabled": false
        },
        {
```

```
            "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/
MyPlantPiMoistureAlertRule",
            "ruleName": "MyPlantPiMoistureAlertRule",
            "topicPattern": "$aws/things/MyPlantPi/shadow/update/accepted",
            "createdAt": 1541458459.0,
            "ruleDisabled": false
        }
    ]
}
```

For more information, see Viewing a rule in the *AWS IoT Developers Guide*.

- For API details, see ListTopicRules in *AWS CLI Command Reference*.

`list-v2-logging-levels`

The following code example shows how to use `list-v2-logging-levels`.

AWS CLI

To list logging levels

The following `list-v2-logging-levels` example lists the configured logging levels. If logging levels were not set, a `NotConfiguredException` occurs when you run this command.

```
aws iot list-v2-logging-levels
```

Output:

```
{
    "logTargetConfigurations": [
        {
            "logTarget": {
                "targetType": "DEFAULT"
            },
            "logLevel": "ERROR"
        }
    ]
}
```

For more information, see Configure AWS IoT logging in the *AWS IoT Core Developer Guide*.

- For API details, see ListV2LoggingLevels in *AWS CLI Command Reference*.

`list-violation-events`

The following code example shows how to use `list-violation-events`.

AWS CLI

To list the security profile violations during a time period

The following `list-violation-events` example lists violations that occurred between June 5, 2019 and June 12, 2019 for all AWS IoT Device Defender security profiles for the current AWS account and AWS Region.

```
aws iot list-violation-events \
    --start-time 1559747125 \
    --end-time 1560351925
```

Output:

```
{
    "violationEvents": [
        {
            "violationId": "174db59167fa474c80a652ad1583fd44",
            "thingName": "iotconsole-1560269126751-1",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",
                "metric": "aws:num-authorization-failures",
                "criteria": {
                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 10
                    },
                    "durationSeconds": 300,
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
            "metricValue": {
                "count": 0
            },
            "violationEventType": "in-alarm",
            "violationEventTime": 1560279000.0
        },
```

```
        {
            "violationId": "c8a9466a093d3b7b35cd44ca58bdbeab",
            "thingName": "TvnQoEoU",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "CellularBandwidth",
                "metric": "aws:message-byte-size",
                "criteria": {
                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 128
                    },
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
            "metricValue": {
                "count": 110
            },
            "violationEventType": "in-alarm",
            "violationEventTime": 1560276600.0
        },
        {
            "violationId": "74aa393adea02e6648f3ac362beed55e",
            "thingName": "iotconsole-1560269232412-2",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",
                "metric": "aws:num-authorization-failures",
                "criteria": {
                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 10
                    },
                    "durationSeconds": 300,
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
            "metricValue": {
                "count": 0
            },
            "violationEventType": "in-alarm",
            "violationEventTime": 1560276600.0
```

```
        },
        {
            "violationId": "1e6ab5f7cf39a1466fcd154e1377e406",
            "thingName": "TvnQoEoU",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",
                "metric": "aws:num-authorization-failures",
                "criteria": {
                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 10
                    },
                    "durationSeconds": 300,
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
            "metricValue": {
                "count": 0
            },
            "violationEventType": "in-alarm",
            "violationEventTime": 1560276600.0
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListViolationEvents in *AWS CLI Command Reference*.

`register-ca-certificate`

The following code example shows how to use `register-ca-certificate`.

AWS CLI

To register a certificate authority (CA) certificate

The following `register-ca-certificate` example registers a CA certificate. The command supplies the CA certificate and a key verification certificate that proves you own the private key associated with the CA certificate.

```
aws iot register-ca-certificate \
    --ca-certificate file://rootCA.pem \
    --verification-certificate file://verificationCert.pem
```

Contents of `rootCA.pem`:

```
-----BEGIN CERTIFICATE-----
MIIDWTCCAkGgAwIBAgIUEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEwDQYJKoZI
hvcNAQELBQAwTDELMAkGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAO
...
EXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLE==
-----END CERTIFICATE-----
```

Contents of `verificationCert.pem`:

```
-----BEGIN CERTIFICATE-----
MIIDWTCCAkGgAwIBAgIUEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEwDQYJKoZI
hvcNAQELBQAwTDELMAkGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAO
...
EXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLE==
-----END CERTIFICATE-----
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/
f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467",
    "certificateId":
 "f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467"
}
```

For more information, see Register your CA certificate in the *AWS IoT Core Developer Guide*.

- For API details, see RegisterCaCertificate in *AWS CLI Command Reference*.

`register-certificate`

The following code example shows how to use `register-certificate`.

AWS CLI

To register a self signed device certificate

The following `register-certificate` example registers the `deviceCert.pem` device certificate signed by the `rootCA.pem` CA certificate. The CA certificate must be registered before you use it to register a self-signed device certificate. The self-signed certificate must be signed by the same CA certificate you pass to this command.

```
aws iot register-certificate \
    --certificate-pem file://deviceCert.pem \
    --ca-certificate-pem file://rootCA.pem
```

Contents of `deviceCert.pem`:

}
```

For more information, see Register a client certificate manually in the *AWS IoT Core Developer Guide*.

- For API details, see RegisterCertificate in *AWS CLI Command Reference*.

register-thing

The following code example shows how to use `register-thing`.

AWS CLI

To register a thing

The following `register-thing` example registers a thing using a provisioning template.

```
aws iot register-thing \
    --template-body '{"Parameters":{"ThingName":
{"Type":"String"},"AWS::IoT::Certificate::Id":{"Type":"String"}},"Resources":
 {"certificate":{"Properties":{"CertificateId":
{"Ref":"AWS::IoT::Certificate::Id"},"Status":"Active"},"Type":"AWS::IoT::Certificate"},"poli
{"Properties":{"PolicyName":"MyIotPolicy"},"Type":"AWS::IoT::Policy"},"thing":
{"OverrideSettings":
{"AttributePayload":"MERGE","ThingGroups":"DO_NOTHING","ThingTypeName":"REPLACE"},"Propertie
{"AttributePayload":{},"ThingGroups":[],"ThingName":
{"Ref":"ThingName"},"ThingTypeName":"VirtualThings"},"Type":"AWS::IoT::Thing"}}' \
    --parameters '{"ThingName":"Register-thing-
trial-1","AWS::IoT::Certificate::Id":"799a9ea048a1e6aea42b55EXAMPLEf8697b4bafcd77a318a3068e3
```

Output:

```
{
    "certificatePem": "-----BEGIN CERTIFICATE-----

For more information, see Provisioning by trusted user in the *AWS IoT Core Developers Guide*.

- For API details, see RegisterThing in *AWS CLI Command Reference*.

`reject-certificate-transfer`

The following code example shows how to use `reject-certificate-transfer`.

AWS CLI

To reject a certificate transfer

The following `reject-certificate-transfer` example rejects the transfer of the specified device certificate from another AWS account.

```
aws iot reject-certificate-transfer \
    --certificate-
id f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78addd5e605d630e05c7fc8
```

This command produces no output.

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see RejectCertificateTransfer in *AWS CLI Command Reference*.

`remove-thing-from-billing-group`

The following code example shows how to use `remove-thing-from-billing-group`.

AWS CLI

To remove a thing from a billing group

The following `remove-thing-from-billing-group` example removes the specified thing from a billing group.

```
aws iot remove-thing-from-billing-group \
    --billing-group-name GroupOne \
    --thing-name MyOtherLightBulb
```

This command produces no output.

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see RemoveThingFromBillingGroup in *AWS CLI Command Reference*.

`remove-thing-from-thing-group`

The following code example shows how to use `remove-thing-from-thing-group`.

AWS CLI

To remove a thing from a thing group

The following `remove-thing-from-thing-group` example removes the specified thing from a thing group.

```
aws iot remove-thing-from-thing-group \
    --thing-name bulb7 \
    --thing-group-name DeadBulbs
```

This command produces no output.

For more information, see Static thing groups in the *AWS IoT Core Developer Guide*.

- For API details, see RemoveThingFromThingGroup in *AWS CLI Command Reference*.

`replace-topic-rule`

The following code example shows how to use `replace-topic-rule`.

AWS CLI

To update a topic's rule definition

The following `replace-topic-rule` example updates the specified rule to send an SNS alert when soil moisture level readings are too low.

```
aws iot replace-topic-rule \
    --rule-name MyRPiLowMoistureAlertRule \
    --topic-rule-payload "{\"sql\": \"SELECT * FROM '$aws/things/MyRPi/shadow/
update/accepted' WHERE state.reported.moisture = 'low'\", \"description\": \"Sends
 an alert when soil moisture level readings are too low.\",\"actions\": [{\"sns
\":{\"targetArn\":\"arn:aws:sns:us-west-2:123456789012:MyRPiLowMoistureTopic\",
\"roleArn\":\"arn:aws:iam::123456789012:role/service-role/MyRPiLowMoistureTopicRole
\",\"messageFormat\": \"RAW\"}}],\"ruleDisabled\": false,\"awsIotSqlVersion\":
\"2016-03-23\"}"
```

This command produces no output.

For more information, see Creating an AWS IoT Rule in the *AWS IoT Developer Guide*.

- For API details, see ReplaceTopicRule in *AWS CLI Command Reference*.

`search-index`

The following code example shows how to use `search-index`.

AWS CLI

To query the thing index

The following `search-index` example queries the `AWS_Things` index for things that have a type of `LightBulb`.

```
aws iot search-index \
    --index-name "AWS_Things" \
    --query-string "thingTypeName:LightBulb"
```

Output:

```
{
    "things": [
        {
            "thingName": "MyLightBulb",
            "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "thingTypeName": "LightBulb",
            "thingGroupNames": [
                "LightBulbs",
                "DeadBulbs"
```

```
            ],
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        },
        {
            "thingName": "ThirdBulb",
            "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "thingTypeName": "LightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        },
        {
            "thingName": "MyOtherLightBulb",
            "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "thingTypeName": "LightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        }
    ]
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developer Guide*.

- For API details, see SearchIndex in *AWS CLI Command Reference*.

`set-default-authorizer`

The following code example shows how to use `set-default-authorizer`.

AWS CLI

To set a default authorizer

The following `set-default-authorizer` example sets the custom authorizer named `CustomAuthorizer` as the default authorizer.

```
aws iot set-default-authorizer \
    --authorizer-name CustomAuthorizer
```

Output:

```
{
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
}
```

For more information, see Creating and managing custom authorizers (CLI) in the *AWS IoT Core Developer Guide*.

- For API details, see SetDefaultAuthorizer in *AWS CLI Command Reference*.

`set-default-policy-version`

The following code example shows how to use `set-default-policy-version`.

AWS CLI

To set the default version for a policy

The following `set-default-policy-version` example sets the default version to 2 for the policy named `UpdateDeviceCertPolicy`.

```
aws iot set-default-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-version-id 2
```

This command produces no output.

For more information, see AWS IoT Core policies in the *AWS IoT Core Developer Guide*.

- For API details, see SetDefaultPolicyVersion in *AWS CLI Command Reference*.

`set-v2-logging-level`

The following code example shows how to use `set-v2-logging-level`.

AWS CLI

To set the logging level for a thing group

The following `set-v2-logging-level` example sets the logging level to log warnings for the specified thing group.

```
aws iot set-v2-logging-level \
    --log-target "{\"targetType\":\"THING_GROUP\",\"targetName\":\"LightBulbs\"}" \
    --log-level WARN
```

This command produces no output.

For more information, see Configure AWS IoT logging in the *AWS IoT Core Developer Guide*.

- For API details, see SetV2LoggingLevel in *AWS CLI Command Reference*.

`set-v2-logging-options`

The following code example shows how to use `set-v2-logging-options`.

AWS CLI

To set the logging options

The following `set-v2-logging-options` example sets the default logging verbosity level to ERROR and specifies the ARN to use for logging.

```
aws iot set-v2-logging-options \
    --default-log-level ERROR \
    --role-arn "arn:aws:iam::123456789012:role/service-role/iotLoggingRole"
```

This command produces no output.

For more information, see Configure AWS IoT logging in the *AWS IoT Core Developer Guide*.

- For API details, see SetV2LoggingOptions in *AWS CLI Command Reference*.

`start-audit-mitigation-actions-task`

The following code example shows how to use `start-audit-mitigation-actions-task`.

AWS CLI

To apply a mitigation action to the findings from an audit

The following `start-audit-mitigation-actions-task` example applies the `ResetPolicyVersionAction` action (which clears the policy) to the specified single finding.

```
aws iot start-audit-mitigation-actions-task \
    --task-id "myActionsTaskId" \
    --target "findingIds=[\"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111\"]" \
    --audit-check-to-actions-mapping
 "IOT_POLICY_OVERLY_PERMISSIVE_CHECK=[\"ResetPolicyVersionAction\"]" \
    --client-request-token "adhadhahda"
```

Output:

```
{
    "taskId": "myActionsTaskId"
}
```

For more information, see StartAuditMitigationActionsTask (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see StartAuditMitigationActionsTask in *AWS CLI Command Reference*.

`start-on-demand-audit-task`

The following code example shows how to use `start-on-demand-audit-task`.

AWS CLI

To start an audit right away

The following `start-on-demand-audit-task` example starts an AWS IoT Device Defender audit and performs three certificate checks.

```
aws iot start-on-demand-audit-task \
    --target-check-
names CA_CERTIFICATE_EXPIRING_CHECK DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE
```

Output:

```
{
    "taskId": "a3aea009955e501a31b764abe1bebd3d"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see StartOnDemandAuditTask in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To specify a tag key and value for a resource

The following `tag-resource` example applies the tag with a key `Assembly` and the value `Fact1NW` to the thing group `LightBulbs`.

```
aws iot tag-resource \
    --tags Key=Assembly,Value="Fact1NW" \
    --resource-arn "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
```

This command produces no output.

For more information, see Tagging Your AWS IoT Resources in the *AWS IoT Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`test-authorization`

The following code example shows how to use `test-authorization`.

AWS CLI

To test your AWS IoT policies

The following `test-authorization` example tests the AWS IoT policies associated with the specified principal.

```
aws iot test-authorization \
    --auth-infos actionType=CONNECT,resources=arn:aws:iot:us-
west-2:123456789012:client/client1 \
    --principal arn:aws:iot:us-west-2:123456789012:cert/
aab1068f7f43ac3e3cae4b3a8aa3f308d2a750e6350507962e32c1eb465d9775
```

Output:

```
{
    "authResults": [
        {
            "authInfo": {
                "actionType": "CONNECT",
                "resources": [
                    "arn:aws:iot:us-west-2:123456789012:client/client1"
                ]
            },
            "allowed": {
                "policies": [
                    {
                        "policyName": "TestPolicyAllowed",
                        "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyAllowed"
                    }
                ]
            },
            "denied": {
                "implicitDeny": {
                    "policies": [
                        {
                            "policyName": "TestPolicyDenied",
                            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyDenied"
                        }
                    ]
                },
                "explicitDeny": {
                    "policies": [
                        {
                            "policyName": "TestPolicyExplicitDenied",
```

```
                            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyExplicitDenied"
                        }
                    ]
                }
            },
            "authDecision": "IMPLICIT_DENY",
            "missingContextValues": []
        }
    ]
}
```

For more information, see AWS IoT Core policies in the *AWS IoT Core Developer Guide*.

- For API details, see TestAuthorization in *AWS CLI Command Reference*.

`test-invoke-authorizer`

The following code example shows how to use `test-invoke-authorizer`.

AWS CLI

To test your custom authorizer

The following `test-invoke-authorizer` example testS your custom authorizer.

```
aws iot test-invoke-authorizer \
    --authorizer-name IoTAuthorizer \
    --token allow \
    --token-signature "mE0GvaHqy9nER/
FdgtJX5lXYEJ3b3vE7t1gEszc0TKGgLKWXTnPkb2AbKnOAZ8lGyoN5dVtWDWVmr25m7+
+zjbYIMk2TBvyGXhOmvKFBPkdgyA43KL6SiZy0cTqlPMcQDsP7VX2rXr7CTowCxSNKphGXdQe0/

+wfo8pb0DubAIX1Ua705kuhRUcTx4SxUShEYKmN4IDEvLB6FsIr0B2wvB7y4iPmcajxzGl02ExvyCUNctCV9dYlRRGJj
```

Output:

```
{
    "isAuthenticated": true,
    "principalId": "principalId",
    "policyDocuments": [
```

```
        "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Action\":\"iot:Publish
\",\"Effect\":\"Allow\",\"Resource\":\"arn:aws:iot:us-west-2:123456789012:topic/
customauthtesting\"}]}"
    ],
    "refreshAfterInSeconds": 600,
    "disconnectAfterInSeconds": 3600
}
```

For more information, see Creating and managing custom authorizers (CLI) in the *AWS IoT Core Developer Guide*.

- For API details, see TestInvokeAuthorizer in *AWS CLI Command Reference*.

`transfer-certificate`

The following code example shows how to use `transfer-certificate`.

AWS CLI

To transfer a device certificate to a different AWS account

The following `transfer-certificate` example transfers a device certificate to another AWS account. The certificate and AWS account are identified by ID.

```
aws iot transfer-certificate \
    --certificate-
id 488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142 \
    --target-aws-account 123456789111
```

Output:

```
{
    "transferredCertificateArn": "arn:aws:iot:us-
west-2:123456789111:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142"
}
```

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see TransferCertificate in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag key from a resource

The following `untag-resource` example removes the tag `MyTag` and its value from the thing group `LightBulbs`.

```
aws iot untag-resource \
    --resource-arn "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --tag-keys MyTag
```

This command produces no output.

For more information, see Tagging Your AWS IoT Resources in the *AWS IoT Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-account-audit-configuration`

The following code example shows how to use `update-account-audit-configuration`.

AWS CLI

Example 1: To enable Amazon SNS notifications for audit notifications

The following `update-account-audit-configuration` example enables Amazon SNS notifications for AWS IoT Device Defender audit notifications, specifying a target and the role used to write to that target.

```
aws iot update-account-audit-configuration \
    --audit-notification-target-configurations "SNS={targetArn=\"arn:aws:sns:us-
west-2:123456789012:ddaudits\",roleArn=\"arn:aws:iam::123456789012:role/service-
role/AWSIoTDeviceDefenderAudit\",enabled=true}"
```

This command produces no output.

Example 2: To enable an audit check

The following `update-account-audit-configuration` example enables the AWS IoT Device Defender audit check named `AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK`. You cannot disable an audit check if it is part of the `targetCheckNames` for one or more scheduled audits for the AWS account.

```
aws iot update-account-audit-configuration \
    --audit-check-configurations
 "{\"AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK\":{\"enabled\":true}}"
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see UpdateAccountAuditConfiguration in *AWS CLI Command Reference*.

`update-audit-suppression`

The following code example shows how to use `update-audit-suppression`.

AWS CLI

To update an audit finding suppression

The following `update-audit-suppression` example updates an audit finding suppression's expiration date to 2020-09-21.

```
aws iot update-audit-suppression \
    --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
    --resource-
identifier deviceCertificateId=c7691e8b4a5f7d9e8c6b3a2f1e0d9c8b7a6f5e4d3c2b1a0f9e8d7c6b5a4f3
 \
    --no-suppress-indefinitely \
    --expiration-date 2020-09-21
```

This command produces no output.

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see UpdateAuditSuppression in *AWS CLI Command Reference*.

update-authorizer

The following code example shows how to use update-authorizer.

AWS CLI

To update a custom authorizer

The following update-authorizer example he state of CustomAuthorizer2 to INACTIVE.

```
aws iot update-authorizer \
    --authorizer-name CustomAuthorizer2 \
    --status INACTIVE
```

Output:

```
{
    "authorizerName": "CustomAuthorizer2",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
}
```

For more information, see Creating and managing custom authorizers (CLI) in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateAuthorizer in *AWS CLI Command Reference*.

update-billing-group

The following code example shows how to use update-billing-group.

AWS CLI

To update information about a billing group

The following update-billing-group example updates the description for the specified billing group.

```
aws iot update-billing-group \
    --billing-group-name GroupOne \
    --billing-group-properties "billingGroupDescription=\"Primary bulb billing group
\""
```

Output:

```
{
    "version": 2
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see UpdateBillingGroup in *AWS CLI Command Reference*.

`update-ca-certificate`

The following code example shows how to use `update-ca-certificate`.

AWS CLI

To update a certificate authority (CA) certificate

The following `update-ca-certificate` example sets the specified CA certificate to ACTIVE status.

```
aws iot update-ca-certificate \
    --certificate-
id f4efed62c0142f16af278166f61962501165c4f05362952074264600 58cd1467 \
    --new-status ACTIVE
```

This command produces no output.

For more information, see Manage your CA certificates in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateCaCertificate in *AWS CLI Command Reference*.

`update-certificate`

The following code example shows how to use `update-certificate`.

AWS CLI

To update a device certificate

The following `update-certificate` example sets the specified device certificate to INACTIVE status.

```
aws iot update-certificate \
    --certificate-
id d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be \
    --new-status INACTIVE
```

This command produces no output.

For more information, see Activate or deactivate a client certificate in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateCertificate in *AWS CLI Command Reference*.

`update-custom-metric`

The following code example shows how to use `update-custom-metric`.

AWS CLI

To update a custom metric

The following `update-custom-metric` example updates a custom metric to have a new `display-name`.

```
aws iot update-custom-metric \
    --metric-name batteryPercentage \
    --display-name 'remaining battery percentage on device'
```

Output:

```
{
    "metricName": "batteryPercentage",
    "metricArn": "arn:aws:iot:us-west-2:1234564789012:custommetric/
batteryPercentage",
    "metricType": "number",
    "displayName": "remaining battery percentage on device",
    "creationDate": "2020-11-17T23:01:35.110000-08:00",
    "lastModifiedDate": "2020-11-17T23:02:12.879000-08:00"
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateCustomMetric in *AWS CLI Command Reference*.

`update-dimension`

The following code example shows how to use `update-dimension`.

AWS CLI

To update a dimension

The following `update-dimension` example updates a dimension.

```
aws iot update-dimension \
    --name TopicFilterForAuthMessages \
    --string-values device/${iot:ClientId}/auth
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "lastModifiedDate": 1585866222.317,
    "stringValues": [
        "device/${iot:ClientId}/auth"
    ],
    "creationDate": 1585854500.474,
    "type": "TOPIC_FILTER",
    "arn": "arn:aws:iot:us-west-2:1234564789012:dimension/
TopicFilterForAuthMessages"
}
```

For more information, see Scoping metrics in security profiles using dimensions in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateDimension in *AWS CLI Command Reference*.

`update-domain-configuration`

The following code example shows how to use `update-domain-configuration`.

AWS CLI

To update a domain configuration

The following `update-domain-configuration` example disables the specified domain configuration.

```
aws iot update-domain-configuration \
    --domain-configuration-name "additionalDataDomain" \
    --domain-configuration-status "DISABLED"
```

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see UpdateDomainConfiguration in *AWS CLI Command Reference*.

`update-dynamic-thing-group`

The following code example shows how to use `update-dynamic-thing-group`.

AWS CLI

To update a dynamic thing group

The following `update-dynamic-thing-group` example updates the specified dynamic thing group. It provides a description and updates the query string to change the group membership criteria.

```
aws iot update-dynamic-thing-group \
    --thing-group-name "RoomTooWarm" \
    --thing-group-properties "thingGroupDescription=\"This thing group contains
 rooms warmer than 65F.\"" \
    --query-string "attributes.temperature>65"
```

Output:

```
{
    "version": 2
}
```

For more information, see Dynamic Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see UpdateDynamicThingGroup in *AWS CLI Command Reference*.

`update-event-configurations`

The following code example shows how to use `update-event-configurations`.

AWS CLI

To show which event types are published

The following `update-event-configurations` example updates the configuration to enable messages when the CA certificate is added, updated, or deleted.

```
aws iot update-event-configurations \
    --event-configurations "{\"CA_CERTIFICATE\":{\"Enabled\":true}}"
```

This command produces no output.

For more information, see Event Messages in the *AWS IoT Developer Guide*.

- For API details, see UpdateEventConfigurations in *AWS CLI Command Reference*.

`update-indexing-configuration`

The following code example shows how to use `update-indexing-configuration`.

AWS CLI

To enable thing indexing

The following `update-indexing-configuration` example enables thing indexing to support searching registry data, shadow data, and thing connectivity status using the AWS_Things index.

```
aws iot update-indexing-configuration \
    --thing-indexing-
configuration thingIndexingMode=REGISTRY_AND_SHADOW,thingConnectivityIndexingMode=STATUS
```

This command produces no output.

For more information, see Managing Thing Indexing in the *AWS IoT Developers Guide*.

- For API details, see UpdateIndexingConfiguration in *AWS CLI Command Reference*.

update-job

The following code example shows how to use update-job.

AWS CLI

To update a job

The following update-job example updates the description of the job whose ID is example-job-01.

```
aws iot update-job \
    --job-id "example-job-01" \
    --description "example job test"
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see UpdateJob in *AWS CLI Command Reference*.

update-mitigation-action

The following code example shows how to use update-mitigation-action.

AWS CLI

To update a mitigation action

The following update-mitigation-action example updates the specified mitigation action named AddThingsToQuarantineGroupAction, changes the thing group name, and sets overrideDynamicGroups to false. You can verify your changes by using the describe-mitigation-action command.

```
aws iot update-mitigation-action \
    --cli-input-json "{ \"actionName\": \"AddThingsToQuarantineGroupAction\",
 \"actionParams\": { \"addThingsToThingGroupParams\": {\"thingGroupNames\":
[\"QuarantineGroup2\"],\"overrideDynamicGroups\": false}}}"
```

Output:

```
{
```

```
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
    "actionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see UpdateMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see UpdateMitigationAction in *AWS CLI Command Reference*.

`update-provisioning-template`

The following code example shows how to use `update-provisioning-template`.

AWS CLI

To update a provisioning template

The following `update-provisioning-template` example modifies the description and role arn for the specified provisioning template and enables the template.

```
aws iot update-provisioning-template \
    --template-name widget-template \
    --enabled \
    --description "An updated provisioning template for widgets" \
    --provisioning-role-arn arn:aws:iam::123456789012:role/Provision_role
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateProvisioningTemplate in *AWS CLI Command Reference*.

`update-role-alias`

The following code example shows how to use `update-role-alias`.

AWS CLI

To update a role alias

The following `update-role-alias` example updates the `LightBulbRole` role alias.

```
aws iot update-role-alias \
    --role-alias LightBulbRole \
    --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:

```
{
    "roleAlias": "LightBulbRole",
    "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}
```

For more information, see Authorizing direct calls to AWS services using AWS IoT Core credential provider in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateRoleAlias in *AWS CLI Command Reference*.

`update-scheduled-audit`

The following code example shows how to use `update-scheduled-audit`.

AWS CLI

To update a scheduled audit definition

The following `update-scheduled-audit` example changes the target check names for an AWS IoT Device Defender scheduled audit.

```
aws iot update-scheduled-audit \
    --scheduled-audit-name WednesdayCertCheck \
    --target-check-
names CA_CERTIFICATE_EXPIRING_CHECK DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE
```

Output:

```
{
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
WednesdayCertCheck"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see UpdateScheduledAudit in *AWS CLI Command Reference*.

update-security-profile

The following code example shows how to use update-security-profile.

AWS CLI

To change a security profile

The following update-security-profile example updates both the description and the behaviors for an AWS IoT Device Defender security profile.

```
aws iot update-security-profile \
    --security-profile-name PossibleIssue \
    --security-profile-description "Check to see if authorization fails 12 times in
 5 minutes or if cellular bandwidth exceeds 128"  \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"less-than\",\"value\":{\"count\":12},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}}]"
```

Output:

```
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
PossibleIssue",
    "securityProfileDescription": "check to see if authorization fails 12 times in 5
 minutes or if cellular bandwidth exceeds 128",
    "behaviors": [
        {
            "name": "CellularBandwidth",
            "metric": "aws:message-byte-size",
            "criteria": {
                "comparisonOperator": "greater-than",
                "value": {
                    "count": 128
                },
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        },
```

```
        {
            "name": "Authorization",
            "metric": "aws:num-authorization-failures",
            "criteria": {
                "comparisonOperator": "less-than",
                "value": {
                    "count": 12
                },
                "durationSeconds": 300,
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        }
    ],
    "version": 2,
    "creationDate": 1560278102.528,
    "lastModifiedDate": 1560352711.207
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see UpdateSecurityProfile in *AWS CLI Command Reference*.

`update-stream`

The following code example shows how to use `update-stream`.

AWS CLI

To update a stream

The following `update-stream` example updates an existing stream. The stream version is incremented by one.

```
aws iot update-stream \
    --cli-input-json file://update-stream.json
```

Contents of `update-stream.json`:

```
{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
```

```
    "files": [
        {
            "fileId": 123,
            "s3Location": {
                "bucket":"codesign-ota-bucket",
                "key":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            }
        }
    ],
    "roleArn": "arn:aws:iam::123456789012:role/service-role/my_ota_stream_role"
}
```

Output:

```
{
    "streamId": "stream12345",
    "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "streamVersion": 2
}
```

For more information, see MQTT-based file delivery in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateStream in *AWS CLI Command Reference*.

`update-thing-group`

The following code example shows how to use `update-thing-group`.

AWS CLI

To update the definition for a thing group

The following `update-thing-group` example updates the definition for the specified thing group, changing the description and two attributes.

```
aws iot update-thing-group \
    --thing-group-name HalogenBulbs \
    --thing-group-properties "thingGroupDescription=\"Halogen bulb group\",
 attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```
{
    "version": 2
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see UpdateThingGroup in *AWS CLI Command Reference*.

`update-thing-groups-for-thing`

The following code example shows how to use `update-thing-groups-for-thing`.

AWS CLI

To change the groups to which a thing belongs

The following `update-thing-groups-for-thing` example removes the thing named `MyLightBulb` from the group named `DeadBulbs` and adds it to the group named `replaceableItems` at the same time.

```
aws iot update-thing-groups-for-thing \
    --thing-name MyLightBulb \
    --thing-groups-to-add "replaceableItems" \
    --thing-groups-to-remove "DeadBulbs"
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developer Guide*.

- For API details, see UpdateThingGroupsForThing in *AWS CLI Command Reference*.

`update-thing`

The following code example shows how to use `update-thing`.

AWS CLI

To associate a thing with a thing type

The following `update-thing` example associates a thing in the AWS IoT registry with a thing type. When you make the association, you provide values for the attributes defined by the thing type.

```
aws iot update-thing \
    --thing-name "MyOtherLightBulb" \
    --thing-type-name "LightBulb" \
    --attribute-payload '{"attributes": {"wattage":"75", "model":"123"}}'
```

This command produces no output. Use the `describe-thing` command to see the result.

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see UpdateThing in *AWS CLI Command Reference*.

update-topic-rule-destination

The following code example shows how to use `update-topic-rule-destination`.

AWS CLI

Example 1: To enable a topic rule destination

The following `update-topic-rule-destination` example enables traffic to a topic rule destination.

```
aws iot update-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --status ENABLED
```

This command produces no output.

For more information, see Confirming HTTP action destinations in the *AWS IoT Developer Guide*.

Example 2: To disable a topic rule destination

The following `update-topic-rule-destination` example disables traffic to a topic rule destination.

```
aws iot update-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --status DISABLED
```

This command produces no output.

For more information, see Disabling and deleting an HTTP action destination in the *AWS IoT Developer Guide*.

Example 3: To send a new confirmation message

The following `update-topic-rule-destination` example sends a new confirmation message for a topic rule destination.

```
aws iot update-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --status IN_PROGRESS
```

This command produces no output.

For more information, see Sending a new confirmation request in the *AWS IoT Developer Guide*.

- For API details, see UpdateTopicRuleDestination in *AWS CLI Command Reference*.

`validate-security-profile-behaviors`

The following code example shows how to use `validate-security-profile-behaviors`.

AWS CLI

Example 1: To validate the behaviors parameters for a security profile

The following `validate-security-profile-behaviors` example validates a well-formed and correct set of behaviors for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":12},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}}]"
```

Output:

```
{
```

```
    "valid": true,
    "validationErrors": []
}
```

Example 2: To validate incorrect behaviors parameters for a security profile

The following `validate-security-profile-behaviors` example validates a set of behaviors that contains an error for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":12},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":100000,\"consecutiveDatapointsToClear
\":1}}]"
```

Output:

```
{
    "valid": false,
    "validationErrors": [
        {
            "errorMessage": "Behavior Authorization is malformed.
 consecutiveDatapointsToAlarm 100000 should be in range[1,10]"
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ValidateSecurityProfileBehaviors in *AWS CLI Command Reference*.

Device Advisor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Device Advisor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-suite-definition`

The following code example shows how to use `create-suite-definition`.

AWS CLI

Example 1: To create an IoT Device Advisor test suite

The following `create-suite-definition` example creates a device advisor test suite in the AWS IoT with the specified suite definition configuration.

```
aws iotdeviceadvisor create-suite-definition \
    --suite-definition-configuration '{
        "suiteDefinitionName": "TestSuiteName",
        "devices": [{"thingArn":"arn:aws:iot:us-west-2:123456789012:thing/
MyIotThing"}],
        "intendedForQualification": false,
        "rootGroup": "{\"configuration\":{},\"tests\":[{\"name\":\"MQTT Connect\",
\"configuration\":{\"EXECUTION_TIMEOUT\":120},\"tests\":[{\"name\":\"MQTT_Connect\",
\"configuration\":{},\"test\":{\"id\":\"MQTT_Connect\",\"testCase\":null,\"version
\":\"0.0.0\"}}]}]}",
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "0jtsgio7yenu",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
west-2:123456789012:suitedefinition/0jtsgio7yenu",
    "suiteDefinitionName": "TestSuiteName",
    "createdAt": "2022-12-02T11:38:13.263000-05:00"
}
```

For more information, see Create a test suite definition in the *AWS IoT Core Developer Guide*.

Example 2: To create an IoT Device Advisor Latest Qualification test suite

The following `create-suite-definition` example creates a device advisor qualification test suite with the latest version in the AWS IoT with the specified suite definition configuration.

```
aws iotdeviceadvisor create-suite-definition \
    --suite-definition-configuration '{
        "suiteDefinitionName": "TestSuiteName",
        "devices": [{"thingArn":"arn:aws:iot:us-west-2:123456789012:thing/
MyIotThing"}],
        "intendedForQualification": true,
        "rootGroup": "",
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "txgsuolk2myj",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
west-2:123456789012:suitedefinition/txgsuolk2myj",
    "suiteDefinitionName": "TestSuiteName",
    "createdAt": "2022-12-02T11:38:13.263000-05:00"
}
```

For more information, see Create a test suite definition in the *AWS IoT Core Developer Guide*.

- For API details, see CreateSuiteDefinition in *AWS CLI Command Reference*.

`delete-suite-definition`

The following code example shows how to use `delete-suite-definition`.

AWS CLI

To delete the IoT Device Advisor test suite

The following `delete-suite-definition` example deletes the device advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor delete-suite-definition \
```

```
    --suite-definition-id 0jtsgio7yenu
```

This command produces no output.

For more information, see Device Advisor workflow in the *AWS IoT Core Developer Guide*.

- For API details, see DeleteSuiteDefinition in *AWS CLI Command Reference*.

`get-endpoint`

The following code example shows how to use `get-endpoint`.

AWS CLI

Example 1: To get the information about an IoT Device Advisor Account-level endpoint

The following `get-endpoint` example gets the information about a device advisor Account-level test endpoint.

```
aws iotdeviceadvisor get-endpoint
```

Output:

```
{
    "endpoint": "t6y4c143x9sfo.deviceadvisor.iot.us-west-2.amazonaws.com"
}
```

Example 2: To get the information about an IoT Device Advisor Device-level endpoint

The following `get-endpoint` example gets the information about a device advisor device-level test endpoint with the specified thing-arn or certificate-arn.

```
aws iotdeviceadvisor get-endpoint \
    --thing-arn arn:aws:iot:us-west-2:123456789012:thing/MyIotThing
```

Output:

```
{
    "endpoint": "tdb7719be5t6y4c143x9sfo.deviceadvisor.iot.us-west-2.amazonaws.com"
```

```
}
```

For more information, see Get a test endpoint in the *AWS IoT Core Developer Guide*.

- For API details, see GetEndpoint in *AWS CLI Command Reference*.

`get-suite-definition`

The following code example shows how to use `get-suite-definition`.

AWS CLI

To get the information about an IoT Device Advisor test suite

The following `get-suite-definition` example get the information about a aevice advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor get-suite-definition \
    --suite-definition-id qqcsmtyyjabl
```

Output:

```
{
    "suiteDefinitionId": "qqcsmtyyjabl",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-

```

For more information, see Get a test suite definition in the *AWS IoT Core Developer Guide*.

- For API details, see GetSuiteDefinition in *AWS CLI Command Reference*.

`get-suite-run-report`

The following code example shows how to use `get-suite-run-report`.

AWS CLI

To get the information about an IoT Device Advisor qualifying test suite run report

The following `get-suite-run-report` example gets the report download link for a successful device advisor qualifying test suite run with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor get-suite-run-report \
    --suite-definition-id ztvb5aek4w4x \
    --suite-run-id p6awv83nre6v
```

Output:

```
{
    "qualificationReportDownloadUrl": "https://senate-apn-reports-us-east-1-
prod.s3.amazonaws.com/report.downloadlink"
}
```

For more information, see Get a qualification report for a successful qualification test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see GetSuiteRunReport in *AWS CLI Command Reference*.

`get-suite-run`

The following code example shows how to use `get-suite-run`.

AWS CLI

To get the information about an IoT Device Advisor test suite run status

The following `get-suite-run` example gets the information about a device advisor test suite run status with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor get-suite-run \
    --suite-definition-id qqcsmtyyjabl \
    --suite-run-id nzlfyhaa18oa
```

Output:

```
{
    "suiteDefinitionId": "qqcsmtyyjabl",
    "suiteDefinitionVersion": "v1",
    "suiteRunId": "nzlfyhaa18oa",
    "suiteRunArn": "arn:aws:iotdeviceadvisor:us-west-2:123456789012:suiterun/

```

For more information, see Get a test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see GetSuiteRun in *AWS CLI Command Reference*.

`list-suite-definitions`

The following code example shows how to use `list-suite-definitions`.

AWS CLI

Example 1: To list the IoT Device Advisor test suites you created

The following `list-suite-definitions` example lists up to 25 device advisor test suites you created in AWS IoT. If you have more than 25 test suites, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suites you created.

```
aws iotdeviceadvisor list-suite-definitions
```

Output:

```
{
    "suiteDefinitionInformationList": [
        {
            "suiteDefinitionId": "3hsn88h4p2g5",
            "suiteDefinitionName": "TestSuite1",
            "defaultDevices": [
                {
                    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/
MyIotThing"
                }
            ],
            "intendedForQualification": false,
            "isLongDurationTest": false,
            "protocol": "MqttV3_1_1",
```

```
            "createdAt": "2022-11-17T14:15:56.830000-05:00"
        }
    ],
    "nextToken": "nextTokenValue"
}
```

Example 2: To list the IoT Device Advisor test suites you created with the specified settings

The following `list-suite-definitions` example lists device advisor test suites you created in AWS IoT with the specified max-result number. If you have more test suites than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suites you created that weren't shown before.

```
aws iotdeviceadvisor list-suite-definitions \
    --max-results 1 \
    --next-token "nextTokenValue"
```

Output:

```
{
    "suiteDefinitionInformationList": [
        {
            "suiteDefinitionId": "ztvb5aew4w4x",
            "suiteDefinitionName": "TestSuite2",
            "defaultDevices": [],
            "intendedForQualification": true,
            "isLongDurationTest": false,
            "protocol": "MqttV3_1_1",
            "createdAt": "2022-11-17T14:15:56.830000-05:00"
        }
    ],
    "nextToken": "nextTokenValue"
}
```

For more information, see Device Advisor workflow in the *AWS IoT Core Developer Guide*.

- For API details, see ListSuiteDefinitions in *AWS CLI Command Reference*.

`list-suite-runs`

The following code example shows how to use `list-suite-runs`.

AWS CLI

Example 1: To list all information about the specified IoT Device Advisor test suite runs status

The following `list-suite-runs` example lists all information about a device advisor test suite runs status with the specified suite definition ID. If you have more than 25 test suite runs, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suite runs.

```
aws iotdeviceadvisor list-suite-runs \
    --suite-definition-id ztvb5aew4w4x
```

Output:

```
{
    "suiteRunsList": [
        {
            "suiteDefinitionId": "ztvb5aew4w4x",
            "suiteDefinitionVersion": "v1",
            "suiteDefinitionName": "TestSuite",
            "suiteRunId": "p6awv89nre6v",
            "createdAt": "2022-12-01T16:33:14.212000-05:00",
            "startedAt": "2022-12-01T16:33:15.710000-05:00",
            "endAt": "2022-12-01T16:42:03.323000-05:00",
            "status": "PASS",
            "passed": 6,
            "failed": 0
        }
    ]
}
```

Example 2: To list information about the specified IoT Device Advisor test suite runs status with the specified settings

The following `list-suite-runs` example lists information about a device advisor test suite runs status with the specified suite definition ID and the specified max-result number. If you have more test suite runs than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suite runs that weren't shown before.

```
aws iotdeviceadvisor list-suite-runs \
    --suite-definition-id qqcsmtyyjaml \
    --max-results 1 \
    --next-token "nextTokenValue"
```

Output:

```
{
    "suiteRunsList": [
        {
            "suiteDefinitionId": "qqcsmtyyjaml",
            "suiteDefinitionVersion": "v1",
            "suiteDefinitionName": "MQTT connection",
            "suiteRunId": "gz9vm2s6d2jy",
            "createdAt": "2022-12-01T20:10:27.079000-05:00",
            "startedAt": "2022-12-01T20:10:28.003000-05:00",
            "endAt": "2022-12-01T20:10:45.084000-05:00",
            "status": "STOPPED",
            "passed": 0,
            "failed": 0
        }
    ],
    "nextToken": "nextTokenValue"
}
```

For more information, see Device Advisor workflow in the *AWS IoT Core Developer Guide*.

- For API details, see ListSuiteRuns in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags attached to an IoT Device Advisor resource

The following `list-tags-for-resource` example lists the tags attached to a device advisor resource. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor list-tags-for-resource \
```

```
    --resource-arn arn:aws:iotdeviceadvisor:us-west-2:123456789012:suitedefinition/
ba0uyjpg38ny
```

Output:

```
{
    "tags": {
        "TestTagKey": "TestTagValue"
    }
}
```

For more information, see Resource types defined by AWS IoT Core Device Advisor in the *Service Authorization Reference* and Tagging your AWS IoT resources in the *AWS IoT Core Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-suite-run`

The following code example shows how to use `start-suite-run`.

AWS CLI

To start an IoT Device Advisor test suite run

The following `start-suite-run` example lists the available widgets in your AWS account.

```
aws iotdeviceadvisor start-suite-run \
    --suite-definition-id qqcsmtyyjabl \
    --suite-definition-version v1 \
    --suite-run-configuration '{"primaryDevice":{"thingArn": "arn:aws:iot:us-
west-2:123456789012:thing/MyIotThing","certificateArn":"arn:aws:iot:us-
west-2:123456789012:cert/certFile"}}'
```

Output:

```
{
    "suiteRunId": "pwmucgw7lt9s",
    "suiteRunArn": "arn:aws:iotdeviceadvisor:us-west-2:123456789012:suiterun/
qqcsmtyyjabl/pwmucgw7lk9s",
    "createdAt": "2022-12-02T15:43:05.581000-05:00"
```

```
}
```

For more information, see Start a test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see StartSuiteRun in *AWS CLI Command Reference*.

`stop-suite-run`

The following code example shows how to use `stop-suite-run`.

AWS CLI

To stop an IoT Device Advisor test suite that is currently running

The following `stop-suite-run` example stops a device advisor test suite that is currently running with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor stop-suite-run \
    --suite-definition-id qqcsmtyyjabl \
    --suite-run-id nzlfyhaa18oa
```

This command produces no output.

For more information, see Stop a test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see StopSuiteRun in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add to and modify the existing tags of an IoT Device Advisor resource

The following `tag-resource` example adds to and modifies the existing tags of a device advisor resource with the specified resource arn and tags. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor tag-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-west-2:123456789012:suitedefinition/
ba0uyjpg38ny \
```

```
    --tags '{"TagKey": "TagValue"}'
```

This command produces no output.

For more information, see Resource types defined by AWS IoT Core Device Advisor in the *Service Authorization Reference* and Tagging your AWS IoT resources in the *AWS IoT Core Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove the existing tags from an IoT Device Advisor resource

The following `untag-resource` example removes the existing tags from a device advisor resource with the specified resource arn and tag key. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor untag-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-west-2:123456789012:suitedefinition/ba0uyjpg38ny \
    --tag-keys "TagKey"
```

This command produces no output.

For more information, see Resource types defined by AWS IoT Core Device Advisor in the *Service Authorization Reference* and Tagging your AWS IoT resources in the *AWS IoT Core Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-suite-definition`

The following code example shows how to use `update-suite-definition`.

AWS CLI

Example 1: To update an IoT Device Advisor test suite

The following `update-suite-definition` example updates a device advisor test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```
aws iotdeviceadvisor update-suite-definition \
    --suite-definition-id 3hsn88h4p2g5 \
    --suite-definition-configuration '{
        "suiteDefinitionName": "TestSuiteName",
        "devices": [{"thingArn":"arn:aws:iot:us-west-2:123456789012:thing/
MyIotThing"}],
        "intendedForQualification": false,
        "rootGroup": "{\"configuration\":{},\"tests\":[{\"name\":\"MQTT Connect\",
\"configuration\":{\"EXECUTION_TIMEOUT\":120},\"tests\":[{\"name\":\"MQTT_Connect\",
\"configuration\":{},\"test\":{\"id\":\"MQTT_Connect\",\"testCase\":null,\"version
\":\"0.0.0\"}}]}]}",
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "3hsn88h4p2g5",
    "suiteDefinitionName": "TestSuiteName",
    "suiteDefinitionVersion": "v3",
    "createdAt": "2022-11-17T14:15:56.830000-05:00",
    "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

Example 2: To update an IoT Device Advisor Qualification test suite

The following `update-suite-definition` example updates a device advisor qualification test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```
aws iotdeviceadvisor update-suite-definition \
    --suite-definition-id txgsuolk2myj \
    --suite-definition-configuration '{
        "suiteDefinitionName": "TestSuiteName",
        "devices": [{"thingArn":"arn:aws:iot:us-west-2:123456789012:thing/
MyIotThing"}],
        "intendedForQualification": true,
        "rootGroup": "",
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "txgsuolk2myj",
    "suiteDefinitionName": "TestSuiteName",
    "suiteDefinitionVersion": "v3",
    "createdAt": "2022-11-17T14:15:56.830000-05:00",
    "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

For more information, see Device Advisor workflow in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateSuiteDefinition in *AWS CLI Command Reference*.

AWS IoT data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT data.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-thing-shadow`

The following code example shows how to use `delete-thing-shadow`.

AWS CLI

To delete a device's shadow document

The following `delete-thing-shadow` example deletes the entire shadow document for the device named `MyRPi`.

```
aws iot-data delete-thing-shadow "output.txt" \
```

```
    --thing-name MyRPi
```

This command produces no output. The `output.txt` file contains information that confirms the version and timestamp of the shadow document that you deleted.

```
{"version":2,"timestamp":1560270384}
```

For more information, see Using Shadows in the *AWS IoT Developers Guide*.

- For API details, see DeleteThingShadow in *AWS CLI Command Reference*.

`get-thing-shadow`

The following code example shows how to use `get-thing-shadow`.

AWS CLI

To get a thing shadow document

The following `get-thing-shadow` example gets the thing shadow document for the specified IoT thing.

```
aws iot-data get-thing-shadow output.txt \
    --thing-name MyRPi
```

Contents of `output.txt`:

```
{
    "state":{
        "reported":{
            "moisture":"low"
        }
    },
    "metadata":{
        "reported":{
            "moisture":{
                "timestamp":1560269319
            }
        }
    },
    "version":1,"timestamp":1560269405
```

```
}
```

This command produces no output.

For more information, see Device Shadow Service Data Flow in the *AWS IoT Developers Guide*.

- For API details, see GetThingShadow in *AWS CLI Command Reference*.

`update-thing-shadow`

The following code example shows how to use `update-thing-shadow`.

AWS CLI

To update a thing shadow

The following `update-thing-shadow` example modifies the current state of the device shadow for the specified thing and saves it to the file `output.txt`.

```
aws iot-data update-thing-shadow "output.txt" \
    --cli-binary-format raw-in-base64-out \
    --thing-name MyRPi \
    --payload '{"state":{"reported":{"moisture":"okay"}}}'
```

This command produces no output. The response payload is saved to `output.txt`.

Contents of `output.txt`:

```
{
    "state": {
        "reported": {
            "moisture": "okay"
        }
    },
    "metadata": {
        "reported": {
            "moisture": {
                "timestamp": 1560270036
            }
        }
    },
    "version": 2,
    "timestamp": 1560270036
```

```
}
```

For more information, see Device Shadow Service Data Flow in the *AWS IoT Developers Guide*.

- For API details, see UpdateThingShadow in *AWS CLI Command Reference*.

AWS IoT Greengrass examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-role-to-group`

The following code example shows how to use `associate-role-to-group`.

AWS CLI

To associate a role with a Greengrass group

The following `associate-role-to-group` example associates the specified IAM role with a Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services. For example, your group role might grant permissions required for CloudWatch Logs integration.

```
aws greengrass associate-role-to-group \
    --group-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --role-arn arn:aws:iam::123456789012:role/GG-Group-Role
```

Output:

```
{
    "AssociatedAt": "2019-09-10T20:03:30Z"
}
```

For more information, see Configure the group role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see AssociateRoleToGroup in *AWS CLI Command Reference*.

`associate-service-role-to-account`

The following code example shows how to use `associate-service-role-to-account`.

AWS CLI

To associate a service role with your AWS account

The following `associate-service-role-to-account` example associates an IAM service role, specified by its ARN, with AWS IoT Greengrass in your AWS account. You must have previously created the service role in IAM, and you must associate a policy document with it that allows AWS IoT Greengrass to assume this role.

```
aws greengrass associate-service-role-to-account \
    --role-arn "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
```

Output:

```
{
    "AssociatedAt": "2019-06-25T18:12:45Z"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see AssociateServiceRoleToAccount in *AWS CLI Command Reference*.

`create-connector-definition-version`

The following code example shows how to use `create-connector-definition-version`.

AWS CLI

To create a connector definition version

The following `create-connector-definition-version` example creates a connector definition version and associates it with the specified connector definition. All connectors in a version define values for their parameters.

```
aws greengrass create-connector-definition-version \
    --connector-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --connectors "[{\"Id\": \"MyTwilioNotificationsConnector\",
 \"ConnectorArn\": \"arn:aws:greengrass:us-west-2::/connectors/
TwilioNotifications/versions/2\", \"Parameters\": {\"TWILIO_ACCOUNT_SID
\": \"AC1a8d4204890840d7fc482aab38090d57\", \"TwilioAuthTokenSecretArn\":

ntSlp6\", \"TwilioAuthTokenSecretArn-ResourceId\": \"TwilioAuthToken\",
 \"DefaultFromPhoneNumber\": \"4254492999\"}}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "CreationTimestamp": "2019-06-24T20:46:30.134Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Getting started with Greengrass connectors (CLI) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateConnectorDefinitionVersion in *AWS CLI Command Reference*.

`create-connector-definition`

The following code example shows how to use `create-connector-definition`.

AWS CLI

To create a connector definition

The following `create-connector-definition` example example creates a connector definition and an initial connector definition version. The initial version contains one connector. All connectors in a version define values for their parameters.

```
aws greengrass create-connector-definition \
    --name MySNSConnector \
    --initial-version "{\"Connectors\": [{\"Id\":\"MySNSConnector\",\"ConnectorArn
\":\"arn:aws:greengrass:us-west-2::/connectors/SNS/versions/1\",\"Parameters\":
 {\"DefaultSNSArn\":\"arn:aws:sns:us-west-2:123456789012:GGConnectorTopic\"}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTimestamp": "2019-06-19T19:30:01.300Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/connectors/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "Name": "MySNSConnector"
}
```

For more information, see Getting started with Greengrass connectors (CLI) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateConnectorDefinition in *AWS CLI Command Reference*.

`create-core-definition-version`

The following code example shows how to use `create-core-definition-version`.

AWS CLI

To create a core definition version

The following `create-core-definition-version` example creates a core definition version and associates it with the specified core definition. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition-version` command.

Create the AWS IoT thing that corresponds to the core device.

```
aws iot create-thing \
    --thing-name "MyCoreDevice"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
    "thingName": "MyCoreDevice",
    "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myCore.cert.pem" \
    --public-key-outfile "myCore.public.key" \
    --private-key-outfile "myCore.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```
aws iot create-policy \
    --policy-name "Core_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "Core_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/Core_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate.

```
aws iot attach-policy \
    --policy-name "Core_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate.

```
aws iot attach-thing-principal \
    --thing-name "MyCoreDevice" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Create the core definition version.

```
aws greengrass create-core-definition-version \
    --core-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" \
    --cores "[{\"Id\":\"MyCoreDevice\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/MyCoreDevice\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz
\",\"SyncShadow\":true}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222/versions/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "CreationTimestamp": "2019-09-18T00:15:09.838Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Configure the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateCoreDefinitionVersion in *AWS CLI Command Reference*.

`create-core-definition`

The following code example shows how to use `create-core-definition`.

AWS CLI

Example 1: To create an empty core definition

The following `create-core-definition` example creates an empty (no initial version) Greengrass core definition. Before the core is usable, you must use the `create-core-definition-version` command to provide the other parameters for the core.

```
aws greengrass create-core-definition \
    --name cliGroup_Core
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTimestamp": "2019-06-25T18:23:22.106Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LastUpdatedTimestamp": "2019-06-25T18:23:22.106Z",
    "Name": "cliGroup_Core"
}
```

Example 2: To create a core definition with an initial version

The following `create-core-definition` example creates a core definition that contains an initial core definition version. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition` command.

Create the AWS IoT thing that corresponds to the core device.

```
aws iot create-thing \
    --thing-name "MyCoreDevice"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
    "thingName": "MyCoreDevice",
    "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myCore.cert.pem" \
    --public-key-outfile "myCore.public.key" \
```

```
    --private-key-outfile "myCore.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```
aws iot create-policy \
    --policy-name "Core_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "Core_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/Core_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
```

```
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate.

```
aws iot attach-policy \
    --policy-name "Core_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate.

```
aws iot attach-thing-principal \
    --thing-name "MyCoreDevice" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Create the core definition.

```
aws greengrass create-core-definition \
    --name "MyCores" \
    --initial-version "{\"Cores\":[{\"Id\":\"MyCoreDevice\",\"ThingArn\":
\"arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice\",\"CertificateArn\":
\"arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz
\",\"SyncShadow\":true}]}"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/cores/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333/versions/a1b2c3d4-5678-90ab-
cdef-EXAMPLE44444",
    "Name": "MyCores",
```

```
    "LastUpdatedTimestamp": "2019-09-18T00:11:06.197Z",
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
    "CreationTimestamp": "2019-09-18T00:11:06.197Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see Configure the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateCoreDefinition in *AWS CLI Command Reference*.

`create-deployment`

The following code example shows how to use `create-deployment`.

AWS CLI

To create a deployment for a version of a Greengrass group

The following `create-deployment` example deploys the specified version of a Greengrass group.

```
aws greengrass create-deployment \
    --deployment-type NewDeployment \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --group-version-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/deployments/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333",
    "DeploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see Getting started with Greengrass connectors (CLI) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateDeployment in *AWS CLI Command Reference*.

create-device-definition-version

The following code example shows how to use `create-device-definition-version`.

AWS CLI

To create a device definition version

The following `create-device-definition-version` example creates a device definition version and associates it with the specified device definition. The version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device.

```
aws iot create-thing \
    --thing-name "InteriorTherm"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/InteriorTherm",
    "thingName": "InteriorTherm",
    "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myDevice.cert.pem" \
    --public-key-outfile "myDevice.public.key" \
    --private-key-outfile "myDevice.private.key"
```

Output:

```
{
```

```
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive.

```
aws iot create-policy \
    --policy-name "GG_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "GG_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/GG_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate.

```
aws iot attach-policy \
    --policy-name "GG_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

Attach the thing to the certificate.

```
aws iot attach-thing-principal \
    --thing-name "InteriorTherm" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

After you create and configure the IoT thing as shown above, use the `ThingArn` and `CertificateArn` from the first two commands in the following example.

```
aws greengrass create-device-definition-version \
    --device-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" \
    --devices "[{\"Id\":\"InteriorTherm\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/InteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92\",
\"SyncShadow\":true},{\"Id\":\"ExteriorTherm\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/ExteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/6c52ce1b47bde88a637e9ccdd45fe4e4c2c0a75a6866f8f63d980ee22fa51e02\",
\"SyncShadow\":true}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
devices/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333",
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "CreationTimestamp": "2019-09-11T00:15:09.838Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Overview of the AWS IoT Greengrass group object model in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateDeviceDefinitionVersion in *AWS CLI Command Reference*.

`create-device-definition`

The following code example shows how to use `create-device-definition`.

AWS CLI

To create a device definition

The following `create-device-definition` example creates a device definition that contains an initial device definition version. The initial version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device.

```
aws iot create-thing \
    --thing-name "InteriorTherm"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/InteriorTherm",
    "thingName": "InteriorTherm",
    "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myDevice.cert.pem" \
    --public-key-outfile "myDevice.public.key" \
    --private-key-outfile "myDevice.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive.

```
aws iot create-policy \
    --policy-name "GG_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "GG_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/GG_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
```

```
}
```

Attach the policy to the certificate.

```
aws iot attach-policy \
    --policy-name "GG_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

Attach the thing to the certificate.

```
aws iot attach-thing-principal \
    --thing-name "InteriorTherm" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

After you create and configure the IoT thing as shown above, use the `ThingArn` and `CertificateArn` from the first two commands in the following example.

```
aws greengrass create-device-definition \
    --name "Sensors" \
    --initial-version "{\"Devices\":[{\"Id\":\"InteriorTherm
\",\"ThingArn\":\"arn:aws:iot:us-west-2:123456789012:thing/
InteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92\",
\"SyncShadow\":true},{\"Id\":\"ExteriorTherm\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/ExteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/6c52ce1b47bde88a637e9ccdd45fe4e4c2c0a75a6866f8f63d980ee22fa51e02\",
\"SyncShadow\":true}]}"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/devices/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222/versions/a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
    "Name": "Sensors",
    "LastUpdatedTimestamp": "2019-09-11T00:11:06.197Z",
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "CreationTimestamp": "2019-09-11T00:11:06.197Z",
```

```
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
devices/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Overview of the AWS IoT Greengrass group object model in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateDeviceDefinition in *AWS CLI Command Reference*.

`create-function-definition-version`

The following code example shows how to use `create-function-definition-version`.

AWS CLI

To create a version of the function definition

The following `create-function-definition-version` example creates a new version of the specified function definition. This version specifies a single function whose ID is `Hello-World-function`, allows access to the file system, and specifies a maximum memory size and timeout period.

```
aws greengrass create-function-definition-version \
    --cli-input-json "{\"FunctionDefinitionId\": \"a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111\",\"Functions\": [{\"Id\": \"Hello-
World-function\", \"FunctionArn\": \""arn:aws:lambda:us-
west-2:123456789012:function:Greengrass_HelloWorld_Counter:gghw-alias"\",
\"FunctionConfiguration\": {\"Environment\": {\"AccessSysfs\": true},\"Executable\":
 \"greengrassHelloWorldCounter.function_handler\",\"MemorySize\": 16000,\"Pinned\":
 false,\"Timeout\": 25}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
functions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "CreationTimestamp": "2019-06-25T22:03:43.376Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

```
}
```

For more information, see Run Lambda functions on the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateFunctionDefinitionVersion in *AWS CLI Command Reference*.

`create-function-definition`

The following code example shows how to use `create-function-definition`.

AWS CLI

To create a Lambda function definition

The following `create-function-definition` example creates a Lambda function definition and an initial version by providing a list of Lambda functions (in this case, a list of just one function named `TempMonitorFunction`) and their configurations. Before you can create the function definition, you need the Lambda function ARN. To create the function and its alias, use Lambda's `create-function` and `publish-version` commands. Lambda's `create-function` command requires the ARN of the execution role, even though AWS IoT Greengrass doesn't use that role because permissions are specified in the Greengrass group role. You can use the IAM `create-role` command to create an empty role to get an ARN to use with Lambda's `create-function` or you can use an existing execution role.

```
aws greengrass create-function-definition \
    --name MyGreengrassFunctions \
    --initial-version "{\"Functions\": [{\"Id\": \"TempMonitorFunction\",
 \"FunctionArn\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\", \"FunctionConfiguration
\": {\"Executable\": \"temp_monitor.function_handler\", \"MemorySize\": 16000,
\"Timeout\": 5}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
functions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTimestamp": "2019-06-19T22:24:44.585Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LastUpdatedTimestamp": "2019-06-19T22:24:44.585Z",
```

```
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/functions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "Name": "MyGreengrassFunctions"
}
```

For more information, see How to configure local resource access using the AWS command line interface in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateFunctionDefinition in *AWS CLI Command Reference*.

`create-group-certificate-authority`

The following code example shows how to use `create-group-certificate-authority`.

AWS CLI

To create a certificate authority (CA) for a group

The following `create-group-certificate-authority` example creates or rotates a CA for the specified group.

```
aws greengrass create-group-certificate-authority \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/certificateauthorities/
d31630d674c4437f6c5dbc0dca56312a902171ce2d086c38e509c8EXAMPLEcc5"
}
```

For more information, see Overview of AWS IoT Greengrass security in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateGroupCertificateAuthority in *AWS CLI Command Reference*.

`create-group-version`

The following code example shows how to use `create-group-version`.

AWS CLI

To create a version of a Greengrass group

The following `create-group-version` example creates a group version and associates it with the specified group. The version references the core, resource, connector, function, and subscription versions that contain the entities to include in this group version. You must create these entities before you can create the group version.

To create a resource definition with an initial version, use the `create-resource-definition` command.To create a connector definition with an initial version, use the `create-connector-definition` command.To create a function definition with an initial version, use the `create-function-definition` command.To create a subscription definition with an initial version, use the `create-subscription-definition` command.To retrieve the ARN of the latest core definition version, use the `get-group-version` command and specify the ID of the latest group version.

```
aws greengrass create-group-version \
    --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \
    --core-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/cores/6a630442-8708-4838-ad36-eb98849d975e/
versions/6c87151b-1fb4-4cb2-8b31-6ee715d8f8ba" \
    --resource-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/
a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1" \
    --connector-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/

versions/78a3331b-895d-489b-8823-17b4f9f418a0" \
    --function-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/
versions/67f918b9-efb4-40b0-b87c-de8c9faf085b" \
    --subscription-definition-version-arn "arn:aws:greengrass:us-
west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-
feccbdd69112/versions/aa645c47-ac90-420d-9091-8c7ffa4f103f"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/
ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca/versions/e10b0459-4345-4a09-88a4-1af1f5d34638",
    "CreationTimestamp": "2019-06-20T18:42:47.020Z",
```

```
    "Id": "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca",
    "Version": "e10b0459-4345-4a09-88a4-1af1f5d34638"
}
```

For more information, see Deploy AWS IoT Greengrass groups to an AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateGroupVersion in *AWS CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

To create a Greeengrass group

The following `create-group` example creates a group named `cli-created-group`.

```
aws greengrass create-group \
    --name cli-created-group
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTimestamp": "2019-06-25T18:07:17.688Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LastUpdatedTimestamp": "2019-06-25T18:07:17.688Z",
    "Name": "cli-created-group"
}
```

For more information, see Deploy AWS IoT Greengrass groups to an AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`create-logger-definition-version`

The following code example shows how to use `create-logger-definition-version`.

AWS CLI

To create a logger definition version

The following `create-logger-definition-version` example creates a logger definition version and associates it with a logger definition. The version defines four logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, 3) system component logs in Amazon CloudWatch Logs, and 4) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```
aws greengrass create-logger-definition-version \
    --logger-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --loggers "[{\"Id\":\"1\",\"Component\":\"GreengrassSystem\",\"Level\":\"ERROR
\",\"Space\":10240,\"Type\":\"FileSystem\"},{\"Id\":\"2\",\"Component\":\"Lambda
\",\"Level\":\"INFO\",\"Space\":10240,\"Type\":\"FileSystem\"},{\"Id\":\"3\",
\"Component\":\"GreengrassSystem\",\"Level\":\"WARN\",\"Type\":\"AWSCloudWatch\"},
{\"Id\":\"4\",\"Component\":\"Lambda\",\"Level\":\"INFO\",\"Type\":\"AWSCloudWatch
\"}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
loggers/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "CreationTimestamp": "2019-07-24T00:04:48.523Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Monitoring with AWS IoT Greengrass logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateLoggerDefinitionVersion in *AWS CLI Command Reference*.

`create-logger-definition`

The following code example shows how to use `create-logger-definition`.

AWS CLI

To create a logger definition

The following `create-logger-definition` example creates a logger definition that contains an initial logger definition version. The initial version defines three logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, and 3) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```
aws greengrass create-logger-definition \
    --name "LoggingConfigs" \
    --initial-version "{\"Loggers\":[{\"Id\":\"1\",\"Component\":\"GreengrassSystem
\",\"Level\":\"ERROR\",\"Space\":10240,\"Type\":\"FileSystem\"},{\"Id\":
\"2\",\"Component\":\"Lambda\",\"Level\":\"INFO\",\"Space\":10240,\"Type\":
\"FileSystem\"},{\"Id\":\"3\",\"Component\":\"Lambda\",\"Level\":\"INFO\",\"Type\":
\"AWSCloudWatch\"}]}"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/loggers/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
    "Name": "LoggingConfigs",
    "LastUpdatedTimestamp": "2019-07-23T23:52:17.165Z",
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "CreationTimestamp": "2019-07-23T23:52:17.165Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
loggers/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Monitoring with AWS IoT Greengrass logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateLoggerDefinition in *AWS CLI Command Reference*.

`create-resource-definition-version`

The following code example shows how to use `create-resource-definition-version`.

AWS CLI

To create a version of a resource definition

The following `create-resource-definition-version` example creates a new version of a TwilioAuthToken.

```
aws greengrass create-resource-definition-version \
    --resource-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --resources "[{\"Id\": \"TwilioAuthToken\",\"Name\": \"MyTwilioAuthToken
\",\"ResourceDataContainer\": {\"SecretsManagerSecretResourceData\": {\"ARN\":
 \"arn:aws:secretsmanager:us-west-2:123456789012:secret:greengrass-TwilioAuthToken-
ntSlp6\"}}}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
resources/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "CreationTimestamp": "2019-06-24T21:17:25.623Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Deploy secrets to the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateResourceDefinitionVersion in *AWS CLI Command Reference*.

`create-resource-definition`

The following code example shows how to use `create-resource-definition`.

AWS CLI

To create a resource definition

The following `create-resource-definition` example creates a resource definition that contains a list of resources to be used in a Greengrass group. In this example, an initial version of the resource definition is included by providing a list of resources. The list includes one

resource for a Twilio authorization token and the ARN for a secret stored in AWS Secrets Manager. You must create the secret before you can create the resource definition.

```
aws greengrass create-resource-definition \
    --name MyGreengrassResources \
    --initial-version "{\"Resources\": [{\"Id\": \"TwilioAuthToken
\",\"Name\": \"MyTwilioAuthToken\",\"ResourceDataContainer\":
 {\"SecretsManagerSecretResourceData\": {\"ARN\": \"arn:aws:secretsmanager:us-
west-2:123456789012:secret:greengrass-TwilioAuthToken-ntSlp6\"}}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
resources/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTimestamp": "2019-06-19T21:51:28.212Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LastUpdatedTimestamp": "2019-06-19T21:51:28.212Z",
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/resources/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "Name": "MyGreengrassResources"
}
```

For more information, see How to configure local resource access using the AWS command line interface in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateResourceDefinition in *AWS CLI Command Reference*.

`create-software-update-job`

The following code example shows how to use `create-software-update-job`.

AWS CLI

To create a software update job for a core

The following `create-software-update-job` example creates an over-the-air (OTA) update job to update the AWS IoT Greengrass Core software on the core whose name is `MyFirstGroup_Core`. This command requires an IAM role that allows access to software update packages in Amazon S3 and includes `iot.amazonaws.com` as a trusted entity.

```
aws greengrass create-software-update-job \
    --update-targets-architecture armv7l \
    --update-targets [\"arn:aws:iot:us-west-2:123456789012:thing/MyFirstGroup_Core
\"] \
    --update-targets-operating-system raspbian \
    --software-to-update core \
    --s3-url-signer-role arn:aws:iam::123456789012:role/OTA_signer_role \
    --update-agent-log-level WARN
```

Output:

```
{
    "IotJobId": "GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",
    "IotJobArn": "arn:aws:iot:us-west-2:123456789012:job/
GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",
    "PlatformSoftwareVersion": "1.9.3"
}
```

For more information, see OTA updates of AWS IoT Greengrass Core software in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateSoftwareUpdateJob in *AWS CLI Command Reference*.

`create-subscription-definition-version`

The following code example shows how to use `create-subscription-definition-version`.

AWS CLI

To create a new version of a subscription definition

The following `create-subscription-definition-version` example creates a new version of a subscription definition that contains three subscriptions: a trigger notification, a temperature input, and an output status.

```
aws greengrass create-subscription-definition-version \
    --subscription-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --subscriptions "[{\"Id\": \"TriggerNotification\", \"Source\":
 \"arn:aws:lambda:us-west-2:123456789012:function:TempMonitor:GG_TempMonitor
\", \"Subject\": \"twilio/txt\", \"Target\": \"arn:aws:greengrass:us-west-2::/
connectors/TwilioNotifications/versions/1\"},{\"Id\": \"TemperatureInput\", \"Source
\": \"cloud\", \"Subject\": \"temperature/input\", \"Target\": \"arn:aws:lambda:us-
```

```
west-2:123456789012:function:TempMonitor:GG_TempMonitor\"},{\"Id\": \"OutputStatus
\", \"Source\": \"arn:aws:greengrass:us-west-2::/connectors/TwilioNotifications/
versions/1\", \"Subject\": \"twilio/message/status\", \"Target\": \"cloud\"}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "CreationTimestamp": "2019-06-24T21:21:33.837Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Configure subscriptions in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateSubscriptionDefinitionVersion in *AWS CLI Command Reference*.

`create-subscription-definition`

The following code example shows how to use `create-subscription-definition`.

AWS CLI

To create a subscription definition

The following `create-subscription-definition` example creates a subscription definition and specifies its initial version. The initial version contains three subscriptions: one for the MQTT topic to which the connector subscribes, one to allow a function to receive temperature readings from AWS IoT, and one to allow AWS IoT to receive status information from the connector. The example provides the ARN for the Lambda function alias that was created earlier by using Lambda's `create-alias` command.

```
aws greengrass create-subscription-definition \
    --initial-version "{\"Subscriptions\": [{\"Id\":
 \"TriggerNotification\", \"Source\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\", \"Subject\":
 \"twilio/txt\", \"Target\": \"arn:aws:greengrass:us-west-2::/connectors/
TwilioNotifications/versions/1\"},{\"Id\": \"TemperatureInput\", \"Source\":
 \"cloud\", \"Subject\": \"temperature/input\", \"Target\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\"},{\"Id\": \"OutputStatus
```

```
\", \"Source\": \"arn:aws:greengrass:us-west-2::/connectors/TwilioNotifications/
versions/1\", \"Subject\": \"twilio/message/status\", \"Target\": \"cloud\"}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTimestamp": "2019-06-19T22:34:26.677Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LastUpdatedTimestamp": "2019-06-19T22:34:26.677Z",
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Getting started with Greengrass connectors (CLI) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateSubscriptionDefinition in *AWS CLI Command Reference*.

`delete-connector-definition`

The following code example shows how to use `delete-connector-definition`.

AWS CLI

To delete a connector definition

The following `delete-connector-definition` example deletes the specified Greengrass connector definition. If you delete a connector definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-connector-definition \
    --connector-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Integrate with services and protocols using Greengrass connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DeleteConnectorDefinition in *AWS CLI Command Reference*.

`delete-core-definition`

The following code example shows how to use `delete-core-definition`.

AWS CLI

To delete a core definition

The following `delete-core-definition` example deletes the specified Greengrass core definition, including all versions. If you delete a core that is associated with a Greengrass group, that group can't be deployed successfully.

```
aws greengrass delete-core-definition \
    --core-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Overview of the AWS IoT Greengrass group object model in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DeleteCoreDefinition in *AWS CLI Command Reference*.

`delete-device-definition`

The following code example shows how to use `delete-device-definition`.

AWS CLI

To delete a device definition

The following `delete-device-definition` example deletes the specified device definition, including all of its versions. If you delete a device definition version that is used by a group version, the group version cannot be deployed successfully.

```
aws greengrass delete-device-definition \
    --device-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Overview of the AWS IoT Greengrass group object model in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DeleteDeviceDefinition in *AWS CLI Command Reference*.

`delete-function-definition`

The following code example shows how to use `delete-function-definition`.

AWS CLI

To delete a function definition

The following `delete-function-definition` example deletes the specified Greengrass function definition. If you delete a function definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-function-definition \
    --function-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Run Lambda functions on the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DeleteFunctionDefinition in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To delete a group

The following `delete-group` example deletes the specified Greengrass group.

```
aws greengrass delete-group \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Overview of the AWS IoT Greengrass group object model in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

`delete-logger-definition`

The following code example shows how to use `delete-logger-definition`.

AWS CLI

To delete a logger definition

The following `delete-logger-definition` example deletes the specified logger definition, including all logger definition versions. If you delete a logger definition version that is used by a group version, the group version cannot be deployed successfully.

```
aws greengrass delete-logger-definition \
    --logger-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Monitoring with AWS IoT Greengrass logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DeleteLoggerDefinition in *AWS CLI Command Reference*.

`delete-resource-definition`

The following code example shows how to use `delete-resource-definition`.

AWS CLI

To delete a resource definition

The following `delete-resource-definition` example deletes the specified resource definition, including all resource versions. If you delete a resource definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-resource-definition \
    --resource-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Access local resources with Lambda functions and connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DeleteResourceDefinition in *AWS CLI Command Reference*.

`delete-subscription-definition`

The following code example shows how to use `delete-subscription-definition`.

AWS CLI

To delete a subscription definition

The following `delete-subscription-definition` example deletes the specified Greengrass subscription definition. If you delete a subscription that is being used by a group, that group can't be deployed successfully.

```
aws greengrass delete-subscription-definition \
    --subscription-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Configure subscriptions in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DeleteSubscriptionDefinition in *AWS CLI Command Reference*.

`disassociate-role-from-group`

The following code example shows how to use `disassociate-role-from-group`.

AWS CLI

To disassociate the role from a Greengrass group

The following `disassociate-role-from-group` example disassociates the IAM role from the specified Greengrass group.

```
aws greengrass disassociate-role-from-group \
    --group-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "DisassociatedAt": "2019-09-10T20:05:49Z"
}
```

For more information, see Configure the group role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DisassociateRoleFromGroup in *AWS CLI Command Reference*.

`disassociate-service-role-from-account`

The following code example shows how to use `disassociate-service-role-from-account`.

AWS CLI

To disassociate a service role from your AWS account

The following `disassociate-service-role-from-account` example removes the service role that is associated with your AWS account. If you are not using the service role in any AWS Region, use the `delete-role-policy` command to detach the `AWSGreengrassResourceAccessRolePolicy` managed policy from the role, and then use the `delete-role` command to delete the role.

```
aws greengrass disassociate-service-role-from-account
```

Output:

```
{
    "DisassociatedAt": "2019-06-25T22:12:55Z"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DisassociateServiceRoleFromAccount in *AWS CLI Command Reference*.

`get-associated-role`

The following code example shows how to use `get-associated-role`.

AWS CLI

To get the role associated with a Greengrass group

The following `get-associated-role` example gets the IAM role that's associated with the specified Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services.

```
aws greengrass get-associated-role \
    --group-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RoleArn": "arn:aws:iam::123456789012:role/GG-Group-Role",
    "AssociatedAt": "2019-09-10T20:03:30Z"
}
```

For more information, see Configure the group role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetAssociatedRole in *AWS CLI Command Reference*.

`get-bulk-deployment-status`

The following code example shows how to use `get-bulk-deployment-status`.

AWS CLI

To check the status of your bulk deployment

The following `get-bulk-deployment-status` example retrieves status information for the specified bulk deployment operation. In this example, the file that specified the groups to be deployed has an invalid input record.

```
aws greengrass get-bulk-deployment-status \
    --bulk-deployment-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "BulkDeploymentMetrics": {
        "InvalidInputRecords": 1,
        "RecordsProcessed": 1,
        "RetryAttempts": 0
    },
    "BulkDeploymentStatus": "Completed",
    "CreatedAt": "2019-06-25T16:11:33.265Z",
    "tags": {}
```

```
}
```

For more information, see Create bulk deployments for groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetBulkDeploymentStatus in *AWS CLI Command Reference*.

`get-connectivity-info`

The following code example shows how to use `get-connectivity-info`.

AWS CLI

To get the connectivity information for a Greengrass core

The following `get-connectivity-info` example displays the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata.

```
aws greengrass get-connectivity-info \
    --thing-name "MyGroup_Core"
```

Output:

```
{
    "ConnectivityInfo": [
        {
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "127.0.0.1",
            "Id": "AUTOIP_127.0.0.1_0"
        },
        {
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "192.168.1.3",
            "Id": "AUTOIP_192.168.1.3_1"
        },
        {
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "::1",
```

```
            "Id": "AUTOIP_::1_2"
        },
        {
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "fe80::1e69:ed93:f5b:f6d",
            "Id": "AUTOIP_fe80::1e69:ed93:f5b:f6d_3"
        }
    ]
}
```

For more information, see Activate automatic IP detection in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetConnectivityInfo in *AWS CLI Command Reference*.

`get-connector-definition-version`

The following code example shows how to use `get-connector-definition-version`.

AWS CLI

To retrieve information about a specific version of a connector definition

The following `get-connector-definition-version` example retrieves information about the specified version of the specified connector definition. To retrieve the IDs of all versions of the connector definition, use the `list-connector-definition-versions` command. To retrieve the ID of the last version added to the connector definition, use the `get-connector-definition` command and check the `LatestVersion` property.

```
aws greengrass get-connector-definition-version \
    --connector-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --connector-definition-version-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "CreationTimestamp": "2019-06-19T19:30:01.300Z",
```

```
    "Definition": {
        "Connectors": [
            {
                "ConnectorArn": "arn:aws:greengrass:us-west-2::/connectors/SNS/
versions/1",
                "Id": "MySNSConnector",
                "Parameters": {
                    "DefaultSNSArn": "arn:aws:sns:us-
west-2:123456789012:GGConnectorTopic"
                }
            }
        ]
    },
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Integrate with services and protocols using Greengrass connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetConnectorDefinitionVersion in *AWS CLI Command Reference*.

`get-connector-definition`

The following code example shows how to use `get-connector-definition`.

AWS CLI

To retrieve information about a connector definition

The following `get-connector-definition` example retrieves information about the specified connector definition. To retrieve the IDs of your connector definitions, use the `list-connector-definitions` command.

```
aws greengrass get-connector-definition \
    --connector-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
    "CreationTimestamp": "2019-06-19T19:30:01.300Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/connectors/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "Name": "MySNSConnector",
    "tags": {}
}
```

For more information, see Integrate with services and protocols using Greengrass connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetConnectorDefinition in *AWS CLI Command Reference*.

`get-core-definition-version`

The following code example shows how to use `get-core-definition-version`.

AWS CLI

To retrieve details about a specific version of the Greengrass core definition

The following `get-core-definition-version` example retrieves information about the specified version of the specified core definition. To retrieve the IDs of all versions of the core definition, use the `list-core-definition-versions` command. To retrieve the ID of the last version added to the core definition, use the `get-core-definition` command and check the `LatestVersion` property.

```
aws greengrass get-core-definition-version \
    --core-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  \
    --core-definition-version-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "CreationTimestamp": "2019-06-18T16:21:21.351Z",
    "Definition": {
```

```
        "Cores": [
            {
                "CertificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/928dea7b82331b47c3ff77b0e763fc5e64e2f7c884e6ef391baed9b6b8e21b45",
                "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
                "SyncShadow": false,
                "ThingArn": "arn:aws:iot:us-west-2:123456789012:thing/
GGGroup4Pi3_Core"
            }
        ]
    },
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Configure the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetCoreDefinitionVersion in *AWS CLI Command Reference*.

`get-core-definition`

The following code example shows how to use `get-core-definition`.

AWS CLI

To retrieve details for a Greengrass core definition

The following `get-core-definition` example retrieves information about the specified core definition. To retrieve the IDs of your core definitions, use the `list-core-definitions` command.

```
aws greengrass get-core-definition \
    --core-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTimestamp": "2018-10-18T04:47:06.721Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
    "LastUpdatedTimestamp": "2018-10-18T04:47:06.721Z",
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/cores/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
    "tags": {}
}
```

For more information, see Configure the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetCoreDefinition in *AWS CLI Command Reference*.

`get-deployment-status`

The following code example shows how to use `get-deployment-status`.

AWS CLI

To retrieve the status of a deployment

The following `get-deployment-status` example retrieves the status for the specified deployment of the specified Greengrass group. To get the deployment ID, use the `list-deployments` command and specify the group ID.

```
aws greengrass get-deployment-status \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --deployment-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "DeploymentStatus": "Success",
    "DeploymentType": "NewDeployment",
    "UpdatedAt": "2019-06-18T17:04:44.761Z"
}
```

For more information, see Deploy AWS IoT Greengrass groups to an AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetDeploymentStatus in *AWS CLI Command Reference*.

get-device-definition-version

The following code example shows how to use `get-device-definition-version`.

AWS CLI

To get a device definition version

The following `get-device-definition-version` example retrieves information about the specified version of the specified device definition. To retrieve the IDs of all versions of the device definition, use the `list-device-definition-versions` command. To retrieve the ID of the last version added to the device definition, use the `get-device-definition` command and check the `LatestVersion` property.

```
aws greengrass get-device-definition-version \
    --device-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --device-definition-version-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "Definition": {
        "Devices": [
            {
                "CertificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/6c52ce1b47bde88a637e9ccdd45fe4e4c2c0a75a6866f8f63d980ee22fa51e02",

`get-device-definition`

The following code example shows how to use `get-device-definition`.

AWS CLI

To get a device definition

The following `get-device-definition` example retrieves information about the specified device definition. To retrieve the IDs of your device definitions, use the `list-device-definitions` command.

```
aws greengrass get-device-definition \
    --device-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/devices/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
    "Name": "TemperatureSensors",
    "tags": {},
    "LastUpdatedTimestamp": "2019-09-11T00:19:03.698Z",
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "CreationTimestamp": "2019-09-11T00:11:06.197Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
devices/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create client devices in an AWS IoT Greengrass group in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetDeviceDefinition in *AWS CLI Command Reference*.

`get-function-definition-version`

The following code example shows how to use `get-function-definition-version`.

AWS CLI

To retrieve details about a specific version of a Lambda function

The following `get-function-definition-version` example retrieves information about the specified version of the specified function definition. To retrieve the IDs of all versions of the function definition, use the `list-function-definition-versions` command. To retrieve the ID of the last version added to the function definition, use the `get-function-definition` command and check the `LatestVersion` property.

```
aws greengrass get-function-definition-version \
    --function-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --function-definition-version-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/

}
```

For more information, see Run Lambda functions on the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetFunctionDefinition in *AWS CLI Command Reference*.

`get-group-certificate-authority`

The following code example shows how to use `get-group-certificate-authority`.

AWS CLI

To retrieve the CA associated with a Greengrass group

The following `get-group-certificate-authority` example retrieves the certificate authority (CA) that is associated with the specified Greengrass group. To get the certificate authority ID, use the `list-group-certificate-authorities` command and specify the group ID.

```
aws greengrass get-group-certificate-authority \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --certificate-authority-
id "f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6"
```

Output:

```
{
    "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/certificateauthorities/
f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6",
```

```
    "GroupCertificateAuthorityId":
 "f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6",

`get-group-certificate-configuration`

The following code example shows how to use `get-group-certificate-configuration`.

AWS CLI

To retrieve the configuration for the certificate authority used by the Greengrass group

The following `get-group-certificate-configuration` example retrieves the configuration for the certificate authority (CA) used by the specified Greengrass group.

```
aws greengrass get-group-certificate-configuration \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "CertificateAuthorityExpiryInMilliseconds": "2524607999000",
    "CertificateExpiryInMilliseconds": "604800000",
    "GroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

```
}
```

For more information, see Overview of AWS IoT Greengrass security in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetGroupCertificateConfiguration in *AWS CLI Command Reference*.

`get-group-version`

The following code example shows how to use `get-group-version`.

AWS CLI

To retrieve information about a version of a Greengrass group

The following `get-group-version` example retrieves information about the specified version of the specified group. To retrieve the IDs of all versions of the group, use the `list-group-versions` command. To retrieve the ID of the last version added to the group, use the `get-group` command and check the `LatestVersion` property.

```
aws greengrass get-group-version \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  \
    --group-version-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```

- For API details, see GetResourceDefinition in *AWS CLI Command Reference*.

`get-service-role-for-account`

The following code example shows how to use `get-service-role-for-account`.

AWS CLI

To retrieve the details for the service role that is attached to your account

The following `get-service-role-for-account` example retrieves information about the service role that is attached to your AWS account.

```
aws greengrass get-service-role-for-account
```

Output:

```
{
    "AssociatedAt": "2018-10-18T15:59:20Z",
    "RoleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetServiceRoleForAccount in *AWS CLI Command Reference*.

`get-subscription-definition-version`

The following code example shows how to use `get-subscription-definition-version`.

AWS CLI

To retrieve information about a specific version of a subscription definition

The following `get-subscription-definition-version` example retrieves retrieves information about the specified version of the specified subscription definition. To retrieve the IDs of all versions of the subscription definition, use the `list-subscription-definition-versions` command. To retrieve the ID of the last version added to the subscription definition, use the `get-subscription-definition` command and check the `LatestVersion` property.

```
aws greengrass get-subscription-definition-version \
    --subscription-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --subscription-definition-version-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "CreationTimestamp": "2019-06-18T17:03:52.499Z",
    "Definition": {
        "Subscriptions": [
```

```
            {
                "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
                "Source": "arn:aws:lambda:us-
west-2:123456789012:function:Greengrass_HelloWorld:GG_HelloWorld",
                "Subject": "hello/world",
                "Target": "cloud"
            }
        ]
    },
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Deploy AWS IoT Greengrass groups to an AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetSubscriptionDefinitionVersion in *AWS CLI Command Reference*.

`get-subscription-definition`

The following code example shows how to use `get-subscription-definition`.

AWS CLI

To retrieve information about a subscription definition

The following `get-subscription-definition` example retrieves information about the specified subscription definition. To retrieve the IDs of your subscription definitions, use the `list-subscription-definitions` command.

```
aws greengrass get-subscription-definition \
    --subscription-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTimestamp": "2019-06-18T17:03:52.392Z",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LastUpdatedTimestamp": "2019-06-18T17:03:52.392Z",
    "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
```

```
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "tags": {}
}
```

For more information, see Deploy AWS IoT Greengrass groups to an AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetSubscriptionDefinition in *AWS CLI Command Reference*.

`get-thing-runtime-configuration`

The following code example shows how to use `get-thing-runtime-configuration`.

AWS CLI

To retrieve the runtime configuration of a Greengrass core

The following `get-thing-runtime-configuration` example retrieves the runtime configuration of a Greengrass core. Before you can retrieve the runtime configuration, you must use the `update-thing-runtime-configuration` command to create a runtime configuration for the core.

```
aws greengrass get-thing-runtime-configuration \
    --thing-name SampleGreengrassCore
```

Output:

```
{
    "RuntimeConfiguration": {
        "TelemetryConfiguration": {
            "ConfigurationSyncStatus": "OutOfSync",
            "Telemetry": "On"
        }
    }
}
```

For more information, see Configuring telemetry settings in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetThingRuntimeConfiguration in *AWS CLI Command Reference*.

`list-bulk-deployment-detailed-reports`

The following code example shows how to use `list-bulk-deployment-detailed-reports`.

AWS CLI

To list information about individual deployments in a bulk deployment

The following `list-bulk-deployment-detailed-reports` example displays information about the individual deployments in a bulk deployment operation, including status.

```
aws greengrass list-bulk-deployment-detailed-reports \
    --bulk-deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE77777
```

Output:

```
{
    "Deployments": [
        {
            "DeploymentType": "NewDeployment",
            "DeploymentStatus": "Success",
            "DeploymentId": "123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333/
deployments/123456789012:123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333/
versions/123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "CreatedAt": "2020-01-21T21:34:16.501Z"
        },
        {
            "DeploymentType": "NewDeployment",
            "DeploymentStatus": "InProgress",
            "DeploymentId": "123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555/
deployments/123456789012:123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE66666",
            "CreatedAt": "2020-01-21T21:34:16.486Z"
        }
    ]
```

```
}
```

For more information, see Create bulk deployments for groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ListBulkDeploymentDetailedReports in *AWS CLI Command Reference*.

`list-bulk-deployments`

The following code example shows how to use `list-bulk-deployments`.

AWS CLI

To list bulk deployments

The following `list-bulk-deployments` example lists all bulk deployments.

```
aws greengrass list-bulk-deployments
```

Output:

```
{
    "BulkDeployments": [
        {
            "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/bulk/deployments/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "BulkDeploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CreatedAt": "2019-06-25T16:11:33.265Z"
        }
    ]
}
```

For more information, see Create bulk deployments for groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ListBulkDeployments in *AWS CLI Command Reference*.

`list-connector-definition-versions`

The following code example shows how to use `list-connector-definition-versions`.

AWS CLI

To list the versions that are available for a connector definition

The following `list-connector-definition-versions` example lists the versions that are available for the specified connector definition. Use the `list-connector-definitions` command to get the connector definition ID.

```
aws greengrass list-connector-definition-versions \
    --connector-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/connectors/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTimestamp": "2019-06-19T19:30:01.300Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see Integrate with services and protocols using Greengrass connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ListConnectorDefinitionVersions in *AWS CLI Command Reference*.

`list-connector-definitions`

The following code example shows how to use `list-connector-definitions`.

AWS CLI

To list the Greengrass connectors that are defined

The following `list-connector-definitions` example lists all of the Greengrass connectors that are defined for your AWS account.

```
aws greengrass list-connector-definitions
```

Output:

```
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/connectors/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CreationTimestamp": "2019-06-19T19:30:01.300Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
            "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/connectors/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Name": "MySNSConnector"
        }
    ]
}
```

For more information, see Integrate with services and protocols using Greengrass connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ListConnectorDefinitions in *AWS CLI Command Reference*.

`list-core-definition-versions`

The following code example shows how to use `list-core-definition-versions`.

AWS CLI

To list the versions of a Greengrass core definition

The following `list-core-definition-versions` example lists all versions of the specified Greengrass core definition. You can use the `list-core-definitions` command to get the version ID.

```
aws greengrass list-core-definition-versions \
    --core-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/cores/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "CreationTimestamp": "2019-06-18T16:14:17.709Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see Configure the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ListCoreDefinitionVersions in *AWS CLI Command Reference*.

`list-core-definitions`

The following code example shows how to use `list-core-definitions`.

AWS CLI

To list Greengrass core definitions

The following `list-core-definitions` example lists all of the Greengrass core definitions for your AWS account.

```
aws greengrass list-core-definitions
```

Output:

```
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

        }
    ]
}
```

For more information, see Configure the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ListCoreDefinitions in *AWS CLI Command Reference*.

`list-deployments`

The following code example shows how to use `list-deployments`.

AWS CLI

To list the deployments for a Greengrass group

The following `list-deployments` example lists the deployments for the specified Greengrass group. You can use the `list-groups` command to look up your group ID.

```
aws greengrass list-deployments \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Deployments": [
        {
            "CreatedAt": "2019-06-18T17:04:32.702Z",
            "DeploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "DeploymentType": "NewDeployment",
            "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333"
        }
    ]
}
```

For more information, see Deploy AWS IoT Greengrass groups to an AWS IoT Greengrass core in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see ListDeployments in *AWS CLI Command Reference*.

`list-device-definition-versions`

The following code example shows how to use `list-device-definition-versions`.

AWS CLI

To list the versions of a device definition

The following `list-device-definition-versions` example displays the device definition versions associated with the specified device definition.

```
aws greengrass list-device-definition-versions \
    --device-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Versions": [
        {
            "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTimestamp": "2019-09-11T00:15:09.838Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/devices/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
        },
        {
            "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "CreationTimestamp": "2019-09-11T00:11:06.197Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/devices/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333"
        }
    ]
}
```

For more information, see Overview of the AWS IoT Greengrass group object model in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see ListDeviceDefinitionVersions in *AWS CLI Command Reference*.

`list-device-definitions`

The following code example shows how to use `list-device-definitions`.

AWS CLI

To list your device definitions

The following `list-device-definitions` example displays details about the device definitions in your AWS account in the current AWS Region.

```
aws greengrass list-device-definitions
```

Output:

```
{
    "Definitions": [
        {
            "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/

`list-function-definition-versions`

The following code example shows how to use `list-function-definition-versions`.

AWS CLI

To list the versions of a Lambda function

The following `list-function-definition-versions` example lists all of the versions of the specified Lambda function. You can use the `list-function-definitions` command to get the ID.

```
aws greengrass list-function-definition-versions \
    --function-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/functions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTimestamp": "2019-06-18T17:04:30.776Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        },
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

`list-resource-definition-versions`

The following code example shows how to use `list-resource-definition-versions`.

AWS CLI

To list the versions of a resource definition

The following `list-resource-definition-versions` example lists the versions for the specified Greengrass resource.

```
aws greengrass list-resource-definition-versions \
    --resource-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTimestamp": "2019-06-19T16:40:59.392Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        },
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "CreationTimestamp": "2019-06-19T16:40:59.261Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
        }
    ]
}
```

For more information, see Access local resources with Lambda functions and connectors in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see ListResourceDefinitionVersions in *AWS CLI Command Reference*.

`list-resource-definitions`

The following code example shows how to use `list-resource-definitions`.

AWS CLI

To list the resources that are defined

The following `list-resource-definitions` example lists the resources that are defined for AWS IoT Greengrass to use.

```
aws greengrass list-resource-definitions
```

Output:

```
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CreationTimestamp": "2019-06-19T16:40:59.261Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "LastUpdatedTimestamp": "2019-06-19T16:40:59.261Z",
            "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/resources/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        },
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "LastUpdatedTimestamp": "2019-06-19T21:51:28.212Z",
            "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/resources/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Name": "MyGreengrassResources"
        }
    ]
}
```

For more information, see Access local resources with Lambda functions and connectors in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see ListResourceDefinitions in *AWS CLI Command Reference*.

`list-subscription-definition-versions`

The following code example shows how to use `list-subscription-definition-versions`.

AWS CLI

To list the versions of a subscription definition

The following `list-subscription-definition-versions` example lists all versions of the specified subscription. You can use the `list-subscription-definitions` command to look up the subscription ID.

```
aws greengrass list-subscription-definition-versions \
    --subscription-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTimestamp": "2019-06-18T17:03:52.499Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        },
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "CreationTimestamp": "2019-06-18T17:03:52.392Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
        }
    ]
}
```

For more information, see Overview of the AWS IoT Greengrass group object model in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see ListSubscriptionDefinitionVersions in *AWS CLI Command Reference*.

`list-subscription-definitions`

The following code example shows how to use `list-subscription-definitions`.

AWS CLI

To get a list subscription definitions

The following `list-subscription-definitions` example lists all of the AWS IoT Greengrass subscriptions that are defined in your AWS account.

```
aws greengrass list-subscription-definitions
```

Output:

```
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CreationTimestamp": "2019-06-18T17:03:52.392Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "LastUpdatedTimestamp": "2019-06-18T17:03:52.392Z",
            "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        },
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "CreationTimestamp": "2018-10-18T15:45:34.024Z",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",

            "LastUpdatedTimestamp": "2018-10-22T17:09:31.429Z",
            "LatestVersion": "a1b2c3d4-5678-90ab-cdef-EXAMPLE66666",
```

```
            "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/subscriptions/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555/versions/
a1b2c3d4-5678-90ab-cdef-EXAMPLE66666"
        }
    ]
}
```

For more information, see Overview of the AWS IoT Greengrass group object model in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see ListSubscriptionDefinitions in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags attached to a resource

The following `list-tags-for-resource` example lists the tags and their values that are attached to the specified resource.

```
aws greengrass list-tags-for-resource \
    --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "tags": {
        "ResourceSubType": "USB",
        "ResourceType": "Device"
    }
}
```

For more information, see Tagging your AWS IoT Greengrass resources in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`reset-deployments`

The following code example shows how to use `reset-deployments`.

AWS CLI

To clean up deployment information for a Greengrass group

The following `reset-deployments` example cleans up deployment information for the specified Greengrass group. When you add the `--force option`, the deployment information is reset without waiting for the core device to respond.

```
aws greengrass reset-deployments \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --force
```

Output:

```
{
    "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/deployments/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "DeploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Reset deployments in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ResetDeployments in *AWS CLI Command Reference*.

`start-bulk-deployment`

The following code example shows how to use `start-bulk-deployment`.

AWS CLI

To start a bulk deployment operation

The following `start-bulk-deployment` example starts a bulk deployment operation, using a file stored in an S3 bucket to specify the groups to be deployed.

```
aws greengrass start-bulk-deployment \
    --cli-input-json "{\"InputFileUri\":\"https://gg-group-deployment1.s3-us-
west-2.amazonaws.com/MyBulkDeploymentInputFile.txt\", \"ExecutionRoleArn\":
```

```
\"arn:aws:iam::123456789012:role/ggCreateDeploymentRole\",\"AmznClientToken\":
\"yourAmazonClientToken\"}"
```

Output:

```
{
    "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
bulk/deployments/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "BulkDeploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create bulk deployments for groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see StartBulkDeployment in *AWS CLI Command Reference*.

`stop-bulk-deployment`

The following code example shows how to use `stop-bulk-deployment`.

AWS CLI

To stop a bulk deployment

The following `stop-bulk-deployment` example stops the specified bulk deployment. If you try to stop a bulk deployment that is complete, you receive the `InvalidInputException: Cannot change state of finished execution.` error.

```
aws greengrass stop-bulk-deployment \
    --bulk-deployment-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Create bulk deployments for groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see StopBulkDeployment in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To apply tags to a resource

The following `tag-resource` example applies two tags, `ResourceType` and `ResourceSubType`, to the specified Greengrass resource. This operation can both add new tags and values or update the value for existing tags. Use the `untag-resource` command to remove a tag.

```
aws greengrass tag-resource \
    --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --tags "ResourceType=Device,ResourceSubType=USB"
```

This command produces no output.

For more information, see Tagging your AWS IoT Greengrass resources in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag and its value from a resource

The following `untag-resource` example removes the tag whose key is `Category` from the specified Greengrass group. If the key `Category` does not exist for the specified resource, no error is returned.

```
aws greengrass untag-resource \
    --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --tag-keys "Category"
```

This command produces no output.

For more information, see Tagging your AWS IoT Greengrass resources in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-connectivity-info`

The following code example shows how to use `update-connectivity-info`.

AWS CLI

To update the connectivity information for a Greengrass core

The following `update-connectivity-info` example changes the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata. You might need to update connectivity information when the local network changes.

```
aws greengrass update-connectivity-info \
    --thing-name "MyGroup_Core" \
    --connectivity-info "[{\"Metadata\":\"\",\"PortNumber\":8883,\"HostAddress\":
\"127.0.0.1\",\"Id\":\"localhost_127.0.0.1_0\"},{\"Metadata\":\"\",\"PortNumber
\":8883,\"HostAddress\":\"192.168.1.3\",\"Id\":\"localIP_192.168.1.3\"}]"
```

Output:

```
{
    "Version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Configure the MQTT port for local messaging in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see UpdateConnectivityInfo in *AWS CLI Command Reference*.

`update-connector-definition`

The following code example shows how to use `update-connector-definition`.

AWS CLI

To update the name for a connector definition

The following `update-connector-definition` example updates the name for the specified connector definition. If you want to update the details for the connector, use the `create-connector-definition-version` command to create a new version.

```
aws greengrass update-connector-definition \
    --connector-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name "GreengrassConnectors2019"
```

This command produces no output.

For more information, see Integrate with services and protocols using Greengrass connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateConnectorDefinition in *AWS CLI Command Reference*.

`update-core-definition`

The following code example shows how to use `update-core-definition`.

AWS CLI

To update a core definition

The following `update-core-definition` example changes the name of the specified core definition. You can update only the `name` property of a core definition.

```
aws greengrass update-core-definition \
    --core-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name "MyCoreDevices"
```

This command produces no output.

For more information, see Configure the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateCoreDefinition in *AWS CLI Command Reference*.

`update-device-definition`

The following code example shows how to use `update-device-definition`.

AWS CLI

To update a device definition

The following `update-device-definition` example changes the name of the specified device definition. You can only update the `name` property of a device definition.

```
aws greengrass update-device-definition \
    --device-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name "TemperatureSensors"
```

This command produces no output.

For more information, see Overview of the AWS IoT Greengrass group object model in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see UpdateDeviceDefinition in *AWS CLI Command Reference*.

`update-function-definition`

The following code example shows how to use `update-function-definition`.

AWS CLI

To update the name for a function definition

The following `update-function-definition` example updates the name for the specified function definition. If you want to update the details for the function, use the `create-function-definition-version` command to create a new version.

```
aws greengrass update-function-definition \
    --function-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name ObsoleteFunction
```

This command produces no output.

For more information, see Run Lambda functions on the AWS IoT Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateFunctionDefinition in *AWS CLI Command Reference*.

update-group-certificate-configuration

The following code example shows how to use update-group-certificate-configuration.

AWS CLI

To update the expiry of a group's certificates

The following update-group-certificate-configuration example sets a 10-day expiry for the certificates generated for the specified group.

```
aws greengrass update-group-certificate-configuration \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --certificate-expiry-in-milliseconds 864000000
```

Output:

```
{
    "CertificateExpiryInMilliseconds": "864000000",
    "CertificateAuthorityExpiryInMilliseconds": "2524607999000",
    "GroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Overview of AWS IoT Greengrass security in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateGroupCertificateConfiguration in *AWS CLI Command Reference*.

update-group

The following code example shows how to use update-group.

AWS CLI

To update the group name

The following update-group example updates the name of the specified Greengrass group. If you want to update the details for the group, use the create-group-version command to create a new version.

```
aws greengrass update-group \
    --group-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
```

```
    --name TestGroup4of6
```

This command produces no output.

For more information, see Provision an AWS IoT thing to use as a Greengrass core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

`update-logger-definition`

The following code example shows how to use `update-logger-definition`.

AWS CLI

To update a logger definition

The following `update-logger-definition` example changes the name of the specified logger definition. You can only update the `name` property of a logger definition.

```
aws greengrass update-logger-definition \
    --logger-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name "LoggingConfigsForSensors"
```

This command produces no output.

For more information, see Monitoring with AWS IoT Greengrass logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateLoggerDefinition in *AWS CLI Command Reference*.

`update-resource-definition`

The following code example shows how to use `update-resource-definition`.

AWS CLI

To update the name for a resource definition

The following `update-resource-definition` example updates the name for the specified resource definition. If you want to change the details for the resource, use the `create-resource-definition-version` command to create a new version.

```
aws greengrass update-resource-definition \
    --resource-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name GreengrassConnectorResources
```

This command produces no output.

For more information, see Access local resources with Lambda functions and connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateResourceDefinition in *AWS CLI Command Reference*.

`update-subscription-definition`

The following code example shows how to use `update-subscription-definition`.

AWS CLI

To update the name for a subscription definition

The following `update-subscription-definition` example updates the name for the specified subscription definition. If you want to change details for the subscription, use the `create-subscription-definition-version` command to create a new version.

```
aws greengrass update-subscription-definition \
    --subscription-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name "ObsoleteSubscription"
```

This command produces no output.

For more information, see Overview of the AWS IoT Greengrass group object model in the *AWS IoT Greengrass Version 1 Developer Guide*.

- For API details, see UpdateSubscriptionDefinition in *AWS CLI Command Reference*.

`update-thing-runtime-configuration`

The following code example shows how to use `update-thing-runtime-configuration`.

AWS CLI

To turn on telemetry in the runtime configuration of a Greengrass core

The following `update-thing-runtime-configuration` example updates the runtime configuration of a Greengrass core to turn on telemetry.

```
aws greengrass update-thing-runtime-configuration \
    --thing-name SampleGreengrassCore \
    --telemetry-configuration {\"Telemetry\":\"On\"}
```

This command produces no output.

For more information, see Configuring telemetry settings in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateThingRuntimeConfiguration in *AWS CLI Command Reference*.

AWS IoT Greengrass V2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass V2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-service-role-to-account`

The following code example shows how to use `associate-service-role-to-account`.

AWS CLI

To associate the Greengrass service role to your AWS account

The following `associate-service-role-to-account` example associates a service role with AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 associate-service-role-to-account \
    --role-arn arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole
```

Output:

```
{
    "associatedAt": "2022-01-19T19:21:53Z"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see AssociateServiceRoleToAccount in *AWS CLI Command Reference*.

`batch-associate-client-device-with-core-device`

The following code example shows how to use `batch-associate-client-device-with-core-device`.

AWS CLI

To associate client devices with a core device

The following `batch-associate-client-device-with-core-device` example associates two client devices with a core device.

```
aws greengrassv2 batch-associate-client-device-with-core-device \
    --core-device-thing-name MyGreengrassCore \
    --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```
{
    "errorEntries": []
}
```

For more information, see Interact with local IoT devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see BatchAssociateClientDeviceWithCoreDevice in *AWS CLI Command Reference*.

`batch-disassociate-client-device-from-core-device`

The following code example shows how to use `batch-disassociate-client-device-from-core-device`.

AWS CLI

To disassociate client devices from a core device

The following `batch-disassociate-client-device-from-core-device` example disassociates two client devices from a core device.

```
aws greengrassv2 batch-disassociate-client-device-from-core-device \
    --core-device-thing-name MyGreengrassCore \
    --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```
{
    "errorEntries": []
}
```

For more information, see Interact with local IoT devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see BatchDisassociateClientDeviceFromCoreDevice in *AWS CLI Command Reference*.

`cancel-deployment`

The following code example shows how to use `cancel-deployment`.

AWS CLI

To cancel a deployment

The following `cancel-deployment` example stops a continuous deployment to a thing group.

```
aws greengrassv2 cancel-deployment \
    --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "message": "SUCCESS"
}
```

For more information, see Cancel deployments in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see CancelDeployment in *AWS CLI Command Reference*.

`create-component-version`

The following code example shows how to use `create-component-version`.

AWS CLI

Example 1: To create a component version from a recipe

The following `create-component-version` example creates a version of a Hello World component from a recipe file.

```
aws greengrassv2 create-component-version \
    --inline-recipe fileb://com.example.HelloWorld-1.0.0.json
```

Contents of `com.example.HelloWorld-1.0.0.json`:

```
{
    "RecipeFormatVersion": "2020-01-25",
    "ComponentName": "com.example.HelloWorld",
    "ComponentVersion": "1.0.0",
    "ComponentDescription": "My first AWS IoT Greengrass component.",
    "ComponentPublisher": "Amazon",
    "ComponentConfiguration": {
        "DefaultConfiguration": {
            "Message": "world"
        }
    },
    "Manifests": [
        {
            "Platform": {
                "os": "linux"
            },
            "Lifecycle": {
                "Run": "echo 'Hello {configuration:/Message}'"
```

```
            }
        }
    ]
}
```

Output:

```
{
    "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0",
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "creationTimestamp": "2021-01-07T16:24:33.650000-08:00",
    "status": {
        "componentState": "REQUESTED",
        "message": "NONE",
        "errors": {}
    }
}
```

For more information, see Create custom components and Upload components to deploy in the *AWS IoT Greengrass V2 Developer Guide*.

Example 2: To create a component version from an AWS Lambda function

The following `create-component-version` example creates a version of a Hello World component from an AWS Lambda function.

```
aws greengrassv2 create-component-version \
    --cli-input-json file://lambda-function-component.json
```

Contents of `lambda-function-component.json`:

```
{
    "lambdaFunction": {
        "lambdaArn": "arn:aws:lambda:us-
west-2:123456789012:function:HelloWorldPythonLambda:1",
        "componentName": "com.example.HelloWorld",
        "componentVersion": "1.0.0",
        "componentLambdaParameters": {
            "eventSources": [
                {
```

```
                    "topic": "hello/world/+",
                    "type": "IOT_CORE"
                }
            ]
        }
    }
}
```

Output:

```
{
    "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0",
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "creationTimestamp": "2021-01-07T17:05:27.347000-08:00",
    "status": {
        "componentState": "REQUESTED",
        "message": "NONE",
        "errors": {}
    }
}
```

For more information, see Run AWS Lambda functions in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see CreateComponentVersion in *AWS CLI Command Reference*.

`create-deployment`

The following code example shows how to use `create-deployment`.

AWS CLI

Example 1: To create a deployment

The following `create-deployment` example deploys the AWS IoT Greengrass Command Line Interface to a core device.

```
aws greengrassv2 create-deployment \
    --cli-input-json file://cli-deployment.json
```

Contents of `cli-deployment.json`:

```
{
    "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",
    "deploymentName": "Deployment for MyGreengrassCore",
    "components": {
        "aws.greengrass.Cli": {
            "componentVersion": "2.0.3"
        }
    },
    "deploymentPolicies": {
        "failureHandlingPolicy": "DO_NOTHING",
        "componentUpdatePolicy": {
            "timeoutInSeconds": 60,
            "action": "NOTIFY_COMPONENTS"
        },
        "configurationValidationPolicy": {
            "timeoutInSeconds": 60
        }
    },
    "iotJobConfiguration": {}
}
```

Output:

```
{
    "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create deployments in the *AWS IoT Greengrass V2 Developer Guide*.

Example 2: To create a deployment that updates component configurations

The following `create-deployment` example deploys the AWS IoT Greengrass nucleus component to a group of core devices. This deployment applies the following configuration updates for the nucleus component:

Reset the target devices' proxy settings to their default no proxy settings.Reset the target devices' MQTT settings to their defaults.Sets the JVM options for the nucleus' JVM.Sets the logging level for the nucleus.

The following command deploys the component to the group of core devices.

```
aws greengrassv2 create-deployment \
    --cli-input-json file://nucleus-deployment.json
```

Contents of `nucleus-deployment.json`:

```
{
    "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
    "deploymentName": "Deployment for MyGreengrassCoreGroup",
    "components": {
        "aws.greengrass.Nucleus": {
            "componentVersion": "2.0.3",
            "configurationUpdate": {
                "reset": [
                    "/networkProxy",
                    "/mqtt"
                ],
                "merge": "{\"jvmOptions\":\"-Xmx64m\",\"logging\":{\"level\":\"WARN
\"}}"
            }
        }
    },
    "deploymentPolicies": {
        "failureHandlingPolicy": "ROLLBACK",
        "componentUpdatePolicy": {
            "timeoutInSeconds": 60,
            "action": "NOTIFY_COMPONENTS"
        },
        "configurationValidationPolicy": {
            "timeoutInSeconds": 60
        }
    },
    "iotJobConfiguration": {}
}
```

Output:

```
{
    "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222"
```

```
}
```

For more information, see Create deployments and Update component configurations in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see CreateDeployment in *AWS CLI Command Reference*.

`delete-component`

The following code example shows how to use `delete-component`.

AWS CLI

To delete a component version

The following `delete-component` example deletes a Hello World component.

```
aws greengrassv2 delete-component \
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0
```

This command produces no output.

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DeleteComponent in *AWS CLI Command Reference*.

`delete-core-device`

The following code example shows how to use `delete-core-device`.

AWS CLI

To delete a core device

The following `delete-core-device` example deletes an AWS IoT Greengrass core device.

```
aws greengrassv2 delete-core-device \
    --core-device-thing-name MyGreengrassCore
```

This command produces no output.

For more information, see Uninstall the AWS IoT Greengrass Core software in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DeleteCoreDevice in *AWS CLI Command Reference*.

`describe-component`

The following code example shows how to use `describe-component`.

AWS CLI

To describe a component version

The following `describe-component` example describes a Hello World component.

```
aws greengrassv2 describe-component \
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0
```

Output:

```
{
    "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0",
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "creationTimestamp": "2021-01-07T17:12:11.133000-08:00",
    "publisher": "Amazon",
    "description": "My first AWS IoT Greengrass component.",
    "status": {
        "componentState": "DEPLOYABLE",
        "message": "NONE",
        "errors": {}
    },
    "platforms": [
        {
            "attributes": {
                "os": "linux"
            }
        }
    ]
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DescribeComponent in *AWS CLI Command Reference*.

`disassociate-service-role-from-account`

The following code example shows how to use `disassociate-service-role-from-account`.

AWS CLI

To disassociate the Greengrass service role from your AWS account

The following `disassociate-service-role-from-account` example disassociates the Greengrass service role from AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 disassociate-service-role-from-account
```

Output:

```
{
    "disassociatedAt": "2022-01-19T19:26:09Z"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DisassociateServiceRoleFromAccount in *AWS CLI Command Reference*.

`get-component-version-artifact`

The following code example shows how to use `get-component-version-artifact`.

AWS CLI

To get a URL to download a component artifact

The following `get-component-version-artifact` example gets a URL to download the local debug console component's JAR file.

```
aws greengrassv2 get-component-version-artifact \
    --arn arn:aws:greengrass:us-
west-2:aws:components:aws.greengrass.LocalDebugConsole:versions:2.0.3 \
```

```
    --artifact-name "Uvt6ZEzQ9TKiAuLbfXBX_APdY0TWks3uc46tHFHTzBM=/
aws.greengrass.LocalDebugConsole.jar"
```

Output:

```
{
    "preSignedUrl": "https://evergreencomponentmanageme-
artifactbucket7410c9ef-g18n1iya8kwr.s3.us-west-2.amazonaws.com/public/
aws.greengrass.LocalDebugConsole/2.0.3/s3/ggv2-component-releases-prod-pdx/
EvergreenHttpDebugView/2ffc496ba41b39568968b22c582b4714a937193ee7687a45527238e696672521/
aws.greengrass.LocalDebugConsole/aws.greengrass.LocalDebugConsole.jar?X-Amz-
Security-Token=KwfLKSdEXAMPLE..."
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetComponentVersionArtifact in *AWS CLI Command Reference*.

`get-component`

The following code example shows how to use `get-component`.

AWS CLI

Example 1: To download a component's recipe in YAML format (Linux, macOS, or Unix)

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command does the following:

Uses the `--output` and `--query` parameters to control the command's output. These parameters extract the recipe blob from the command's output. For more information about controlling output, see Controlling Command Output in the *AWS Command Line Interface User Guide*.Uses the `base64` utility. This utility decodes the extracted blob to the original text. The blob that is returned by a successful `get-component` command is base64-encoded text. You must decode this blob to obtain the original text.Saves the decoded text to a file. The final section of the command (`> com.example.HelloWorld-1.0.0.json`) saves the decoded text to a file.

The following command downloads the recipe.

```
aws greengrassv2 get-component \
```

```
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0 \
    --recipe-output-format YAML \
    --query recipe \
    --output text | base64 --decode > com.example.HelloWorld-1.0.0.json
```

This command produces no output.

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

Example 2: To download a component's recipe in YAML format (Windows CMD)

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command uses the `certutil` utility.

```
aws greengrassv2 get-component ^
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0 ^
    --recipe-output-format YAML ^
    --query recipe ^
    --output text > com.example.HelloWorld-1.0.0.yaml.b64
```

This command produces no output.

Then, use the `certutil` utility to decode the file.

```
certutil -decode com.example.HelloWorld-1.0.0.yaml.b64
 com.example.HelloWorld-1.0.0.yaml
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

Example 3: To download a component's recipe in YAML format (Windows PowerShell)

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command uses the `certutil` utility.

```
aws greengrassv2 get-component `
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0 `
    --recipe-output-format YAML `
    --query recipe `
    --output text > com.example.HelloWorld-1.0.0.yaml.b64
```

This command produces no output.

Then, use the `certutil` utility to decode the file.

```
certutil -decode com.example.HelloWorld-1.0.0.yaml.b64
 com.example.HelloWorld-1.0.0.yaml
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetComponent in *AWS CLI Command Reference*.

`get-connectivity-info`

The following code example shows how to use `get-connectivity-info`.

AWS CLI

To get the connectivity information for a Greengrass core device

The following `get-connectivity-info` example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```
aws greengrassv2 get-connectivity-info \
    --thing-name MyGreengrassCore
```

Output:

```
{
    "connectivityInfo": [
        {
            "id": "localIP_192.0.2.0",
            "hostAddress": "192.0.2.0",
            "portNumber": 8883
        }
    ]
}
```

For more information, see Manage core device endpoints in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetConnectivityInfo in *AWS CLI Command Reference*.

`get-core-device`

The following code example shows how to use `get-core-device`.

AWS CLI

To get a core device

The following `get-core-device` example gets information about an AWS IoT Greengrass core device.

```
aws greengrassv2 get-core-device \
    --core-device-thing-name MyGreengrassCore
```

Output:

```
{
    "coreDeviceThingName": "MyGreengrassCore",
    "coreVersion": "2.0.3",
    "platform": "linux",
    "architecture": "amd64",
    "status": "HEALTHY",
    "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00",
    "tags": {}
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetCoreDevice in *AWS CLI Command Reference*.

`get-deployment`

The following code example shows how to use `get-deployment`.

AWS CLI

To get a deployment

The following `get-deployment` example gets information about the deployment of the AWS IoT Greengrass nucleus component to a group of core devices.

```
aws greengrassv2 get-deployment \
    --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
    "revisionId": "14",
    "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "deploymentName": "Deployment for MyGreengrassCoreGroup",
    "deploymentStatus": "ACTIVE",
    "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "components": {
        "aws.greengrass.Nucleus": {
            "componentVersion": "2.0.3",
            "configurationUpdate": {
                "merge": "{\"jvmOptions\":\"-Xmx64m\",\"logging\":{\"level\":\"WARN
\"}}",
                "reset": [
                    "/networkProxy",
                    "/mqtt"
                ]
            }
        }
    },
    "deploymentPolicies": {
        "failureHandlingPolicy": "ROLLBACK",
        "componentUpdatePolicy": {
            "timeoutInSeconds": 60,
            "action": "NOTIFY_COMPONENTS"
        },
        "configurationValidationPolicy": {
            "timeoutInSeconds": 60
        }
    },
    "iotJobConfiguration": {},
    "creationTimestamp": "2021-01-07T17:21:20.691000-08:00",
```

```
    "isLatestForTarget": false,
    "tags": {}
}
```

For more information, see Deploy components to devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetDeployment in *AWS CLI Command Reference*.

`get-service-role-for-account`

The following code example shows how to use `get-service-role-for-account`.

AWS CLI

To get the Greengrass service role for your AWS account

The following `get-service-role-for-account` example gets the service role that's associated with AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 get-service-role-for-account
```

Output:

```
{
    "associatedAt": "2022-01-19T19:21:53Z",
    "roleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetServiceRoleForAccount in *AWS CLI Command Reference*.

`list-client-devices-associated-with-core-device`

The following code example shows how to use `list-client-devices-associated-with-core-device`.

AWS CLI

To list the client devices associated with a core device

The following `list-client-devices-associated-with-core-device` example lists all client devices associated with a core device.

```
aws greengrassv2 list-client-devices-associated-with-core-device \
    --core-device-thing-name MyTestGreengrassCore
```

Output:

```
{
    "associatedClientDevices": [
        {
            "thingName": "MyClientDevice2",
            "associationTimestamp": "2021-07-12T16:33:55.843000-07:00"
        },
        {
            "thingName": "MyClientDevice1",
            "associationTimestamp": "2021-07-12T16:33:55.843000-07:00"
        }
    ]
}
```

For more information, see Interact with local IoT devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListClientDevicesAssociatedWithCoreDevice in *AWS CLI Command Reference*.

`list-component-versions`

The following code example shows how to use `list-component-versions`.

AWS CLI

To list the versions of a component

The following `list-component-versions` example lists all versions of a Hello World component.

```
aws greengrassv2 list-component-versions \
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld
```

Output:

```
{
    "componentVersions": [
        {
            "componentName": "com.example.HelloWorld",
            "componentVersion": "1.0.1",
            "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.1"
        },
        {
            "componentName": "com.example.HelloWorld",
            "componentVersion": "1.0.0",
            "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0"
        }
    ]
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListComponentVersions in *AWS CLI Command Reference*.

`list-components`

The following code example shows how to use `list-components`.

AWS CLI

To list components

The following `list-components` example lists each component and its latest version defined in your AWS account in the current Region.

```
aws greengrassv2 list-components
```

Output:

```
{
    "components": [
        {
            "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld",
```

```
            "componentName": "com.example.HelloWorld",
            "latestVersion": {
                "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.1",
                "componentVersion": "1.0.1",
                "creationTimestamp": "2021-01-08T16:51:07.352000-08:00",
                "description": "My first AWS IoT Greengrass component.",
                "publisher": "Amazon",
                "platforms": [
                    {
                        "attributes": {
                            "os": "linux"
                        }
                    }
                ]
            }
        }
    ]
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListComponents in *AWS CLI Command Reference*.

`list-core-devices`

The following code example shows how to use `list-core-devices`.

AWS CLI

To list core devices

The following `list-core-devices` example lists the AWS IoT Greengrass core devices in your AWS account in the current Region.

```
aws greengrassv2 list-core-devices
```

Output:

```
{
    "coreDevices": [
        {
            "coreDeviceThingName": "MyGreengrassCore",
```

```
            "status": "HEALTHY",
            "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00"
        }
    ]
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListCoreDevices in *AWS CLI Command Reference*.

`list-deployments`

The following code example shows how to use `list-deployments`.

AWS CLI

To list deployments

The following `list-deployments` example lists the latest revision of each deployment defined in your AWS account in the current Region.

```
aws greengrassv2 list-deployments
```

Output:

```
{
    "deployments": [
        {
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
            "revisionId": "14",
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "deploymentName": "Deployment for MyGreengrassCoreGroup",
            "creationTimestamp": "2021-01-07T17:21:20.691000-08:00",
            "deploymentStatus": "ACTIVE",
            "isLatestForTarget": false
        },
        {
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/
MyGreengrassCore",
            "revisionId": "1",
```

```
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "deploymentName": "Deployment for MyGreengrassCore",
            "creationTimestamp": "2021-01-06T16:10:42.407000-08:00",
            "deploymentStatus": "COMPLETED",
            "isLatestForTarget": false
        }
    ]
}
```

For more information, see Deploy components to devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListDeployments in *AWS CLI Command Reference*.

`list-effective-deployments`

The following code example shows how to use `list-effective-deployments`.

AWS CLI

To list deployment jobs

The following `list-effective-deployments` example lists the deployments that apply to an AWS IoT Greengrass core device.

```
aws greengrassv2 list-effective-deployments \
    --core-device-thing-name MyGreengrassCore
```

Output:

```
{
    "effectiveDeployments": [
        {
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "deploymentName": "Deployment for MyGreengrassCore",
            "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/
MyGreengrassCore",
            "coreDeviceExecutionStatus": "COMPLETED",
            "reason": "SUCCESSFUL",
            "creationTimestamp": "2021-01-06T16:10:42.442000-08:00",
            "modifiedTimestamp": "2021-01-08T17:21:27.830000-08:00"
```

```
        },
        {
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "deploymentName": "Deployment for MyGreengrassCoreGroup",
            "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-
cdef-EXAMPLE44444",
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
            "coreDeviceExecutionStatus": "SUCCEEDED",
            "reason": "SUCCESSFUL",
            "creationTimestamp": "2021-01-07T17:19:20.394000-08:00",
            "modifiedTimestamp": "2021-01-07T17:21:20.721000-08:00"
        }
    ]
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListEffectiveDeployments in *AWS CLI Command Reference*.

`list-installed-components`

The following code example shows how to use `list-installed-components`.

AWS CLI

To list components installed on a core device

The following `list-installed-components` example lists the components that are installed on an AWS IoT Greengrass core device.

```
aws greengrassv2 list-installed-components \
    --core-device-thing-name MyGreengrassCore
```

Output:

```
{
    "installedComponents": [
        {
            "componentName": "aws.greengrass.Cli",
```

```
            "componentVersion": "2.0.3",
            "lifecycleState": "RUNNING",
            "isRoot": true
        },
        {
            "componentName": "aws.greengrass.Nucleus",
            "componentVersion": "2.0.3",
            "lifecycleState": "FINISHED",
            "isRoot": true
        }
    ]
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListInstalledComponents in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example lists all tags for an AWS IoT Greengrass core device.

```
aws greengrassv2 list-tags-for-resource \
    --resource-arn arn:aws:greengrass:us-
west-2:123456789012:coreDevices:MyGreengrassCore
```

Output:

```
{
    "tags": {
        "Owner": "richard-roe"
    }
}
```

For more information, see Tag your resources in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a resource

The following `tag-resource` example adds an owner tag to an AWS IoT Greengrass core device. You can use this tag to control access to the core device based on who owns it.

```
aws greengrassv2 tag-resource \
    --resource-arn arn:aws:greengrass:us-
west-2:123456789012:coreDevices:MyGreengrassCore \
    --tags Owner=richard-roe
```

This command produces no output.

For more information, see Tag your resources in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes an owner tag from an AWS IoT Greengrass core device.

```
aws greengrassv2 untag-resource \
    --resource-arn arn:aws:greengrass:us-
west-2:123456789012:coreDevices:MyGreengrassCore \
    --tag-keys Owner
```

This command produces no output.

For more information, see Tag your resources in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-connectivity-info`

The following code example shows how to use `update-connectivity-info`.

AWS CLI

To update connectivity information for a Greengrass core device

The following `update-connectivity-info` example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```
aws greengrassv2 update-connectivity-info \
    --thing-name MyGreengrassCore \
    --cli-input-json file://core-device-connectivity-info.json
```

Contents of `core-device-connectivity-info.json`:

```
{
    "connectivityInfo": [
        {
            "hostAddress": "192.0.2.0",
            "portNumber": 8883,
            "id": "localIP_192.0.2.0"
        }
    ]
}
```

Output:

```
{
    "version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Manage core device endpoints in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see UpdateConnectivityInfo in *AWS CLI Command Reference*.

AWS IoT Jobs SDK release examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Jobs SDK release.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`describe-job-execution`

The following code example shows how to use `describe-job-execution`.

AWS CLI

To get the details of a job execution

The following `describe-job-execution` example retrieves the details of the latest execution of the specified job and thing.

```
aws iot-jobs-data describe-job-execution \
    --job-id SampleJob \
    --thing-name MotionSensor1 \
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "execution": {
        "approximateSecondsBeforeTimedOut": 88,
        "executionNumber": 2939653338,
        "jobId": "SampleJob",
        "lastUpdatedAt": 1567701875,
        "queuedAt": 1567701902,
        "status": "QUEUED",
```

```
        "thingName": "MotionSensor1 ",
        "versionNumber": 3
    }
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see DescribeJobExecution in *AWS CLI Command Reference*.

`get-pending-job-executions`

The following code example shows how to use `get-pending-job-executions`.

AWS CLI

To get a list of all jobs that are not in a terminal status for a thing

The following `get-pending-job-executions` example displays a list of all jobs that aren't in a terminal state for the specified thing.

```
aws iot-jobs-data get-pending-job-executions \
    --thing-name MotionSensor1 \
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "inProgressJobs": [
    ],
    "queuedJobs": [
        {
            "executionNumber": 2939653338,
            "jobId": "SampleJob",
            "lastUpdatedAt": 1567701875,
            "queuedAt": 1567701902,
            "versionNumber": 3
        }
    ]
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see GetPendingJobExecutions in *AWS CLI Command Reference*.

`start-next-pending-job-execution`

The following code example shows how to use `start-next-pending-job-execution`.

AWS CLI

To get and start the next pending job execution for a thing

The following `start-next-pending-job-execution` example retrieves and starts the next job execution whose status is IN_PROGRESS or QUEUED for the specified thing.

```
aws iot-jobs-data start-next-pending-job-execution \
    --thing-name MotionSensor1 \
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "execution": {
        "approximateSecondsBeforeTimedOut": 88,
        "executionNumber": 2939653338,
        "jobId": "SampleJob",
        "lastUpdatedAt": 1567714853,
        "queuedAt": 1567701902,
        "startedAt": 1567714871,
        "status": "IN_PROGRESS",
        "thingName": "MotionSensor1 ",
        "versionNumber": 3
    }
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see StartNextPendingJobExecution in *AWS CLI Command Reference*.

`update-job-execution`

The following code example shows how to use `update-job-execution`.

AWS CLI

To update the status of a job execution

The following `update-job-execution` example updates the status of the specified job and thing.

```
aws iot-jobs-data update-job-execution \
    --job-id SampleJob \
    --thing-name MotionSensor1 \
    --status REMOVED \
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "executionState": {
        "status": "REMOVED",
        "versionNumber": 3
    }
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see UpdateJobExecution in *AWS CLI Command Reference*.

AWS IoT SiteWise examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT SiteWise.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-assets`

The following code example shows how to use `associate-assets`.

AWS CLI

To associate a child asset to a parent asset

The following `associate-assets` example associates a wind turbine asset to a wind farm asset, where the wind turbine asset model exists as a hierarchy in the wind farm asset model.

```
aws iotsitewise associate-assets \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --hierarchy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --child-asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

This command produces no output.

For more information, see Associating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see AssociateAssets in *AWS CLI Command Reference*.

`batch-associate-project-assets`

The following code example shows how to use `batch-associate-project-assets`.

AWS CLI

To associate an asset to a project

The following `batch-associate-project-assets` example associates a wind farm asset to a project.

```
aws iotsitewise batch-associate-project-assets \
    --project-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --asset-ids a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see Adding assets to projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see BatchAssociateProjectAssets in *AWS CLI Command Reference*.

`batch-disassociate-project-assets`

The following code example shows how to use `batch-disassociate-project-assets`.

AWS CLI

To disassociate an asset from a project

The following `batch-disassociate-project-assets` example disassociates a wind farm asset from a project.

```
aws iotsitewise batch-disassociate-project-assets \
    --project-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --asset-ids a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see Adding assets to projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see BatchDisassociateProjectAssets in *AWS CLI Command Reference*.

`batch-put-asset-property-value`

The following code example shows how to use `batch-put-asset-property-value`.

AWS CLI

To send data to asset properties

The following `batch-put-asset-property-value` example sends power and temperature data to the asset properties identified by property aliases.

```
aws iotsitewise batch-put-asset-property-value \
    --cli-input-json file://batch-put-asset-property-value.json
```

Contents of `batch-put-asset-property-value.json`:

```
{
    "entries": [
        {
            "entryId": "1575691200-company-windfarm-3-turbine-7-power",
            "propertyAlias": "company-windfarm-3-turbine-7-power",
            "propertyValues": [
```

```
                {
                    "value": {
                        "doubleValue": 4.92
                    },
                    "timestamp": {
                        "timeInSeconds": 1575691200
                    },
                    "quality": "GOOD"
                }
            ]
        },
        {
            "entryId": "1575691200-company-windfarm-3-turbine-7-temperature",
            "propertyAlias": "company-windfarm-3-turbine-7-temperature",
            "propertyValues": [
                {
                    "value": {
                        "integerValue": 38
                    },
                    "timestamp": {
                        "timeInSeconds": 1575691200
                    }
                }
            ]
        }
    ]
}
```

Output:

```
{
    "errorEntries": []
}
```

For more information, see Ingesting data using the AWS IoT SiteWise API in the *AWS IoT SiteWise User Guide*.

- For API details, see BatchPutAssetPropertyValue in *AWS CLI Command Reference*.

`create-access-policy`

The following code example shows how to use `create-access-policy`.

AWS CLI

Example 1: To grant a user administrative access to a portal

The following `create-access-policy` example creates an access policy that grants a user administrative access to a web portal for a wind farm company.

```
aws iotsitewise create-access-policy \
    --cli-input-json file://create-portal-administrator-access-policy.json
```

Contents of `create-portal-administrator-access-policy.json`:

```
{
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyPermission": "ADMINISTRATOR",
    "accessPolicyResource": {
        "portal": {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    }
}
```

Output:

```
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Adding or removing portal administrators in the *AWS IoT SiteWise User Guide*.

Example 2: To grant a user read-only access to a project

The following `create-access-policy` example creates an access policy that grants a user read-only access to a wind farm project.

```
aws iotsitewise create-access-policy \
    --cli-input-json file://create-project-viewer-access-policy.json
```

Contents of `create-project-viewer-access-policy.json`:

```
{
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyPermission": "VIEWER",
    "accessPolicyResource": {
        "project": {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
        }
    }
}
```

Output:

```
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
    "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
}
```

For more information, see Assigning project viewers in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see CreateAccessPolicy in *AWS CLI Command Reference*.

`create-asset-model`

The following code example shows how to use `create-asset-model`.

AWS CLI

To create an asset model

The following `create-asset-model` example creates an asset model that defines a wind turbine with the following properties:

Serial number - The serial number of a wind turbineGenerated power - The generated power data stream from a wind turbineTemperature C - The temperature data stream from a wind turbine in CelsiusTemperature F - The mapped temperature data points from Celsius to Fahrenheit

The asset model definition is in the `create-wind-turbine-model.json` file.

```
aws iotsitewise create-asset-model \
    --cli-input-json file://create-wind-turbine-model.json
```

Contents of `create-wind-turbine-model.json`:

```
{
    "assetModelName": "Wind Turbine Model",
    "assetModelDescription": "Represents a wind turbine",
    "assetModelProperties": [
        {
            "name": "Serial Number",
            "dataType": "STRING",
            "type": {
                "attribute": {}
            }
        },
        {
            "name": "Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "measurement": {}
            }
        },
        {
            "name": "Temperature C",
            "dataType": "DOUBLE",
            "unit": "Celsius",
            "type": {
                "measurement": {}
            }
        },
        {
            "name": "Temperature F",
            "dataType": "DOUBLE",
            "unit": "Fahrenheit",
```

```
            "type": {
                "transform": {
                    "expression": "temp_c * 9 / 5 + 32",
                    "variables": [
                        {
                            "name": "temp_c",
                            "value": {
                                "propertyId": "Temperature C"
                            }
                        }
                    ]
                }
            }
        },
        {
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "metric": {
                    "expression": "sum(power)",
                    "variables": [
                        {
                            "name": "power",
                            "value": {
                                "propertyId": "Generated Power"
                            }
                        }
                    ],
                    "window": {
                        "tumbling": {
                            "interval": "1h"
                        }
                    }
                }
            }
        }
    ]
}
```

Output:

```
{
```

```
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "assetModelStatus": {
        "state": "CREATING"
    }
}
```

For more information, see Defining asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateAssetModel in *AWS CLI Command Reference*.

`create-asset`

The following code example shows how to use `create-asset`.

AWS CLI

To create an asset

The following `create-asset` example creates a wind turbine asset from a wind turbine asset model.

```
aws iotsitewise create-asset \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --asset-name "Wind Turbine 1"
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "assetStatus": {
        "state": "CREATING"
    }
}
```

For more information, see Creating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateAsset in *AWS CLI Command Reference*.

`create-dashboard`

The following code example shows how to use `create-dashboard`.

AWS CLI

To create a dashboard

The following `create-dashboard` example creates a dashboard with a line chart that displays total generated power for a wind farm.

```
aws iotsitewise create-dashboard \
    --project-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --dashboard-name "Wind Farm" \
    --dashboard-definition file://create-wind-farm-dashboard.json
```

Contents of `create-wind-farm-dashboard.json`:

```
{
    "widgets": [
        {
            "type": "monitor-line-chart",
            "title": "Generated Power",
            "x": 0,
            "y": 0,
            "height": 3,
            "width": 3,
            "metrics": [
                {
                    "label": "Power",
                    "type": "iotsitewise",
                    "assetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
                    "propertyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
                }
            ]
        }
    ]
}
```

Output:

```
{
    "dashboardId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
```

```
    "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/
a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
}
```

For more information, see Creating dashboards (CLI) in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateDashboard in *AWS CLI Command Reference*.

`create-gateway`

The following code example shows how to use `create-gateway`.

AWS CLI

To create a gateway

The following `create-gateway` example creates a gateway that runs on AWS IoT Greengrass.

```
aws iotsitewise create-gateway \
    --gateway-name ExampleCorpGateway \
    --gateway-platform greengrass={groupArn=arn:aws:greengrass:us-
west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111}
```

Output:

```
{
    "gatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Configuring a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateGateway in *AWS CLI Command Reference*.

`create-portal`

The following code example shows how to use `create-portal`.

AWS CLI

To create a portal

The following `create-portal` example creates a web portal for a wind farm company. You can create portals only in the same Region where you enabled AWS Single Sign-On.

```
aws iotsitewise create-portal \
    --portal-name WindFarmPortal \
    --portal-description "A portal that contains wind farm projects for Example
 Corp." \
    --portal-contact-email support@example.com \
    --role-arn arn:aws:iam::123456789012:role/service-role/
MySiteWiseMonitorServiceRole
```

Output:

```
{
    "portalId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111.app.iotsitewise.aws",
    "portalStatus": {
        "state": "CREATING"
    },
    "ssoApplicationId": "ins-a1b2c3d4-EXAMPLE"
}
```

For more information, see Getting started with AWS IoT SiteWise Monitor in the *AWS IoT SiteWise User Guide* and Enabling AWS SSO in the *AWS IoT SiteWise User Guide*..

- For API details, see CreatePortal in *AWS CLI Command Reference*.

`create-project`

The following code example shows how to use `create-project`.

AWS CLI

To create a project

The following `create-project` example creates a wind farm project.

```
aws iotsitewise create-project \
```

```
    --portal-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --project-name "Wind Farm 1" \
    --project-description "Contains asset visualizations for Wind Farm #1 for
 Example Corp."
```

Output:

```
{
    "projectId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Creating projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see CreateProject in *AWS CLI Command Reference*.

`delete-access-policy`

The following code example shows how to use `delete-access-policy`.

AWS CLI

To revoke a user's access to a project or portal

The following `delete-access-policy` example deletes an access policy that grants a user administrative access to a portal.

```
aws iotsitewise delete-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Adding or removing portal administrators in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteAccessPolicy in *AWS CLI Command Reference*.

`delete-asset-model`

The following code example shows how to use `delete-asset-model`.

AWS CLI

To delete an asset model

The following `delete-asset-model` example deletes a wind turbine asset model.

```
aws iotsitewise delete-asset-model \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "assetModelStatus": {
        "state": "DELETING"
    }
}
```

For more information, see Deleting asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteAssetModel in *AWS CLI Command Reference*.

`delete-asset`

The following code example shows how to use `delete-asset`.

AWS CLI

To delete an asset

The following `delete-asset` example deletes a wind turbine asset.

```
aws iotsitewise delete-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "assetStatus": {
        "state": "DELETING"
    }
```

```
}
```

For more information, see Deleting assets in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteAsset in *AWS CLI Command Reference*.

`delete-dashboard`

The following code example shows how to use `delete-dashboard`.

AWS CLI

To delete a dashboard

The following `delete-dashboard` example deletes a wind turbine dashboard.

```
aws iotsitewise delete-dashboard \
    --dashboard-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Deleting dashboards in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DeleteDashboard in *AWS CLI Command Reference*.

`delete-gateway`

The following code example shows how to use `delete-gateway`.

AWS CLI

To delete a gateway

The following `delete-gateway` example deletes a gateway.

```
aws iotsitewise delete-gateway \
    --gateway-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteGateway in *AWS CLI Command Reference*.

`delete-portal`

The following code example shows how to use `delete-portal`.

AWS CLI

To delete a portal

The following `delete-portal` example deletes a web portal for a wind farm company.

```
aws iotsitewise delete-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "portalStatus": {
        "state": "DELETING"
    }
}
```

For more information, see Deleting a portal in the *AWS IoT SiteWise User Guide*.

- For API details, see DeletePortal in *AWS CLI Command Reference*.

`delete-project`

The following code example shows how to use `delete-project`.

AWS CLI

To delete a project

The following `delete-project` example deletes a wind farm project.

```
aws iotsitewise delete-project \
    --project-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Deleting projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DeleteProject in *AWS CLI Command Reference*.

`describe-access-policy`

The following code example shows how to use `describe-access-policy`.

AWS CLI

To describe an access policy

The following `describe-access-policy` example describes an access policy that grants a user administrative access to a web portal for a wind farm company.

```
aws iotsitewise describe-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyResource": {
        "portal": {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    },
    "accessPolicyPermission": "ADMINISTRATOR",
    "accessPolicyCreationDate": "2020-02-20T22:35:15.552880124Z",
    "accessPolicyLastUpdateDate": "2020-02-20T22:35:15.552880124Z"
}
```

For more information, see Adding or removing portal administrators in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAccessPolicy in *AWS CLI Command Reference*.

`describe-asset-model`

The following code example shows how to use `describe-asset-model`.

AWS CLI

To describe an asset model

The following `describe-asset-model` example describes a wind farm asset model.

```
aws iotsitewise describe-asset-model \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

        "state": "ACTIVE"
    }
}
```

For more information, see Check the status of an asset or component model in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAssetModel in *AWS CLI Command Reference*.

`describe-asset-property`

The following code example shows how to use `describe-asset-property`.

AWS CLI

To describe an asset property

The following `describe-asset-property` example describes a wind farm asset's total generated power property.

```
aws iotsitewise describe-asset-property \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --property-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "assetName": "Wind Farm 1",
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "assetProperty": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "name": "Total Generated Power",
        "notification": {
            "topic": "$aws/sitewise/asset-models/a1b2c3d4-5678-90ab-

                ],
                "window": {
                    "tumbling": {
                        "interval": "1h"
```

```
                    }
                }
            }
        }
    }
}
```

For more information, see Model industrial assets in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAssetProperty in *AWS CLI Command Reference*.

`describe-asset`

The following code example shows how to use `describe-asset`.

AWS CLI

To describe an asset

The following `describe-asset` example describes a wind farm asset.

```
aws iotsitewise describe-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "assetName": "Wind Farm 1",
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "assetProperties": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "name": "Region",
            "dataType": "STRING"
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
```

```
            "unit": "kW"
        }
    ],
    "assetHierarchies": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
            "name": "Wind Turbines"
        }
    ],
    "assetCreationDate": 1575672453.0,
    "assetLastUpdateDate": 1575672453.0,
    "assetStatus": {
        "state": "ACTIVE"
    }
}
```

For more information, see Check the status of an asset in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAsset in *AWS CLI Command Reference*.

`describe-dashboard`

The following code example shows how to use `describe-dashboard`.

AWS CLI

To describe a dashboard

The following `describe-dashboard` example describes the specified wind farm dashboard.

```
aws iotsitewise describe-dashboard \
    --dashboard-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "dashboardId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "dashboardName": "Wind Farm",
    "projectId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "dashboardDefinition": "{\"widgets\":[{\"type\":\"monitor-line-chart\",\"title
\":\"Generated Power\",\"x\":0,\"y\":0,\"height\":3,\"width\":3,\"metrics\":
```

```
[{\"label\":\"Power\",\"type\":\"iotsitewise\",\"assetId\":\"a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333\",\"propertyId\":\"a1b2c3d4-5678-90ab-cdef-EXAMPLE44444\"}]}]}",
    "dashboardCreationDate": "2020-05-01T20:32:12.228476348Z",
    "dashboardLastUpdateDate": "2020-05-01T20:32:12.228476348Z"
}
```

For more information, see Viewing dashboards in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DescribeDashboard in *AWS CLI Command Reference*.

`describe-gateway-capability-configuration`

The following code example shows how to use `describe-gateway-capability-configuration`.

AWS CLI

To describe a gateway capability

The following `describe-gateway-capability-configuration` example describes an OPC-UA source capability.

```
aws iotsitewise describe-gateway-capability-configuration \
    --gateway-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --capability-namespace "iotsitewise:opcuacollector:1"
```

Output:

```
{
    "gatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "capabilityNamespace": "iotsitewise:opcuacollector:1",
    "capabilityConfiguration": "{\"sources\":[{\"name\":\"Wind Farm #1\",
\"endpoint\":{\"certificateTrust\":{\"type\":\"TrustAny\"},\"endpointUri
\":\"opc.tcp://203.0.113.0:49320\",\"securityPolicy\":\"BASIC256\",
\"messageSecurityMode\":\"SIGN_AND_ENCRYPT\",\"identityProvider\":
{\"type\":\"Username\",\"usernameSecretArn\":\"arn:aws:secretsmanager:us-
west-2:123456789012:secret:greengrass-factory1-auth-3QNDmM\"},\"nodeFilterRules\":
[]},\"measurementDataStreamPrefix\":\"\"}]}",
    "capabilitySyncStatus": "IN_SYNC"
}
```

For more information, see OPC UA data sources for AWS IoT SiteWise Edge gateways in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeGatewayCapabilityConfiguration in *AWS CLI Command Reference*.

`describe-gateway`

The following code example shows how to use `describe-gateway`.

AWS CLI

To describe a gateway

The following `describe-gateway` example describes a gateway.

```
aws iotsitewise describe-gateway \
    --gateway-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "gatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "gatewayName": "ExampleCorpGateway",
    "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "gatewayPlatform": {
        "greengrass": {
            "groupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    },
    "gatewayCapabilitySummaries": [
        {
            "capabilityNamespace": "iotsitewise:opcuacollector:1",
            "capabilitySyncStatus": "IN_SYNC"
        }
    ],
    "creationDate": 1588369971.457,
    "lastUpdateDate": 1588369971.457
}
```

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeGateway in *AWS CLI Command Reference*.

`describe-logging-options`

The following code example shows how to use `describe-logging-options`.

AWS CLI

To retrieve the current AWS IoT SiteWise logging options

The following `describe-logging-options` example retrieves the current AWS IoT SiteWise logging options for your AWS account in the current Region.

```
aws iotsitewise describe-logging-options
```

Output:

```
{
    "loggingOptions": {
        "level": "INFO"
    }
}
```

For more information, see Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeLoggingOptions in *AWS CLI Command Reference*.

`describe-portal`

The following code example shows how to use `describe-portal`.

AWS CLI

To describe a portal

The following `describe-portal` example describes a web portal for a wind farm company.

```
aws iotsitewise describe-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "portalId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "portalName": "WindFarmPortal",
    "portalDescription": "A portal that contains wind farm projects for Example
 Corp.",
    "portalClientId": "E-a1b2c3d4e5f6_a1b2c3d4e5f6EXAMPLE",
    "portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111.app.iotsitewise.aws",
    "portalContactEmail": "support@example.com",
    "portalStatus": {
        "state": "ACTIVE"
    },
    "portalCreationDate": "2020-02-04T23:01:52.90248068Z",
    "portalLastUpdateDate": "2020-02-04T23:01:52.90248078Z",
    "roleArn": "arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole"
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribePortal in *AWS CLI Command Reference*.

`describe-project`

The following code example shows how to use `describe-project`.

AWS CLI

To describe a project

The following `describe-project` example describes a wind farm project.

```
aws iotsitewise describe-project \
    --project-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "projectId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
    "projectName": "Wind Farm 1",
    "portalId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "projectDescription": "Contains asset visualizations for Wind Farm #1 for
 Example Corp.",
    "projectCreationDate": "2020-02-20T21:58:43.362246001Z",
    "projectLastUpdateDate": "2020-02-20T21:58:43.362246095Z"
}
```

For more information, see Viewing project details in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DescribeProject in *AWS CLI Command Reference*.

`disassociate-assets`

The following code example shows how to use `disassociate-assets`.

AWS CLI

To disassociate a child asset from a parent asset

The following `disassociate-assets` example disassociates a wind turbine asset from a wind farm asset.

```
aws iotsitewise disassociate-assets \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE44444 \
    --hierarchy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE77777 \
    --child-asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

This command produces no output.

For more information, see Associating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see DisassociateAssets in *AWS CLI Command Reference*.

`get-asset-property-aggregates`

The following code example shows how to use `get-asset-property-aggregates`.

AWS CLI

To retrieve an asset property's aggregated average and count values

The following `get-asset-property-aggregates` example retrieves a wind turbine asset's average total power and count of total power data points for a 1 hour period in time.

```
aws iotsitewise get-asset-property-aggregates \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --property-id a1b2c3d4-5678-90ab-cdef-EXAMPLE66666 \
    --start-date 1580849400 \
    --end-date 1580853000 \
    --aggregate-types AVERAGE COUNT \
    --resolution 1h
```

Output:

```
{
    "aggregatedValues": [
        {
            "timestamp": 1580850000.0,
            "quality": "GOOD",
            "value": {
                "average": 8723.46538886233,
                "count": 12.0
            }
        }
    ]
}
```

For more information, see Querying asset property aggregates in the *AWS IoT SiteWise User Guide*.

- For API details, see GetAssetPropertyAggregates in *AWS CLI Command Reference*.

`get-asset-property-value-history`

The following code example shows how to use `get-asset-property-value-history`.

AWS CLI

To retrieve an asset property's historical values

The following `get-asset-property-value-history` example retrieves a wind turbine asset's total power values for a 20 minute period in time.

```
aws iotsitewise get-asset-property-value-history \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --property-id a1b2c3d4-5678-90ab-cdef-EXAMPLE66666 \
    --start-date 1580851800 \
    --end-date 1580853000
```

Output:

```
{
    "assetPropertyValueHistory": [
        {
            "value": {
                "doubleValue": 7217.787046814844
            },
            "timestamp": {
                "timeInSeconds": 1580852100,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6941.242811875451
            },
            "timestamp": {
                "timeInSeconds": 1580852400,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6976.797662266717
            },
            "timestamp": {
                "timeInSeconds": 1580852700,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6890.8677520453875
```

```
            },
            "timestamp": {
                "timeInSeconds": 1580853000,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        }
    ]
}
```

For more information, see Querying historical asset property values in the *AWS IoT SiteWise User Guide*.

- For API details, see GetAssetPropertyValueHistory in *AWS CLI Command Reference*.

`get-asset-property-value`

The following code example shows how to use `get-asset-property-value`.

AWS CLI

To retrieve an asset property's current value

The following `get-asset-property-value` example retrieves a wind turbine asset's current total power.

```
aws iotsitewise get-asset-property-value \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --property-id a1b2c3d4-5678-90ab-cdef-EXAMPLE66666
```

Output:

```
{
    "propertyValue": {
        "value": {
            "doubleValue": 6890.8677520453875
        },
        "timestamp": {
            "timeInSeconds": 1580853000,
            "offsetInNanos": 0
        },
        "quality": "GOOD"
```

```
    }
}
```

For more information, see Querying current asset property values in the *AWS IoT SiteWise User Guide*.

- For API details, see GetAssetPropertyValue in *AWS CLI Command Reference*.

`list-access-policies`

The following code example shows how to use `list-access-policies`.

AWS CLI

To list all access policies

The following `list-access-policies` example lists all access policies for a user who is a portal administrator.

```
aws iotsitewise list-access-policies \
    --identity-type USER \
    --identity-id a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE
```

Output:

```
{
    "accessPolicySummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "identity": {
                "user": {
                    "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
                }
            },
            "resource": {
                "portal": {
                    "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                }
            },
            "permission": "ADMINISTRATOR"
        }
    ]
```

```
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAccessPolicies in *AWS CLI Command Reference*.

`list-asset-models`

The following code example shows how to use `list-asset-models`.

AWS CLI

To list all asset models

The following `list-asset-models` example lists all asset models that are defined in your AWS account in the current Region.

```
aws iotsitewise list-asset-models
```

Output:

```
{
    "assetModelSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "name": "Wind Farm Model",
            "description": "Represents a wind farm that comprises many wind
 turbines",
            "creationDate": 1575671284.0,
            "lastUpdateDate": 1575671988.0,
            "status": {
                "state": "ACTIVE"
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "name": "Wind Turbine Model",
            "description": "Represents a wind turbine manufactured by Example Corp",
```

```
            "creationDate": 1575671207.0,
            "lastUpdateDate": 1575686273.0,
            "status": {
                "state": "ACTIVE"
            }
        }
    ]
}
```

For more information, see Model industrial assets in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAssetModels in *AWS CLI Command Reference*.

`list-assets`

The following code example shows how to use `list-assets`.

AWS CLI

Example 1: To list all top-level assets

The following `list-assets` example lists all assets that are top-level in the asset hierarchy tree and defined in your AWS account in the current Region.

```
aws iotsitewise list-assets \
    --filter TOP_LEVEL
```

Output:

```
{
    "assetSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "name": "Wind Farm 1",
            "assetModelId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "creationDate": 1575672453.0,
            "lastUpdateDate": 1575672453.0,
            "status": {
                "state": "ACTIVE"
            },
```

```
            "hierarchies": [
                {
                    "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE77777",
                    "name": "Wind Turbines"
                }
            ]
        }
    ]
}
```

For more information, see Model industrial assets in the *AWS IoT SiteWise User Guide*.

Example 2: To list all assets based on an asset model

The following `list-assets` example lists all assets based on an asset model and defined in your AWS account in the current Region.

```
aws iotsitewise list-assets \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "assetSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "name": "Wind Turbine 1",
            "assetModelId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "creationDate": 1575671550.0,
            "lastUpdateDate": 1575686308.0,
            "status": {
                "state": "ACTIVE"
            },
            "hierarchies": []
        }
    ]
}
```

For more information, see Model industrial assets in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAssets in *AWS CLI Command Reference*.

`list-associated-assets`

The following code example shows how to use `list-associated-assets`.

AWS CLI

To list all assets associated to an asset in a specific hierarchy

The following `list-associated-assets` example lists all wind turbine assets associated to the specified wind farm asset.

```
aws iotsitewise list-associated-assets \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE44444 \
    --hierarchy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE77777
```

Output:

```
{
    "assetSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "name": "Wind Turbine 1",
            "assetModelId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "creationDate": 1575671550.0,
            "lastUpdateDate": 1575686308.0,
            "status": {
                "state": "ACTIVE"
            },
            "hierarchies": []
        }
    ]
}
```

For more information, see Model industrial assets in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAssociatedAssets in *AWS CLI Command Reference*.

`list-dashboards`

The following code example shows how to use `list-dashboards`.

AWS CLI

To list all dashboards in a project

The following `list-dashboards` example lists all dashboards that are defined in a project.

```
aws iotsitewise list-dashboards \
    --project-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "dashboardSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "name": "Wind Farm",
            "creationDate": "2020-05-01T20:32:12.228476348Z",
            "lastUpdateDate": "2020-05-01T20:32:12.228476348Z"
        }
    ]
}
```

For more information, see Viewing dashboards in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see ListDashboards in *AWS CLI Command Reference*.

`list-gateways`

The following code example shows how to use `list-gateways`.

AWS CLI

To list all gateways

The following `list-gateways` example lists all gateways that are defined in your AWS account in the current Region.

```
aws iotsitewise list-gateways
```

Output:

```
{
    "gatewaySummaries": [
        {
            "gatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "gatewayName": "ExampleCorpGateway",
            "gatewayCapabilitySummaries": [
                {
                    "capabilityNamespace": "iotsitewise:opcuacollector:1",
                    "capabilitySyncStatus": "IN_SYNC"
                }
            ],
            "creationDate": 1588369971.457,
            "lastUpdateDate": 1588369971.457
        }
    ]
}
```

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see ListGateways in *AWS CLI Command Reference*.

`list-portals`

The following code example shows how to use `list-portals`.

AWS CLI

To list all portals

The following `list-portals` example lists all portals that are defined in your AWS account in the current Region.

```
aws iotsitewise list-portals
```

Output:

```
{
    "portalSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "name": "WindFarmPortal",
```

```
            "description": "A portal that contains wind farm projects for Example
 Corp.",
            "startUrl": "https://a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111.app.iotsitewise.aws",
            "creationDate": "2020-02-04T23:01:52.90248068Z",
            "lastUpdateDate": "2020-02-04T23:01:52.90248078Z",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/
MySiteWiseMonitorServiceRole"
        }
    ]
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see ListPortals in *AWS CLI Command Reference*.

`list-project-assets`

The following code example shows how to use `list-project-assets`.

AWS CLI

To list all assets associated to a project

The following `list-project-assets` example lists all assets that are associated to a wind farm project.

```
aws iotsitewise list-project-assets \
    --project-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "assetIds": [
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
    ]
}
```

For more information, see Adding assets to projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see ListProjectAssets in *AWS CLI Command Reference*.

`list-projects`

The following code example shows how to use `list-projects`.

AWS CLI

To list all projects in a portal

The following `list-projects` example lists all projects that are defined in a portal.

```
aws iotsitewise list-projects \
    --portal-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "projectSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "name": "Wind Farm 1",
            "description": "Contains asset visualizations for Wind Farm #1 for
 Example Corp.",
            "creationDate": "2020-02-20T21:58:43.362246001Z",
            "lastUpdateDate": "2020-02-20T21:58:43.362246095Z"
        }
    ]
}
```

For more information, see Viewing project details in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see ListProjects in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for a resource

The following `list-tags-for-resource` example lists all tags for a wind turbine asset.

```
aws iotsitewise list-tags-for-resource \
    --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

Output:

```
{
    "tags": {
        "Owner": "richard-roe"
    }
}
```

For more information, see Tagging your resources in the *AWS IoT SiteWise User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-logging-options`

The following code example shows how to use `put-logging-options`.

AWS CLI

To specify the level of logging

The following `put-logging-options` example enables `INFO` level logging in AWS IoT SiteWise. Other levels include `DEBUG` and `OFF`.

```
aws iotsitewise put-logging-options \
    --logging-options level=INFO
```

This command produces no output.

For more information, see Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs in the *AWS IoT SiteWise User Guide*.

- For API details, see PutLoggingOptions in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a resource

The following `tag-resource` example adds an owner tag to a wind turbine asset. This lets you control access to the asset based on who owns it.

```
aws iotsitewise tag-resource \
    --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --tags Owner=richard-roe
```

This command produces no output.

For more information, see Tagging your resources in the *AWS IoT SiteWise User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes an owner tag from a wind turbine asset.

```
aws iotsitewise untag-resource \
    --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --tag-keys Owner
```

This command produces no output.

For more information, see Tagging your resources in the *AWS IoT SiteWise User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-access-policy`

The following code example shows how to use `update-access-policy`.

AWS CLI

To grant a project viewer ownership of a project

The following `update-access-policy` example updates an access policy that grants a project viewer ownership of a project.

```
aws iotsitewise update-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --cli-input-json file://update-project-viewer-access-policy.json
```

Contents of `update-project-viewer-access-policy.json`:

```
{
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyPermission": "ADMINISTRATOR",
    "accessPolicyResource": {
        "project": {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    }
}
```

This command produces no output.

For more information, see Assigning project owners in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see UpdateAccessPolicy in *AWS CLI Command Reference*.

`update-asset-model`

The following code example shows how to use `update-asset-model`.

AWS CLI

To update an asset model

The following `update-asset-model` example updates a wind farm asset model's description. This example includes the model's existing IDs and definitions, because `update-asset-model` overwrites the existing model with the new model.

```
aws iotsitewise update-asset-model \
    --cli-input-json file://update-wind-farm-model.json
```

Contents of `update-wind-farm-model.json`:

```
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "assetModelName": "Wind Farm Model",
    "assetModelDescription": "Represents a wind farm that comprises many wind
 turbines",
    "assetModelProperties": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE88888",
            "name": "Region",
            "dataType": "STRING",
            "type": {
                "attribute": {}
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE99999",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "metric": {
                    "expression": "sum(power)",
                    "variables": [
                        {
                            "name": "power",
                            "value": {
                                "hierarchyId": "a1b2c3d4-5678-90ab-cdef-
EXAMPLE77777",
                                "propertyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE66666"
                            }
                        }
                    ],
                    "window": {
                        "tumbling": {
```

```
                            "interval": "1h"
                        }
                    }
                }
            }
        }
    ],
    "assetModelHierarchies": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE77777",
            "name": "Wind Turbines",
            "childAssetModelId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

Output:

```
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "assetModelStatus": {
        "state": "CREATING"
    }
}
```

For more information, see Updating asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateAssetModel in *AWS CLI Command Reference*.

`update-asset-property`

The following code example shows how to use `update-asset-property`.

AWS CLI

Example 1: To update an asset property's alias

The following `update-asset-property` example updates a wind turbine asset's power property alias.

```
aws iotsitewise update-asset-property \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --property-id a1b2c3d4-5678-90ab-cdef-EXAMPLE55555 \
```

```
    --property-alias "/examplecorp/windfarm/1/turbine/1/power" \
    --property-notification-state DISABLED
```

This command produces no output.

For more information, see Update an asset property alias in the *AWS IoT SiteWise User Guide*.

Example 2: To enable asset property notifications

The following `update-asset-property` example enables asset property update notifications for a wind turbine asset's power property. Property value updates are published to the MQTT topic `$aws/sitewise/asset-models/<assetModelId>/assets/<assetId>/properties/<propertyId>`, where each ID is replaced by the property, asset, and model ID of the asset property.

```
aws iotsitewise update-asset-property \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --property-id a1b2c3d4-5678-90ab-cdef-EXAMPLE66666 \
    --property-notification-state ENABLED \
    --property-alias "/examplecorp/windfarm/1/turbine/1/power"
```

This command produces no output.

For more information, see Interacting with other services in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateAssetProperty in *AWS CLI Command Reference*.

`update-asset`

The following code example shows how to use `update-asset`.

AWS CLI

To update an asset's name

The following `update-asset` example updates a wind turbine asset's name.

```
aws iotsitewise update-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --asset-name "Wind Turbine 2"
```

Output:

```
{
    "assetStatus": {
        "state": "UPDATING"
    }
}
```

For more information, see Updating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateAsset in *AWS CLI Command Reference*.

`update-dashboard`

The following code example shows how to use `update-dashboard`.

AWS CLI

To update a dashboard

The following `update-dashboard` example changes the title of a dashboard's line chart that displays total generated power for a wind farm.

```
aws iotsitewise update-dashboard \
    --dashboard-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --dashboard-name "Wind Farm" \
    --dashboard-definition file://update-wind-farm-dashboard.json
```

Contents of `update-wind-farm-dashboard.json`:

```
{
    "widgets": [
        {
            "type": "monitor-line-chart",
            "title": "Total Generated Power",
            "x": 0,
            "y": 0,
            "height": 3,
            "width": 3,
            "metrics": [
                {
                    "label": "Power",
                    "type": "iotsitewise",
                    "assetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
```

```
                    "propertyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE99999"
                }
            ]
        }
    ]
}
```

This command produces no output.

For more information, see Creating dashboards (CLI) in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateDashboard in *AWS CLI Command Reference*.

`update-gateway-capability-configuration`

The following code example shows how to use `update-gateway-capability-configuration`.

AWS CLI

To update a gateway capability

The following `update-gateway-capability-configuration` example configures an OPC-UA source with the following properties:

Trusts any certificate.Uses the Basic256 algorithm to secure messages.Uses the SignAndEncrypt mode to secure connections.Uses authentication credentials stored in an AWS Secrets Manager secret.

The capability configuration is in the `opc-ua-capability-configuration.json` file.

```
aws iotsitewise update-gateway-capability-configuration \
    --gateway-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --capability-namespace "iotsitewise:opcuacollector:1" \
    --capability-configuration file://opc-ua-capability-configuration.json
```

Contents of `opc-ua-capability-configuration.json`:

```
{
    "sources": [
        {
            "name": "Wind Farm #1",
            "endpoint": {
                "certificateTrust": {
```

```
                    "type": "TrustAny"
                },
                "endpointUri": "opc.tcp://203.0.113.0:49320",
                "securityPolicy": "BASIC256",
                "messageSecurityMode": "SIGN_AND_ENCRYPT",
                "identityProvider": {
                    "type": "Username",
                    "usernameSecretArn": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:greengrass-windfarm1-auth-1ABCDE"
                },
                "nodeFilterRules": []
            },
            "measurementDataStreamPrefix": ""
        }
    ]
}
```

Output:

```
{
    "capabilityNamespace": "iotsitewise:opcuacollector:1",
    "capabilitySyncStatus": "OUT_OF_SYNC"
}
```

For more information, see OPC UA data sources for AWS IoT SiteWise Edge gateways in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateGatewayCapabilityConfiguration in *AWS CLI Command Reference*.

`update-gateway`

The following code example shows how to use `update-gateway`.

AWS CLI

To update a gateway's name

The following `update-gateway` example updates a gateway's name.

```
aws iotsitewise update-gateway \
    --gateway-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --gateway-name ExampleCorpGateway1
```

This command produces no output.

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateGateway in *AWS CLI Command Reference*.

`update-portal`

The following code example shows how to use `update-portal`.

AWS CLI

To update a portal's details

The following `update-portal` example updates a web portal for a wind farm company.

```
aws iotsitewise update-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --portal-name WindFarmPortal \
    --portal-description "A portal that contains wind farm projects for Example
 Corp." \
    --portal-contact-email support@example.com \
    --role-arn arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole
```

Output:

```
{
    "portalStatus": {
        "state": "UPDATING"
    }
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdatePortal in *AWS CLI Command Reference*.

`update-project`

The following code example shows how to use `update-project`.

AWS CLI

To update a project's details

The following `update-project` example updates a wind farm project.

```
aws iotsitewise update-project \
    --project-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --project-name "Wind Farm 1" \
    --project-description "Contains asset visualizations for Wind Farm #1 for
 Example Corp."
```

This command produces no output.

For more information, see Changing project details in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see UpdateProject in *AWS CLI Command Reference*.

AWS IoT Things Graph examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Things Graph.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-entity-to-thing`

The following code example shows how to use `associate-entity-to-thing`.

AWS CLI

To associate a thing with a device

The following `associate-entity-to-thing` example associates a thing with a device. The example uses a motion sensor device that is in the public namespace.

```
aws iotthingsgraph associate-entity-to-thing \
    --thing-name "MotionSensorName" \
    --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

This command produces no output.

- For API details, see AssociateEntityToThing in *AWS CLI Command Reference*.

`create-flow-template`

The following code example shows how to use `create-flow-template`.

AWS CLI

To create a flow

The following `create-flow-template` example creates a flow (workflow). The value of `MyFlowDefinition` is the GraphQL that models the flow.

```
aws iotthingsgraph create-flow-template \
    --definition language=GRAPHQL,text="MyFlowDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559248067.545,
        "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
        "revisionNumber": 1
    }
}
```

- For API details, see CreateFlowTemplate in *AWS CLI Command Reference*.

`create-system-instance`

The following code example shows how to use `create-system-instance`.

AWS CLI

To create a system instance

The following `create-system-instance` example creates a system instance. The value of `MySystemInstanceDefinition` is the GraphQL that models the system instance.

```
aws iotthingsgraph create-system-instance \
    --definition language=GRAPHQL,text="MySystemInstanceDefinition" \
    --target CLOUD \
    --flow-actions-role-arn arn:aws:iam::123456789012:role/MyThingsGraphRole
```

Output:

```
{
    "summary": {
        "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/default/
Room218",
        "status": "NOT_DEPLOYED",
        "target": "CLOUD",
        "createdAt": 1559249315.208,
        "updatedAt": 1559249315.208
    }
}
```

- For API details, see CreateSystemInstance in *AWS CLI Command Reference*.

`create-system-template`

The following code example shows how to use `create-system-template`.

AWS CLI

To create a system

The following `create-system-template` example creates a system. The value of MySystemDefinition is the GraphQL that models the system.

```
aws iotthingsgraph create-system-template \
    --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```
{
```

```
    "summary": {
        "createdAt": 1559249776.254,
        "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MySystem",
        "revisionNumber": 1
    }
}
```

- For API details, see CreateSystemTemplate in *AWS CLI Command Reference*.

`delete-flow-template`

The following code example shows how to use `delete-flow-template`.

AWS CLI

To delete a flow

The following `delete-flow-template` example deletes a flow (workflow).

```
aws iotthingsgraph delete-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

This command produces no output.

- For API details, see DeleteFlowTemplate in *AWS CLI Command Reference*.

`delete-namespace`

The following code example shows how to use `delete-namespace`.

AWS CLI

To delete a namespace

The following `delete-namespace` example deletes a namespace.

```
aws iotthingsgraph delete-namespace
```

Output:

```
{
    "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
    "namespaceName": "us-west-2/123456789012/default"
}
```

- For API details, see DeleteNamespace in *AWS CLI Command Reference*.

`delete-system-instance`

The following code example shows how to use `delete-system-instance`.

AWS CLI

To delete a system instance

The following `delete-system-instance` example deletes a system instance.

```
aws iotthingsgraph delete-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

This command produces no output.

- For API details, see DeleteSystemInstance in *AWS CLI Command Reference*.

`delete-system-template`

The following code example shows how to use `delete-system-template`.

AWS CLI

To delete a system

The following `delete-system-template` example deletes a system.

```
aws iotthingsgraph delete-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

This command produces no output.

- For API details, see DeleteSystemTemplate in *AWS CLI Command Reference*.

deploy-system-instance

The following code example shows how to use `deploy-system-instance`.

AWS CLI

To deploy a system instance

The following `deploy-system-instance` example deploys a system instance.

```
aws iotthingsgraph deploy-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{
    "summary": {
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment:Room218",
        "createdAt": 1559249776.254,
        "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
        "status": "DEPLOYED_IN_TARGET",
        "target": "CLOUD",
        "updatedAt": 1559249776.254
    }
}
```

- For API details, see DeploySystemInstance in *AWS CLI Command Reference*.

deprecate-flow-template

The following code example shows how to use `deprecate-flow-template`.

AWS CLI

To deprecate a flow

The following `deprecate-flow-template` example deprecates a flow (workflow).

```
aws iotthingsgraph deprecate-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

This command produces no output.

- For API details, see DeprecateFlowTemplate in *AWS CLI Command Reference*.

`deprecate-system-template`

The following code example shows how to use `deprecate-system-template`.

AWS CLI

To deprecate a system

The following `deprecate-system-template` example deprecates a system.

```
aws iotthingsgraph deprecate-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

This command produces no output.

- For API details, see DeprecateSystemTemplate in *AWS CLI Command Reference*.

`describe-namespace`

The following code example shows how to use `describe-namespace`.

AWS CLI

To get a description of your namespace

The following `describe-namespace` example gets a description of your namespace.

```
aws iotthingsgraph describe-namespace
```

Output:

```
{
    "namespaceName": "us-west-2/123456789012/default",
    "trackingNamespaceName": "aws",
    "trackingNamespaceVersion": 1,
    "namespaceVersion": 5
}
```

- For API details, see DescribeNamespace in *AWS CLI Command Reference*.

`dissociate-entity-from-thing`

The following code example shows how to use `dissociate-entity-from-thing`.

AWS CLI

To dissociate a thing from a device

The following `dissociate-entity-from-thing` example dissociates a thing from a device.

```
aws iotthingsgraph dissociate-entity-from-thing \
    --thing-name "MotionSensorName" \
    --entity-type "DEVICE"
```

This command produces no output.

- For API details, see DissociateEntityFromThing in *AWS CLI Command Reference*.

`get-entities`

The following code example shows how to use `get-entities`.

AWS CLI

To get definitions for entities

The following `get-entities` example gets a definition for a device model.

```
aws iotthingsgraph get-entities \
    --ids "urn:tdm:aws/examples:DeviceModel:MotionSensor"
```

Output:

```
{
    "descriptions": [
        {
            "id": "urn:tdm:aws/examples:DeviceModel:MotionSensor",
            "type": "DEVICE_MODEL",
            "createdAt": 1559256190.599,
            "definition": {
                "language": "GRAPHQL",
                "text": "##\n# Specification of motion sensor devices interface.\n##
\ntype MotionSensor @deviceModel(id: \"urn:tdm:aws/examples:deviceModel:MotionSensor
```

```
\",\n        capability: \"urn:tdm:aws/examples:capability:MotionSensorCapability\")
 {ignore:void}"
            }
        }
    ]
}
```

- For API details, see GetEntities in *AWS CLI Command Reference*.

`get-flow-template-revisions`

The following code example shows how to use `get-flow-template-revisions`.

AWS CLI

To get revision information about a flow

The following `get-flow-template-revisions` example gets revision information about a flow (workflow).

```
aws iotthingsgraph get-flow-template-revisions \
    --id urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        }
    ]
}
```

- For API details, see GetFlowTemplateRevisions in *AWS CLI Command Reference*.

`get-flow-template`

The following code example shows how to use `get-flow-template`.

AWS CLI

To get a flow definition

The following `get-flow-template` example gets a definition for a flow (workflow).

```
aws iotthingsgraph get-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

Output:

```
{
    "description": {
        "summary": {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        },
        "definition": {
            "language": "GRAPHQL",
            "text": "{\nquery MyFlow($camera: string!, $screen: string!)
 @workflowType(id: \"urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow\")

        },
        "validatedNamespaceVersion": 5
    }
}
```

- For API details, see GetFlowTemplate in *AWS CLI Command Reference*.

get-namespace-deletion-status

The following code example shows how to use `get-namespace-deletion-status`.

AWS CLI

To get the status of the namespace deletion task

The following `get-namespace-deletion-status` example gets the status of the namespace deletion task.

```
aws iotthingsgraph get-namespace-deletion-status
```

Output:

```
{
    "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
    "namespaceName": "us-west-2/123456789012/default",
    "status": "SUCCEEDED"
}
```

- For API details, see GetNamespaceDeletionStatus in *AWS CLI Command Reference*.

get-system-instance

The following code example shows how to use `get-system-instance`.

AWS CLI

To get a system instance

The following `get-system-instance` example gets a definition for a system instance.

```
aws iotthingsgraph get-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{
    "description": {
```

```
        "summary": {
            "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218",
            "status": "NOT_DEPLOYED",
            "target": "CLOUD",
            "createdAt": 1559249315.208,
            "updatedAt": 1559249315.208
        },
        "definition": {
            "language": "GRAPHQL",
            "text": "{\r\nquery Room218 @deployment(id: \"urn:tdm:us-
west-2/123456789012/default:Deployment:Room218\", systemId: \"urn:tdm:us-

 \"a trigger\") {  \r\n    condition(expr: \"devices[name ==
 'motionSensor'].events[name == 'StateChanged'].lastEvent\") \r\n    action(expr:
 \"ThingsGraph.startFlow('SecurityFlow', bindings[name == 'camera'].deviceId,
 bindings[name == 'screen'].deviceId)\")\r\n    }\r\n   }\r\n  }\r\n  }"
        },
        "metricsConfiguration": {
            "cloudMetricEnabled": false
        },
        "validatedNamespaceVersion": 5,
        "flowActionsRoleArn": "arn:aws:iam::123456789012:role/ThingsGraphRole"
    }
}
```

- For API details, see GetSystemInstance in *AWS CLI Command Reference*.

`get-system-template-revisions`

The following code example shows how to use `get-system-template-revisions`.

AWS CLI

To get revision information about a system

The following `get-system-template-revisions` example gets revision information about a system.

```
aws iotthingsgraph get-system-template-revisions \
```

```
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MySystem",
            "revisionNumber": 1,
            "createdAt": 1559247540.656
        }
    ]
}
```

- For API details, see GetSystemTemplateRevisions in *AWS CLI Command Reference*.

`get-system-template`

The following code example shows how to use `get-system-template`.

AWS CLI

To get a system

The following `get-system-template` example gets a definition for a system.

```
aws iotthingsgraph get-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```
{
    "description": {
        "summary": {
            "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.656
        },
```

```
        "definition": {
            "language": "GRAPHQL",
            "text": "{\ntype MySystem @systemType(id: \"urn:tdm:us-
west-2/123456789012/default:System:MySystem\", description: \"\") {\n  camera:
 Camera @thing(id: \"urn:tdm:aws/examples:deviceModel:Camera\")\n  screen:
 Screen @thing(id: \"urn:tdm:aws/examples:deviceModel:Screen\")\n  motionSensor:
 MotionSensor @thing(id: \"urn:tdm:aws/examples:deviceModel:MotionSensor
\")\n  MyFlow: MyFlow @workflow(id: \"urn:tdm:us-west-2/123456789012/
default:Workflow:MyFlow\")\n}\n}"
        },
        "validatedNamespaceVersion": 5
    }
}
```

- For API details, see GetSystemTemplate in *AWS CLI Command Reference*.

`get-upload-status`

The following code example shows how to use `get-upload-status`.

AWS CLI

To get the status of your entity upload

The following `get-upload-status` example gets the status of your entity upload operation. The value of `MyUploadId` is the ID value returned by the `upload-entity-definitions` operation.

```
aws iotthingsgraph get-upload-status \
    --upload-id "MyUploadId"
```

Output:

```
{
    "namespaceName": "us-west-2/123456789012/default",
    "namespaceVersion": 5,
    "uploadId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "uploadStatus": "SUCCEEDED"
}
```

- For API details, see GetUploadStatus in *AWS CLI Command Reference*.

`list-flow-execution-messages`

The following code example shows how to use `list-flow-execution-messages`.

AWS CLI

To get information about events in a flow execution

The following `list-flow-execution-messages` example gets information about events in a flow execution.

```
aws iotthingsgraph list-flow-execution-messages \
    --flow-execution-id "urn:tdm:us-west-2/123456789012/
default:Workflow:SecurityFlow_2019-05-11T19:39:55.317Z_MotionSensor_69b151ad-
a611-42f5-ac21-fe537f9868ad"
```

Output:

```
{
    "messages": [
        {
            "eventType": "EXECUTION_STARTED",
            "messageId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "payload": "Flow execution started",
            "timestamp": 1559247540.656
        }
    ]
}
```

- For API details, see ListFlowExecutionMessages in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for a resource

The following `list-tags-for-resource` example list all tags for an AWS IoT Things Graph resource.

```
aws iotthingsgraph list-tags-for-resource \
    --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218"
```

Output:

```
{
    "tags": [
        {
            "key": "Type",
            "value": "Residential"
        }
    ]
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`search-entities`

The following code example shows how to use `search-entities`.

AWS CLI

To search for entities

The following `search-entities` example searches for all entities of type EVENT.

```
aws iotthingsgraph search-entities \
    --entity-types "EVENT"
```

Output:

```
{
    "descriptions": [
        {
            "id": "urn:tdm:aws/examples:Event:MotionSensorEvent",
            "type": "EVENT",
            "definition": {
                "language": "GRAPHQL",
                "text": "##\n# Description of events emitted by motion
 sensor.\n##\ntype MotionSensorEvent @eventType(id: \"urn:tdm:aws/
```

```
examples:event:MotionSensorEvent\",\n            payload: \"urn:tdm:aws/
examples:property:MotionSensorStateProperty\") {ignore:void}"
            }
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Event:CameraClickedEventV2",
            "type": "EVENT",
            "definition": {
                "language": "GRAPHQL",
                "text": "type CameraClickedEventV2 @eventType(id: \"urn:tdm:us-
west-2/123456789012/default:event:CameraClickedEventV2\",\r\npayload:
 \"urn:tdm:aws:Property:Boolean\"){ignore:void}"
            }
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Event:MotionSensorEventV2",
            "type": "EVENT",
            "definition": {
                "language": "GRAPHQL",
                "text": "# Event emitted by the motion sensor.\r\ntype
 MotionSensorEventV2 @eventType(id: \"urn:tdm:us-west-2/123456789012/
default:event:MotionSensorEventV2\",\r\npayload: \"urn:tdm:us-west-2/123456789012/
default:property:MotionSensorStateProperty2\") {ignore:void}"
            }
        }
    ],
    "nextToken": "urn:tdm:us-west-2/123456789012/default:Event:MotionSensorEventV2"
}
```

- For API details, see SearchEntities in *AWS CLI Command Reference*.

`search-flow-executions`

The following code example shows how to use `search-flow-executions`.

AWS CLI

To search for flow executions

The following `search-flow-executions` example search for all executions of a flow in a specified system instance.

```
aws iotthingsgraph search-flow-executions \
    --system-instance-id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{
    "summaries": [
        {
            "createdAt": 1559247540.656,
            "flowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "flowTemplateId": "urn:tdm:us-west-2/123456789012/
default:Workflow:MyFlow",
            "status": "RUNNING ",
            "systemInstanceId": "urn:tdm:us-west-2/123456789012/
default:System:MySystem",
            "updatedAt": 1559247540.656
        }
    ]
}
```

- For API details, see SearchFlowExecutions in *AWS CLI Command Reference*.

`search-flow-templates`

The following code example shows how to use `search-flow-templates`.

AWS CLI

To search for flows (or workflows)

The following `search-flow-templates` example searches for all flows (workflows) that contain the Camera device model.

```
aws iotthingsgraph search-flow-templates \
    --filters name="DEVICE_MODEL_ID",value="urn:tdm:aws/examples:DeviceModel:Camera"
```

Output:

```
{
    "summaries": [
        {
```

```
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:SecurityFlow",
            "revisionNumber": 3,
            "createdAt": 1548283099.27
        }
    ]
}
```

- For API details, see SearchFlowTemplates in *AWS CLI Command Reference*.

`search-system-instances`

The following code example shows how to use `search-system-instances`.

AWS CLI

To search for system instances

The following `search-system-instances` example searches for all system instances that contain the specified system.

```
aws iotthingsgraph search-system-instances \
    --filters name="SYSTEM_TEMPLATE_ID",value="urn:tdm:us-west-2/123456789012/
default:System:SecurityFlow"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Deployment:DeploymentForSample",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/DeploymentForSample",
            "status": "NOT_DEPLOYED",
            "target": "GREENGRASS",
            "greengrassGroupName": "ThingsGraphGrnGr",
            "createdAt": 1555716314.707,
```

```
            "updatedAt": 1555716314.707
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Deployment:MockDeployment",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/MockDeployment",
            "status": "DELETED_IN_TARGET",
            "target": "GREENGRASS",
            "greengrassGroupName": "ThingsGraphGrnGr",
            "createdAt": 1549416462.049,
            "updatedAt": 1549416722.361,
            "greengrassGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "greengrassGroupVersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Deployment:MockDeployment2",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/MockDeployment2",
            "status": "DEPLOYED_IN_TARGET",
            "target": "GREENGRASS",
            "greengrassGroupName": "ThingsGraphGrnGr",
            "createdAt": 1549572385.774,
            "updatedAt": 1549572418.408,
            "greengrassGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "greengrassGroupVersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room215",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room215",
            "status": "NOT_DEPLOYED",
            "target": "GREENGRASS",
            "greengrassGroupName": "ThingsGraphGG",
            "createdAt": 1547056918.413,
            "updatedAt": 1547056918.413
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218",
            "status": "NOT_DEPLOYED",
            "target": "CLOUD",
```

```
            "createdAt": 1559249315.208,
            "updatedAt": 1559249315.208
        }
    ]
}
```

- For API details, see SearchSystemInstances in *AWS CLI Command Reference*.

`search-system-templates`

The following code example shows how to use `search-system-templates`.

AWS CLI

To search for system

The following `search-system-templates` example searches for all systems that contain the specified flow.

```
aws iotthingsgraph search-system-templates \
    --filters name="FLOW_TEMPLATE_ID",value="urn:tdm:us-west-2/123456789012/
default:Workflow:SecurityFlow"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:System:SecurityFlow",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
SecurityFlow",
            "revisionNumber": 1,
            "createdAt": 1548283099.433
        }
    ]
}
```

- For API details, see SearchSystemTemplates in *AWS CLI Command Reference*.

`search-things`

The following code example shows how to use `search-things`.

AWS CLI

To search for things associated with devices and device models

The following `search-things` example searches for all things that are associated with the HCSR501MotionSensor device.

```
aws iotthingsgraph search-things \
    --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

Output:

```
{
    "things": [
        {
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MotionSensor1",
            "thingName": "MotionSensor1"
        },
        {
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/TG_MS",
            "thingName": "TG_MS"
        }
    ]
}
```

- For API details, see SearchThings in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To create a tag for a resource

The following `tag-resource` example creates a tag for the specified resource.

```
aws iotthingsgraph tag-resource \
    --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218" \
```

```
    --tags key="Type",value="Residential"
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

`undeploy-system-instance`

The following code example shows how to use `undeploy-system-instance`.

AWS CLI

To undeploy a system instance from its target

The following `undeploy-system-instance` example removes a system instance from its target.

```
aws iotthingsgraph undeploy-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room215"
```

Output:

```
{
    "summary": {
        "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room215",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/default/
Room215",
        "status": "PENDING_DELETE",
        "target": "GREENGRASS",
        "greengrassGroupName": "ThingsGraphGrnGr",
        "createdAt": 1553189694.255,
        "updatedAt": 1559344549.601,
        "greengrassGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "greengrassGroupVersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    }
}
```

- For API details, see UndeploySystemInstance in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag for a resource

The following `untag-resource` example removes a tag for the specified resource.

```
aws iotthingsgraph untag-resource \
    --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218" \
    --tag-keys "Type"
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-flow-template`

The following code example shows how to use `update-flow-template`.

AWS CLI

To update a flow

The following `update-flow-template` example updates a flow (workflow). The value of `MyFlowDefinition` is the GraphQL that models the flow.

```
aws iotthingsgraph update-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow" \
    --definition language=GRAPHQL,text="MyFlowDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559248067.545,
        "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
        "revisionNumber": 2
    }
}
```

- For API details, see UpdateFlowTemplate in *AWS CLI Command Reference*.

update-system-template

The following code example shows how to use update-system-template.

AWS CLI

To update a system

The following update-system-template example updates a system. The value of MySystemDefinition is the GraphQL that models the system.

```
aws iotthingsgraph update-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem" \
    --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559249776.254,
        "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MySystem",
        "revisionNumber": 2
    }
}
```

- For API details, see UpdateSystemTemplate in *AWS CLI Command Reference*.

upload-entity-definitions

The following code example shows how to use upload-entity-definitions.

AWS CLI

To upload entity definitions

The following upload-entity-definitions example uploads entity definitions to your namespace. The value of MyEntityDefinitions is the GraphQL that models the entities.

```
aws iotthingsgraph upload-entity-definitions \
    --document language=GRAPHQL,text="MyEntityDefinitions"
```

Output:

```
{
    "uploadId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

- For API details, see UploadEntityDefinitions in *AWS CLI Command Reference*.

AWS IoT Wireless examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Wireless.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-aws-account-with-partner-account`

The following code example shows how to use `associate-aws-account-with-partner-account`.

AWS CLI

To associate a partner account with your AWS account

The following `associate-aws-account-with-partner-account` example associates the following Sidewalk account credentials with your AWS account.

```
aws iotwireless associate-aws-account-with-partner-account \
    --sidewalk
 AmazonId="12345678901234",AppServerPrivateKey="a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78
```

Output:

```
{
    "Sidewalk": {
        "AmazonId": "12345678901234",
        "AppServerPrivateKey":
 "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
    }
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see AssociateAwsAccountWithPartnerAccount in *AWS CLI Command Reference*.

`associate-wireless-device-with-thing`

The following code example shows how to use `associate-wireless-device-with-thing`.

AWS CLI

To associate a thing to a wireless device

The following `associate-wireless-device-with-thing` example associates a thing to your wireless device that has the specified ID.

```
aws iotwireless associate-wireless-device-with-thing \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --thing-arn "arn:aws:iot:us-west-2:123456789012:thing/MyIoTWirelessThing"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see AssociateWirelessDeviceWithThing in *AWS CLI Command Reference*.

`associate-wireless-gateway-with-certificate`

The following code example shows how to use `associate-wireless-gateway-with-certificate`.

AWS CLI

To associate the certificate with the wireless gateway

The following `associate-wireless-gateway-with-certificate` example associates a wireless gateway with a certificate.

```
aws iotwireless associate-wireless-gateway-with-certificate \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --iot-certificate-
id "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
```

Output:

```
{
    "IotCertificateId":
 "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
}
```

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see AssociateWirelessGatewayWithCertificate in *AWS CLI Command Reference*.

`associate-wireless-gateway-with-thing`

The following code example shows how to use `associate-wireless-gateway-with-thing`.

AWS CLI

To associate a thing to a wireless gateway

The following `associate-wireless-gateway-with-thing` example associates a thing to a wireless gateway.

```
aws iotwireless associate-wireless-gateway-with-thing \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --thing-arn "arn:aws:iot:us-west-2:123456789012:thing/MyIoTWirelessThing"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see AssociateWirelessGatewayWithThing in *AWS CLI Command Reference*.

`create-destination`

The following code example shows how to use `create-destination`.

AWS CLI

To create an IoT wireless destination

The following `create-destination` example creates a destination for mapping a device message to an AWS IoT rule. Before you run this command, you must have created an IAM role that gives AWS IoT Core for LoRaWAN the permissions necessary to send data to the AWS IoT rule.

```
aws iotwireless create-destination \
    --name IoTWirelessDestination \
    --expression-type RuleName \
    --expression IoTWirelessRule \
    --role-arn arn:aws:iam::123456789012:role/IoTWirelessDestinationRole
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-west-2:123456789012:Destination/
IoTWirelessDestination",
    "Name": "IoTWirelessDestination"
}
```

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateDestination in *AWS CLI Command Reference*.

`create-device-profile`

The following code example shows how to use `create-device-profile`.

AWS CLI

To create a new device profile

The following `create-device-profile` example creates a new IoT wireless device profile.

```
aws iotwireless create-device-profile
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-west-2:123456789012:DeviceProfile/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateDeviceProfile in *AWS CLI Command Reference*.

`create-service-profile`

The following code example shows how to use `create-service-profile`.

AWS CLI

To create a new service profile

The following `create-service-profile` example creates a new IoT wireless service profile.

```
aws iotwireless create-service-profile
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-west-2:123456789012:ServiceProfile/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateServiceProfile in *AWS CLI Command Reference*.

`create-wireless-device`

The following code example shows how to use `create-wireless-device`.

AWS CLI

To create an IoT wireless device

The following `create-wireless-device` example creates a wireless device resource of the type LoRaWAN.

```
aws iotwireless create-wireless-device \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "Description": "My LoRaWAN wireless device",
    "DestinationName": "IoTWirelessDestination",
    "LoRaWAN": {
        "DeviceProfileId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "ServiceProfileId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "OtaaV1_1": {
            "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",
            "JoinEui": "b4c231a359bc2e3d",
            "NwkKey": "01c3f004a2d6efffe32c4eda14bcd2b4"
        },
        "DevEui": "ac12efc654d23fc2"
    },
    "Name": "SampleIoTWirelessThing",
    "Type": "LoRaWAN"
}
```

Output:

```
{
```

```
    "Arn": "arn:aws:iotwireless:us-west-2:123456789012:WirelessDevice/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateWirelessDevice in *AWS CLI Command Reference*.

`create-wireless-gateway-task-definition`

The following code example shows how to use `create-wireless-gateway-task-definition`.

AWS CLI

To create a wireless gateway task definition

The following `create-wireless-gateway-task-definition` example automatically creates tasks using this task definition for all gateways with the specified current version.

```
aws iotwireless create-wireless-gateway-task-definition \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "AutoCreateTasks": true,
    "Name": "TestAutoUpdate",
    "Update":{
        "UpdateDataSource" : "s3://amzn-s3-demo-bucket/station",
        "UpdateDataRole" : "arn:aws:iam::123456789012:role/SDK_Test_Role",
        "LoRaWAN" :{
            "CurrentVersion" :{
                "PackageVersion" : "1.0.0",
                "Station" : "2.0.5",
                "Model" : "linux"
            },
            "UpdateVersion" :{
                "PackageVersion" : "1.0.1",
                "Station" : "2.0.5",
                "Model" : "minihub"
```

```
            }
        }
    }
}
```

Output:

```
{
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateWirelessGatewayTaskDefinition in *AWS CLI Command Reference*.

`create-wireless-gateway-task`

The following code example shows how to use `create-wireless-gateway-task`.

AWS CLI

To create the task for a wireless gateway

The following `create-wireless-gateway-task` example creates a task for a wireless gateway.

```
aws iotwireless create-wireless-gateway-task \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --wireless-gateway-task-definition-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "WirelessGatewayTaskDefinitionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "Status": "Success"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateWirelessGatewayTask in *AWS CLI Command Reference*.

`create-wireless-gateway`

The following code example shows how to use `create-wireless-gateway`.

AWS CLI

To create a wireless gateway

The following `create-wireless-gateway` example creates a wireless LoRaWAN device gateway.

```
aws iotwireless create-wireless-gateway \
    --lorawan GatewayEui="a1b2c3d4567890ab",RfRegion="US915" \
    --name "myFirstLoRaWANGateway" \
    --description "Using my first LoRaWAN gateway"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-west-2:123456789012:WirelessGateway/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateWirelessGateway in *AWS CLI Command Reference*.

`delete-destination`

The following code example shows how to use `delete-destination`.

AWS CLI

To delete an IoT wireless destination

The following `delete-destination` example deletes the wireless destination resource with the name `IoTWirelessDestination` that you created.

```
aws iotwireless delete-destination \
    --name "IoTWirelessDestination"
```

This command produces no output.

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteDestination in *AWS CLI Command Reference*.

`delete-device-profile`

The following code example shows how to use `delete-device-profile`.

AWS CLI

To delete a device profile

The following `delete-device-profile` example deletes a device profile with the specified ID that you created.

```
aws iotwireless delete-device-profile \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteDeviceProfile in *AWS CLI Command Reference*.

`delete-service-profile`

The following code example shows how to use `delete-service-profile`.

AWS CLI

To delete a service profile

The following `delete-service-profile` example deletes a service profile with the specified ID that you created.

```
aws iotwireless delete-service-profile \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteServiceProfile in *AWS CLI Command Reference*.

`delete-wireless-device`

The following code example shows how to use `delete-wireless-device`.

AWS CLI

To delete a wireless device

The following `delete-wireless-device` example deletes a wireless device that has the specified ID.

```
aws iotwireless delete-wireless-device \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessDevice in *AWS CLI Command Reference*.

`delete-wireless-gateway-task-definition`

The following code example shows how to use `delete-wireless-gateway-task-definition`.

AWS CLI

To delete a wireless gateway task definition

The following `delete-wireless-gateway-task-definition` example deletes the wireless gateway task definition that you created with the following ID.

```
aws iotwireless delete-wireless-gateway-task-definition \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessGatewayTaskDefinition in *AWS CLI Command Reference*.

`delete-wireless-gateway-task`

The following code example shows how to use `delete-wireless-gateway-task`.

AWS CLI

To delete a wireless gateway task

The following `delete-wireless-gateway-task` example deletes the wireless gateway task that has the specified ID.

```
aws iotwireless delete-wireless-gateway-task \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessGatewayTask in *AWS CLI Command Reference*.

`delete-wireless-gateway`

The following code example shows how to use `delete-wireless-gateway`.

AWS CLI

To delete a wireless gateway

The following `delete-wireless-gateway` example deletes a wireless gateway that has the specified ID.

```
aws iotwireless delete-wireless-gateway \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessGateway in *AWS CLI Command Reference*.

`disassociate-aws-account-from-partner-account`

The following code example shows how to use `disassociate-aws-account-from-partner-account`.

AWS CLI

To disassociate the partner account from the AWS account

The following `disassociate-aws-account-from-partner-account` example disassociates a partner account from your currently associated AWS account.

```
aws iotwireless disassociate-aws-account-from-partner-account \
    --partner-account-id "12345678901234" \
    --partner-type "Sidewalk"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateAwsAccountFromPartnerAccount in *AWS CLI Command Reference*.

`disassociate-wireless-device-from-thing`

The following code example shows how to use `disassociate-wireless-device-from-thing`.

AWS CLI

To disassociate the thing from the wireless device

The following `disassociate-wireless-device-from-thing` example disassociates a wireless device from its currently associated thing.

```
aws iotwireless disassociate-wireless-device-from-thing \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateWirelessDeviceFromThing in *AWS CLI Command Reference*.

`disassociate-wireless-gateway-from-certificate`

The following code example shows how to use `disassociate-wireless-gateway-from-certificate`.

AWS CLI

To disassociate the certificate from the wireless gateway

The following `disassociate-wireless-gateway-from-certificate` example disassociates a wireless gateway from its currently associated certificate.

```
aws iotwireless disassociate-wireless-gateway-from-certificate \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateWirelessGatewayFromCertificate in *AWS CLI Command Reference*.

`disassociate-wireless-gateway-from-thing`

The following code example shows how to use `disassociate-wireless-gateway-from-thing`.

AWS CLI

To disassociate the thing from the wireless gateway

The following `disassociate-wireless-gateway-from-thing` example disassociates a wireless gateway from its currently associated thing.

```
aws iotwireless disassociate-wireless-gateway-from-thing \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateWirelessGatewayFromThing in *AWS CLI Command Reference*.

`get-destination`

The following code example shows how to use `get-destination`.

AWS CLI

To get information about an IoT wireless destination

The following `get-destination` example gets information about the destination resource with the name `IoTWirelessDestination` that you created.

```
aws iotwireless get-destination \
    --name "IoTWirelessDestination"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-west-2:123456789012:Destination/
IoTWirelessDestination",
    "Name": "IoTWirelessDestination",
    "Expression": "IoTWirelessRule",
    "ExpressionType": "RuleName",
    "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
}
```

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetDestination in *AWS CLI Command Reference*.

`get-device-profile`

The following code example shows how to use `get-device-profile`.

AWS CLI

To get information about a device profile

The following `get-device-profile` example gets information about the device profile with the specified ID that you created.

```
aws iotwireless get-device-profile \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-west-2:123456789012:DeviceProfile/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LoRaWAN": {
    "MacVersion": "1.0.3",
    "MaxDutyCycle": 10,
    "Supports32BitFCnt": false,
    "RegParamsRevision": "RP002-1.0.1",
    "SupportsJoin": true,
    "RfRegion": "US915",
    "MaxEirp": 13,
    "SupportsClassB": false,
    "SupportsClassC": false
    }
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetDeviceProfile in *AWS CLI Command Reference*.

`get-partner-account`

The following code example shows how to use `get-partner-account`.

AWS CLI

To get the partner account information

The following `get-partner-account` example gets information about your Sidewalk account that has the following ID.

```
aws iotwireless get-partner-account \
    --partner-account-id "12345678901234" \
    --partner-type "Sidewalk"
```

Output:

```
{
    "Sidewalk": {
        "AmazonId": "12345678901234",
        "Fingerprint":
 "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
    },
    "AccountLinked": false
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see GetPartnerAccount in *AWS CLI Command Reference*.

`get-service-endpoint`

The following code example shows how to use `get-service-endpoint`.

AWS CLI

To get the service endpoint

The following `get-service-endpoint` example gets the account-specific endpoint for CUPS protocol.

```
aws iotwireless get-service-endpoint
```

Output:

```
{
    "ServiceType": "CUPS",
    "ServiceEndpoint": "https://A1RMKZ37ACAGOT.cups.lorawan.us-
west-2.amazonaws.com:443",
    "ServerTrust": "-----BEGIN CERTIFICATE-----\nMIIESTCCAzGgAwIBAgITBn

`get-service-profile`

The following code example shows how to use `get-service-profile`.

AWS CLI

To get information about a service profile

The following `get-service-profile` example gets information about the service profile with the specified ID that you created.

```
aws iotwireless get-service-profile \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-west-2:123456789012:ServiceProfile/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LoRaWAN": {
        "HrAllowed": false,

        "DlRate": 60,
        "AddGwMetadata": false,
        "ReportDevStatusMargin": false,
        "MinGwDiversity": 1,
        "RaAllowed": false,
        "DlBucketSize": 4096,
        "DevStatusReqFreq": 24,
        "TargetPer": 5,
        "UlRate": 60
    }
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetServiceProfile in *AWS CLI Command Reference*.

`get-wireless-device-statistics`

The following code example shows how to use `get-wireless-device-statistics`.

AWS CLI

To get operating information about a wireless device

The following `get-wireless-device-statistics` example gets operating information about a wireless device.

```
aws iotwireless get-wireless-device-statistics \
    --wireless-device-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "WirelessDeviceId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessDeviceStatistics in *AWS CLI Command Reference*.

`get-wireless-device`

The following code example shows how to use `get-wireless-device`.

AWS CLI

To get information about the wireless device

The following `get-wireless-device` example lists the available widgets in your AWS account.

```
aws iotwireless get-wireless-device \
    --identifier "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --identifier-type WirelessDeviceID
```

Output:

```
{
    "Name": "myLoRaWANDevice",
    "ThingArn": "arn:aws:iot:us-west-2:123456789012:thing/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "DestinationName": "IoTWirelessDestination",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "ThingName": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "Type": "LoRaWAN",
    "LoRaWAN": {
        "DeviceProfileId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "ServiceProfileId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
        "OtaaV1_1": {
            "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",
            "JoinEui": "b4c231a359bc2e3d",
            "NwkKey": "01c3f004a2d6efffe32c4eda14bcd2b4"
        },
        "DevEui": "ac12efc654d23fc2"
    },
    "Arn": "arn:aws:iotwireless:us-west-2:123456789012:WirelessDevice/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Description": "My LoRaWAN wireless device"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessDevice in *AWS CLI Command Reference*.

`get-wireless-gateway-certificate`

The following code example shows how to use `get-wireless-gateway-certificate`.

AWS CLI

To get the ID of a certificate associated with a wireless gateway

The following `get-wireless-gateway-certificate` example gets the certificate ID associated with a wireless gateway that has the specified ID.

```
aws iotwireless get-wireless-gateway-certificate \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "IotCertificateId":
 "8ea4aeae3db34c78cce75d9abd830356869ead6972997e0603e5fd032c804b6f"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayCertificate in *AWS CLI Command Reference*.

`get-wireless-gateway-firmware-information`

The following code example shows how to use `get-wireless-gateway-firmware-information`.

AWS CLI

To get firmware information about a wireless gateway

The following `get-wireless-gateway-firmware-information` example gets firmware version and other information about a wireless gateway.

```
aws iotwireless get-wireless-gateway-firmware-information \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "LoRaWAN" :{
        "CurrentVersion" :{
            "PackageVersion" : "1.0.0",
            "Station" : "2.0.5",
            "Model" : "linux"
        }
    }
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayFirmwareInformation in *AWS CLI Command Reference*.

`get-wireless-gateway-statistics`

The following code example shows how to use `get-wireless-gateway-statistics`.

AWS CLI

To get operating information about a wireless gateway

The following `get-wireless-gateway-statistics` example gets operating information about a wireless gateway.

```
aws iotwireless get-wireless-gateway-statistics \
    --wireless-gateway-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "WirelessGatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayStatistics in *AWS CLI Command Reference*.

`get-wireless-gateway-task-definition`

The following code example shows how to use `get-wireless-gateway-task-definition`.

AWS CLI

To get information about a wireless gateway task definition

The following `get-wireless-gateway-task-definition` example gets information about the wireless task definition with the specified ID.

```
aws iotwireless get-wireless-gateway-task-definition \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "AutoCreateTasks": true,
    "Name": "TestAutoUpdate",
    "Update":{
        "UpdateDataSource" : "s3://amzn-s3-demo-bucket/station",
        "UpdateDataRole" : "arn:aws:iam::123456789012:role/SDK_Test_Role",
        "LoRaWAN" :{
            "CurrentVersion" :{
                "PackageVersion" : "1.0.0",
                "Station" : "2.0.5",
                "Model" : "linux"
            },
            "UpdateVersion" :{
                "PackageVersion" : "1.0.1",
                "Station" : "2.0.5",
                "Model" : "minihub"
            }
        }
    }
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayTaskDefinition in *AWS CLI Command Reference*.

`get-wireless-gateway-task`

The following code example shows how to use `get-wireless-gateway-task`.

AWS CLI

To get information about the wireless gateway task

The following `get-wireless-gateway-task` example gets information about the wireless gateway task with the specified ID.

```
aws iotwireless get-wireless-gateway-task \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "WirelessGatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "WirelessGatewayTaskDefinitionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "Status": "Success"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayTask in *AWS CLI Command Reference*.

`get-wireless-gateway`

The following code example shows how to use `get-wireless-gateway`.

AWS CLI

To get information about a wireless gateway

The following `get-wireless-gateway` example gets information about the wireless gateway `myFirstLoRaWANGateway`.

```
aws iotwireless get-wireless-gateway \
    --identifier "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --identifier-type WirelessGatewayId
```

Output:

```
{
    "Description": "My first LoRaWAN gateway",

}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGateway in *AWS CLI Command Reference*.

`list-destinations`

The following code example shows how to use `list-destinations`.

AWS CLI

To list the wireless destinations

The following `list-destinations` example lists the available destinations registered to your AWS account.

```
aws iotwireless list-destinations
```

Output:

```
{
    "DestinationList": [
        {
            "Arn": "arn:aws:iotwireless:us-west-2:123456789012:Destination/
IoTWirelessDestination",
            "Name": "IoTWirelessDestination",
            "Expression": "IoTWirelessRule",
            "Description": "Destination for messages processed using
 IoTWirelessRule",
            "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
        },
        {
            "Arn": "arn:aws:iotwireless:us-west-2:123456789012:Destination/
IoTWirelessDestination2",
            "Name": "IoTWirelessDestination2",
            "Expression": "IoTWirelessRule2",
            "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
        }
    ]
```

```
}
```

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListDestinations in *AWS CLI Command Reference*.

`list-device-profiles`

The following code example shows how to use `list-device-profiles`.

AWS CLI

To list the device profiles

The following `list-device-profiles` example lists the available device profiles registered to your AWS account.

```
aws iotwireless list-device-profiles
```

Output:

```
{
    "DeviceProfileList": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Arn": "arn:aws:iotwireless:us-west-2:123456789012:DeviceProfile/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:iotwireless:us-west-2:123456789012:DeviceProfile/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListDeviceProfiles in *AWS CLI Command Reference*.

`list-partner-accounts`

The following code example shows how to use `list-partner-accounts`.

AWS CLI

To list the partner accounts

The following `list-partner-accounts` example lists the available partner accounts associated with your AWS account.

```
aws iotwireless list-partner-accounts
```

Output:

```
{
    "Sidewalk": [
        {
            "AmazonId": "78965678771228",
            "Fingerprint":
 "bd96d8ef66dbfd2160eb60e156849e82ad7018b8b73c1ba0b4fc65c32498ee35"
        },
        {
            "AmazonId": "89656787651228",
            "Fingerprint":
 "bc5e99e151c07be14be7e6603e4489c53f858b271213a36ebe3370777ba06e9b"
        }
    ]
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see ListPartnerAccounts in *AWS CLI Command Reference*.

`list-service-profiles`

The following code example shows how to use `list-service-profiles`.

AWS CLI

To list the service profiles

The following `list-service-profiles` example lists the available service profiles registered to your AWS account.

```
aws iotwireless list-service-profiles
```

Output:

```
{
    "ServiceProfileList": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Arn": "arn:aws:iotwireless:us-west-2:123456789012:ServiceProfile/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:iotwireless:us-west-2:123456789012:ServiceProfile/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListServiceProfiles in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags assigned to the resource

The following `list-tags-for-resource` example lists the tags assigned to a wireless destination resource.

```
aws iotwireless list-tags-for-resource \
    --resource-arn "arn:aws:iotwireless:us-west-2:123456789012:Destination/
IoTWirelessDestination"
```

Output:

```
{
    "Tags": [
        {
            "Value": "MyValue",
            "Key": "MyTag"
        }
    ]
}
```

For more information, see Tagging your AWS IoT Wireless resources in the *AWS IoT Developers Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-wireless-devices`

The following code example shows how to use `list-wireless-devices`.

AWS CLI

To list the available wireless devices

The following `list-wireless-devices` example lists the available wireless devices registered to your AWS account.

```
aws iotwireless list-wireless-devices
```

Output:

```
{
    "WirelessDeviceList": [
        {
            "Name": "myLoRaWANDevice",
            "DestinationName": "IoTWirelessDestination",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Type": "LoRaWAN",
            "LoRaWAN": {
                "DevEui": "ac12efc654d23fc2"
            },
```

```
            "Arn": "arn:aws:iotwireless:us-west-2:123456789012:WirelessDevice/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListWirelessDevices in *AWS CLI Command Reference*.

`list-wireless-gateway-task-definitions`

The following code example shows how to use `list-wireless-gateway-task-definitions`.

AWS CLI

To list the wireless gateway task definitions

The following `list-wireless-gateway-task-definitions` example lists the available wireless gateway task definitions registered to your AWS account.

```
aws iotwireless list-wireless-gateway-task-definitions
```

Output:

```
{
    "TaskDefinitions": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "LoRaWAN" :
                {
                "CurrentVersion" :{
                    "PackageVersion" : "1.0.0",
                    "Station" : "2.0.5",
                    "Model" : "linux"
                },
                "UpdateVersion" :{
                    "PackageVersion" : "1.0.1",
                    "Station" : "2.0.5",
                    "Model" : "minihub"
                }
```

```
            }
        }
    ]
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListWirelessGatewayTaskDefinitions in *AWS CLI Command Reference*.

`list-wireless-gateways`

The following code example shows how to use `list-wireless-gateways`.

AWS CLI

To list the wireless gateways

The following `list-wireless-gateways` example lists the available wireless gateways in your AWS account.

```
aws iotwireless list-wireless-gateways
```

Output:

```
{
    "WirelessGatewayList": [
        {
            "Description": "My first LoRaWAN gateway",
            "LoRaWAN": {
                "RfRegion": "US915",
                "GatewayEui": "dac632ebc01d23e4"
            },
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Arn": "arn:aws:iotwireless:us-west-2:123456789012:WirelessGateway/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "myFirstLoRaWANGateway"
        },
        {
            "Description": "My second LoRaWAN gateway",
            "LoRaWAN": {
                "RfRegion": "US915",
```

```
                "GatewayEui": "cda123fffe92ecd2"
            },
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:iotwireless:us-west-2:123456789012:WirelessGateway/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Name": "mySecondLoRaWANGateway"
        }
    ]
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListWirelessGateways in *AWS CLI Command Reference*.

`send-data-to-wireless-device`

The following code example shows how to use `send-data-to-wireless-device`.

AWS CLI

To send data to the wireless device

The following `send-data-to-wireless-device` example sends a decrypted application data frame to the wireless device.

```
aws iotwireless send-data-to-wireless-device \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --transmit-mode "1" \
    --payload-data "SGVsbG8gVG8gRGV2c2lt" \
    --wireless-metadata LoRaWAN={FPort=1}
```

Output:

```
{
    "MessageId": "6011dd36-0043d6eb-0072-0008"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see SendDataToWirelessDevice in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To specify a tag key and value for a resource

The following `tag-resource` example tags the wireless destination `IoTWirelessDestination` with the key `MyTag` and value `MyValue`.

```
aws iotwireless tag-resource \
    --resource-arn "arn:aws:iotwireless:us-west-2:123456789012:Destination/
IoTWirelessDestination" \
    --tags Key="MyTag",Value="MyValue"
```

This command produces no output.

For more information, see Tagging your AWS IoT Wireless resources in the *AWS IoT Developers Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`test-wireless-device`

The following code example shows how to use `test-wireless-device`.

AWS CLI

To test the wireless device

The following `test-wireless-device` example sends uplink data of `Hello` to a device with specified ID.

```
aws iotwireless test-wireless-device \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Result": "Test succeeded. one message is sent with payload: hello"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see TestWirelessDevice in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove one or more tags from a resource

The following `untag-resource` example removes the tag `MyTag` and its value from the wireless destination `IoTWirelessDestination`.

```
aws iotwireless untag-resource \
    --resource-arn "arn:aws:iotwireless:us-west-2:123456789012:Destination/
IoTWirelessDestination" \
    --tag-keys "MyTag"
```

This command produces no output.

For more information, see Tagging your AWS IoT Wireless resources in the *AWS IoT Developers Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-destination`

The following code example shows how to use `update-destination`.

AWS CLI

To update the properties of a destination

The following `update-destination` example updates the description property of a wireless destination.

```
aws iotwireless update-destination \
    --name "IoTWirelessDestination" \
    --description "Destination for messages processed using IoTWirelessRule"
```

This command produces no output.

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see UpdateDestination in *AWS CLI Command Reference*.

`update-partner-account`

The following code example shows how to use `update-partner-account`.

AWS CLI

To update the properties of a partner account

The following `update-partner-account` example updates the `AppServerPrivateKey` for the account that has the specified ID.

```
aws iotwireless update-partner-account \
    --partner-account-id "78965678771228" \
    --partner-type "Sidewalk" \
    --sidewalk
 AppServerPrivateKey="f798ab4899346a88599180fee9e14fa1ada7b6df989425b7c6d2146dd6c815bb"
```

This command produces no output.

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see UpdatePartnerAccount in *AWS CLI Command Reference*.

`update-wireless-device`

The following code example shows how to use `update-wireless-device`.

AWS CLI

To update the properties of a wireless device

The following `update-wireless-device` example updates the properties of a wireless device registered to your AWS account.

```
aws iotwireless update-wireless-device \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --destination-name IoTWirelessDestination2 \
    --description "Using my first LoRaWAN device"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see UpdateWirelessDevice in *AWS CLI Command Reference*.

`update-wireless-gateway`

The following code example shows how to use `update-wireless-gateway`.

AWS CLI

To update the wireless gateway

The following `update-wireless-gateway` example updates the description of your wireless gateway.

```
aws iotwireless update-wireless-gateway \
    --id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --description "Using my LoRaWAN gateway"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see UpdateWirelessGateway in *AWS CLI Command Reference*.

Amazon IVS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-get-channel`

The following code example shows how to use `batch-get-channel`.

AWS CLI

To get channel configuration information about multiple channels

The following `batch-get-channel` example lists information about the specified channels.

```
aws ivs batch-get-channel \
    --arns arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "authorized": false,
            "containerFormat": "TS",
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "insecureIngest": false,
            "latencyMode": "LOW",
            "multitrackInputConfiguration": {
                "enabled": false,
                "maximumResolution": "FULL_HD",
                "policy": "ALLOW"
            },
            "name": "channel-1",
            "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel-1.abcdEFGH.m3u8",
            "preset": "",

            },
            "tags": {},
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see BatchGetChannel in *AWS CLI Command Reference*.

batch-get-stream-key

The following code example shows how to use `batch-get-stream-key`.

AWS CLI

To get information about multiple stream keys

The following `batch-get-stream-key` example gets information about the specified stream keys.

```
aws ivs batch-get-stream-key \
    --arns arn:aws:ivs:us-west-2:123456789012:stream-key/
skSKABCDefgh arn:aws:ivs:us-west-2:123456789012:stream-key/skSKIJKLmnop
```

Output:

```
{
    "streamKeys": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh",
            "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKIJKLmnop",
            "value": "sk_us-west-2_abcdABCDefgh_567890ghijkl",
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "tags": {}
        }
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see BatchGetStreamKey in *AWS CLI Command Reference*.

batch-start-viewer-session-revocation

The following code example shows how to use `batch-start-viewer-session-revocation`.

AWS CLI

To revoke viewer sessions for multiple channel-ARN and viewer-ID pairs

The following `batch-start-viewer-session-revocation` example performs session revocation on multiple channel-ARN and viewer-ID pairs simultaneously. The request may complete normally but return values in the errors field if the caller does not have permission to revoke specified session.

```
aws ivs batch-start-viewer-session-revocation \
    --viewer-sessions '[{"channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh1","viewerId":"abcdefg1","viewerSessionVersionsLessThanOrEqualTo":1234567890},
      {"channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh2","viewerId":"abcdefg2","viewerSessionVersionsLessThanOrEqualTo":1234567890}]'
```

Output:

```
{
    "errors": [
        {
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh1",
            "viewerId": "abcdefg1",
            "code": "403",
            "message": "not authorized"
        },
        {
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh2",
            "viewerId": "abcdefg2",
            "code": "403",
            "message": "not authorized"
        }
    ]
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see BatchStartViewerSessionRevocation in *AWS CLI Command Reference*.

`create-channel`

The following code example shows how to use `create-channel`.

AWS CLI

Example 1: To create a channel with no recording

The following `create-channel` example creates a new channel and an associated stream key to start streaming.

```
aws ivs create-channel \
    --name 'test-channel' \
    --no-insecure-ingest
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "authorized": false,
        "containerFormat": "TS",
        "name": "test-channel",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "tags": {},
        "type": "STANDARD"
```

```
    },
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

Example 2: To create a channel with recording enabled, using the RecordingConfiguration resource specified by its ARN

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up recording for the channel.

```
aws ivs create-channel \
    --name test-channel-with-recording \
    --insecure-ingest \
    --recording-configuration-arn 'arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "containerFormat": "TS",
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "BA1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
```

```
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": true,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {},
        "type": "STANDARD"
    },
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

Example 3: To create a channel with a playback restriction policy specified by its ARN

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up a playback restriction policy for the channel.

```
aws ivs create-channel \
    --name test-channel-with-playback-restriction-policy \
    --insecure-ingest \
    --playback-restriction-policy-arn 'arn:aws:ivs:us-west-2:123456789012:playback-
restriction-policy/ABcdef34ghIJ'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "containerFormat": "TS",
        "name": "test-channel-with-playback-restriction-policy",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
```

```
        },
        "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2edfGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": true,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {},
        "type": "STANDARD"
    },
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

Example 4: To create a channel with multitrack enabled

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and enables multitrack.

```
aws ivs create-channel \
    --name 'test-channel' \
    --no-insecure-ingest \
    --container-format 'FRAGMENTED_MP4' \
    --multitrack-input-configuration '{"enabled": true,"maximumResolution":
 "FULL_HD","policy": "ALLOW"}'
```

Output:

```
{
```

```
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "authorized": false,
        "containerFormat": "FRAGMENTED_MP4",
        "name": "test-channel",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": true,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "tags": {},
        "type": "STANDARD"
    },
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see CreateChannel in *AWS CLI Command Reference*.

`create-playback-restriction-policy`

The following code example shows how to use `create-playback-restriction-policy`.

AWS CLI

To create a playback restriction policy

The following `create-playback-restriction-policy` example creates a new playback resriction policy.

```
aws ivs create-playback-restriction-policy \
    --name "test-playback-restriction-policy" \
    --enable-strict-origin-enforcement \
    --tags "key1=value1, key2=value2" \
    --allowed-countries US MX \
    --allowed-origins https://www.website1.com https://www.website2.com
```

Output:

```
{
    "playbackRestrictionPolicy": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": true,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see CreatePlaybackRestrictionPolicy in *AWS CLI Command Reference*.

create-recording-configuration

The following code example shows how to use `create-recording-configuration`.

AWS CLI

To create a RecordingConfiguration resource

The following `create-recording-configuration` example creates a RecordingConfiguration resource to enable recording to Amazon S3.

```
aws ivs create-recording-configuration \
    --name "test-recording-config" \
    --recording-reconnect-window-seconds 60 \
    --tags "key1=value1, key2=value2" \
    --rendition-configuration renditionSelection="CUSTOM",renditions="HD" \
    --thumbnail-configuration
 recordingMode="INTERVAL",targetIntervalSeconds=1,storage="LATEST",resolution="LOWEST_RESOLU
 \
    --destination-configuration s3={bucketName=demo-recording-bucket}
```

Output:

```
{
    "recordingConfiguration": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
        "name": "test-recording-config",
        "destinationConfiguration": {
            "s3": {
                "bucketName": "demo-recording-bucket"
            }
        },
        "state": "CREATING",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        },
        "thumbnailConfiguration": {
            "recordingMode": "INTERVAL",
            "targetIntervalSeconds": 1,
            "resolution": "LOWEST_RESOLUTION",
            "storage": [
```

```
                "LATEST"
            ]
        },
        "recordingReconnectWindowSeconds": 60,
        "renditionConfiguration": {
            "renditionSelection": "CUSTOM",
            "renditions": [
                "HD"
            ]
        }
    }
}
```

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateRecordingConfiguration in *AWS CLI Command Reference*.

`create-stream-key`

The following code example shows how to use `create-stream-key`.

AWS CLI

To create a stream key

The following `create-stream-key` example creates a stream key for a specified ARN (Amazon Resource Name).

```
aws ivs create-stream-key \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see CreateStreamKey in *AWS CLI Command Reference*.

`delete-channel`

The following code example shows how to use `delete-channel`.

AWS CLI

To delete a channel and its associated stream keys

The following `delete-channel` example deletes the channel with the specified ARN (Amazon Resource Name).

```
aws ivs delete-channel \
    --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see DeleteChannel in *AWS CLI Command Reference*.

`delete-playback-key-pair`

The following code example shows how to use `delete-playback-key-pair`.

AWS CLI

To delete a specified playback key pair

The following `delete-playback-key-pair` example returns the fingerprint of the specified key pair.

```
aws ivs delete-playback-key-pair \
    --arn arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh
```

This command produces no output.

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeletePlaybackKeyPair in *AWS CLI Command Reference*.

`delete-playback-restriction-policy`

The following code example shows how to use `delete-playback-restriction-policy`.

AWS CLI

To delete a playback restriction policy

The following `delete-playback-restriction-policy` example deletes the playback resriction policy with the specified policy ARN (Amazon Resource Name).

```
aws ivs delete-playback-restriction-policy \
    --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ"
```

This command produces no output.

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see DeletePlaybackRestrictionPolicy in *AWS CLI Command Reference*.

`delete-recording-configuration`

The following code example shows how to use `delete-recording-configuration`.

AWS CLI

To delete the RecordingConfiguration resource specified by its ARN

The following `delete-recording-configuration` example deletes the RecordingConfiguration resource with the specified ARN.

```
aws ivs delete-recording-configuration \
    --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

This command produces no output.

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteRecordingConfiguration in *AWS CLI Command Reference*.

`delete-stream-key`

The following code example shows how to use `delete-stream-key`.

AWS CLI

To delete a stream key

The following `delete-stream-key` example deletes the stream key for a specified ARN (Amazon Resource Name), so it can no longer be used to stream.

```
aws ivs delete-stream-key \
    --arn arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see DeleteStreamKey in *AWS CLI Command Reference*.

`get-channel`

The following code example shows how to use `get-channel`.

AWS CLI

To get a channel's configuration information

The following `get-channel` example gets the channel configuration for a specified channel ARN (Amazon Resource Name).

```
aws ivs get-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "authorized": false,
        "containerFormat": "TS",
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
```

```
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "name": "channel-1",
        "playbackRestrictionPolicyArn": "",
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "tags": {},
        "type": "STANDARD"
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see GetChannel in *AWS CLI Command Reference*.

`get-playback-key-pair`

The following code example shows how to use `get-playback-key-pair`.

AWS CLI

To get a specified playback key pair

The following `get-playback-key-pair` example returns the fingerprint of the specified key pair.

```
aws ivs get-playback-key-pair \
    --arn arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh
```

Output:

```
{
```

```
    "keyPair": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
        "name": "my-playback-key",
        "fingerprint": "0a:1b:2c:ab:cd:ef:34:56:70:b1:b2:71:01:2a:a3:72",
        "tags": {}
    }
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetPlaybackKeyPair in *AWS CLI Command Reference*.

`get-playback-restriction-policy`

The following code example shows how to use `get-playback-restriction-policy`.

AWS CLI

To get a playback restriction policy's configuration information

The following `get-playback-restriction-policy` example gets the playback restriciton policy configuration with the specified policy ARN (Amazon Resource Name).

```
aws ivs get-playback-restriction-policy \
    --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ"
```

Output:

```
{
    "playbackRestrictionPolicy": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": true,
```

```
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see GetPlaybackRestrictionPolicy in *AWS CLI Command Reference*.

`get-recording-configuration`

The following code example shows how to use `get-recording-configuration`.

AWS CLI

To get information about a RecordingConfiguration resource

The following `get-recording-configuration` example gets information about the RecordingConfiguration resource for the specified ARN.

```
aws ivs get-recording-configuration \
    --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

Output:

```
{
    "recordingConfiguration": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
        "destinationConfiguration": {
            "s3": {
                "bucketName": "demo-recording-bucket"
            }
        },
        "name": "test-recording-config",
        "recordingReconnectWindowSeconds": 60,
        "state": "ACTIVE",
        "tags": {
            "key1" : "value1",
            "key2" : "value2"
```

```
        },
        "thumbnailConfiguration": {
            "recordingMode": "INTERVAL",
            "targetIntervalSeconds": 1,
            "resolution": "LOWEST_RESOLUTION",
            "storage": [
                "LATEST"
            ]
        },
        "renditionConfiguration": {
            "renditionSelection": "CUSTOM",
            "renditions": [
                "HD"
            ]
        }
    }
}
```

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetRecordingConfiguration in *AWS CLI Command Reference*.

`get-stream-key`

The following code example shows how to use `get-stream-key`.

AWS CLI

To get information about a stream

The following `get-stream-key` example gets information about the specified stream key.

```
aws ivs get-stream-key \
    --arn arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh
```

Output:

```
{
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
```

```
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see GetStreamKey in *AWS CLI Command Reference*.

`get-stream-session`

The following code example shows how to use `get-stream-session`.

AWS CLI

To get metadata for a specified stream

The following `get-stream-session` example gets the metadata configuration for the specified channel ARN (Amazon Resource Name) and the specified stream; if `streamId` is not provided, the most recent stream for the channel is selected.

```
aws ivs get-stream-session \
    --channel-arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --stream-id 'st-1A2b3C4d5E6f7G8h9I0j1K2l'
```

Output:

```
{
    "streamSession": {
        "streamId": "st-1A2b3C4d5E6f7G8h9I0j1K2l",
        "startTime": "2023-06-26T19:09:28+00:00",
        "channel": {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "name": "mychannel",
            "latencyMode": "LOW",
            "type": "STANDARD",
            "recordingConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABcdef34ghIJ",
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "playbackUrl": "url-string",
            "authorized": false,
            "insecureIngest": false,
            "preset": ""
        },
```

```
        "ingestConfiguration": {
            "audio": {

        ]
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see GetStreamSession in *AWS CLI Command Reference*.

`get-stream`

The following code example shows how to use `get-stream`.

AWS CLI

To get information about a stream

The following `get-stream` example gets information about the stream for the specified channel.

```
aws ivs get-stream \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "stream": {
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
```

```
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "startTime": "2020-05-05T21:55:38Z",
        "state": "LIVE",
        "health": "HEALTHY",
        "streamId": "st-ABCDEfghij01234KLMN5678",
        "viewerCount": 1
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see GetStream in *AWS CLI Command Reference*.

`import-playback-key-pair`

The following code example shows how to use `import-playback-key-pair`.

AWS CLI

To import the public portion of a new key pair

The following `import-playback-key-pair` example imports the specified public key (specified as a string in PEM format) and returns the arn and fingerprint of the new key pair.

```
aws ivs import-playback-key-pair \
    --name "my-playback-key" \
    --public-key-material "G1lbnQxOTA3BgNVBAMMMFdoeSBhcmUgeW91IGRl..."
```

Output:

```
{
    "keyPair": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
        "name": "my-playback-key",
        "fingerprint": "0a:1b:2c:ab:cd:ef:34:56:70:b1:b2:71:01:2a:a3:72",
        "tags": {}
    }
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see ImportPlaybackKeyPair in *AWS CLI Command Reference*.

`list-channels`

The following code example shows how to use `list-channels`.

AWS CLI

Example 1: To get summary information about all channels

The following `list-channels` example lists all channels for your AWS account.

```
aws ivs list-channels
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "name": "channel-1",
            "latencyMode": "LOW",
            "authorized": false,
            "insecureIngest": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "",
            "recordingConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABCD12cdEFgh",
            "tags": {},
            "type": "STANDARD"
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl",
            "name": "channel-2",
            "latencyMode": "LOW",
            "authorized": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
            "recordingConfigurationArn": "",
            "tags": {},
            "type": "STANDARD"
        }
```

```
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

Example 2: To get summary information about all channels, filtered by the specified RecordingConfiguration ARN

The following `list-channels` example lists all channels for your AWS account, that are associated with the specified RecordingConfiguration ARN.

```
aws ivs list-channels \
    --filter-by-recording-configuration-arn "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABCD12cdEFgh"
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "name": "channel-1",
            "latencyMode": "LOW",
            "authorized": false,
            "insecureIngest": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "",
            "recordingConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABCD12cdEFgh",
            "tags": {},
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

Example 3: To get summary information about all channels, filtered by the specified PlaybackRestrictionPolicy ARN

The following `list-channels` example lists all channels for your AWS account, that are associated with the specified PlaybackRestrictionPolicy ARN.

```
aws ivs list-channels \
    --filter-by-playback-restriction-policy-arn "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ"
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl",
            "name": "channel-2",
            "latencyMode": "LOW",
            "authorized": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
            "recordingConfigurationArn": "",
            "tags": {},
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see ListChannels in *AWS CLI Command Reference*.

`list-playback-key-pairs`

The following code example shows how to use `list-playback-key-pairs`.

AWS CLI

To get summary information about all playback key pairs

The following `list-playback-key-pairs` example returns information about all key pairs.

```
aws ivs list-playback-key-pairs
```

Output:

```
{
```

```
    "keyPairs": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
            "name": "test-key-0",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/ijkl5678mnop",
            "name": "test-key-1",
            "tags": {}
        }
    ]
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListPlaybackKeyPairs in *AWS CLI Command Reference*.

`list-playback-restriction-policies`

The following code example shows how to use `list-playback-restriction-policies`.

AWS CLI

To get summary information about all playback restriction policies

The following `list-playback-restriction-policies` example lists all playback restriction policies for your AWS account.

```
aws ivs list-playback-restriction-policies
```

Output:

```
{
    "playbackRestrictionPolicies": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
            "allowedCountries": [
                "US",
                "MX"
```

```
            ],
            "allowedOrigins": [
                "https://www.website1.com",
                "https://www.website2.com"
            ],
            "enableStrictOriginEnforcement": true,
            "name": "test-playback-restriction-policy",
            "tags": {
                "key1": "value1",
                "key2": "value2"
            }
        }
    ]
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see ListPlaybackRestrictionPolicies in *AWS CLI Command Reference*.

`list-recording-configurations`

The following code example shows how to use `list-recording-configurations`.

AWS CLI

To list all the RecordingConfiguration resources created in this account

The following `list-recording-configurations` example gets information about all RecordingConfiguration resources in your account.

```
aws ivs list-recording-configurations
```

Output:

```
{
    "recordingConfigurations": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
            "name": "test-recording-config-1",
            "destinationConfiguration": {
                "s3": {
                    "bucketName": "demo-recording-bucket-1"
```

```
                }
            },
            "state": "ACTIVE",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
CD12abcdGHIJ",
            "name": "test-recording-config-2",
            "destinationConfiguration": {
                "s3": {
                    "bucketName": "demo-recording-bucket-2"
                }
            },
            "state": "ACTIVE",
            "tags": {}
        }
    ]
}
```

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListRecordingConfigurations in *AWS CLI Command Reference*.

`list-stream-keys`

The following code example shows how to use `list-stream-keys`.

AWS CLI

To get a list of stream keys

The following `list-stream-keys` example lists all stream keys for a specified ARN (Amazon Resource Name).

```
aws ivs list-stream-keys \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
```

```
    "streamKeys": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "tags": {}
        }
    ]
}
```

FFor more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see ListStreamKeys in *AWS CLI Command Reference*.

`list-stream-sessions`

The following code example shows how to use `list-stream-sessions`.

AWS CLI

To get a summary of current and previous streams for a specified channel in the current AWS region

The following `list-stream-sessions` example reports summary information for streams for a specified channel ARN (Amazon Resource Name).

```
aws ivs list-stream-sessions \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --max-results 25 \
    --next-token ""
```

Output:

```
{
    "nextToken": "set-2",
    "streamSessions": [
        {
            "startTime": 1641578182,
            "endTime": 1641579982,
            "hasErrorEvent": false,
            "streamId": "mystream"
        }
    ]
```

```
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see ListStreamSessions in *AWS CLI Command Reference*.

`list-streams`

The following code example shows how to use `list-streams`.

AWS CLI

To get a list of live streams and their state

The following `list-streams` example lists all live streams for your AWS account.

```
aws ivs list-streams
```

Output:

```
{
    "streams": [
        {
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "state": "LIVE",
            "health": "HEALTHY",
            "streamId": "st-ABCDEfghij01234KLMN5678",
            "viewerCount": 1
        }
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see ListStreams in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for an AWS resource (for example: channel, stream key)

The following `list-tags-for-resource` example lists all tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs list-tags-for-resource \
    --resource-arn arn:aws:ivs:us-west-2:12345689012:channel/abcdABCDefgh
```

Output:

```
{
    "tags":
    {
        "key1": "value1",
        "key2": "value2"
    }
}
```

For more information, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-metadata`

The following code example shows how to use `put-metadata`.

AWS CLI

To insert metadata into the active stream for a specified channel

The following `put-metadata` example inserts the given metadata into the stream for the specified channel.

```
aws ivs put-metadata \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --metadata '{"my": "metadata"}'
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see PutMetadata in *AWS CLI Command Reference*.

`start-viewer-session-revocation`

The following code example shows how to use `start-viewer-session-revocation`.

AWS CLI

To revoke a viewer session for a given multiple channel-ARN and viewer-ID pair

The following `start-viewer-session-revocation` example starts the process of revoking the viewer session associated with a specified channel ARN and viewer ID, up to and including the specified session version number. If the version is not provided, it defaults to 0.

```
aws ivs start-viewer-session-revocation \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --viewer-id abcdefg \
    --viewer-session-versions-less-than-or-equal-to 1234567890
```

This command produces no output.

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see StartViewerSessionRevocation in *AWS CLI Command Reference*.

`stop-stream`

The following code example shows how to use `stop-stream`.

AWS CLI

To stop a specified stream

The following `stop-stream` example stops the stream on the specified channel.

```
aws ivs stop-stream \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see StopStream in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add or update tags for an AWS resource (for example: channel, stream key)

The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs tag-resource \
    --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --tags "tagkey1=tagvalue1, tagkey2=tagvalue2"
```

This command produces no output.

For more information, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags for an AWS resource (for example: channel, stream key)

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs untag-resource \
    --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-channel`

The following code example shows how to use `update-channel`.

AWS CLI

Example 1: To update a channel's configuration information

The following `update-channel` example updates the channel configuration for a specified channel ARN to change the channel name. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --name 'channel-1' \
    --insecure-ingest
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "channel-1",
        "latencyMode": "LOW",
        "containerFormat": "TS",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": true,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
```

```
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

Example 2: To update a channel's configuration to enable recording

The following `update-channel` example updates the channel configuration for a specified channel ARN to enable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --no-insecure-ingest \
    --recording-configuration-arn 'arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",
        "containerFormat": "TS",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "BA1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
```

```
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

Example 3: To update a channel's configuration to disable recording

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --recording-configuration-arn ''
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",
        "containerFormat": "TS",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2edfGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
```

```
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

Example 4: To update a channel's configuration to enable playback restriction

The following `update-channel` example updates the channel configuration for a specified channel ARN to apply a playback restriction policy. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --no-insecure-ingest \
    --playback-restriction-policy-arn 'arn:aws:ivs:us-west-2:123456789012:playback-
restriction-policy/ABcdef34ghIJ'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-playback-restriction-policy",
        "latencyMode": "LOW",
        "containerFormat": "TS",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaCBDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
```

```
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

Example 5: To update a channel's configuration to disable playback restriction

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable playback restriction. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --playback-restriction-policy-arn ''
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-playback-restriction-policy",
        "latencyMode": "LOW",
        "containerFormat": "TS",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDeFghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
```

```
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

Example 6: To update a channel's configuration to enable multitrack

The following `update-channel` example updates the channel configuration for a specified channel ARN to enable multitrack. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --container-format 'FRAGMENTED_MP4' \
    --multitrack-input-configuration '{"enabled": true,"maximumResolution":
 "FULL_HD","policy": "ALLOW"}'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "containerFormat": "FRAGMENTED_MP4",
        "name": "test-channel-with-multitrack",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": true,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
```

```
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaCBDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

Example 7: To update a channel's configuration to disable playback restriction

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable multitrack. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --container-format 'TS' \
    --multitrack-input-configuration '{"enabled": false}'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "containerFormat": "TS",
        "name": "test-channel-with-multitrack",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
```

```
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaCBDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see UpdateChannel in *AWS CLI Command Reference*.

`update-playback-restriction-policy`

The following code example shows how to use `update-playback-restriction-policy`.

AWS CLI

To update a playback restriction policy

The following `update-playback-restriction-policy` example updates the playback restriction policy with the specified policy ARN to disable strict origin enforcement. This does not affect an ongoing stream of the associated channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-playback-restriction-policy \
    --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ" \
    --no-enable-strict-origin-enforcement
```

Output:

```
{
    "playbackRestrictionPolicy": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
```

```
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": false,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see UpdatePlaybackRestrictionPolicy in *AWS CLI Command Reference*.

Amazon IVS Chat examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Chat.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-chat-token`

The following code example shows how to use `create-chat-token`.

AWS CLI

To create a chat token

The following `create-chat-token` example creates an encrypted chat token that is used to establish an individual WebSocket connection to a room. The token is valid for one minute, and a connection (session) established with the token is valid for the specified duration.

```
aws ivschat create-chat-token \
    --room-identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --user-id "11231234" \
    --capabilities "SEND_MESSAGE" \
    --session-duration-in-minutes 30
```

Output:

```
{
    "token": "ACEGmnoq#1rstu2...BDFH3vxwy!4hlm!#5",
    "sessionExpirationTime": "2022-03-16T04:44:09+00:00",
    "tokenExpirationTime": "2022-03-16T03:45:09+00:00"
}
```

For more information, see Step 3: Authenticate and Authorize Chat Clients in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateChatToken in *AWS CLI Command Reference*.

`create-logging-configuration`

The following code example shows how to use `create-logging-configuration`.

AWS CLI

To create a chat LoggingConfiguration resource

The following `create-logging-configuration` example creates a LoggingConfiguration resource that allows clients to store and record sent messages.

```
aws ivschat create-logging-configuration \
    --destination-configuration s3={bucketName=demo-logging-bucket} \
    --name "test-logging-config" \
```

```
    --tags "key1=value1, key2=value2"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
    "createTime": "2022-09-14T17:48:00.653000+00:00",
    "destinationConfiguration": {
        "s3": {
            "bucketName": "demo-logging-bucket"
        }
    },
    "id": "ABcdef34ghIJ",
    "name": "test-logging-config",
    "state": "ACTIVE",
    "tags": { "key1" : "value1", "key2" : "value2" },
    "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateLoggingConfiguration in *AWS CLI Command Reference*.

`create-room`

The following code example shows how to use `create-room`.

AWS CLI

To create a room

The following `create-room` example creates a new room.

```
aws ivschat create-room \
    --name "test-room-1" \
    --logging-configuration-identifiers "arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
    --maximum-message-length 256 \
    --maximum-message-rate-per-second 5
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "id": "g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "test-room-1",
    "tags": {},
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see Step 2: Create a Chat Room in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateRoom in *AWS CLI Command Reference*.

`delete-logging-configuration`

The following code example shows how to use `delete-logging-configuration`.

AWS CLI

To delete a chat LoggingConfiguration resource

The following `delete-logging-configuration` example deletes the LoggingConfiguration resource for the specified ARN.

```
aws ivschat delete-logging-configuration \
    --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteLoggingConfiguration in *AWS CLI Command Reference*.

`delete-message`

The following code example shows how to use `delete-message`.

AWS CLI

To delete messages from a specified room

The following `delete-message` example sends an even to the specified room, which directs clients to delete the specified message: that is, unrender it from view and delete it from the client's chat history.

```
aws ivschat delete-message \
    --room-identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --id "ABC123def456" \
    --reason "Message contains profanity"
```

Output:

```
{
    "id": "12345689012"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteMessage in *AWS CLI Command Reference*.

`delete-room`

The following code example shows how to use `delete-room`.

AWS CLI

To delete a room

The following `delete-room` example deletes the specified room. Connected clients are disconnected. On success it returns HTTP 204 with an empty response body.

```
aws ivschat delete-room \
    --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteRoom in *AWS CLI Command Reference*.

`disconnect-user`

The following code example shows how to use `disconnect-user`.

AWS CLI

To disconnect a user from a room

The following `disconnect-user` example disconnects all connections for the specified user from the specified room. On success it returns HTTP 200 with an empty response body.

```
aws ivschat disconnect-user \
    --room-identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --user-id "ABC123def456" \
    --reason "Violated terms of service"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DisconnectUser in *AWS CLI Command Reference*.

`get-logging-configuration`

The following code example shows how to use `get-logging-configuration`.

AWS CLI

To get information about a LoggingConfiguration resource

The following `get-logging-configuration` example gets information about the LoggingConfiguration resource for the specified ARN.

```
aws ivschat get-logging-configuration \
```

```
    --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
    "createTime": "2022-09-14T17:48:00.653000+00:00",
    "destinationConfiguration": {
        "s3": {
            "bucketName": "demo-logging-bucket"
        }
    },
    "id": "ABcdef34ghIJ",
    "name": "test-logging-config",
    "state": "ACTIVE",
    "tags": { "key1" : "value1", "key2" : "value2" },
    "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetLoggingConfiguration in *AWS CLI Command Reference*.

`get-room`

The following code example shows how to use `get-room`.

AWS CLI

To get the specified room

The following `get-room` example gets information about the specified room.

```
aws ivschat get-room \
    --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
```

Output:

```
{
```

```
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "id": "g1H2I3j4k5L6",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "test-room-1",
    "tags": {},
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetRoom in *AWS CLI Command Reference*.

`list-logging-configurations`

The following code example shows how to use `list-logging-configurations`.

AWS CLI

To get summary information about all logging configurations for the user in the AWS region where the API request is processed

The following `list-logging-configurations` example lists information about all LoggingConfiguration resources for the user in the AWS region where the API request is processed.

```
aws ivschat list-logging-configurations \
    --max-results 2 \
    --next-token ""
```

Output:

```
{
    "nextToken": "set-2",
    "loggingConfigurations": [
        {
            "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
```

```
            "createTime": "2022-09-14T17:48:00.653000+00:00",
            "destinationConfiguration": {
                "s3": {
                    "bucketName": "demo-logging-bucket"
                }
            },
            "id": "ABcdef34ghIJ",
            "name": "test-logging-config",
            "state": "ACTIVE",
            "tags": { "key1" : "value1", "key2" : "value2" },
            "updateTime": "2022-09-14T17:48:01.104000+00:00"
        }
    ]
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListLoggingConfigurations in *AWS CLI Command Reference*.

`list-rooms`

The following code example shows how to use `list-rooms`.

AWS CLI

To get summary information about all your rooms in the current region

The following `list-rooms` example gets summary information about all the rooms in the AWS region where the request is processed. Results are sorted in descending order of updateTime.

```
aws ivschat list-rooms \
    --logging-configuration-identifier "arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
    --max-results 10 \
    --next-token ""
```

Output:

```
{
    "nextToken": "page3",
    "rooms": [
```

```
        {
            "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
            "createTime": "2022-03-16T04:44:09+00:00",
            "id": "g1H2I3j4k5L6",
            "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
            "name": "test-room-1",
            "tags": {},
            "updateTime": "2022-03-16T07:22:09+00:00"
        }
    ]
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListRooms in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for an AWS resource (for example: Room)

The following `list-tags-for-resource` example lists all tags for a specified resource ARN (Amazon Resource Name).

```
aws ivschat list-tags-for-resource \
    --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6
```

Output:

```
{
    "tags":
    {
        "key1": "value1",
        "key2": "value2"
    }
}
```

For more information, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`send-event`

The following code example shows how to use `send-event`.

AWS CLI

To send an event to a room

The following `send-event` example sends the given event to the specified room.

```
aws ivschat send-event \
    --room-identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --event-name "SystemMessage" \
    --attributes "msgType"="user-notification","msgText"="This chat room will close
 in 15 minutes."
```

Output:

```
{
    "id": "12345689012"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see SendEvent in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add or update tags for an AWS resource (for example: Room)

The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```
aws ivschat tag-resource \
    --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \
    --tags "tagkey1=tagkeyvalue1, tagkey2=tagkeyvalue2"
```

This command produces no output.

For more information, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags for an AWS resource (for example: Room)

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```
aws ivschat untag-resource \
    --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \
    --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-logging-configuration`

The following code example shows how to use `update-logging-configuration`.

AWS CLI

To update a room's logging configuration

The following `update-logging-configuration` example updates a LoggingConfiguration resource with the given data.

```
aws ivschat update-logging-configuration \
    --destination-configuration s3={bucketName=demo-logging-bucket} \
    --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ" \
    --name "test-logging-config"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
    "createTime": "2022-09-14T17:48:00.653000+00:00",
    "destinationConfiguration": {
        "s3": {
            "bucketName": "demo-logging-bucket"
        }
    },
    "id": "ABcdef34ghIJ",
    "name": "test-logging-config",
    "state": "ACTIVE",
    "tags": { "key1" : "value1", "key2" : "value2" },
    "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see UpdateLoggingConfiguration in *AWS CLI Command Reference*.

`update-room`

The following code example shows how to use `update-room`.

AWS CLI

To update a room's configuration

The following `update-room` example updates the specified room's configuration with the given data.

```
aws ivschat update-room \
    --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --logging-configuration-identifiers "arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
    --name "chat-room-a" \
    --maximum-message-length 256 \
    --maximum-message-rate-per-second 5
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "id": "g1H2I3j4k5L6",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "chat-room-a",
    "tags": {},
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see UpdateRoom in *AWS CLI Command Reference*.

Amazon IVS Real-Time Streaming examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Real-Time Streaming.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-encoder-configuration`

The following code example shows how to use `create-encoder-configuration`.

AWS CLI

To create a composition encoder configuration

The following `create-encoder-configuration` example creates a composition encoder configuration with the specified properties.

```
aws ivs-realtime create-encoder-configuration \
    --name test-ec \
    --video bitrate=3500000,framerate=30.0,height=1080,width=1920
```

Output:

```
{
    "encoderConfiguration": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:encoder-configuration/
ABabCDcdEFef",
        "name": "test-ec",
        "tags": {},
        "video": {
            "bitrate": 3500000,
            "framerate": 30,
            "height": 1080,
            "width": 1920
        }
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateEncoderConfiguration in *AWS CLI Command Reference*.

`create-ingest-configuration`

The following code example shows how to use `create-ingest-configuration`.

AWS CLI

To create an ingest configuration

The following `create-ingest-configuration` example creates an ingest configuration using RTMPS protocol.

```
aws ivs-realtime create-ingest-configuration \
    --name ingest1 \
    --ingest-protocol rtmps
```

Output:

```
{
    "ingestConfiguration": {
        "name": "ingest1",
        "arn": "arn:aws:ivs:us-west-2:123456789012:ingest-configuration/
AbCdEfGh1234",
        "ingestProtocol": "RTMPS",
        "streamKey": "rt_123456789012_us-
west-2_AbCdEfGh1234_abcd1234efgh5678ijkl9012MNOP34",
        "stageArn": "",
        "participantId": "xyZ654abC321",
        "state": "INACTIVE",
        "userId": "",
        "tags": {}
    }
}
```

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateIngestConfiguration in *AWS CLI Command Reference*.

`create-participant-token`

The following code example shows how to use `create-participant-token`.

AWS CLI

To create a stage participant token

The following `create-participant-token` example creates a participant toke for the specified stage.

```
aws ivs-realtime create-participant-token \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --user-id bob
```

Output:

```
{
    "participantToken": {
        "expirationTime": "2023-03-07T09:47:43+00:00",
        "participantId": "ABCDEfghij01234KLMN6789",
        "token": "abcd1234defg5678"
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateParticipantToken in *AWS CLI Command Reference*.

`create-stage`

The following code example shows how to use `create-stage`.

AWS CLI

Example 1: To create a stage

The following `create-stage` example creates a stage and stage participant token for a specified user.

```
aws ivs-realtime create-stage \
    --name stage1 \
    --participant-token-configurations userId=alice
```

Output:

```
{
    "participantTokens": [
        {
```

```
            "participantId": "ABCDEfghij01234KLMN5678",
            "token": "a1b2c3d4567890ab",
            "userId": "alice"
        }
    ],
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "storageConfigurationArn": "",
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "DISABLED"
            },
            "recordingReconnectWindowSeconds": 0,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 6
            },
            "recordParticipantReplicas": true
        },
        "endpoints": {
            "events": "wss://global.events.live-video.net",
            "rtmp": "rtmp://9x0y8z7s6t5u.global-contribute-staging.live-video.net/
app/",
            "rtmps": "rtmps://9x0y8z7s6t5u.global-contribute-staging.live-
video.net:443/app/",
            "whip": "https://9x0y8z7s6t5u.global-bm.whip.live-video.net"
        },
        "name": "stage1",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 2: To create a stage and configure individual participant recording

The following `create-stage` example creates a stage and configures individual participant recording.

```
aws ivs-realtime create-stage \
    --name stage1 \
    --auto-participant-recording-configuration '{"mediaTypes":
 ["AUDIO_VIDEO"],"storageConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:storage-configuration/abcdABCDefgh",
 "recordingReconnectWindowSeconds": 100,
       "hlsConfiguration": {"targetSegmentDurationSeconds": 5}}'
```

Output:

```
{
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "storageConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:storage-
configuration/abcdABCDefgh",
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "DISABLED"
            },
            "recordingReconnectWindowSeconds": 100,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 5
            },
            "recordParticipantReplicas": true
        },
        "endpoints": {
            "events": "wss://global.events.live-video.net",
            "rtmp": "rtmp://9x0y8z7s6t5u.global-contribute-staging.live-video.net/
app/",
            "rtmps": "rtmps://9x0y8z7s6t5u.global-contribute-staging.live-
video.net:443/app/",
            "whip": "https://9x0y8z7s6t5u.global-bm.whip.live-video.net"
```

```
        },
        "name": "stage1",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 3: To create a stage and configure individual participant recording with thumbnail recording enabled

The following `create-stage` example creates a stage and configures individual participant recording with thumbnail recording enabled.

```
aws ivs-realtime create-stage \
    --name stage1 \
    --auto-participant-recording-configuration '{"mediaTypes":
 ["AUDIO_VIDEO"],"storageConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:storage-configuration/abcdABCDefgh",
        "thumbnailConfiguration": {"recordingMode": "INTERVAL","storage":
 ["SEQUENTIAL"],"targetIntervalSeconds": 60}}'
```

Output:

```
{
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "storageConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:storage-
configuration/abcdABCDefgh",
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "INTERVAL"
            },
```

```
            "recordingReconnectWindowSeconds": 0,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 6
            },
            "recordParticipantReplicas": true
        },
        "endpoints": {
            "events": "wss://global.events.live-video.net",
            "rtmp": "rtmp://9x0y8z7s6t5u.global-contribute-staging.live-video.net/
app/",
            "rtmps": "rtmps://9x0y8z7s6t5u.global-contribute-staging.live-
video.net:443/app/",
            "whip": "https://9x0y8z7s6t5u.global-bm.whip.live-video.net"
        },
        "name": "stage1",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see CreateStage in *AWS CLI Command Reference*.

`create-storage-configuration`

The following code example shows how to use `create-storage-configuration`.

AWS CLI

To create a composition storage configuration

The following `create-storage-configuration` example creates a composition storage configuration with the specified properties.

```
aws ivs-realtime create-storage-configuration \
    --name "test-sc" \
    --s3 "bucketName=amzn-s3-demo-bucket"
```

Output:

```
{
    "storageConfiguration": {
```

```
        "arn": "arn:aws:ivs:us-west-2:123456789012:storage-configuration/
ABabCDcdEFef",
        "name": "test-sc",
        "s3": {
            "bucketName": "amzn-s3-demo-bucket"
        },
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateStorageConfiguration in *AWS CLI Command Reference*.

`delete-encoder-configuration`

The following code example shows how to use `delete-encoder-configuration`.

AWS CLI

To delete a composition encoder configuration

The following `delete-encoder-configuration` example deletes the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-encoder-configuration \
    --arn "arn:aws:ivs:us-west-2:123456789012:encoder-configuration/ABabCDcdEFef"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteEncoderConfiguration in *AWS CLI Command Reference*.

`delete-ingest-configuration`

The following code example shows how to use `delete-ingest-configuration`.

AWS CLI

Example 1: To delete an inactive ingest configuration

The following `delete-ingest-configuration` example deletes the inactive ingest configuration for a specified ingest-configuration ARN (Amazon Resource Name).

```
aws ivs-realtime delete-ingest-configuration \
    --arn arn:aws:ivs:us-west-2:123456789012:ingest-configuration/AbCdEfGh1234
```

This command produces no output.

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

Example 2: To force delete an active ingest configuration

The following `delete-ingest-configuration` example forces deletion of the active ingest configuration for a specified ingest-configuration ARN (Amazon Resource Name).

```
aws ivs-realtime delete-ingest-configuration \
    --arn arn:aws:ivs:us-west-2:123456789012:ingest-configuration/AbCdEfGh1234 \
    --force
```

This command produces no output.

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteIngestConfiguration in *AWS CLI Command Reference*.

`delete-public-key`

The following code example shows how to use `delete-public-key`.

AWS CLI

To delete a public key

The following `delete-public-key` example deletes the specified public key.

```
aws ivs-realtime delete-public-key \
    --arn arn:aws:ivs:us-west-2:123456789012:public-key/abcdABC1efg2
```

This command produces no output.

For more information, see Distribute Participant Tokens in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see DeletePublicKey in *AWS CLI Command Reference*.

`delete-stage`

The following code example shows how to use `delete-stage`.

AWS CLI

To delete a stage

The following `delete-stage` example deletes the specified stage.

```
aws ivs-realtime delete-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteStage in *AWS CLI Command Reference*.

`delete-storage-configuration`

The following code example shows how to use `delete-storage-configuration`.

AWS CLI

To delete a composition storage configuration

The following `delete-storage-configuration` example deletes the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-storage-configuration \
    --arn "arn:aws:ivs:us-west-2:123456789012:storage-configuration/ABabCDcdEFef"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteStorageConfiguration in *AWS CLI Command Reference*.

`disconnect-participant`

The following code example shows how to use `disconnect-participant`.

AWS CLI

To disconnect a stage participant

The following `disconnect-participant` example disconnects the specified participant from the specified stage.

```
aws ivs-realtime disconnect-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --participant-id ABCDEfghij01234KLMN5678
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DisconnectParticipant in *AWS CLI Command Reference*.

`get-composition`

The following code example shows how to use `get-composition`.

AWS CLI

Example 1: To get a composition with default layout settings

The following `get-composition` example gets the composition for the ARN (Amazon Resource Name) specified.

```
aws ivs-realtime get-composition \
    --arn "arn:aws:ivs:us-west-2:123456789012:composition/abcdABCDefgh"
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "startTime": "2023-10-16T23:26:00+00:00",
                "state": "ACTIVE"
            },
            {
                "configuration": {
                    "name": "",
                    "s3": {
                        "encoderConfigurationArns": [
                            "arn:aws:ivs:arn:aws:ivs:us-west-2:123456789012:encoder-
configuration/ABabCDcdEFef"
                        ],

                                "targetSegmentDurationSeconds": 2
                            }
                        },
                        "storageConfigurationArn": "arn:arn:aws:ivs:us-
west-2:123456789012:storage-configuration/FefABabCDcdE"
                    }
                },
                "detail": {
                    "s3": {
                        "recordingPrefix": "aBcDeFgHhGfE/AbCdEfGhHgFe/GHFabcgefABC/
composite"
                    }
                },
```

```
                "id": "GHFabcgefABC",
                "startTime": "2023-10-16T23:26:00+00:00",
                "state": "STARTING"
            }
        ],
        "layout": {
            "grid": {
                "featuredParticipantAttribute": "",
                "gridGap": 2,
                "omitStoppedVideo": false,
                "participantOrderAttribute": "",
                "videoAspectRatio": "VIDEO",
                "videoFillMode": ""
            }
        },
        "stageArn": "arn:aws:ivs:us-west-2:123456789012:stage/defgABCDabcd",
        "startTime": "2023-10-16T23:24:00+00:00",
        "state": "ACTIVE",
        "tags": {}
    }
}
```

For more information, see IVS Composite Recording | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

Example 2: To get a composition with PiP layout

The following `get-composition` example gets the composition for the ARN (Amazon Resource Name) specified, which uses PiP layout.

```
aws ivs-realtime get-composition \
    --arn "arn:aws:ivs:us-west-2:123456789012:composition/wxyzWXYZpqrs"
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:composition/wxyzWXYZpqrs",
        "destinations": [
            {
                "configuration": {
                    "channel": {
```

```
                        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "startTime": "2023-10-16T23:26:00+00:00",
                "state": "ACTIVE"
            },
            {
                "configuration": {
                    "name": "",
                    "s3": {

    }
}
```

For more information, see IVS Composite Recording | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

Example 3: To get a composition with thumbnail recording enabled

The following `get-composition` example gets the composition for the ARN (Amazon Resource Name) specified, which has thumbnail recording enabled with default settings.

```
aws ivs-realtime get-composition \
    --arn "arn:aws:ivs:us-west-2:123456789012:composition/abcdABCDefgh"
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
```

```
                "id": "AabBCcdDEefF",
                "startTime": "2023-10-16T23:26:00+00:00",
                "state": "ACTIVE"
            },
            {
                "configuration": {
                    "name": "",
                    "s3": {
                        "encoderConfigurationArns": [
                            "arn:aws:ivs:arn:aws:ivs:us-west-2:123456789012:encoder-
configuration/ABabCDcdEFef"
                        ],

    }
}
```

For more information, see IVS Composite Recording | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetComposition in *AWS CLI Command Reference*.

`get-encoder-configuration`

The following code example shows how to use `get-encoder-configuration`.

AWS CLI

To get a composition encoder configuration

The following `get-encoder-configuration` example gets the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime get-encoder-configuration \
    --arn "arn:aws:ivs:us-west-2:123456789012:encoder-configuration/abcdABCDefgh"
```

Output:

```
{
    "encoderConfiguration": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:encoder-configuration/
abcdABCDefgh",
        "name": "test-ec",
        "tags": {},
        "video": {
```

```
            "bitrate": 3500000,
            "framerate": 30,
            "height": 1080,
            "width": 1920
        }
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetEncoderConfiguration in *AWS CLI Command Reference*.

`get-ingest-configuration`

The following code example shows how to use `get-ingest-configuration`.

AWS CLI

To get ingest configuration information

The following `get-ingest-configuration` example gets the ingest configuration for a specified ingest-configuration ARN (Amazon Resource Name).

```
aws ivs-realtime get-ingest-configuration \
    --arn arn:aws:ivs:us-west-2:123456789012:ingest-configuration/AbCdEfGh1234
```

Output:

```
{
    "ingestConfiguration": {
        "name": "ingest1",
        "arn": "arn:aws:ivs:us-west-2:123456789012:ingest-configuration/
AbCdEfGh1234",
        "ingestProtocol": "RTMPS",
        "streamKey": "rt_123456789012_us-
west-2_AbCdEfGh1234_abcd1234efgh5678ijkl9012MNOP34",
        "stageArn": "",
        "participantId": "xyZ654abC321",
        "state": "INACTIVE",
        "userId": "",
        "tags": {}
```

```
    }
}
```

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetIngestConfiguration in *AWS CLI Command Reference*.

`get-participant`

The following code example shows how to use `get-participant`.

AWS CLI

Example 1: To get a stage participant

The following `get-participant` example gets the stage participant for a specified participant ID and session ID in the specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "participant": {
        "browserName": "Google Chrome",
        "browserVersion": "116",
        "firstJoinTime": "2023-04-26T20:30:34+00:00",
        "ispName": "Comcast",
        "osName": "Microsoft Windows 10 Pro",
        "osVersion": "10.0.19044",
        "participantId": "abCDEf12GHIj",
        "published": true,
        "recordingS3BucketName": "bucket-name",
        "recordingS3Prefix": "abcdABCDefgh/st-a1b2c3d4e5f6g/
abCDEf12GHIj/1234567890",
        "recordingState": "ACTIVE",
        "sdkVersion": "",
        "state": "CONNECTED",
```

```
        "userId": ""
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 2: To get a stage participant that has been replicated to another stage

The following `get-participant` example gets the stage participant for a specified participant ID and session ID in the specified stage ARN (Amazon Resource Name), when the participant has also been replicated to another stage.

```
aws ivs-realtime get-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "participant": {
        "browserName": "Google Chrome",
        "browserVersion": "116",
        "firstJoinTime": "2023-04-26T20:30:34+00:00",
        "ispName": "Comcast",
        "osName": "Microsoft Windows 10 Pro",
        "osVersion": "10.0.19044",
        "participantId": "abCDEf12GHIj",
        "published": true,
        "recordingS3BucketName": "bucket-name",
        "recordingS3Prefix": "abcdABCDefgh/st-a1b2c3d4e5f6g/
abCDEf12GHIj/1234567890",
        "recordingState": "ACTIVE",
        "replicationState": "ACTIVE",
        "replicationType": "SOURCE",
        "sdkVersion": "",
        "state": "CONNECTED",
        "userId": ""
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 3: To get a stage participant that has been replicated from another stage

The following `get-participant` example gets the stage participant for a specified participant ID and session ID in the specified stage ARN (Amazon Resource Name), when the participant has been replicated from another stage.

```
aws ivs-realtime get-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "participant": {
        "browserName": "Google Chrome",
        "browserVersion": "116",
        "firstJoinTime": "2023-04-26T20:30:34+00:00",
        "ispName": "Comcast",
        "osName": "Microsoft Windows 10 Pro",
        "osVersion": "10.0.19044",
        "participantId": "abCDEf12GHIj",
        "published": true,
        "recordingS3BucketName": "bucket-name",
        "recordingS3Prefix": "abcdABCDefgh/st-a1b2c3d4e5f6g/
abCDEf12GHIj/1234567890",
        "recordingState": "ACTIVE",
        "replicationState": "ACTIVE",
        "replicationType": "REPLICA",
        "sdkVersion": "",
        "state": "CONNECTED",
        "userId": ""
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see GetParticipant in *AWS CLI Command Reference*.

`get-public-key`

The following code example shows how to use `get-public-key`.

AWS CLI

To get an existing public key used to sign stage participant tokens

The following `get-public-key` example gets a public key specified by the provided ARN, for sigining stage participant tokens.

```
aws ivs-realtime get-public-key \
    --arn arn:aws:ivs:us-west-2:123456789012:public-key/abcdABC1efg2
```

Output:

```
{
    "publicKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:public-key/abcdABC1efg2",
        "name": "",
        "publicKeyMaterial": "-----BEGIN PUBLIC KEY-----

\n0UAb8NdD4tUE0At4a9hYP9IETEXAMPLE\n-----END PUBLIC KEY-----",
        "fingerprint": "12:a3:44:56:bc:7d:e8:9f:10:2g:34:hi:56:78:90:12",
        "tags": {}
    }
}
```

For more information, see Distribute Participant Tokens in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see GetPublicKey in *AWS CLI Command Reference*.

`get-stage-session`

The following code example shows how to use `get-stage-session`.

AWS CLI

To get a stage session

The following `get-stage-session` example gets the stage session for a specified session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-stage-session \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
    "stageSession": {
        "endTime": "2023-04-26T20:36:29+00:00",
        "sessionId": "st-a1b2c3d4e5f6g",
        "startTime": "2023-04-26T20:30:29.602000+00:00"
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetStageSession in *AWS CLI Command Reference*.

`get-stage`

The following code example shows how to use `get-stage`.

AWS CLI

To get a stage's configuration information

The following `get-stage` example gets the stage configuration for a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
```

```
        "autoParticipantRecordingConfiguration": {
            "storageConfigurationArn": "",
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "DISABLED"
            },
            "recordingReconnectWindowSeconds": 0,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 6
            },

        },
        "name": "test",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see GetStage in *AWS CLI Command Reference*.

`get-storage-configuration`

The following code example shows how to use `get-storage-configuration`.

AWS CLI

To get a composition storage configuration

The following `get-storage-configuration` example gets the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime get-storage-configuration \
    --arn "arn:aws:ivs:us-west-2:123456789012:storage-configuration/abcdABCDefgh"
```

Output:

```
{
    "storageConfiguration": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:storage-configuration/
abcdABCDefgh",
        "name": "test-sc",
        "s3": {
            "bucketName": "amzn-s3-demo-bucket"
        },
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetStorageConfiguration in *AWS CLI Command Reference*.

`import-public-key`

The following code example shows how to use `import-public-key`.

AWS CLI

To import an existing public key to be used to sign stage participant tokens

The following `import-public-key` example imports a public key from a material file, to be used for sigining stage participant tokens.

```
aws ivs-realtime import-public-key \
    --public-key-material="`cat public.pem`"
```

Output:

```
{
```

```
    "publicKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:public-key/abcdABC1efg2",
        "name": "",
        "publicKeyMaterial": "-----BEGIN PUBLIC KEY-----

\n0UAb8NdD4tUE0At4a9hYP9IETEXAMPLE\n-----END PUBLIC KEY-----",
        "fingerprint": "12:a3:44:56:bc:7d:e8:9f:10:2g:34:hi:56:78:90:12",
        "tags": {}
    }
}
```

For more information, see Distribute Participant Tokens in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see ImportPublicKey in *AWS CLI Command Reference*.

`list-compositions`

The following code example shows how to use `list-compositions`.

AWS CLI

To get a list of compositions

The following `list-compositions` example lists all compositions for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-compositions
```

Output:

```
{
    "compositions": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:composition/abcdABCDefgh",
            "destinations": [
                {
                    "id": "AabBCcdDEefF",
                    "startTime": "2023-10-16T23:25:23+00:00",
                    "state": "ACTIVE"
                }
```

```
            ],
            "stageArn": "arn:aws:ivs:us-west-2:123456789012:stage/defgABCDabcd",
            "startTime": "2023-10-16T23:25:21+00:00",
            "state": "ACTIVE",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:composition/ABcdabCDefgh",
            "destinations": [
                {
                    "endTime": "2023-10-16T23:25:00.786512+00:00",
                    "id": "aABbcCDdeEFf",
                    "startTime": "2023-10-16T23:24:01+00:00",
                    "state": "STOPPED"
                },
                {
                    "endTime": "2023-10-16T23:25:00.786512+00:00",
                    "id": "deEFfaABbcCD",
                    "startTime": "2023-10-16T23:24:01+00:00",
                    "state": "STOPPED"
                }
            ],
            "endTime": "2023-10-16T23:25:00+00:00",
            "stageArn": "arn:aws:ivs:us-west-2:123456789012:stage/efghabcdABCD",
            "startTime": "2023-10-16T23:24:00+00:00",
            "state": "STOPPED",
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListCompositions in *AWS CLI Command Reference*.

`list-encoder-configurations`

The following code example shows how to use `list-encoder-configurations`.

AWS CLI

To list composition encoder configurations

The following `list-encoder-configurations` example lists all composition encoder configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-encoder-configurations
```

Output:

```
{
    "encoderConfigurations": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:encoder-configuration/
abcdABCDefgh",
            "name": "test-ec-1",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:encoder-configuration/
ABCefgEFGabc",
            "name": "test-ec-2",
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListEncoderConfigurations in *AWS CLI Command Reference*.

`list-ingest-configurations`

The following code example shows how to use `list-ingest-configurations`.

AWS CLI

To get summary information about all ingest configurations

The following `list-ingest-configurations` example lists all ingest configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-ingest-configurations
```

Output:

```
{
    "ingestConfigurations": [
        {
            "name": "",
            "arn": "arn:aws:ivs:us-west-2:123456789012:ingest-configuration/
XYZuvwSt4567",
            "ingestProtocol": "RTMPS",
            "stageArn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
            "participantId": "abC789Xyz456",
            "state": "INACTIVE",
            "userId": ""
        }
    ]
}
```

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListIngestConfigurations in *AWS CLI Command Reference*.

`list-participant-events`

The following code example shows how to use `list-participant-events`.

AWS CLI

Example 1: To get a list of stage participant events

The following `list-participant-events` example lists all participant events for a specified participant ID and session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-participant-events \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
```

```
    "events": [
        {
            "eventTime": "2023-04-26T20:36:28+00:00",
            "name": "LEFT",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2023-04-26T20:36:28+00:00",
            "name": "PUBLISH_STOPPED",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2023-04-26T20:30:34+00:00",
            "name": "JOINED",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2023-04-26T20:30:34+00:00",
            "name": "PUBLISH_STARTED",
            "participantId": "abCDEf12GHIj"
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 2: To get a list of stage participant events, including participant replication stop and start

The following `list-participant-events` example lists all participant events for a specified session ID of a specified stage ARN (Amazon Resource Name), where a participant is replicated to another stage.

```
aws ivs-realtime list-participant-events \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
```

```
    "events": [
        {
            "eventTime": "2025-04-26T20:36:28+00:00",
            "name": "LEFT",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2025-04-26T20:36:28+00:00",
            "name": "PUBLISH_STOPPED",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2025-04-26T20:30:34+00:00",
            "name": "JOINED",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2025-04-26T20:30:34+00:00",
            "name": "PUBLISH_STARTED",
            "participantId": "abCDEf12GHIj"
        },
        {
            "name": "REPLICATION_STARTED",
            "participantId": "abCDEf12GHIj",
            "eventTime": "2025-04-26T20:30:34+00:00",
            "destinationStageArn": "arn:aws:ivs:us-west-2:12345678901:stage/
ABCDabcdefgh",
            "destinationSessionId": "st-b1c2d3e4f5g6a"
        },
        {
            "name": "REPLICATION_STOPPED",
            "participantId": "abCDEf12GHIj",
            "eventTime": "2025-04-26T20:32:34+00:00",
            "destinationStageArn": "arn:aws:ivs:us-west-2:12345678901:stage/
ABCDabcdefgh",
            "destinationSessionId": "st-b1c2d3e4f5g6a"
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see ListParticipantEvents in *AWS CLI Command Reference*.

`list-participant-replicas`

The following code example shows how to use `list-participant-replicas`.

AWS CLI

To get a list of stage participant replicas

The following `list-participant-replicas` example lists all stage participants replicated from the specified source stage ARN (Amazon Resource Name) to another stage.

```
aws ivs-realtime list-participant-replicas \
    --source-stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "replicas": [
        {
            "sourceStageArn": "arn:aws:ivs:us-west-2:123456789012:stage/
abcdABCDefgh",
            "participantId": "abCDEf12GHIj",
            "sourceSessionId": "st-a1b2c3d4e5f6g",
            "destinationStageArn": "arn:aws:ivs:us-west-2:123456789111:stage/
ABCDabcdefgh",
            "destinationSessionId": "st-b1c2d3e4f5g6a",
            "replicationState": "ACTIVE"
        }
    ]
}
```

For more information, see IVS Participant Replication in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see ListParticipantReplicas in *AWS CLI Command Reference*.

`list-participants`

The following code example shows how to use `list-participants`.

AWS CLI

Example 1: To get a list of stage participants

The following `list-participants` example lists all participants for a specified session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-participants \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
    "participants": [
        {
            "firstJoinTime": "2023-04-26T20:30:34+00:00",
            "participantId": "abCDEf12GHIj",
            "published": true,
            "recordingState": "STOPPED",
            "state": "DISCONNECTED",
            "userId": ""
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 2: To get a list of stage participants, when a participant has been replicated to another stage

The following `list-participants` example lists all participants for a specified session ID of a specified stage ARN (Amazon Resource Name), when a participant has been replicated to another stage.

```
aws ivs-realtime list-participants \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
    "participants": [
        {
            "firstJoinTime": "2023-04-26T20:30:34+00:00",
            "participantId": "abCDEf12GHIj",
            "published": true,
            "recordingState": "STOPPED",
            "state": "DISCONNECTED",
            "userId": "",
            "replicationState": "ACTIVE",
            "replicationType": "SOURCE",
            "sourceStageArn": "",
            "sourceSessionId": ""
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 3: To get a list of stage participants, when a participant has been replicated from another stage

The following `list-participants` example lists all participants for a specified session ID of a specified stage ARN (Amazon Resource Name), when a participant has been replicated from another stage.

```
aws ivs-realtime list-participants \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
    "participants": [
        {
            "firstJoinTime": "2023-04-26T20:30:34+00:00",
            "participantId": "abCDEf12GHIj",
            "published": true,
            "recordingState": "STOPPED",
            "state": "DISCONNECTED",
            "userId": "",
```

```
            "replicationState": "ACTIVE",
            "replicationType": "REPLICA",
            "sourceStageArn": "arn:aws:ivs:us-west-2:123456789012:stage/
abcdABCDefgh",
            "sourceSessionId": "st-a1b2c3d4e5f6g"
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see ListParticipants in *AWS CLI Command Reference*.

`list-public-keys`

The following code example shows how to use `list-public-keys`.

AWS CLI

To list existing public keys available to sign stage participant tokens

The following `list-public-keys` example lists all public keys available for sigining stage participant tokens, in the AWS region where the API request is processed.

```
aws ivs-realtime list-public-keys
```

Output:

```
{
    "publicKeys": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:public-key/abcdABC1efg2",
            "name": "",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:public-key/3bcdABCDefg4",
            "name": "",
            "tags": {}
        }
    ]
```

```
}
```

For more information, see Distribute Participant Tokens in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see ListPublicKeys in *AWS CLI Command Reference*.

`list-stage-sessions`

The following code example shows how to use `list-stage-sessions`.

AWS CLI

To get a list of stage sessions

The following `list-stage-sessions` example lists all sessions for a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-stage-sessions \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{
    "stageSessions": [
        {
            "endTime": "2023-04-26T20:36:29+00:00",
            "sessionId": "st-a1b2c3d4e5f6g",
            "startTime": "2023-04-26T20:30:29.602000+00:00"
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListStageSessions in *AWS CLI Command Reference*.

`list-stages`

The following code example shows how to use `list-stages`.

AWS CLI

To get summary information about all stages

The following `list-stages` example lists all stages for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-stages
```

Output:

```
{
    "stages": [
        {
            "activeSessionId": "st-a1b2c3d4e5f6g",
            "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
            "name": "stage1",
            "tags": {}
        },
        {
            "activeSessionId": "st-a123bcd456efg",
            "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcd1234ABCD",
            "name": "stage2",
            "tags": {}
        },
        {
            "activeSessionId": "st-abcDEF1234ghi",
            "arn": "arn:aws:ivs:us-west-2:123456789012:stage/ABCD1234efgh",
            "name": "stage3",
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListStages in *AWS CLI Command Reference*.

`list-storage-configurations`

The following code example shows how to use `list-storage-configurations`.

AWS CLI

To list composition storage configurations

The following `list-storage-configurations` example lists all composition storage configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-storage-configurations
```

Output:

```
{
    "storageConfigurations": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:storage-configuration/
abcdABCDefgh",
            "name": "test-sc-1",
            "s3": {
                "bucketName": "amzn-s3-demo-bucket-1"
            },
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:storage-configuration/
ABCefgEFGabc",
            "name": "test-sc-2",
            "s3": {
                "bucketName": "amzn-s3-demo-bucket-2"
            },
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListStorageConfigurations in *AWS CLI Command Reference*.

`start-composition`

The following code example shows how to use `start-composition`.

AWS CLI

Example 1: To start a composition with default layout settings

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations.

```
aws ivs-realtime start-composition \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/defgABCDabcd \
    --destinations '[{"channel": {"channelArn": "arn:aws:ivs:us-
west-2:123456789012:channel/abcABCdefDEg",
        "encoderConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:encoder-
configuration/ABabCDcdEFef"}},
        {"s3":{"encoderConfigurationArns":["arn:aws:ivs:us-
west-2:123456789012:encoder-configuration/ABabCDcdEFef"],
        "recordingConfiguration": {"hlsConfiguration":
 {"targetSegmentDurationSeconds": 5}},
        "storageConfigurationArn":"arn:aws:ivs:us-west-2:123456789012:storage-
configuration/FefABabCDcdE"}}]'
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "state": "STARTING"
            },
            {
                "configuration": {
                    "name": "",
                    "s3": {
```

```
                        "encoderConfigurationArns": [
                            "arn:aws:ivs:arn:aws:ivs:us-west-2:123456789012:encoder-
configuration/ABabCDcdEFef"
                        ],
                        "recordingConfiguration": {
                            "format": "HLS",
                            "hlsConfiguration": {
                                "targetSegmentDurationSeconds": 5
                            }
                        },
                        "storageConfigurationArn": "arn:arn:aws:ivs:us-
west-2:123456789012:storage-configuration/FefABabCDcdE"
                    }
                },
                "detail": {
                    "s3": {
                        "recordingPrefix": "aBcDeFgHhGfE/AbCdEfGhHgFe/GHFabcgefABC/
composite"
                    }
                },
                "id": "GHFabcgefABC",
                "state": "STARTING"
            }
        ],
        "layout": {
            "grid": {
                "featuredParticipantAttribute": "",
                "gridGap": 2,
                "omitStoppedVideo": false,
                "participantOrderAttribute": "",
                "videoAspectRatio": "VIDEO",
                "videoFillMode": ""
            }
        },
        "stageArn": "arn:aws:ivs:us-west-2:123456789012:stage/defgABCDabcd",
        "startTime": "2023-10-16T23:24:00+00:00",
        "state": "STARTING",
        "tags": {}
    }
}
```

For more information, see IVS Composite Recording | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

Example 2: To start a composition with PiP layout

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations using PiP layout.

```
aws ivs-realtime start-composition \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/defgABCDabcd \
    --destinations '[{"channel": {"channelArn": "arn:aws:ivs:us-
west-2:123456789012:channel/abcABCdefDEg",
        "encoderConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:encoder-
configuration/ABabCDcdEFef"}},
        {"s3":{"encoderConfigurationArns":["arn:aws:ivs:us-
west-2:123456789012:encoder-configuration/ABabCDcdEFef"],
        "storageConfigurationArn":"arn:aws:ivs:us-west-2:123456789012:storage-
configuration/FefABabCDcdE"}}]' \
    --layout pip='{featuredParticipantAttribute="abcdefg"}'
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:composition/wxyzWXYZpqrs",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "state": "STARTING"
            },
            {

        "state": "STARTING",
        "tags": {}
    }
}
```

For more information, see IVS Composite Recording | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

Example 3: To start a composition with thumbnail recording enabled

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations with thumbnail recording enabled.

```
aws ivs-realtime start-composition \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/defgABCDabcd \
    --destinations '[{"channel": {"channelArn": "arn:aws:ivs:us-
west-2:123456789012:channel/abcABCdefDEg",
        "encoderConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:encoder-
configuration/ABabCDcdEFef"}},
        {"s3": {"encoderConfigurationArns": ["arn:aws:ivs:us-
west-2:123456789012:encoder-configuration/ABabCDcdEFef"],
        "storageConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:storage-
configuration/FefABabCDcdE",
        "thumbnailConfigurations": [{"storage":
 ["SEQUENTIAL"],"targetIntervalSeconds": 60}]}}]'
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {
                "configuration": {

            }
        },
        "stageArn": "arn:aws:ivs:us-west-2:123456789012:stage/defgABCDabcd",
        "startTime": "2023-10-16T23:24:00+00:00",
        "state": "STARTING",
```

```
        "tags": {}
    }
}
```

For more information, see Composite Recording (Real-Time Streaming) in the *Amazon Interactive Video Service User Guide*.

Example 4: To start a composition using grid layout with custom participant ordering

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations using grid layout with custom participant ordering.

```
aws ivs-realtime start-composition \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/defgABCDabcd \
    --destinations '[{"channel": {"channelArn": "arn:aws:ivs:us-
west-2:123456789012:channel/abcABCdefDEg",
        "encoderConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:encoder-
configuration/ABabCDcdEFef"}},
        {"s3": {"encoderConfigurationArns": ["arn:aws:ivs:us-
west-2:123456789012:encoder-configuration/ABabCDcdEFef"],
        "storageConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:storage-
configuration/FefABabCDcdE",
        "thumbnailConfigurations": [{"storage":
 ["SEQUENTIAL"],"targetIntervalSeconds": 60}]}}]' \
    --layout grid='{participantOrderAttribute="abcdefg"}'
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {

- For API details, see StartComposition in *AWS CLI Command Reference*.

`start-participant-replication`

The following code example shows how to use `start-participant-replication`.

AWS CLI

To start replicating a participant from one stage to another stage

The following `start-participant-replication` example replicates a participant from a source stage to a destination stage, with each stage specified by its ARN (Amazon Resource Name).

```
aws ivs-realtime start-participant-replication \
    --source-stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --destination-stage-arn arn:aws:ivs:us-west-2:123456789111:stage/bcdABCDefghi \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "accessControlAllowOrigin": "*",
    "accessControlExposeHeaders": "Access-Control-Allow-Origin,Access-Control-
Expose-Headers,Cache-Control,Content-Length,Content-Security-Policy,Content-
Type,date,Strict-Transport-Security,x-amz-apigw-id,x-amzn-errormessage,x-amzn-
errortype,x-amzn-requestid,x-amzn-trace-id,X-Content-Type-Options,X-Frame-Options",
    "cacheControl": "no-store, no-cache",
```

```
    "contentSecurityPolicy": "default-src 'self'; upgrade-insecure-requests;",
    "strictTransportSecurity": "max-age:47304000; includeSubDomains",
    "xContentTypeOptions": "nosniff",
    "xFrameOptions": "DENY"
}
```

For more information, see IVS Participant Replication in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see StartParticipantReplication in *AWS CLI Command Reference*.

`stop-composition`

The following code example shows how to use `stop-composition`.

AWS CLI

To stop a composition

The following `stop-composition` example stops the composition specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime stop-composition \
    --arn "arn:aws:ivs:us-west-2:123456789012:composition/abcdABCDefgh"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see StopComposition in *AWS CLI Command Reference*.

`stop-participant-replication`

The following code example shows how to use `stop-participant-replication`.

AWS CLI

To stop replicating a participant from one stage to another stage

The following `stop-participant-replication` example stops replicating a participant from a source stage to a destination stage, with each stage specified by its ARN (Amazon Resource Name).

```
aws ivs-realtime stop-participant-replication \
    --source-stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --destination-stage-arn arn:aws:ivs:us-west-2:123456789111:stage/bcdABCDefghi \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "accessControlAllowOrigin": "*",
    "accessControlExposeHeaders": "Access-Control-Allow-Origin,Access-Control-
Expose-Headers,Cache-Control,Content-Length,Content-Security-Policy,Content-
Type,date,Strict-Transport-Security,x-amz-apigw-id,x-amzn-errormessage,x-amzn-
errortype,x-amzn-requestid,x-amzn-trace-id,X-Content-Type-Options,X-Frame-Options",
    "cacheControl": "no-store, no-cache",
    "contentSecurityPolicy": "default-src 'self'; upgrade-insecure-requests;",
    "strictTransportSecurity": "max-age:47304000; includeSubDomains",
    "xContentTypeOptions": "nosniff",
    "xFrameOptions": "DENY"
}
```

For more information, see IVS Participant Replication in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see StopParticipantReplication in *AWS CLI Command Reference*.

`update-ingest-configuration`

The following code example shows how to use `update-ingest-configuration`.

AWS CLI

To update an ingest configuration

The following `update-ingest-configuration` example updates an ingest configuration to attach it to a stage.

```
aws ivs-realtime update-ingest-configuration \
    --arn arn:aws:ivs:us-west-2:123456789012:ingest-configuration/AbCdEfGh1234 \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{
    "ingestConfiguration": {
        "name": "ingest1",
        "arn": "arn:aws:ivs:us-west-2:123456789012:ingest-configuration/
AbCdEfGh1234",
        "ingestProtocol": "RTMPS",
        "streamKey": "rt_123456789012_us-
west-2_AbCdEfGh1234_abcd1234efgh5678ijkl9012MNOP34",
        "stageArn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "participantId": "xyZ654abC321",
        "state": "INACTIVE",
        "userId": "",
        "tags": {}
    }
}
```

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see UpdateIngestConfiguration in *AWS CLI Command Reference*.

`update-stage`

The following code example shows how to use `update-stage`.

AWS CLI

Example 1: To update a stage's configuration

The following `update-stage` example updates a stage for a specified stage ARN to update the stage name and configure individual participant recording with thumbnail recording enabled.

```
aws ivs-realtime update-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --auto-participant-recording-configuration '{"mediaTypes":
 ["AUDIO_VIDEO"],"storageConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:storage-configuration/abcdABCDefgh",
 "recordingReconnectWindowSeconds": 100,
        "thumbnailConfiguration": {"recordingMode": "INTERVAL","storage":
 ["SEQUENTIAL"],"targetIntervalSeconds": 60},
        "hlsConfiguration": {"targetSegmentDurationSeconds": 5}}' \
    --name stage1a
```

Output:

```
{
    "stage": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "storageConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:storage-
configuration/abcdABCDefgh",
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "INTERVAL"
            },
            "recordingReconnectWindowSeconds": 100,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 5
            },
            "recordParticipantReplicas": true
        },
        "endpoints": {
            "events": "wss://global.events.live-video.net",

        },
        "name": "stage1a",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 2: To update a stage's configuration, including disabling participant replica recording

The following `update-stage` example updates a stage for a specified stage ARN to update the stage name and configure individual participant recording with thumbnail recording enabled and participant replica recording disabled.

```
aws ivs-realtime update-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --auto-participant-recording-configuration '{"mediaTypes":
 ["AUDIO_VIDEO"],"storageConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:storage-configuration/abcdABCDefgh",
 "recordingReconnectWindowSeconds": 100,
        "thumbnailConfiguration": {"recordingMode": "INTERVAL","storage":
 ["SEQUENTIAL"],"targetIntervalSeconds": 60}, "recordParticipantReplicas":false,
        "hlsConfiguration": {"targetSegmentDurationSeconds": 5}}' \
    --name stage1a
```

Output:

```
{
    "stage": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "storageConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:storage-
configuration/abcdABCDefgh",
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "INTERVAL"
            },
            "recordingReconnectWindowSeconds": 100,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 5
            },
            "recordParticipantReplicas": false
        },
        "endpoints": {
            "events": "wss://global.events.live-video.net",

app/",
```

```
            "rtmps": "rtmps://9x0y8z7s6t5u.global-contribute-staging.live-
video.net:443/app/",
            "whip": "https://1a2b3c4d5e6f.global-bm.whip.live-video.net"
        },
        "name": "stage1a",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see UpdateStage in *AWS CLI Command Reference*.

Amazon Kendra examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Kendra.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-data-source`

The following code example shows how to use `create-data-source`.

AWS CLI

To create an Amazon Kendra data source connector

The following `create-data-source` example creates and configures an Amazon Kendra data source connector. You can use `describe-data-source` to view the status of a data source

connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra create-data-source \
    --name "example data source 1" \
    --description "Example data source 1 for example index 1 contains the first set
 of example documents" \
    --tags '[{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources",
 "Value": "aws"}]' \
    --role-arn "arn:aws:iam::my-account-id:role/
KendraRoleForS3TemplateConfigDataSource" \
    --index-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --language-code "es" \
    --schedule "0 0 18 ? * TUE,MON,WED,THU,FRI,SAT *" \
    --configuration file://s3schemaconfig.json \
    --type "TEMPLATE" \
    --custom-document-enrichment-configuration '{"PostExtractionHookConfiguration":
 {"LambdaArn": "arn:aws:iam::my-account-id:function/my-function-ocr-docs",
 "S3Bucket": "s3://amzn-s3-demo-bucket/scanned-image-text-example-docs"}, "RoleArn":
 "arn:aws:iam:my-account-id:role/KendraRoleForCDE"}' \
    --vpc-configuration '{"SecurityGroupIds": ["sg-1234567890abcdef0"], "SubnetIds":
 ["subnet-1c234","subnet-2b134"]}'
```

Contents of `s3schemaconfig.json`:

```
{
    "TemplateConfiguration": {
        "Template": {
            "connectionConfiguration": {
                "repositoryEndpointMetadata": {
                    "BucketName": "amzn-s3-demo-bucket"
                }
            },
            "repositoryConfigurations": {
                "document": {
                    "fieldMappings": [
                        {
                            "indexFieldName": "_document_title",
                            "indexFieldType": "STRING",
                            "dataSourceFieldName": "title"
                        }
                    ]
                }
```

```
            },
            "additionalProperties": {
                "inclusionPatterns": [
                    "*.txt",
                    "*.doc",
                    "*.docx"
                ],
                "inclusionPrefixes": [
                    "PublicExampleDocsFolder"
                ]
            },
            "syncMode": "FULL_CRAWL",
            "type": "S3",
            "version": "1.0.0"
        }
    }
}
```

Output:

```
{
    "Id": "exampledatasource1"
}
```

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see CreateDataSource in *AWS CLI Command Reference*.

`create-index`

The following code example shows how to use `create-index`.

AWS CLI

To create an Amazon Kendra index

The following `create-index` example creates and configures an Amazon Kendra index. You can use `describe-index` to view the status of an index, and read any error messages if the status shows an index "FAILED" to completely create.

```
aws kendra create-index \
```

```
    --name "example index 1" \
    --description "Example index 1 contains the first set of example documents" \
    --tags '[{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources",
 "Value": "aws"}]' \
    --role-arn "arn:aws:iam::my-account-id:role/KendraRoleForExampleIndex" \
    --edition "DEVELOPER_EDITION" \
    --server-side-encryption-configuration '{"KmsKeyId": "my-kms-key-id"}' \
    --user-context-policy "USER_TOKEN" \
    --user-token-configurations '{"JsonTokenTypeConfiguration":
 {"GroupAttributeField": "groupNameField", "UserNameAttributeField":
 "userNameField"}}'
```

Output:

```
{
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see CreateIndex in *AWS CLI Command Reference*.

`describe-data-source`

The following code example shows how to use `describe-data-source`.

AWS CLI

To get information about an Amazon Kendra data source connector

The following `describe-data-source` example gets information about an Amazon Kendra data source connector. You can view the configuration of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra describe-data-source \
    --id exampledatasource1 \
    --index-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
```

```
    "Configuration": {
        "TemplateConfiguration": {
            "Template": {
                "connectionConfiguration": {
                    "repositoryEndpointMetadata": {
                        "BucketName": "amzn-s3-demo-bucket"
                    }
                },
                "repositoryConfigurations": {
                    "document":{
                        "fieldMappings": [
                            {

`update-data-source`

The following code example shows how to use `update-data-source`.

AWS CLI

To update an Amazon Kendra data source connector

The following `update-data-source` example updates the configuration of an Amazon Kendra data source connector. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use `describe-data-source` to view the configuration and status of a data source connector.

```
aws kendra update-data-source \
    --id exampledatasource1 \
    --index-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --name "new name for example data source 1" \
```

```
    --description "new description for example data source 1" \
    --role-arn arn:aws:iam::my-account-id:role/KendraNewRoleForExampleDataSource \
    --configuration file://s3schemanewconfig.json \
    --custom-document-enrichment-configuration '{"PostExtractionHookConfiguration":
{"LambdaArn": "arn:aws:iam::my-account-id:function/my-function-ocr-docs",
"S3Bucket": "s3://amzn-s3-demo-bucket/scanned-image-text-example-docs"}, "RoleArn":
"arn:aws:iam:my-account-id:role/KendraNewRoleForCDE"}' \
    --language-code "es" \
    --schedule "0 0 18 ? * MON,WED,FRI *" \
    --vpc-configuration '{"SecurityGroupIds": ["sg-1234567890abcdef0"], "SubnetIds":
["subnet-1c234","subnet-2b134"]}'
```

Contents of `s3schemanewconfig.json`:

```
{
    "TemplateConfiguration": {
        "Template": {
            "connectionConfiguration": {
                "repositoryEndpointMetadata": {
                    "BucketName": "amzn-s3-demo-bucket"
                }
            },
            "repositoryConfigurations": {
                "document": {
                    "fieldMappings": [
                        {
                            "indexFieldName": "_document_title",
                            "indexFieldType": "STRING",
                            "dataSourceFieldName": "title"
                        }
                    ]
                }
            },
            "additionalProperties": {
                "inclusionPatterns": [
                    "*.txt",
                    "*.doc",
                    "*.docx"
                ],
                "inclusionPrefixes": [
                    "NewPublicExampleDocsFolder"
                ]
            },
```

```
            "syncMode": "FULL_CRAWL",
            "type": "S3",
            "version": "1.0.0"
        }
    }
}
```

This command produces no output.

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see UpdateDataSource in *AWS CLI Command Reference*.

`update-index`

The following code example shows how to use `update-index`.

AWS CLI

To update an Amazon Kendra index

The following `update-index` example updates the configuration of an Amazon Kendra index. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use `describe-index` to view the configuration and status of an index.

```
aws kendra update-index \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --name "new name for Enterprise Edition index 1" \
    --description "new description for Enterprise Edition index 1" \
    --role-arn arn:aws:iam::my-account-id:role/KendraNewRoleForEnterpriseIndex \
    --capacity-units '{"QueryCapacityUnits": 2, "StorageCapacityUnits": 1}' \
    --document-metadata-configuration-updates '[{"Name": "_document_title", "Type":
 "STRING_VALUE", "Relevance": {"Importance": 6}}, {"Name": "_last_updated_at",
 "Type": "DATE_VALUE", "Relevance": {"Importance": 8}}]' \
    --user-context-policy "USER_TOKEN" \
    --user-token-configurations '[{"JsonTokenTypeConfiguration":
 {"GroupAttributeField": "groupNameField", "UserNameAttributeField":
 "userNameField"}}]'
```

This command produces no output.

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see UpdateIndex in *AWS CLI Command Reference*.

Kinesis examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Kinesis.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags-to-stream`

The following code example shows how to use `add-tags-to-stream`.

AWS CLI

To add tags to a data stream

The following `add-tags-to-stream` example assigns a tag with the key `samplekey` and value `example` to the specified stream.

```
aws kinesis add-tags-to-stream \
    --stream-name samplestream \
    --tags samplekey=example
```

This command produces no output.

For more information, see Tagging Your Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see AddTagsToStream in *AWS CLI Command Reference*.

`create-stream`

The following code example shows how to use `create-stream`.

AWS CLI

To create a data stream

The following `create-stream` example creates a data stream named samplestream with 3 shards.

```
aws kinesis create-stream \
    --stream-name samplestream \
    --shard-count 3
```

This command produces no output.

For more information, see Creating a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see CreateStream in *AWS CLI Command Reference*.

`decrease-stream-retention-period`

The following code example shows how to use `decrease-stream-retention-period`.

AWS CLI

To decrease data stream retention period

The following `decrease-stream-retention-period` example decreases the retention period (the length of time data records are accessible after they are added to the stream) of a stream named samplestream to 48 hours.

```
aws kinesis decrease-stream-retention-period \
    --stream-name samplestream \
    --retention-period-hours 48
```

This command produces no output.

For more information, see Changing the Data Retention Period in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DecreaseStreamRetentionPeriod in *AWS CLI Command Reference*.

`delete-stream`

The following code example shows how to use `delete-stream`.

AWS CLI

To delete a data stream

The following `delete-stream` example deletes the specified data stream.

```
aws kinesis delete-stream \
    --stream-name samplestream
```

This command produces no output.

For more information, see Deleting a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DeleteStream in *AWS CLI Command Reference*.

`deregister-stream-consumer`

The following code example shows how to use `deregister-stream-consumer`.

AWS CLI

To deregister a data stream consumer

The following `deregister-stream-consumer` example deregisters the specified consumer from the specified data stream.

```
aws kinesis deregister-stream-consumer \
    --stream-arn arn:aws:kinesis:us-west-2:123456789012:stream/samplestream \
    --consumer-name KinesisConsumerApplication
```

This command produces no output.

For more information, see Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DeregisterStreamConsumer in *AWS CLI Command Reference*.

`describe-limits`

The following code example shows how to use `describe-limits`.

AWS CLI

To describe shard limits

The following `describe-limits` example displays the shard limits and usage for the current AWS account.

```
aws kinesis describe-limits
```

Output:

```
{
    "ShardLimit": 500,
    "OpenShardCount": 29
}
```

For more information, see Resharding a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeLimits in *AWS CLI Command Reference*.

`describe-stream-consumer`

The following code example shows how to use `describe-stream-consumer`.

AWS CLI

To describe a data stream consumer

The following `describe-stream-consumer` example returns the description of the specified consumer, registered with the specified data stream.

```
aws kinesis describe-stream-consumer \
    --stream-arn arn:aws:kinesis:us-west-2:123456789012:stream/samplestream \
    --consumer-name KinesisConsumerApplication
```

Output:

```
{
    "ConsumerDescription": {
        "ConsumerName": "KinesisConsumerApplication",
        "ConsumerARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream/
consumer/KinesisConsumerApplication:1572383852",
        "ConsumerStatus": "ACTIVE",
        "ConsumerCreationTimestamp": 1572383852.0,
        "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream"
    }
}
```

For more information, see Reading Data from Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeStreamConsumer in *AWS CLI Command Reference*.

`describe-stream-summary`

The following code example shows how to use `describe-stream-summary`.

AWS CLI

To describe a data stream summary

The following `describe-stream-summary` example provides a summarized description (without the shard list) of the specified data stream.

```
aws kinesis describe-stream-summary \
    --stream-name samplestream
```

Output:

```
{
    "StreamDescriptionSummary": {
        "StreamName": "samplestream",
        "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream",
        "StreamStatus": "ACTIVE",
        "RetentionPeriodHours": 48,
        "StreamCreationTimestamp": 1572297168.0,
        "EnhancedMonitoring": [
```

```
            {
                "ShardLevelMetrics": []
            }
        ],
        "EncryptionType": "NONE",
        "OpenShardCount": 3,
        "ConsumerCount": 0
    }
}
```

For more information, see Creating and Managing Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeStreamSummary in *AWS CLI Command Reference*.

`describe-stream`

The following code example shows how to use `describe-stream`.

AWS CLI

To describe a data stream

The following `describe-stream` example returns the details of the specified data stream.

```
aws kinesis describe-stream \
    --stream-name samplestream
```

Output:

```
{
    "StreamDescription": {
        "Shards": [
            {
                "ShardId": "shardId-000000000000",
                "HashKeyRange": {
                    "StartingHashKey": "0",
                    "EndingHashKey": "113427455640312821154458202477256070484"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber":
 "496008716829570364423650249261910734372510605801286533l4"
```

```
                }
            },
            {
                "ShardId": "shardId-000000000001",
                "HashKeyRange": {
                    "StartingHashKey": "113427455640312821154458202477256070485",
                    "EndingHashKey": "226854911280625642308916404954512140969"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber":
 "496008716829793371875635555493326091555237089416346337 46"
                }
            },
            {
                "ShardId": "shardId-000000000002",
                "HashKeyRange": {
                    "StartingHashKey": "226854911280625642308916404954512140970",
                    "EndingHashKey": "340282366920938463463374607431768211455"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber":
 "496008716830016379327620861724741448737963573031406141 78"
                }
            }
        ],
        "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream",
        "StreamName": "samplestream",
        "StreamStatus": "ACTIVE",
        "RetentionPeriodHours": 24,
        "EnhancedMonitoring": [
            {
                "ShardLevelMetrics": []
            }
        ],
        "EncryptionType": "NONE",
        "KeyId": null,
        "StreamCreationTimestamp": 1572297168.0
    }
}
```

For more information, see Creating and Managing Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeStream in *AWS CLI Command Reference*.

`disable-enhanced-monitoring`

The following code example shows how to use `disable-enhanced-monitoring`.

AWS CLI

To disable enhanced monitoring for shard-level metrics

The following `disable-enhanced-monitoring` example disables enhanced Kinesis data stream monitoring for shard-level metrics.

```
aws kinesis disable-enhanced-monitoring \
    --stream-name samplestream \
    --shard-level-metrics ALL
```

Output:

```
{
    "StreamName": "samplestream",
    "CurrentShardLevelMetrics": [
        "IncomingBytes",
        "OutgoingRecords",
        "IteratorAgeMilliseconds",
        "IncomingRecords",
        "ReadProvisionedThroughputExceeded",
        "WriteProvisionedThroughputExceeded",
        "OutgoingBytes"
    ],
    "DesiredShardLevelMetrics": []
}
```

For more information, see Monitoring Streams in Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DisableEnhancedMonitoring in *AWS CLI Command Reference*.

`enable-enhanced-monitoring`

The following code example shows how to use `enable-enhanced-monitoring`.

AWS CLI

To enable enhanced monitoring for shard-level metrics

The following `enable-enhanced-monitoring` example enables enhanced Kinesis data stream monitoring for shard-level metrics.

```
aws kinesis enable-enhanced-monitoring \
    --stream-name samplestream \
    --shard-level-metrics ALL
```

Output:

```
{
    "StreamName": "samplestream",
    "CurrentShardLevelMetrics": [],
    "DesiredShardLevelMetrics": [
        "IncomingBytes",
        "OutgoingRecords",
        "IteratorAgeMilliseconds",
        "IncomingRecords",
        "ReadProvisionedThroughputExceeded",
        "WriteProvisionedThroughputExceeded",
        "OutgoingBytes"
    ]
}
```

For more information, see Monitoring Streams in Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see EnableEnhancedMonitoring in *AWS CLI Command Reference*.

`get-records`

The following code example shows how to use `get-records`.

AWS CLI

To obtain records from a shard

The following `get-records` example gets data records from a Kinesis data stream's shard using the specified shard iterator.

```
aws kinesis get-records \
    --shard-iterator AAAAAAAAAAF7/0mWD7IuHj1yGv/
TKuNgx2ukD5xipCY4cy4gU96orWwZwcSXh3K9tAmGYeOZyLZrvzzeOFVf9iN99hUPw/w/
```

```
b0YWYeehfNvnf1DYt5XpDJghLKr3DzgznkTmMymDP3R+3wRKeuEw6/kdxY2yKJH0veaiekaVc4N2VwK/
GvaGP2Hh9Fg7N++q0Adg6fIDQPt4p8RpavDbk+A4sL9SWGE1
```

Output:

```
{
    "Records": [],
    "MillisBehindLatest": 80742000
}
```

For more information, see Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see GetRecords in *AWS CLI Command Reference*.

`get-shard-iterator`

The following code example shows how to use `get-shard-iterator`.

AWS CLI

To obtain a shard iterator

The following `get-shard-iterator` example uses the AT_SEQUENCE_NUMBER shard iterator type and generates a shard iterator to start reading data records exactly from the position denoted by the specified sequence number.

```
aws kinesis get-shard-iterator \
    --stream-name samplestream \
    --shard-id shardId-000000000001 \
    --shard-iterator-type LATEST
```

Output:

```
{
    "ShardIterator": "AAAAAAAAAAFEvJjIYI+3jw/4aqgH9FifJ+n48XWTh/
IFIsbILP6o5eDueD39NXNBfpZ10WL5K6ADXk8w+5H+Qhd9cFA9k268CPXCz/kebq1TGYI7Vy
+lUkA9BuN3xvATxMBGxRY3zYK05gqgvaIRn94O8SqeEqwhigwZxNWxID3Ej7YYYcxQi8Q/fIrCjGAy/
n2r5Z9G864YpWDfN9upNNQAR/iiOWKs"
}
```

For more information, see Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see GetShardIterator in *AWS CLI Command Reference*.

`increase-stream-retention-period`

The following code example shows how to use `increase-stream-retention-period`.

AWS CLI

To increase data stream retention period

The following `increase-stream-retention-period` example increases the retention period (the length of time data records are accessible after they are added to the stream) of the specified stream to 168 hours.

```
aws kinesis increase-stream-retention-period \
    --stream-name samplestream \
    --retention-period-hours 168
```

This command produces no output.

For more information, see Changing the Data Retention Period in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see IncreaseStreamRetentionPeriod in *AWS CLI Command Reference*.

`list-shards`

The following code example shows how to use `list-shards`.

AWS CLI

To list shards in a data stream

The following `list-shards` example lists all shards in the specified stream starting with the shard whose ID immediately follows the specified `exclusive-start-shard-id` of `shardId-000000000000`.

```
aws kinesis list-shards \
```

```
    --stream-name samplestream \
    --exclusive-start-shard-id shardId-000000000000
```

Output:

```
{
    "Shards": [
        {
            "ShardId": "shardId-000000000001",
            "HashKeyRange": {
                "StartingHashKey": "113427455640312821154458202477256070485",
                "EndingHashKey": "226854911280625642308916404954512140969"
            },
            "SequenceNumberRange": {
                "StartingSequenceNumber":
 "496008716829793371875635555493326091555237089416346337 46"
            }
        },
        {
            "ShardId": "shardId-000000000002",
            "HashKeyRange": {
                "StartingHashKey": "226854911280625642308916404954512140970",
                "EndingHashKey": "340282366920938463463374607431768211455"
            },
            "SequenceNumberRange": {
                "StartingSequenceNumber":
 "496008716830016379327620861724741448737963573031406141 78"
            }
        }
    ]
}
```

For more information, see Listing Shards in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see ListShards in *AWS CLI Command Reference*.

`list-streams`

The following code example shows how to use `list-streams`.

AWS CLI

To list data streams

The following `list-streams` example lists all active data streams in the current account and region.

```
aws kinesis list-streams
```

Output:

```
{
    "StreamNames": [
        "samplestream",
        "samplestream1"
    ]
}
```

For more information, see Listing Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see ListStreams in *AWS CLI Command Reference*.

`list-tags-for-stream`

The following code example shows how to use `list-tags-for-stream`.

AWS CLI

To list tags for a data stream

The following `list-tags-for-stream` example lists the tags attached to the specified data stream.

```
aws kinesis list-tags-for-stream \
    --stream-name samplestream
```

Output:

```
{
    "Tags": [
        {
            "Key": "samplekey",
            "Value": "example"
        }
```

```
    ],
    "HasMoreTags": false
}
```

For more information, see Tagging Your Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see ListTagsForStream in *AWS CLI Command Reference*.

`merge-shards`

The following code example shows how to use `merge-shards`.

AWS CLI

To merge shards

The following `merge-shards` example merges two adjacent shards with IDs of shardId-000000000000 and shardId-000000000001 in the specified data stream and combines them into a single shard.

```
aws kinesis merge-shards \
    --stream-name samplestream \
    --shard-to-merge shardId-000000000000 \
    --adjacent-shard-to-merge shardId-000000000001
```

This command produces no output.

For more information, see Merging Two Shards in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see MergeShards in *AWS CLI Command Reference*.

`put-record`

The following code example shows how to use `put-record`.

AWS CLI

To write a record into a data stream

The following `put-record` example writes a single data record into the specified data stream using the specified partition key.

```
aws kinesis put-record \
    --stream-name samplestream \
    --data sampledatarecord \
    --partition-key samplepartitionkey
```

Output:

```
{
    "ShardId": "shardId-000000000009",
    "SequenceNumber": "49600902273357540915989931256901506243878407835297513618",
    "EncryptionType": "KMS"
}
```

For more information, see Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see PutRecord in *AWS CLI Command Reference*.

`put-records`

The following code example shows how to use `put-records`.

AWS CLI

To write multiple records into a data stream

The following `put-records` example writes a data record using the specified partition key and another data record using a different partition key in a single call. The `--cli-binary-format raw-in-base64-out` option passes the data as raw text instead of base64.

```
aws kinesis put-records \
    --stream-name samplestream \
    --cli-binary-format raw-in-base64-out \
    --
records Data=blob1,PartitionKey=partitionkey1 Data=blob2,PartitionKey=partitionkey2
```

Output:

```
{
    "FailedRecordCount": 0,
    "Records": [
        {
            "SequenceNumber":
 "49600883331171471519674795588238531498465399900093808706",
            "ShardId": "shardId-000000000004"
        },
        {
            "SequenceNumber":
 "49600902273357540915989931256902715169698037101720764562",
            "ShardId": "shardId-000000000009"
        }
    ],
    "EncryptionType": "KMS"
}
```

For more information, see Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see PutRecords in *AWS CLI Command Reference*.

`register-stream-consumer`

The following code example shows how to use `register-stream-consumer`.

AWS CLI

To register a data stream consumer

The following `register-stream-consumer` example registers a consumer called `KinesisConsumerApplication` with the specified data stream.

```
aws kinesis register-stream-consumer \
    --stream-arn arn:aws:kinesis:us-west-2:123456789012:stream/samplestream \
    --consumer-name KinesisConsumerApplication
```

Output:

```
{
    "Consumer": {
```

```
        "ConsumerName": "KinesisConsumerApplication",
        "ConsumerARN": "arn:aws:kinesis:us-west-2: 123456789012:stream/samplestream/
consumer/KinesisConsumerApplication:1572383852",
        "ConsumerStatus": "CREATING",
        "ConsumerCreationTimestamp": 1572383852.0
    }
}
```

For more information, see Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see RegisterStreamConsumer in *AWS CLI Command Reference*.

`remove-tags-from-stream`

The following code example shows how to use `remove-tags-from-stream`.

AWS CLI

To remove tags from a data stream

The following `remove-tags-from-stream` example removes the tag with the specified key from the specified data stream.

```
aws kinesis remove-tags-from-stream \
    --stream-name samplestream \
    --tag-keys samplekey
```

This command produces no output.

For more information, see Tagging Your Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see RemoveTagsFromStream in *AWS CLI Command Reference*.

`split-shard`

The following code example shows how to use `split-shard`.

AWS CLI

To split shards

The following `split-shard` example splits the specified shard into two new shards using a new starting hash key of 10.

```
aws kinesis split-shard \
    --stream-name samplestream \
    --shard-to-split shardId-000000000000 \
    --new-starting-hash-key 10
```

This command produces no output.

For more information, see Splitting a Shard in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see SplitShard in *AWS CLI Command Reference*.

`start-stream-encryption`

The following code example shows how to use `start-stream-encryption`.

AWS CLI

To enable data stream encryption

The following `start-stream-encryption` example enables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis start-stream-encryption \
    --encryption-type KMS \
    --key-id arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 \
    --stream-name samplestream
```

This command produces no output.

For more information, see Data Protection in Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see StartStreamEncryption in *AWS CLI Command Reference*.

`stop-stream-encryption`

The following code example shows how to use `stop-stream-encryption`.

AWS CLI

To disable data stream encryption

The following `stop-stream-encryption` example disables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis stop-stream-encryption \
    --encryption-type KMS \
    --key-id arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 \
    --stream-name samplestream
```

This command produces no output.

For more information, see Data Protection in Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see StopStreamEncryption in *AWS CLI Command Reference*.

`update-shard-count`

The following code example shows how to use `update-shard-count`.

AWS CLI

To update the shard count in a data stream

The following `update-shard-count` example updates the shard count of the specified data stream to 6. This example uses uniform scaling, which creates shards of equal size.

```
aws kinesis update-shard-count \
    --stream-name samplestream \
    --scaling-type UNIFORM_SCALING \
    --target-shard-count 6
```

Output:

```
{
    "StreamName": "samplestream",
    "CurrentShardCount": 3,
```

```
    "TargetShardCount": 6
}
```

For more information, see Resharding a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see UpdateShardCount in *AWS CLI Command Reference*.

AWS KMS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS KMS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`cancel-key-deletion`

The following code example shows how to use `cancel-key-deletion`.

AWS CLI

To cancel the scheduled deletion of a customer managed KMS key

The following `cancel-key-deletion` example cancels the scheduled deletion of a customer managed KMS key.

```
aws kms cancel-key-deletion \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

When the `cancel-key-deletion` command succeeds, the scheduled deletion is canceled. However, the key state of the KMS key is `Disabled`, so you can't use the KMS key in cryptographic operations. To restore its functionality, use the `enable-key` command .

For more information, see Scheduling and canceling key deletion in the *AWS Key Management Service Developer Guide*.

- For API details, see CancelKeyDeletion in *AWS CLI Command Reference*.

`connect-custom-key-store`

The following code example shows how to use `connect-custom-key-store`.

AWS CLI

To connect a custom key store

The following `connect-custom-key-store` example reconnects the specified custom key store. You can use a command like this one to connect a custom key store for the first time or to reconnect a key store that was disconnected.

You can use this command to connect an AWS CloudHSM key store or an external key store.

```
aws kms connect-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0
```

This command produces no output. To verify that the command was effective, use the `describe-custom-key-stores` command.

For information about connecting an AWS CloudHSM key store, see Connecting and disconnecting an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

For information about connecting an external key store, see Connecting and disconnecting an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see ConnectCustomKeyStore in *AWS CLI Command Reference*.

`create-alias`

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias for a KMS key

The following `create-alias` example creates an alias named `example-alias` for the KMS key identified by key ID `a1b2c3d4-5678-90ab-cdef-EXAMPLE11111`.

Alias names must begin with `alias/`. Do not use alias names that begin with `alias/aws`; these are reserved for use by AWS.

```
aws kms create-alias \
    --alias-name alias/example-alias \
    --target-key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output. To see the new alias, use the `list-aliases` command.

For more information, see Using aliases in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

`create-custom-key-store`

The following code example shows how to use `create-custom-key-store`.

AWS CLI

Example 1: To create an AWS CloudHSM key store

The following `create-custom-key-store` example creates an AWS CloudHSM key store backed by an AWS CloudHSM cluster using the required parameters. You can also add the `custom-key-store-type``parameter with the default value: ``AWS_CLOUDHSM`.

To specify the file input for the `trust-anchor-certificate` command in the AWS CLI, the `file://` prefix is required.

```
aws kms create-custom-key-store \
    --custom-key-store-name ExampleCloudHSMKeyStore \
    --cloud-hsm-cluster-id cluster-1a23b4cdefg \
    --key-store-password kmsPswd \
    --trust-anchor-certificate file://customerCA.crt
```

Contents of `customerCA.crt`:

```
-----BEGIN CERTIFICATE-----
MIIDWTCCAkGgAwIBAgIUEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEwDQYJKoZI
hvcNAQELBQAwTDELMAkGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAO
...
EXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLEEXAMPLE==
-----END CERTIFICATE-----
```

Output:

```
{
    "CustomKeyStoreId": "cks-1234567890abcdef0"
}
```

For more information, see Creating an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

Example 2: To create an external key store with public endpoint connectivity

The following `create-custom-key-store` example creates an external key store (XKS) that communicates with AWS KMS over the internet.

In this example, the `XksProxyUriPath` uses an optional prefix of `example-prefix`.

NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the XksProxyUriEndpoint parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \
```

```
    --custom-key-store-name ExamplePublicEndpointXKS \
    --custom-key-store-type EXTERNAL_KEY_STORE \
    --xks-proxy-connectivity PUBLIC_ENDPOINT \
    --xks-proxy-uri-endpoint "https://myproxy.xks.example.com" \
    --xks-proxy-uri-path "/example-prefix/kms/xks/v1" \
    --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
 RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

Output:

```
{
    "CustomKeyStoreId": "cks-2234567890abcdef0"
}
```

For more information, see Create an external key store in the *AWS Key Management Service Developer Guide*.

Example 3: To create an external key store with VPC endpoint service connectivity

The following `create-custom-key-store` example creates an external key store (XKS) that uses an Amazon VPC endpoint service to communicate with AWS KMS.

NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the XksProxyUriEndpoint parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \
    --custom-key-store-name ExampleVPCEndpointXKS \
    --custom-key-store-type EXTERNAL_KEY_STORE \
    --xks-proxy-connectivity VPC_ENDPOINT_SERVICE \
    --xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \
    --xks-proxy-uri-path "/kms/xks/v1" \
    --xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-west-2.vpce-svc-
example1" \
    --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
 RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

Output:

```
{
    "CustomKeyStoreId": "cks-3234567890abcdef0"
}
```

For more information, see Create an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateCustomKeyStore in *AWS CLI Command Reference*.

`create-grant`

The following code example shows how to use `create-grant`.

AWS CLI

To create a grant

The following `create-grant` example creates a grant that allows the `exampleUser` user to use the `decrypt` command on the `a1b2c3d4-5678-90ab-cdef-EXAMPLE11111` example KMS key. The retiring principal is the `adminRole` role. The grant uses the `EncryptionContextSubset` grant constraint to allow this permission only when the encryption context in the `decrypt` request includes the `"Department": "IT"` key-value pair.

```
aws kms create-grant \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --grantee-principal arn:aws:iam::123456789012:user/exampleUser \
    --operations Decrypt \
    --constraints EncryptionContextSubset={Department=IT} \
    --retiring-principal arn:aws:iam::123456789012:role/adminRole
```

Output:

```
{
    "GrantId": "1a2b3c4d2f5e69f440bae30eaec9570bb1fb7358824f9ddfa1aa5a0dab1a59b2",
    "GrantToken": "<grant token here>"
}
```

To view detailed information about the grant, use the `list-grants` command.

For more information, see Grants in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateGrant in *AWS CLI Command Reference*.

`create-key`

The following code example shows how to use `create-key`.

AWS CLI

Example 1: To create a customer managed KMS key in AWS KMS

The following `create-key` example creates a symmetric encryption KMS key.

To create the basic KMS key, a symmetric encryption key, you do not need to specify any parameters. The default values for those parameters create a symmetric encryption key.

Because this command doesn't specify a key policy, the KMS key gets the default key policy for programmatically created KMS keys. To view the key policy, use the `get-key-policy` command. To change the key policy, use the `put-key-policy` command.

```
aws kms create-key
```

The `create-key` command returns the key metadata, including the key ID and ARN of the new KMS key. You can use these values to identify the KMS key in other AWS KMS operations. The output does not include the tags. To view the tags for a KMS key, use the `list-resource-tags command`.

Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "123456789012",
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "CreationDate": "2017-07-05T14:04:55-07:00",
        "CurrentKeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "Description": "",
```

```
        "Enabled": true,
        "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "AWS_KMS",
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ]
    }
}
```

Note: The `create-key` command does not let you specify an alias, To create an alias for the new KMS key, use the `create-alias` command.

For more information, see Creating keys in the *AWS Key Management Service Developer Guide*.

Example 2: To create an asymmetric RSA KMS key for encryption and decryption

The following `create-key` example creates a KMS key that contains an asymmetric RSA key pair for encryption and decryption. The key spec and key usage can't be changed after the key is created.

```
aws kms create-key \
    --key-spec RSA_4096 \
    --key-usage ENCRYPT_DECRYPT
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "AWSAccountId": "123456789012",
        "CreationDate": "2021-04-05T14:04:55-07:00",
        "CustomerMasterKeySpec": "RSA_4096",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "RSAES_OAEP_SHA_1",
```

```
            "RSAES_OAEP_SHA_256"
        ],
        "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "KeyManager": "CUSTOMER",
        "KeySpec": "RSA_4096",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "AWS_KMS"
    }
}
```

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 3: To create an asymmetric elliptic curve KMS key for signing and verification

The following `create-key` example creates an asymmetric KMS key that contains an asymmetric elliptic curve (ECC) key pair for signing and verification. The `--key-usage` parameter is required even though `SIGN_VERIFY` is the only valid value for ECC KMS keys. The key spec and key usage can't be changed after the key is created.

```
aws kms create-key \
    --key-spec ECC_NIST_P521 \
    --key-usage SIGN_VERIFY
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "AWSAccountId": "123456789012",
        "CreationDate": "2019-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "ECC_NIST_P521",
        "Description": "",
        "Enabled": true,
        "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "KeyManager": "CUSTOMER",
        "KeySpec": "ECC_NIST_P521",
        "KeyState": "Enabled",
        "KeyUsage": "SIGN_VERIFY",
```

```
        "MultiRegion": false,
        "Origin": "AWS_KMS",
        "SigningAlgorithms": [
            "ECDSA_SHA_512"
        ]
    }
}
```

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 4: To create an asymmetric ML-DSA KMS key for signing and verification

The following `create-key` example creates a module-lattice digital signature algorithm (ML-DSA) key for signing and verification. The key-usage parameter is required even though `SIGN_VERIFY` is the only valid value for ML-DSA keys.

```
aws kms create-key \
    --key-spec ML_DSA_65 \
    --key-usage SIGN_VERIFY
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "AWSAccountId": "123456789012",
        "CreationDate": "2019-12-02T07:48:55-07:00",
        "Description": "",
        "Enabled": true,
        "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "KeyManager": "CUSTOMER",
        "KeySpec": "ML_DSA_65",
        "KeyState": "Enabled",
        "KeyUsage": "SIGN_VERIFY",
        "MultiRegion": false,
        "Origin": "AWS_KMS",
        "SigningAlgorithms": [
            "ML_DSA_SHAKE_256"
        ]
    }
```

```
}
```

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 5: To create an HMAC KMS key

The following `create-key` example creates a 384-bit HMAC KMS key. The `GENERATE_VERIFY_MAC` value for the `--key-usage` parameter is required even though it's the only valid value for HMAC KMS keys.

```
aws kms create-key \
    --key-spec HMAC_384 \
    --key-usage GENERATE_VERIFY_MAC
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "AWSAccountId": "123456789012",
        "CreationDate": "2022-04-05T14:04:55-07:00",
        "CustomerMasterKeySpec": "HMAC_384",
        "Description": "",
        "Enabled": true,
        "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "KeyManager": "CUSTOMER",
        "KeySpec": "HMAC_384",
        "KeyState": "Enabled",
        "KeyUsage": "GENERATE_VERIFY_MAC",
        "MacAlgorithms": [
            "HMAC_SHA_384"
        ],
        "MultiRegion": false,
        "Origin": "AWS_KMS"
    }
}
```

For more information, see HMAC keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 6: To create a multi-Region primary KMS key

The following `create-key` example creates a multi-Region primary symmetric encryption key. Because the default values for all parameters create a symmetric encryption key, only the `--multi-region` parameter is required for this KMS key. In the AWS CLI, to indicate that a Boolean parameter is true, just specify the parameter name.

```
aws kms create-key \
    --multi-region
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/
mrk-1234abcd12ab34cd56ef12345678990ab",
        "AWSAccountId": "123456789012",
        "CreationDate": "2021-09-02T016:15:21-09:00",
        "CurrentKeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "mrk-1234abcd12ab34cd56ef12345678990ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": true,
        "MultiRegionConfiguration": {
            "MultiRegionKeyType": "PRIMARY",
            "PrimaryKey": {
                "Arn": "arn:aws:kms:us-west-2:123456789012:key/
mrk-1234abcd12ab34cd56ef12345678990ab",
                "Region": "us-west-2"
            },
            "ReplicaKeys": []
        },
        "Origin": "AWS_KMS"
```

```
    }
}
```

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 7: To create a KMS key for imported key material

The following `create-key` example creates a creates a KMS key with no key material. When the operation is complete, you can import your own key material into the KMS key. To create this KMS key, set the `--origin` parameter to EXTERNAL.

```
aws kms create-key \
    --origin EXTERNAL
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "AWSAccountId": "123456789012",
        "CreationDate": "2019-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "Description": "",
        "Enabled": false,
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "PendingImport",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "EXTERNAL"
    }
}
```

For more information, see Importing key material in AWS KMS keys in the *AWS Key Management Service Developer Guide*.

Example 8: To create a KMS key in an AWS CloudHSM key store

The following `create-key` example creates a creates a KMS key in the specified AWS CloudHSM key store. The operation creates the KMS key and its metadata in AWS KMS and creates the key material in the AWS CloudHSM cluster associated with the custom key store. The `--custom-key-store-id` and `--origin` parameters are required.

```
aws kms create-key \
    --origin AWS_CLOUDHSM \
    --custom-key-store-id cks-1234567890abcdef0
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "AWSAccountId": "123456789012",
        "CloudHsmClusterId": "cluster-1a23b4cdefg",
        "CreationDate": "2019-12-02T07:48:55-07:00",

        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "AWS_CLOUDHSM"
    }
}
```

For more information, see AWS CloudHSM key stores in the *AWS Key Management Service Developer Guide*.

Example 9: To create a KMS key in an external key store

The following `create-key` example creates a creates a KMS key in the specified external key store. The `--custom-key-store-id`, `--origin`, and `--xks-key-id` parameters are required in this command.

The `--xks-key-id` parameter specifies the ID of an existing symmetric encryption key in your external key manager. This key serves as the external key material for the KMS key.The value of the `--origin` parameter must be `EXTERNAL_KEY_STORE`.The `custom-key-store-id` parameter must identify an external key store that is connected to its external key store proxy.

```
aws kms create-key \
    --origin EXTERNAL_KEY_STORE \
    --custom-key-store-id cks-9876543210fedcba9 \
    --xks-key-id bb8562717f809024
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "AWSAccountId": "123456789012",
        "CreationDate": "2022-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "CustomKeyStoreId": "cks-9876543210fedcba9",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "EXTERNAL_KEY_STORE",
        "XksKeyConfiguration": {
            "Id": "bb8562717f809024"
        }
    }
}
```

For more information, see External key stores in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateKey in *AWS CLI Command Reference*.

`decrypt`

The following code example shows how to use `decrypt`.

AWS CLI

Example 1: To decrypt an encrypted message with a symmetric KMS key (Linux and macOS)

The following `decrypt` example demonstrates the recommended way to decrypt data with the AWS CLI. This version shows how to decrypt data under a symmetric KMS key.

Provide the ciphertext in a file.In the value of the `--ciphertext-blob` parameter, use the `fileb://` prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see Loading AWS CLI parameters from a file <https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html> in the *AWS Command Line Interface User Guide* and Best Practices for Local File Parameters<https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/> in the *AWS Command Line Tool Blog*.Specify the KMS key to decrypt the ciphertext.The `--key-id` parameter is not required when decrypting with a symmetric KMS key. AWS KMS can get the key ID of the KMS key that was used to encrypt the data from the metadata in the ciphertext. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust.Request the plaintext output as a text value.The `--query` parameter tells the CLI to get only the value of the `Plaintext` field from the output. The `--output` parameter returns the output as text.Base64-decode the plaintext and save it in a file.The following example pipes (|) the value of the `Plaintext` parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the `ExamplePlaintext` file.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \
```

```
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --output text \
    --query Plaintext | base64 --decode > ExamplePlaintextFile
```

This command produces no output. The output from the `decrypt` command is base64-decoded and saved in a file.

For more information, see AWS KMS cryptography essentials in the *AWS Key Management Service Developer Guide*.

Example 2: To decrypt an encrypted message with a symmetric KMS key (Windows command prompt)

The following `decrypt` example is the same as the previous one except that it uses the `certutil` utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt ^
    --ciphertext-blob fileb://ExampleEncryptedFile ^
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 ^
    --output text ^
    --query Plaintext > ExamplePlaintextFile.base64
```

Run the `certutil` command.

```
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see AWS KMS cryptography essentials in the *AWS Key Management Service Developer Guide*.

Example 3: To decrypt an encrypted message with an asymmetric KMS key (Linux and macOS)

The following `decrypt` example shows how to decrypt data encrypted under an RSA asymmetric KMS key.

When using an asymmetric KMS key, the `encryption-algorithm` parameter, which specifies the algorithm used to encrypt the plaintext, is required.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --encryption-algorithm RSAES_OAEP_SHA_256 \
    --output text \
    --query Plaintext | base64 --decode > ExamplePlaintextFile
```

This command produces no output. The output from the `decrypt` command is base64-decoded and saved in a file.

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see Decrypt in *AWS CLI Command Reference*.

`delete-alias`

The following code example shows how to use `delete-alias`.

AWS CLI

To delete an AWS KMS alias

The following `delete-alias` example deletes the alias `alias/example-alias`. The alias name must begin with alias/.

```
aws kms delete-alias \
    --alias-name alias/example-alias
```

This command produces no output. To find the alias, use the `list-aliases` command.

For more information, see Deleting an alias in the *AWS Key Management Service Developer Guide*.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

`delete-custom-key-store`

The following code example shows how to use `delete-custom-key-store`.

AWS CLI

To delete a custom key store

The following `delete-custom-key-store` example deletes the specified custom key store.

Deleting an AWS CloudHSM key store has no effect on the associated CloudHSM cluster. Deleting an external key store has no effect on the associated external key store proxy, external key manager, or external keys.

NOTE: Before you can delete a custom key store, you must schedule the deletion of all KMS keys in the custom key store and then wait for those KMS keys to be deleted. Then, you must disconnect the custom key store. For help finding the KMS keys in your custom key store, see Delete an AWS CloudHSM key store (API) in the *AWS Key Management Service Developer Guide*.

```
delete-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0
```

This command does not return any output. To verify that the custom key store is deleted, use the `describe-custom-key-stores` command.

For information about deleting an AWS CloudHSM key stores, see Deleting an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

For information about deleting external key stores, see Deleting an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see DeleteCustomKeyStore in *AWS CLI Command Reference*.

`delete-imported-key-material`

The following code example shows how to use `delete-imported-key-material`.

AWS CLI

To delete imported key material from a KMS key

The following `delete-imported-key-material` example deletes key material that had been imported into a KMS key.

```
aws kms delete-imported-key-material \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6"
}
```

For more information, see Deleting imported key material in the *AWS Key Management Service Developer Guide*.

- For API details, see DeleteImportedKeyMaterial in *AWS CLI Command Reference*.

`derive-shared-secret`

The following code example shows how to use `derive-shared-secret`.

AWS CLI

To derive a shared secret

The following `derive-shared-secret` example derives a shared secret using a key agreement algorithm.

You must use an asymmetric NIST-recommended elliptic curve (ECC) or SM2 (China Regions only) KMS key pair with a `KeyUsage` value of `KEY_AGREEMENT` to call DeriveSharedSecret. The `public_key.der` file contains the public key of the other party in DER format.

```
aws kms derive-shared-secret \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --key-agreement-algorithm ECDH \
```

```
    --public-key fileb://public_key.der
```

Output:

```
{
    "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "SharedSecret": "MEYCIQCKZLWyTk5runarx6XiAkU9gv3lbwPO/pHa
+DXFehzdDwIhANwpsIV2g/9SPWLLsF6p/hiSskuIXMTRwqrMdVKWTMHG",
    "KeyAgreementAlgorithm": "ECDH",
    "KeyOrigin": "AWS_KMS"
}
```

For more information, see AWS KMS cryptography essentials in the *AWS Key Management Service Developer Guide*.

- For API details, see DeriveSharedSecret in *AWS CLI Command Reference*.

`describe-custom-key-stores`

The following code example shows how to use `describe-custom-key-stores`.

AWS CLI

Example 1: To get details about an AWS CloudHSM key store

The following `describe-custom-key-stores` example displays details about the specified AWS CloudHSM key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
    --custom-key-store-name ExampleCloudHSMKeyStore
```

The output of this command includes useful details about the AWS CloudHSM key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
    "CustomKeyStores": [
        {
            "CloudHsmClusterId": "cluster-1a23b4cdefg",
            "ConnectionState": "CONNECTED",
            "CreationDate": "2022-04-05T14:04:55-07:00",
            "CustomKeyStoreId": "cks-1234567890abcdef0",
            "CustomKeyStoreName": "ExampleExternalKeyStore",
            "TrustAnchorCertificate": "<certificate appears here>"
        }
    ]
}
```

For more information, see Viewing an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

Example 2: To get details about an external key store with public endpoint connectivity

The following `describe-custom-key-stores` example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
    --custom-key-store-id cks-9876543210fedcba9
```

The output of this command includes useful details about the external key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
    "CustomKeyStores": [
        {
            "CustomKeyStoreId": "cks-9876543210fedcba9",
            "CustomKeyStoreName": "ExampleXKS",
            "ConnectionState": "CONNECTED",
```

```
            "CreationDate": "2022-12-02T07:48:55-07:00",
            "CustomKeyStoreType": "EXTERNAL_KEY_STORE",
            "XksProxyConfiguration": {
                "AccessKeyId": "ABCDE12345670EXAMPLE",
                "Connectivity": "PUBLIC_ENDPOINT",
                "UriEndpoint": "https://myproxy.xks.example.com",
                "UriPath": "/example-prefix/kms/xks/v1"
            }
        }
    ]
}
```

For more information, see Viewing an external key store in the *AWS Key Management Service Developer Guide*.

Example 3: To get details about an external key store with VPC endpoint service connectivity

The following `describe-custom-key-stores` example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
    --custom-key-store-id cks-2234567890abcdef0
```

The output of this command includes useful details about the external key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
    "CustomKeyStores": [
        {
            "CustomKeyStoreId": "cks-3234567890abcdef0",
            "CustomKeyStoreName": "ExampleVPCExternalKeyStore",
            "ConnectionState": "CONNECTED",
```

```
            "CreationDate": "2022-12-22T07:48:55-07:00",
            "CustomKeyStoreType": "EXTERNAL_KEY_STORE",
            "XksProxyConfiguration": {
                "AccessKeyId": "ABCDE12345670EXAMPLE",
                "Connectivity": "VPC_ENDPOINT_SERVICE",
                "UriEndpoint": "https://myproxy-private.xks.example.com",
                "UriPath": "/kms/xks/v1",
                "VpcEndpointServiceName": "com.amazonaws.vpce.us-west-2.vpce-svc-
example1"
            }
        }
    ]
}
```

For more information, see Viewing an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see DescribeCustomKeyStores in *AWS CLI Command Reference*.

`describe-key`

The following code example shows how to use `describe-key`.

AWS CLI

Example 1: To find detailed information about a KMS key

The following `describe-key` example gets detailed information about the AWS managed key for Amazon S3 in the example account and Region. You can use this command to find details about AWS managed keys and customer managed keys.

To specify the KMS key, use the `key-id` parameter. This example uses an alias name value, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```
aws kms describe-key \
    --key-id alias/aws/s3
```

Output:

```
{
    "KeyMetadata": {
```

```
        "AWSAccountId": "123456789012",
        "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "CurrentKeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
        "CreationDate": "2017-06-30T21:44:32.140000+00:00",
        "Enabled": true,
        "Description": "Default KMS key that protects my S3 objects when no other
 key is defined",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "KeyState": "Enabled",
        "Origin": "AWS_KMS",
        "KeyManager": "AWS",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ]
    }
}
```

For more information, see Viewing keys in the *AWS Key Management Service Developer Guide*.

Example 2: To get details about an RSA asymmetric KMS key

The following `describe-key` example gets detailed information about an asymmetric RSA KMS key used for signing and verification.

```
aws kms describe-key \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "123456789012",
        "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Arn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
        "CreationDate": "2019-12-02T19:47:14.861000+00:00",
        "CustomerMasterKeySpec": "RSA_2048",
        "Enabled": false,
        "Description": "",
```

```
        "KeyState": "Disabled",
        "Origin": "AWS_KMS",
        "MultiRegion": false,
        "KeyManager": "CUSTOMER",
        "KeySpec": "RSA_2048",
        "KeyUsage": "SIGN_VERIFY",
        "SigningAlgorithms": [
            "RSASSA_PKCS1_V1_5_SHA_256",
            "RSASSA_PKCS1_V1_5_SHA_384",
            "RSASSA_PKCS1_V1_5_SHA_512",
            "RSASSA_PSS_SHA_256",
            "RSASSA_PSS_SHA_384",
            "RSASSA_PSS_SHA_512"
        ]
    }
}
```

Example 3: To get details about a multi-Region replica key

The following `describe-key` example gets metadata for a multi-Region replica key. This multi-Region key is a symmetric encryption key. The output of a `describe-key` command for any multi-Region key returns information about the primary key and all of its replicas.

```
aws kms describe-key \
    --key-id arn:aws:kms:ap-northeast-1:123456789012:key/
mrk-1234abcd12ab34cd56ef1234567890ab
```

Output:

```
{
    "KeyMetadata": {
        "MultiRegion": true,
        "AWSAccountId": "123456789012",
        "Arn": "arn:aws:kms:ap-northeast-1:123456789012:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
        "CreationDate": "2021-06-28T21:09:16.114000+00:00",
        "CurrentKeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
        "Description": "",
        "Enabled": true,
        "KeyId": "mrk-1234abcd12ab34cd56ef1234567890ab",
        "KeyManager": "CUSTOMER",
```

```
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "Origin": "AWS_KMS",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "MultiRegionConfiguration": {
            "MultiRegionKeyType": "PRIMARY",
            "PrimaryKey": {
                "Arn": "arn:aws:kms:us-west-2:123456789012:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                "Region": "us-west-2"
            },
            "ReplicaKeys": [
                {
                    "Arn": "arn:aws:kms:eu-west-1:123456789012:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                    "Region": "eu-west-1"
                },
                {
                    "Arn": "arn:aws:kms:ap-northeast-1:123456789012:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                    "Region": "ap-northeast-1"
                },
                {
                    "Arn": "arn:aws:kms:sa-east-1:123456789012:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                    "Region": "sa-east-1"
                }
            ]
        }
    }
}
```

Example 4: To get details about an HMAC KMS key

The following `describe-key` example gets detailed information about an HMAC KMS key.

```
aws kms describe-key \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "123456789012",

```

- For API details, see DescribeKey in *AWS CLI Command Reference*.

`disable-key-rotation`

The following code example shows how to use `disable-key-rotation`.

AWS CLI

To disable automatic rotation of a KMS key

The following `disable-key-rotation` example disables automatic rotation of a customer managed KMS key. To reenable automatic rotation, use the `enable-key-rotation` command.

```
aws kms disable-key-rotation \
    --key-id arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111
```

This command produces no output. To verify that automatic rotation is disable for the KMS key, use the `get-key-rotation-status` command.

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see DisableKeyRotation in *AWS CLI Command Reference*.

`disable-key`

The following code example shows how to use `disable-key`.

AWS CLI

To temporarily disable a KMS key

The following `disable-key` example disables a customer managed KMS key. To re-enable the KMS key, use the `enable-key` command.

```
aws kms disable-key \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Enabling and Disabling Keys in the *AWS Key Management Service Developer Guide*.

- For API details, see DisableKey in *AWS CLI Command Reference*.

`disconnect-custom-key-store`

The following code example shows how to use `disconnect-custom-key-store`.

AWS CLI

To disconnect a custom key store

The following `disconnect-custom-key-store` example disconnects a custom key store from its AWS CloudHSM cluster. You might disconnect a key store to troubleshoot a problem, to update its settings, or to prevent KMS keys in the keystore from being used in cryptographic operations.

This command is the same for all custom key stores, including AWS CloudHSM key stores and external key stores.

Before running this command, replace the example custom key store ID with a valid one.

```
aws kms disconnect-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0
```

This command produces no output. To verify that the command was effective, use the `describe-custom-key-stores` command.

For more information about disconnecting an AWS CloudHSM key store, see Connecting and disconnecting an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

For more information about disconnecting an external key store, see Connecting and disconnecting an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see DisconnectCustomKeyStore in *AWS CLI Command Reference*.

`enable-key-rotation`

The following code example shows how to use `enable-key-rotation`.

AWS CLI

To enable automatic rotation of a KMS key

The following `enable-key-rotation` example enables automatic rotation of a customer managed KMS key with a rotation period of 180 days. The KMS key will be rotated one year (approximate 365 days) from the date that this command completes and every year thereafter.

The `--key-id` parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key.The `--rotation-period-in-days` parameter specifies the number of days between each rotation date. Specify a value between 90 and 2560 days. If no value is specified, the default value is 365 days.

```
aws kms enable-key-rotation \
    --key-id arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 \
    --rotation-period-in-days 180
```

This command produces no output. To verify that the KMS key is enabled, use the `get-key-rotation-status` command.

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see EnableKeyRotation in *AWS CLI Command Reference*.

`enable-key`

The following code example shows how to use `enable-key`.

AWS CLI

To enable a KMS key

The following `enable-key` example enables a customer managed key. You can use a command like this one to enable a KMS key that you temporarily disabled by using the `disable-key` command. You can also use it to enable a KMS key that is disabled because it was scheduled for deletion and the deletion was canceled.

To specify the KMS key, use the `key-id` parameter. This example uses an key ID value, but you can use a key ID or key ARN value in this command.

Before running this command, replace the example key ID with a valid one.

```
aws kms enable-key \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output. To verify that the KMS key is enabled, use the `describe-key` command. See the values of the `KeyState` and `Enabled` fields in the `describe-key` output.

For more information, see Enabling and Disabling Keys in the *AWS Key Management Service Developer Guide*.

- For API details, see EnableKey in *AWS CLI Command Reference*.

`encrypt`

The following code example shows how to use `encrypt`.

AWS CLI

Example 1: To encrypt the contents of a file (Linux and macOS)

The following `encrypt` example demonstrates the recommended way to encrypt data with the AWS CLI.

```
aws kms encrypt \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --plaintext fileb://ExamplePlaintextFile \
    --output text \
    --query CiphertextBlob | base64 --decode > ExampleEncryptedFile
```

The command does several things:

Uses the `--plaintext` parameter to indicate the data to encrypt. This parameter value must be base64-encoded.The value of the `plaintext` parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.If the file is not in the current directory, type the full path to file. For example: `fileb:///var/tmp/ExamplePlaintextFile` or `fileb://C:\Temp\ExamplePlaintextFile`. For more information about reading AWS CLI parameter values from a file, see Loading Parameters from a File in the *AWS Command Line Interface User Guide*.Uses the `--output` and `--query` parameters to control the command's output.These parameters extract the encrypted data, called the *ciphertext*, from the command's output.For more information about controlling output, see Controlling Command Output in the *AWS Command Line Interface User Guide*.Uses the `base64` utility to decode the extracted output into binary data.The ciphertext that is returned by a successful `encrypt` command is base64-encoded text. You must decode this text before you can use the AWS CLI to decrypt it.Saves the binary ciphertext to a file.The final part of the command (`> ExampleEncryptedFile`) saves the binary ciphertext to a file to make decryption easier. For an example command that uses the AWS CLI to decrypt data, see the decrypt examples.

This command produces no output.

Example 2: To encrypt the contents of a file (Windows)

The following `encrypt` example is the same as the previous one, except that it uses the `certutil` tool instead of `base64`. This procedure requires two commands, as shown in the following example.

```
aws kms encrypt ^
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 ^
    --plaintext fileb://ExamplePlaintextFile ^
```

```
    --output text ^
    --query CiphertextBlob > C:\Temp\ExampleEncryptedFile.base64
```

This command produces no output. The base64-encoded ciphertext is saved to `C:\Temp\ExampleEncryptedFile.base64`.

Run the `certutil` command.

```
certutil -decode C:\Temp\ExampleEncryptedFile.base64 C:\Temp\ExampleEncryptedFile
```

The ciphertext is saved to `C:\Temp\ExampleEncryptedFile`.

Example 3: To encrypt the contents of a file with an asymmetric KMS key

The following `encrypt` example shows how to encrypt plaintext with an asymmetric KMS key. The `--encryption-algorithm` parameter is required. As in all `encrypt` CLI commands, the `plaintext` parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

```
aws kms encrypt \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --encryption-algorithm RSAES_OAEP_SHA_256 \
    --plaintext fileb://ExamplePlaintextFile \
    --output text \
    --query CiphertextBlob | base64 --decode > ExampleEncryptedFile
```

This command produces no output.

- For API details, see Encrypt in *AWS CLI Command Reference*.

`generate-data-key-pair-without-plaintext`

The following code example shows how to use `generate-data-key-pair-without-plaintext`.

AWS CLI

To generate an ECC NIST P384 asymmetric data key pair

The following `generate-data-key-pair-without-plaintext` example requests an ECC NIST P384 key pair for use outside of AWS.

The command returns a plaintext public key and a copy of the private key encrypted under the specified KMS key. It does not return a plaintext private key. You can safely store the encrypted private key with the encrypted data, and call AWS KMS to decrypt the private key when you need to use it.

To request an ECC NIST P384 asymmetric data key pair, use the `key-pair-spec` parameter with a value of `ECC_NIST_P384`.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a `KeySpec` value of `SYMMETRIC_DEFAULT`.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair-without-plaintext \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --key-pair-spec ECC_NIST_P384
```

Output:

```
{
    "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdKl2aJTzkK6FbhOtQkMlQJJH3PdtHvS/y
+hAFFxmiD134doUDzMGmfCEtcAAAHaTCCB2UGCSqGSIb3DQEHBqCCB1...",
    "PublicKey":
 "MIIBojANBgkqhkiG9w0BAQEFAAOCAY8AMIIBigKCAYEA3A3eGMyPrvSn7+LdlJE1oUoQV5HpEuHAVbdOyND

    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
    "KeyPairSpec": "ECC_NIST_P384"
}
```

The `PublicKey` and `PrivateKeyCiphertextBlob` are returned in base64-encoded format.

For more information, see Data key pairs in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKeyPairWithoutPlaintext in *AWS CLI Command Reference*.

`generate-data-key-pair`

The following code example shows how to use `generate-data-key-pair`.

AWS CLI

To generate an 2048-bit RSA asymmetric data key pair

The following `generate-data-key-pair` example requests a 2048-bit RSA asymmetric data key pair for use outside of AWS. The command returns a plaintext public key and a plaintext private key for immediate use and deletion, and a copy of the private key encrypted under the specified KMS key. You can safely store the encrypted private key with the encrypted data.

To request a 2048-bit RSA asymmetric data key pair, use the `key-pair-spec` parameter with a value of `RSA_2048`.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a `KeySpec` value of `SYMMETRIC_DEFAULT`.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --key-pair-spec RSA_2048
```

Output:

```
{
    "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdKl2aJTzkK6FbhOtQkMlQJJH3PdtHvS/y
+hAFFxmiD134doUDzMGmfCEtcAAAHaTCCB2UGCSqGSIb3DQEHBqCCB1...",
    "PrivateKeyPlaintext": "MIIG/

    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
    "KeyPairSpec": "RSA_2048"
}
```

The `PublicKey`, `PrivateKeyPlaintext`, and `PrivateKeyCiphertextBlob` are returned in base64-encoded format.

For more information, see Data key pairs in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKeyPair in *AWS CLI Command Reference*.

`generate-data-key-without-plaintext`

The following code example shows how to use `generate-data-key-without-plaintext`.

AWS CLI

To generate a 256-bit symmetric data key without a plaintext key

The following `generate-data-key-without-plaintext` example requests an encrypted copy of a 256-bit symmetric data key for use outside of AWS. You can call AWS KMS to decrypt the data key when you are ready to use it.

To request a 256-bit data key, use the `key-spec` parameter with a value of AES_256. To request a 128-bit data key, use the `key-spec` parameter with a value of AES_128. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

```
aws kms generate-data-key-without-plaintext \
    --key-id "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111" \
    --key-spec AES_256
```

Output:

```
{
    "CiphertextBlob":
 "AQEDAHjRYf5WytIc0C857tFSnBaPn2F8DgfmThbJlGfR8P3WlwAAAH4wfAYJKoZIhvcNAQcGoG8wbQIBADBoBgkqhk
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6"
}
```

The `CiphertextBlob` (encrypted data key) is returned in base64-encoded format.

For more information, see Data keys in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKeyWithoutPlaintext in *AWS CLI Command Reference*.

`generate-data-key`

The following code example shows how to use `generate-data-key`.

AWS CLI

Example 1: To generate a 256-bit symmetric data key

The following `generate-data-key` example requests a 256-bit symmetric data key for use outside of AWS. The command returns a plaintext data key for immediate use and deletion, and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a 256-bit data key, use the `key-spec` parameter with a value of AES_256. To request a 128-bit data key, use the `key-spec` parameter with a value of AES_128. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

```
aws kms generate-data-key \
    --key-id alias/ExampleAlias \
    --key-spec AES_256
```

Output:

```
{
    "Plaintext": "VdzKNHGzUAzJeRBVY+uUmofUGGiDzyB3+i9fVkh3piw=",
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
    "CiphertextBlob":
 "AQEDAHjRYf5WytIc0C857tFSnBaPn2F8DgfmThbJlGfR8P3WlwAAAH4wfAYJKoZIhvcNAQcGoG8wbQIBADBoBgkqhk
+YdhV8MrkBQPeac0ReRVNDt9qleAt+SHgIRF8P0H+7U="
}
```

The `Plaintext` (plaintext data key) and the `CiphertextBlob` (encrypted data key) are returned in base64-encoded format.

For more information, see Data keys in the *AWS Key Management Service Developer Guide*.

Example 2: To generate a 512-bit symmetric data key

The following `generate-data-key` example requests a 512-bit symmetric data key for encryption and decryption. The command returns a plaintext data key for immediate use and deletion, and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a key length other than 128 or 256 bits, use the `number-of-bytes` parameter. To request a 512-bit data key, the following example uses the `number-of-bytes` parameter with a value of 64 (bytes).

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --number-of-bytes 64
```

Output:

```
{
    "CiphertextBlob": "AQIBAHi6LtupRpdKl2aJTzkK6FbhOtQkMlQJJH3PdtHvS/y+hAEnX/
QQNmMwDfg2korNMEc8AAACaDCCAmQGCSqGSIb3DQEHBqCCAlUwggJRAgEAMIICSgYJKoZ...",
    "Plaintext": "ty8Lr0Bk6OF07M2BWt6qbFdNB
+G00ZLtf5MSEb4al3R2UKWGOp06njAwy2n72VRm2m7z/
Pm9Wpbvttz6a4lSo9hgPvKhZ5y6RTm4OovEXiVfBveyX3DQxDzRSwbKDPk/...",
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6"
}
```

The `Plaintext` (plaintext data key) and `CiphertextBlob` (encrypted data key) are returned in base64-encoded format.

For more information, see Data keys in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKey in *AWS CLI Command Reference*.

`generate-mac`

The following code example shows how to use `generate-mac`.

AWS CLI

Example 1: To generate an HMAC for a message

The following `generate-mac` example generates an HMAC for a message, an HMAC KMS key, and a MAC algorithm. The algorithm must be supported by the specified HMAC KMS key.

In AWS CLI v2, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent a HMAC KMS key with a key usage of `GENERATE_VERIFY_MAC`.

```
msg=(echo 'Hello World' | base64)

aws kms generate-mac \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --message fileb://Message \
    --mac-algorithm HMAC_SHA_384
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "Mac": "<HMAC_TAG>",
    "MacAlgorithm": "HMAC_SHA_384"
}
```

For more information about using HMAC KMS keys in AWS KMS, see HMAC keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 2: To save an HMAC in a file (Linux and macOs)

The following `generate-mac` example generates an HMAC for a short message stored in a local file. The command also gets the `Mac` property from the response, Base64-decodes it and saves it in the ExampleMac file. You can use the MAC file in a `verify-mac` command that verifies the MAC.

The `generate-mac` command requires a Base64-encoded message and a MAC algorithm that your HMAC KMS key supports. To get the MAC algorithms that your KMS key supports, use the `describe-key` command.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of GENERATE_VERIFY_MAC.

First, Base64-encode the message and save it in the `EncodedMessage` file.

```
echo 'hello world' | base64 > EncodedMessage
```

Then, generate the HMAC for the encoded message.

```
aws kms generate-mac \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --message fileb://EncodedMessage \
    --mac-algorithm HMAC_SHA_384 \
    --output text \
    --query Mac | base64 --decode > ExampleMac
```

This command produces no output. This example extracts the `Mac` property of the output and saves it in a file.

For more information about using HMAC KMS keys in AWS KMS, see HMAC keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateMac in *AWS CLI Command Reference*.

`generate-random`

The following code example shows how to use `generate-random`.

AWS CLI

Example 1: To generate a 256-bit random byte string (Linux or macOs)

The following `generate-random` example generates a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the random file.

When you run this command, you must use the `number-of-bytes` parameter to specify the length of the random value in bytes.

You don't specify a KMS key when you run this command. The random byte string is unrelated to any KMS key.

By default, AWS KMS generates the random number. However, if you specify a custom key store, the random byte string is generated in the AWS CloudHSM cluster associated with the custom key store.

This example uses the following parameters and values:

It uses the required `--number-of-bytes` parameter with a value of `32` to request a 32-byte (256-bit) string.It uses the `--output` parameter with a value of `text` to direct the AWS CLI to return the output as text, instead of JSON.It uses the `--query parameter` to extract the value of the `Plaintext` property from the response.It pipes (|) the output of the command to the `base64` utility, which decodes the extracted output.It uses the redirection operator (>) to save decoded byte string to the `ExampleRandom` file.It uses the redirection operator (>) to save the binary ciphertext to a file.

```
aws kms generate-random \
    --number-of-bytes 32 \
    --output text \
    --query Plaintext | base64 --decode > ExampleRandom
```

This command produces no output.

For more information, see AWS KMS cryptography essentials in the *AWS Key Management Service Developer Guide*.

Example 2: To generate a 256-bit random number (Windows Command Prompt)

The following `generate-random` example generates a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the random file. This example is the same as the previous example, except that it uses the `certutil` utility in Windows to base64-decode the random byte string before saving it in a file.

First, generate a base64-encoded random byte string and saves it in a temporary file, `ExampleRandom.base64`.

```
aws kms generate-random \
    --number-of-bytes 32 \
    --output text \
    --query Plaintext > ExampleRandom.base64
```

This command produces no output. The output of the `generate-random` command is saved in a file.

Now use the `certutil -decode` command to decode the base64-encoded byte string in the `ExampleRandom.base64` file. Then, it saves the decoded byte string in the `ExampleRandom` file.

```
certutil -decode ExampleRandom.base64 ExampleRandom
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see AWS KMS cryptography essentials in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateRandom in *AWS CLI Command Reference*.

`get-key-policy`

The following code example shows how to use `get-key-policy`.

AWS CLI

To copy a key policy from one KMS key to another KMS key

The following `get-key-policy` example gets the key policy from one KMS key and saves it in a text file. Then, it replaces the policy of a different KMS key using the text file as the policy input.

Because the `--policy` parameter of `put-key-policy` requires a string, you must use the `--output text` option to return the output as a text string instead of JSON.

```
aws kms get-key-policy \
    --policy-name default \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --query Policy \
    --output text > policy.txt
```

The following `put-key-policy` example uses the `policy.txt` file to replace the key policy of the other KMS key.

```
aws kms put-key-policy \
    --policy-name default \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --policy file://policy.txt
```

Contents of `policy.txt`:

```
{
    "Version":"2012-10-17",
    "Id": "key-default-1",
    "Statement": [
        {
            "Sid": "Enable IAM User Permissions",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": "kms:*",
            "Resource": "*"
        }
    ]
}
```

This command produces no output.

For more information, see Key policies in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see GetKeyPolicy in *AWS CLI Command Reference*.

`get-key-rotation-status`

The following code example shows how to use `get-key-rotation-status`.

AWS CLI

To retrieve the rotation status for a KMS key.

The following `get-key-rotation-status` example returns information about the rotation status of the specified KMS key, including whether automatic rotation is enabled, the rotation period, and the next scheduled rotation date. You can use this command on customer managed KMS keys and AWS managed KMS keys. However, all AWS managed KMS keys are automatically rotated every year.

```
aws kms get-key-rotation-status \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "KeyRotationEnabled": true,
    "NextRotationDate": "2024-02-14T18:14:33.587000+00:00",
    "RotationPeriodInDays": 365
}
```

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see GetKeyRotationStatus in *AWS CLI Command Reference*.

`get-parameters-for-import`

The following code example shows how to use `get-parameters-for-import`.

AWS CLI

To get the items required to import key material into a KMS key

The following `get-parameters-for-import` example gets the public key and import token that you need to import key material into a KMS key. When you use the `import-key-material` command, be sure to use the import token and key material encrypted by the public

key that were returned in the same `get-parameters-for-import` command. Also, the wrapping algorithm that you specify in this command must be one that you use to encrypt the key material with the public key.

To specify the KMS key, use the `key-id` parameter. This example uses an key ID, but you can use a key ID or key ARN in this command.

```
aws kms get-parameters-for-import \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --wrapping-algorithm RSAES_OAEP_SHA_256 \
    --wrapping-key-spec RSA_2048
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "PublicKey": "<public key base64 encoded data>",
    "ImportToken": "<import token base64 encoded data>",
    "ParametersValidTo": 1593893322.32
}
```

For more information, see Download the public key and import token in the *AWS Key Management Service Developer Guide*.

- For API details, see GetParametersForImport in *AWS CLI Command Reference*.

`get-public-key`

The following code example shows how to use `get-public-key`.

AWS CLI

Example 1: To download the public key of an asymmetric KMS key

The following `get-public-key` example downloads the public key of an asymmetric KMS key.

In addition to returning the public key, the output includes information that you need to use the public key safely outside of AWS KMS, including the key usage and supported encryption algorithms.

```
aws kms get-public-key \
```

```
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "PublicKey": "jANBgkqhkiG9w0BAQEFAAOCAg8AMIICCgKCAgEAl5epvg1/
QtJhxSi2g9SDEVg8QV/...",
    "CustomerMasterKeySpec": "RSA_4096",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "EncryptionAlgorithms": [
        "RSAES_OAEP_SHA_1",
        "RSAES_OAEP_SHA_256"
    ]
}
```

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*. **Example 2: To convert a public key to DER format (Linux and macOS)**

The following `get-public-key` example downloads the public key of an asymmetric KMS key and saves it in a DER file.

When you use the `get-public-key` command in the AWS CLI, it returns a DER-encoded X.509 public key that is Base64-encoded. This example gets the value of the `PublicKey` property as text. It Base64-decodes the `PublicKey` and saves it in the `public_key.der` file. The `output` parameter returns the output as text, instead of JSON. The `--query` parameter gets only the `PublicKey` property, not the properties that you need to use the public key safely outside of AWS KMS.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms get-public-key \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --output text \
    --query PublicKey | base64 --decode > public_key.der
```

This command produces no output.

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see GetPublicKey in *AWS CLI Command Reference*.

`import-key-material`

The following code example shows how to use `import-key-material`.

AWS CLI

To import key material into a KMS key

The following `import-key-material` example uploads key material into a KMS key that was created with no key material. The key state of the KMS key must be `PendingImport`.

This command uses key material that you encrypted with the public key that the `get-parameters-for-import` command returned. It also uses the import token from the same `get-parameters-for-import` command.

The `expiration-model` parameter indicates that the key material automatically expires on the date and time specified by the `valid-to` parameter. When the key material expires, AWS KMS deletes the key material, the key state of the KMS key changes to `Pending import` and the KMS key becomes unusable. To restore the KMS key, you must reimport the same key material. To use different key material, you must create a new KMS key.

Before running this command, replace the example key ID with a valid key ID or key ARN from your AWS account.

```
aws kms import-key-material \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --encrypted-key-material fileb://EncryptedKeyMaterial.bin \
    --import-token fileb://ImportToken.bin \
    --expiration-model KEY_MATERIAL_EXPIRES \
    --valid-to 2021-09-21T19:00:00Z
```

Output:

```
{
    "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6"
```

```
}
```

For more information about importing key material, see Importing Key Material in the *AWS Key Management Service Developer Guide*.

- For API details, see ImportKeyMaterial in *AWS CLI Command Reference*.

`list-aliases`

The following code example shows how to use `list-aliases`.

AWS CLI

Example 1: To list all aliases in an AWS account and Region

The following `list-aliases` example lists all aliases in the default Region of the AWS account. The output includes aliases associated with AWS managed KMS keys and customer managed KMS keys.

```
aws kms list-aliases
```

Output:

```
{
    "Aliases": [
        {
            "AliasArn": "arn:aws:kms:us-west-2:123456789012:alias/testKey",
            "AliasName": "alias/testKey",
            "TargetKeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "AliasArn": "arn:aws:kms:us-west-2:123456789012:alias/FinanceDept",
            "AliasName": "alias/FinanceDept",
            "TargetKeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        },
        {
            "AliasArn": "arn:aws:kms:us-west-2:123456789012:alias/aws/dynamodb",
            "AliasName": "alias/aws/dynamodb",
            "TargetKeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
        },
        {
            "AliasArn": "arn:aws:kms:us-west-2:123456789012:alias/aws/ebs",
```

```
            "AliasName": "alias/aws/ebs",
            "TargetKeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
        }
    ]
}
```

Example 2: To list all aliases for a particular KMS key

The following `list-aliases` example uses the `key-id` parameter to list all aliases that are associated with a particular KMS key.

Each alias is associated with only one KMS key, but a KMS key can have multiple aliases. This command is very useful because the AWS KMS console lists only one alias for each KMS key. To find all aliases for a KMS key, you must use the `list-aliases` command.

This example uses the key ID of the KMS key for the `--key-id` parameter, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```
aws kms list-aliases \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Aliases": [
        {
            "TargetKeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AliasArn": "arn:aws:kms:us-west-2:123456789012:alias/oregon-test-key",
            "AliasName": "alias/oregon-test-key"
        },
        {
            "TargetKeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AliasArn": "arn:aws:kms:us-west-2:123456789012:alias/project121-test",
            "AliasName": "alias/project121-test"
        }
    ]
}
```

For more information, see Aliases in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see ListAliases in *AWS CLI Command Reference*.

`list-grants`

The following code example shows how to use `list-grants`.

AWS CLI

To view the grants on an AWS KMS key

The following `list-grants` example displays all of the grants on the specified AWS managed KMS key for Amazon DynamoDB in your account. This grant allows DynamoDB to use the KMS key on your behalf to encrypt a DynamoDB table before writing it to disk. You can use a command like this one to view the grants on the AWS managed KMS keys and customer managed KMS keys in the AWS account and Region.

This command uses the `key-id` parameter with a key ID to identify the KMS key. You can use a key ID or key ARN to identify the KMS key. To get the key ID or key ARN of an AWS managed KMS key, use the `list-keys` or `list-aliases` command.

```
aws kms list-grants \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

The output shows that the grant gives Amazon DynamoDB permission to use the KMS key for cryptographic operations, and gives it permission to view details about the KMS key (`DescribeKey`) and to retire grants (`RetireGrant`). The `EncryptionContextSubset` constraint limits these permission to requests that include the specified encryption context pairs. As a result, the permissions in the grant are effective only on specified account and DynamoDB table.

Output:

```
{
    "Grants": [
        {
            "Constraints": {
                "EncryptionContextSubset": {
                    "aws:dynamodb:subscriberId": "123456789012",
                    "aws:dynamodb:tableName": "Services"
                }
            },
            "IssuingAccount": "arn:aws:iam::123456789012:root",
            "Name": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
```

```
            "Operations": [
                "Decrypt",
                "Encrypt",
                "GenerateDataKey",
                "ReEncryptFrom",
                "ReEncryptTo",
                "RetireGrant",
                "DescribeKey"
            ],
            "GrantId":
 "1667b97d27cf748cf05b487217dd4179526c949d14fb3903858e25193253fe59",
            "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "RetiringPrincipal": "dynamodb.us-west-2.amazonaws.com",
            "GranteePrincipal": "dynamodb.us-west-2.amazonaws.com",
            "CreationDate": "2021-05-13T18:32:45.144000+00:00"
        }
    ]
}
```

For more information, see Grants in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see ListGrants in *AWS CLI Command Reference*.

`list-key-policies`

The following code example shows how to use `list-key-policies`.

AWS CLI

To get the names of key policies for a KMS key

The following `list-key-policies` example gets the names of the key policies for a customer managed key in the example account and Region. You can use this command to find the names of key policies for AWS managed keys and customer managed keys.

Because the only valid key policy name is `default`, this command is not useful.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms list-key-policies \
```

```
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "PolicyNames": [
    "default"
    ]
}
```

For more information about AWS KMS key policies, see Using Key Policies in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see ListKeyPolicies in *AWS CLI Command Reference*.

`list-key-rotations`

The following code example shows how to use `list-key-rotations`.

AWS CLI

To retrieve information about all completed key material rotations

The following `list-key-rotations` example lists information about all completed key material rotations for the specified KMS key.

```
aws kms list-key-rotations \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Rotations": [
        {
            "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RotationDate": "2024-03-02T10:11:36.564000+00:00",
            "RotationType": "AUTOMATIC"
        },
        {
            "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RotationDate": "2024-04-05T15:14:47.757000+00:00",
            "RotationType": "ON_DEMAND"
```

```
        }
    ],
    "Truncated": false
}
```

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ListKeyRotations in *AWS CLI Command Reference*.

`list-keys`

The following code example shows how to use `list-keys`.

AWS CLI

To get the KMS keys in an account and Region

The following `list-keys` example gets the KMS keys in an account and Region. This command returns both AWS managed keys and customer managed keys.

```
aws kms list-keys
```

Output:

```
{
    "Keys": [
        {
            "KeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "KeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        },
        {
            "KeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
            "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
        }
    ]
```

```
}
```

For more information, see Viewing Keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ListKeys in *AWS CLI Command Reference*.

`list-resource-tags`

The following code example shows how to use `list-resource-tags`.

AWS CLI

To get the tags on a KMS key

The following `list-resource-tags` example gets the tags for a KMS key. To add or replace resource tags on KMS keys, use the `tag-resource` command. The output shows that this KMS key has two resource tags, each of which has a key and value.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms list-resource-tags \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Tags": [
    {
        "TagKey": "Dept",
        "TagValue": "IT"
    },
    {
        "TagKey": "Purpose",
        "TagValue": "Test"
    }
    ],
    "Truncated": false
}
```

For more information about using tags in AWS KMS, see Tagging keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ListResourceTags in *AWS CLI Command Reference*.

`list-retirable-grants`

The following code example shows how to use `list-retirable-grants`.

AWS CLI

To view the grants that a principal can retire

The following `list-retirable-grants` example displays all of the grants that the `ExampleAdmin` user can retire on the KMS keys in an AWS account and Region. You can use a command like this one to view the grants that any account principal can retire on KMS keys in the AWS account and Region.

The value of the required `retiring-principal` parameter must be the Amazon Resource Name (ARN) of an account, user, or role.

You cannot specify a service for the value of `retiring-principal` in this command, even though a service can be the retiring principal. To find the grants in which a particular service is the retiring principal, use the `list-grants` command.

The output shows that `ExampleAdmin` user has permission to retire grants on two different KMS keys in the account and region. In addition to the retiring principal, the account has permission to retire any grant in the account.

```
aws kms list-retirable-grants \
    --retiring-principal arn:aws:iam::123456789012:user/ExampleAdmin
```

Output:

```
{
    "Grants": [
        {
            "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "GrantId":
 "156b69c63cb154aa21f59929ff19760717be8d9d82b99df53e18b94a15a5e88e",
            "Name": "",
            "CreationDate": "2021-01-14T20:17:36.419000+00:00",
```

```
            "GranteePrincipal": "arn:aws:iam::123456789012:user/ExampleUser",
            "RetiringPrincipal": "arn:aws:iam::123456789012:user/ExampleAdmin",
            "IssuingAccount": "arn:aws:iam::123456789012:root",
            "Operations": [
                "Encrypt"
            ],
            "Constraints": {
                "EncryptionContextSubset": {
                    "Department": "IT"
                }
            }
        },
        {
            "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "GrantId":
 "8c94d1f12f5e69f440bae30eaec9570bb1fb7358824f9ddfa1aa5a0dab1a59b2",
            "Name": "",
            "CreationDate": "2021-02-02T19:49:49.638000+00:00",
            "GranteePrincipal": "arn:aws:iam::123456789012:role/ExampleRole",
            "RetiringPrincipal": "arn:aws:iam::123456789012:user/ExampleAdmin",
            "IssuingAccount": "arn:aws:iam::123456789012:root",
            "Operations": [
                "Decrypt"
            ],
            "Constraints": {
                "EncryptionContextSubset": {
                    "Department": "IT"
                }
            }
        }
    ],
    "Truncated": false
}
```

For more information, see Grants in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see ListRetirableGrants in *AWS CLI Command Reference*.

`put-key-policy`

The following code example shows how to use `put-key-policy`.

AWS CLI

To change the key policy for a KMS key

The following `put-key-policy` example changes the key policy for a customer managed key.

To begin, create a key policy and save it in a local JSON file. In this example, the file is `key_policy.json`. You can also specify the key policy as a string value of the `policy` parameter.

The first statement in this key policy gives the AWS account permission to use IAM policies to control access to the KMS key. The second statement gives the `test-user` user permission to run the `describe-key` and `list-keys` commands on the KMS key.

Contents of `key_policy.json`:

```
{
    "Version":"2012-10-17",
    "Id" : "key-default-1",
    "Statement" : [
        {
            "Sid" : "Enable IAM User Permissions",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::123456789012:root"
            },
            "Action" : "kms:*",
            "Resource" : "*"
        },
        {
            "Sid" : "Allow Use of Key",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::123456789012:user/test-user"
            },
            "Action" : [
                "kms:DescribeKey",
                "kms:ListKeys"
            ],
            "Resource" : "*"
        }
    ]
}
```

To identify the KMS key, this example uses the key ID, but you can also use a key ARN. To specify the key policy, the command uses the `policy` parameter. To indicate that the policy is in a file, it uses the required `file://` prefix. This prefix is required to identify files on all supported operating systems. Finally, the command uses the `policy-name` parameter with a value of `default`. If no policy name is specified, the default value is `default`. The only valid value is `default`.

```
aws kms put-key-policy \
    --policy-name default \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --policy file://key_policy.json
```

This command does not produce any output. To verify that the command was effective, use the `get-key-policy` command. The following example command gets the key policy for the same KMS key. The `output` parameter with a value of `text` returns a text format that is easy to read.

```
aws kms get-key-policy \
    --policy-name default \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --output text
```

Output:

```
{
    "Version":"2012-10-17",
    "Id" : "key-default-1",
    "Statement" : [
        {
            "Sid" : "Enable IAM User Permissions",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::123456789012:root"
            },
            "Action" : "kms:*",
            "Resource" : "*"
            },
            {
            "Sid" : "Allow Use of Key",
            "Effect" : "Allow",
            "Principal" : {
```

```
                "AWS" : "arn:aws:iam::123456789012:user/test-user"
            },
            "Action" : [ "kms:Describe", "kms:List" ],
            "Resource" : "*"
        }
    ]
}
```

For more information, see Changing a Key Policy in the *AWS Key Management Service Developer Guide*.

- For API details, see PutKeyPolicy in *AWS CLI Command Reference*.

`re-encrypt`

The following code example shows how to use `re-encrypt`.

AWS CLI

Example 1: To re-encrypt an encrypted message under a different symmetric KMS key (Linux and macOS)

The following `re-encrypt` example demonstrates the recommended way to re-encrypt data with the AWS CLI.

Provide the ciphertext in a file.In the value of the `--ciphertext-blob` parameter, use the `fileb://` prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see Loading AWS CLI parameters from a file in the *AWS Command Line Interface User Guide* and Best Practices for Local File Parameters in the *AWS Command Line Tool Blog*.Specify the source KMS key, which decrypts the ciphertext.The `--source-key-id` parameter is not required when decrypting with symmetric encryption KMS keys. AWS KMS can get the KMS key that was used to encrypt the data from the metadata in the ciphertext blob. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust.Specify the destination KMS key, which re-encrypts the data.The `--destination-key-id` parameter is always required. This example uses a key ARN, but you can use any valid key identifier.Request the plaintext output as a text value.The `--query` parameter tells the CLI to get only the value of the `Plaintext` field from the output. The `--output` parameter returns the output as text.Base64-decode the plaintext and save it

in a file.The following example pipes (|) the value of the `Plaintext` parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the `ExamplePlaintext` file.

Before running this command, replace the example key IDs with valid key identifiers from your AWS account.

```
aws kms re-encrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --source-key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --destination-key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --query CiphertextBlob \
    --output text | base64 --decode > ExampleReEncryptedFile
```

This command produces no output. The output from the `re-encrypt` command is base64-decoded and saved in a file.

For more information, see AWS KMS cryptography essentials in the *AWS Key Management Service Developer Guide*.

Example 2: To re-encrypt an encrypted message under a different symmetric KMS key (Windows command prompt)

The following `re-encrypt` example is the same as the previous one except that it uses the `certutil` utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms re-encrypt ^
    --ciphertext-blob fileb://ExampleEncryptedFile ^
    --source-key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 ^
    --destination-key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 ^
    --query CiphertextBlob ^
    --output text > ExampleReEncryptedFile.base64
```

Then use the `certutil` utility.

```
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see AWS KMS cryptography essentials in the *AWS Key Management Service Developer Guide*.

- For API details, see ReEncrypt in *AWS CLI Command Reference*.

`retire-grant`

The following code example shows how to use `retire-grant`.

AWS CLI

To retire a grant on a customer master key

The following `retire-grant` example deletes a grant from a KMS key.

The following example command specifies the `grant-id` and the `key-id` parameters. The value of the `key-id` parameter must be the key ARN of the KMS key.

```
aws kms retire-grant \
    --grant-id 1234a2345b8a4e350500d432bccf8ecd6506710e1391880c4f7f7140160c9af3 \
    --key-id arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111
```

This command produces no output. To confirm that the grant was retired, use the `list-grants` command.

For more information, see Retiring and revoking grants in the *AWS Key Management Service Developer Guide*.

- For API details, see RetireGrant in *AWS CLI Command Reference*.

`revoke-grant`

The following code example shows how to use `revoke-grant`.

AWS CLI

To revoke a grant on a customer master key

The following `revoke-grant` example deletes a grant from a KMS key. The following example command specifies the `grant-id` and the `key-id` parameters. The value of the `key-id` parameter can be the key ID or key ARN of the KMS key.

```
aws kms revoke-grant \
    --grant-id 1234a2345b8a4e350500d432bccf8ecd6506710e1391880c4f7f7140160c9af3 \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output. To confirm that the grant was revoked, use the `list-grants` command.

For more information, see Retiring and revoking grants in the *AWS Key Management Service Developer Guide*.

- For API details, see RevokeGrant in *AWS CLI Command Reference*.

`rotate-key-on-demand`

The following code example shows how to use `rotate-key-on-demand`.

AWS CLI

To perform on-demand rotation of a KMS key

The following `rotate-key-on-demand` example immediately initiates rotation of the key material for the specified KMS key.

```
aws kms rotate-key-on-demand \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "KeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see How to perform on-demand key rotation in the *AWS Key Management Service Developer Guide*.

- For API details, see RotateKeyOnDemand in *AWS CLI Command Reference*.

`schedule-key-deletion`

The following code example shows how to use `schedule-key-deletion`.

AWS CLI

To schedule the deletion of a customer managed KMS key.

The following `schedule-key-deletion` example schedules the specified customer managed KMS key to be deleted in 15 days.

The `--key-id` parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key.The `--pending-window-in-days` parameter specifies the length of the 7-30 day waiting period. By default, the waiting period is 30 days. This example specifies a value of 15, which tells AWS to permanently delete the KMS key 15 days after the command completes.

```
aws kms schedule-key-deletion \
    --key-id arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 \
    --pending-window-in-days 15
```

The response includes the key ARN, key state, waiting period (`PendingWindowInDays`), and the deletion date in Unix time. To view the deletion date in local time, use the AWS KMS console. KMS keys in the `PendingDeletion` key state cannot be used in cryptographic operations.

Output:

```
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "DeletionDate": "2022-06-18T23:43:51.272000+00:00",
    "KeyState": "PendingDeletion",
    "PendingWindowInDays": 15
}
```

For more information, see Deleting keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ScheduleKeyDeletion in *AWS CLI Command Reference*.

`sign`

The following code example shows how to use `sign`.

AWS CLI

Example 1: To generate a digital signature for a message

The following `sign` example generates a cryptographic signature for a short message. The output of the command includes a base-64 encoded `Signature` field that you can verify by using the `verify` command.

You must specify a message to sign and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms for your KMS key, use the `describe-key` command.

In AWS CLI v2, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of SIGN_VERIFY.

```
msg=(echo 'Hello World' | base64)

aws kms sign \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --message fileb://UnsignedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "Signature": "ABCDEFhpyVYyTxbafE74ccSvEJLJr3zuoV1Hfymz4qv+/
fxmxNLA7SE1SiF8lHw80fKZZ3bJ...",
    "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
}
```

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 2: To save a digital signature in a file (Linux and macOs)

The following `sign` example generates a cryptographic signature for a short message stored in a local file. The command also gets the `Signature` property from the response, Base64-decodes it and saves it in the ExampleSignature file. You can use the signature file in a `verify` command that verifies the signature.

The `sign` command requires a Base64-encoded message and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms that your KMS key supports, use the `describe-key` command.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of SIGN_VERIFY.

First, Base64-encode the message and save it in the `EncodedMessage` file.

```
echo 'hello world' | base64 > EncodedMessage
```

Then, sign the encoded message.

```
aws kms sign \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --message fileb://EncodedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \
    --output text \
    --query Signature | base64 --decode > ExampleSignature
```

This command produces no output. This example extracts the `Signature` property of the output and saves it in a file.

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see Sign in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a KMS key

The following `tag-resource` example adds `"Purpose":"Test"` and `"Dept":"IT"` tags to a customer managed KMS key. You can use tags like these to label KMS keys and create categories of KMS keys for permissions and auditing.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms tag-resource \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags TagKey='Purpose',TagValue='Test' TagKey='Dept',TagValue='IT'
```

This command produces no output. To view the tags on an AWS KMS KMS key, use the `list-resource-tags` command.

For more information about using tags in AWS KMS, see Tagging keys in the *AWS Key Management Service Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To delete a tag from a KMS key

The following `untag-resource` example deletes the tag with the `"Purpose"` key from a customer managed KMS key.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command. Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms untag-resource \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tag-keys 'Purpose'
```

This command produces no output. To view the tags on an AWS KMS KMS key, use the `list-resource-tags` command.

For more information about using tags in AWS KMS, see Tagging keys in the *AWS Key Management Service Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-alias`

The following code example shows how to use `update-alias`.

AWS CLI

To associate an alias with a different KMS key

The following `update-alias` example associates the alias `alias/test-key` with a different KMS key.

The `--alias-name` parameter specifies the alias. The alias name value must begin with `alias/`.The `--target-key-id` parameter specifies the KMS key to associate with the alias. You don't need to specify the current KMS key for the alias.

```
aws kms update-alias \
    --alias-name alias/test-key \
    --target-key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output. To find the alias, use the `list-aliases` command.

For more information, see Updating aliases in the *AWS Key Management Service Developer Guide*.

- For API details, see UpdateAlias in *AWS CLI Command Reference*.

`update-custom-key-store`

The following code example shows how to use `update-custom-key-store`.

AWS CLI

Example 1: To edit the friendly name of a custom key store

The following `update-custom-key-store` example changes the name of the custom key store. This example works for an AWS CloudHSM key store or an external key store.

Use the `custom-key-store-id` to identify the key store. Use the `new-custom-key-store-name` parameter to specify the new friendly name.

To update the friendly name of an AWS CloudHSM key store, you must first disconnect the key store, such as by using the `disconnect-custom-key-store` command. You can update the friendly name of an external key store while it is connected or disconnected. To find the connection state of your custom key store, use the `describe-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --new-custom-key-store-name ExampleKeyStore
```

This command produces no output. To verify that the command worked, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the *AWS Key Management Service Developer Guide*.

For more information about updating an external key store, see Editing external key store properties in the *AWS Key Management Service Developer Guide*.

Example 2: To edit the kmsuser password of an AWS CloudHSM key store

The following `update-custom-key-store` example updates the value of the `kmsuser` password to the current password for the `kmsuser` in the CloudHSM cluster associated with the specified key store. This command doesn't change the `kmsuser` password it the cluster. It just tells AWS KMS the current password. If KMS doesn't have the current `kmsuser` password, it cannot connect to the AWS CloudHSM key store.

NOTE: Before updating an AWS CloudHSM key store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --key-store-password ExamplePassword
```

This command produces no output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the *AWS Key Management Service Developer Guide*.

Example 3: To edit the AWS CloudHSM cluster of an AWS CloudHSM key store

The following `update-custom-key-store` example changes the AWS CloudHSM cluster that is associated with an AWS CloudHSM key store to a related cluster, such as a different backup of the same cluster.

NOTE: Before updating an AWS CloudHSM key store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --cloud-hsm-cluster-id cluster-1a23b4cdefg
```

This command produces no output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the *AWS Key Management Service Developer Guide*.

Example 4: To edit the proxy authentication credential of an external key store

The following `update-custom-key-store` example updates the proxy authentication credential for your external key store. You must specify both the `raw-secret-access-key` and the `access-key-id`, even if you are changing only one of the values. You can use this feature to fix an invalid credential or to change the credential when the external key store proxy rotates it.

Establish the proxy authentication credential for AWS KMS on your external key store. Then use this command to provide the credential to AWS KMS. AWS KMS uses this credential to sign its requests to your external key store proxy.

You can update the proxy authentication credential while the external key store is connected or disconnected. To find the connection state of your custom key store, use the `describe-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
 RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

This command produces no output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see Editing external key store properties in the *AWS Key Management Service Developer Guide*.

Example 5: To edit the proxy connectivity of an external key store

The following `update-custom-key-store` example changes the external key store proxy connectivity option from public endpoint connectivity to VPC endpoint service connectivity. In addition to changing the `xks-proxy-connectivity` value, you must change the `xks-proxy-uri-endpoint` value to reflect the private DNS name associated with the VPC endpoint service. You must also add an `xks-proxy-vpc-endpoint-service-name` value.

NOTE: Before updating the proxy connectivity of an external store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the external key store by using the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --xks-proxy-connectivity VPC_ENDPOINT_SERVICE \
    --xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \
    --xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-west-2.vpce-svc-
example"
```

This command produces no output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see Editing external key store properties in the *AWS Key Management Service Developer Guide*.

- For API details, see UpdateCustomKeyStore in *AWS CLI Command Reference*.

update-key-description

The following code example shows how to use `update-key-description`.

AWS CLI

Example 1: To add or change a description to a customer managed KMS key

The following `update-key-description` example adds a description to a customer managed KMS key. You can use the same command to change an existing description.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ARN value, but you can use either the key ID or the key ARN of the KMS key.The `--description` parameter specifies the new description. The value of this parameter replaces the current description of the KMS key, if any.

```
aws kms update-key-description \
    --key-id arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 \
    --description "IT Department test key"
```

This command produces no output. To view the description of a KMS key, use the `describe-key` command.

For more information, see Access and list KMS key details in the *AWS Key Management Service Developer Guide*.

Example 2: To delete the description of a customer managed KMS key

The following `update-key-description` example deletes the description to a customer managed KMS key.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ID value, but you can use either the key ID or the key ARN of the KMS key.The `--description` parameter with an empty string value ('') deletes the existing description.

```
aws kms update-key-description \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --description ''
```

This command produces no output. To view the description of a KMS key, use the the describe-key command.

For more information, see Access and list KMS key details in the *AWS Key Management Service Developer Guide*.

- For API details, see UpdateKeyDescription in *AWS CLI Command Reference*.

`verify-mac`

The following code example shows how to use `verify-mac`.

AWS CLI

Example 1: To verify an HMAC

The following `verify-mac` example verifies an HMAC for a particular message, HMAC KMS keys, and MAC algorithm. A value of 'true' in the MacValid value in the response indicates that the HMAC is valid.

In AWS CLI v2, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

The MAC that you specify cannot be base64-encoded. For help decoding the MAC that the `generate-mac` command returns, see the `generate-mac` command examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent a HMAC KMS key with a key usage of `GENERATE_VERIFY_MAC`.

```
msg=(echo 'Hello World' | base64)

aws kms verify-mac \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --message fileb://Message \
    --mac-algorithm HMAC_SHA_384 \
    --mac fileb://ExampleMac
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "MacValid": true,
    "MacAlgorithm": "HMAC_SHA_384"
}
```

For more information about using HMAC KMS keys in AWS KMS, see HMAC keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see VerifyMac in *AWS CLI Command Reference*.

`verify`

The following code example shows how to use `verify`.

AWS CLI

To verify a digital signature

The following `verify` example verifies a cryptographic signature for a short, Base64-encoded message. The key ID, message, message type, and signing algorithm must be same ones that were used to sign the message.

In AWS CLI v2, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

The signature that you specify cannot be base64-encoded. For help decoding the signature that the `sign` command returns, see the `sign` command examples.

The output of the command includes a Boolean `SignatureValid` field that indicates that the signature was verified. If the signature validation fails, the `verify` command fails, too.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms verify \
    --key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --message fileb://EncodedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \
    --signature fileb://ExampleSignature
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
```

```
    "SignatureValid": true,
    "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
}
```

For more information about using asymmetric KMS keys in AWS KMS, see Using asymmetric keys in the *AWS Key Management Service Developer Guide*.

- For API details, see Verify in *AWS CLI Command Reference*.

Lake Formation examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lake Formation.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`add-lf-tags-to-resource`

The following code example shows how to use `add-lf-tags-to-resource`.

AWS CLI

To attach one or more LF-tags to an existing resource

The following `add-lf-tags-to-resource` example attaches given LF-tag to the table resource.

```
aws lakeformation add-lf-tags-to-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    },
    "LFTags": [{
        "CatalogId": "123456789111",
        "TagKey": "usergroup",
        "TagValues": [
            "analyst"
        ]
    }]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see Assigning LF-Tags to Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see AddLfTagsToResource in *AWS CLI Command Reference*.

`batch-grant-permissions`

The following code example shows how to use `batch-grant-permissions`.

AWS CLI

To bulk grant permissions on resources to the principals

The following `batch-grant-permissions` example bulk grants access on specified resources to the principals.

```
aws lakeformation batch-grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Entries": [{
            "Id": "1",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
        {
            "Id": "2",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_customer"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
```

```
        {
            "Id": "3",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
business-analyst"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
        {
            "Id": "4",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "DataCellsFilter": {
                    "TableCatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "TableName": "dl_tpc_item",
                    "Name": "developer_item"
                }
            },
            "Permissions": [
                "SELECT"
            ],
            "PermissionsWithGrantOption": []
        }
    ]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see BatchGrantPermissions in *AWS CLI Command Reference*.

`batch-revoke-permissions`

The following code example shows how to use `batch-revoke-permissions`.

AWS CLI

To bulk revoke permissions on resources from the principals

The following `batch-revoke-permissions` example bulk revokes access on specified resources from the principals.

```
aws lakeformation batch-revoke-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Entries": [{
            "Id": "1",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
```

```
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
        {
            "Id": "2",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
business-analyst"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        }
    ]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see BatchRevokePermissions in *AWS CLI Command Reference*.

`cancel-transaction`

The following code example shows how to use `cancel-transaction`.

AWS CLI

To cancel a transaction

The following `cancel-transaction` example cancels the transaction.

```
aws lakeformation cancel-transaction \
    --transaction-id='b014d972ca8347b89825e33c5774aec4'
```

This command produces no output.

- For API details, see CancelTransaction in *AWS CLI Command Reference*.

`commit-transaction`

The following code example shows how to use `commit-transaction`.

AWS CLI

To commit transaction

The following `commit-transaction` example commits the transaction.

```
aws lakeformation commit-transaction \
    --transaction-id='b014d972ca8347b89825e33c5774aec4'
```

Output:

```
{
    "TransactionStatus": "committed"
}
```

- For API details, see CommitTransaction in *AWS CLI Command Reference*.

`create-data-cells-filter`

The following code example shows how to use `create-data-cells-filter`.

AWS CLI

Example 1: To create data cell filter

The following `create-data-cells-filter` example creates a data cell filter to allow one to grant access to certain columns based on row condition.

```
aws lakeformation create-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableData": {
        "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],
        "DatabaseName": "tpc",
        "Name": "developer_promotion",
        "RowFilter": {
            "FilterExpression": "p_promo_name='ese'"
        },
        "TableCatalogId": "123456789111",
        "TableName": "dl_tpc_promotion"
    }
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

Example 2: To create column filter

The following `create-data-cells-filter` example creates a data filter to allow one to grant access to certain columns.

```
aws lakeformation create-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableData": {
        "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],
        "DatabaseName": "tpc",
        "Name": "developer_promotion_allrows",
```

```
        "RowFilter": {
            "AllRowsWildcard": {}
        },
        "TableCatalogId": "123456789111",
        "TableName": "dl_tpc_promotion"
    }
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

Example 3: To create data filter with exclude columns

The following `create-data-cells-filter` example creates a data filter to allow one to grant access all except the mentioned columns.

```
aws lakeformation create-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableData": {
        "ColumnWildcard": {
            "ExcludedColumnNames": ["p_channel_details", "p_start_date_sk"]
        },
        "DatabaseName": "tpc",
        "Name": "developer_promotion_excludecolumn",
        "RowFilter": {
            "AllRowsWildcard": {}
        },
        "TableCatalogId": "123456789111",
        "TableName": "dl_tpc_promotion"
    }
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

- For API details, see CreateDataCellsFilter in *AWS CLI Command Reference*.

`create-lf-tag`

The following code example shows how to use `create-lf-tag`.

AWS CLI

To create LF-Tag

The following `create-lf-tag` example creates an LF-Tag with the specified name and values.

```
aws lakeformation create-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup' \
    --tag-values '["developer","analyst","campaign"]'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see CreateLfTag in *AWS CLI Command Reference*.

`delete-data-cells-filter`

The following code example shows how to use `delete-data-cells-filter`.

AWS CLI

To delete data cell filter

The following `delete-data-cells-filter` example deletes given data cell filter.

```
aws lakeformation delete-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableCatalogId": "123456789111",
    "DatabaseName": "tpc",
```

```
    "TableName": "dl_tpc_promotion",
    "Name": "developer_promotion"
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

- For API details, see DeleteDataCellsFilter in *AWS CLI Command Reference*.

`delete-lf-tag`

The following code example shows how to use `delete-lf-tag`.

AWS CLI

To delete LF-Tag definition

The following `delete-lf-tag` example deletes LF-Tag definition.

```
aws lakeformation delete-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see DeleteLfTag in *AWS CLI Command Reference*.

`delete-objects-on-cancel`

The following code example shows how to use `delete-objects-on-cancel`.

AWS CLI

To delete object when transaction is cancelled

The following `delete-objects-on-cancel` example deletes the listed s3 object when the transaction is cancelled.

```
aws lakeformation delete-objects-on-cancel \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789012",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_household_demographics_gov",
    "TransactionId": "1234d972ca8347b89825e33c5774aec4",
    "Objects": [{
        "Uri": "s3://amzn-s3-demo-bucket/target/dl_tpc_household_demographics_gov/
run-unnamed-1-part-block-0-r-00000-snappy-ff26b17504414fe88b302cd795eabd00.parquet",
        "ETag": "1234ab1fc50a316b149b4e1f21a73800"
    }]
}
```

This command produces no output.

- For API details, see DeleteObjectsOnCancel in *AWS CLI Command Reference*.

`deregister-resource`

The following code example shows how to use `deregister-resource`.

AWS CLI

To deregister data lake storage

The following `deregister-resource` example deregisters the resource as managed by the Lake Formation.

```
aws lakeformation deregister-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::amzn-s3-demo-bucket"
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see DeregisterResource in *AWS CLI Command Reference*.

`describe-transaction`

The following code example shows how to use `describe-transaction`.

AWS CLI

To retrieve a transaction details

The following `describe-transaction` example returns the details of a single transaction.

```
aws lakeformation describe-transaction \
    --transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

Output:

```
{
    "TransactionDescription": {
        "TransactionId": "12345972ca8347b89825e33c5774aec4",
        "TransactionStatus": "committed",
        "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
        "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
    }
}
```

- For API details, see DescribeTransaction in *AWS CLI Command Reference*.

`extend-transaction`

The following code example shows how to use `extend-transaction`.

AWS CLI

To extend a transaction

The following `extend-transaction` example extends the transaction.

```
aws lakeformation extend-transaction \
    --transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

This command produces no output.

- For API details, see ExtendTransaction in *AWS CLI Command Reference*.

`get-data-lake-settings`

The following code example shows how to use `get-data-lake-settings`.

AWS CLI

To retrieve AWS Lake Formation-managed data lake settings

The following `get-data-lake-settings` example retrieves the list of data lake administrators and other data lake settings.

```
aws lakeformation get-data-lake-settings \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111"
}
```

Output:

```
{
    "DataLakeSettings": {
        "DataLakeAdmins": [{
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
        }],
        "CreateDatabaseDefaultPermissions": [],
        "CreateTableDefaultPermissions": [
                {
                        "Principal": {
                            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
                        },
                        "Permissions": [
```

```
                            "ALL"
                        ]
                }
        ],
        "TrustedResourceOwners": [],
        "AllowExternalDataFiltering": true,
        "ExternalDataFilteringAllowList": [{
            "DataLakePrincipalIdentifier": "123456789111"
        }],
        "AuthorizedSessionTagValueList": [
            "Amazon EMR"
        ]
    }
}
```

For more information, see Changing the default security settings for your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see GetDataLakeSettings in *AWS CLI Command Reference*.

`get-effective-permissions-for-path`

The following code example shows how to use `get-effective-permissions-for-path`.

AWS CLI

To retrieve permissions on resources located at specific path

The following `get-effective-permissions-for-path` example returns the Lake Formation permissions for a specified table or database resource located at a path in Amazon S3.

```
aws lakeformation get-effective-permissions-for-path \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "ResourceArn": "arn:aws:s3:::amzn-s3-demo-bucket"
}
```

Output:

```
{
    "Permissions": [{
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
campaign-manager"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "DESCRIBE"
            ],
            "PermissionsWithGrantOption": []
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/EMR-
RuntimeRole"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "ALL"

```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

- For API details, see GetEffectivePermissionsForPath in *AWS CLI Command Reference*.

`get-lf-tag`

The following code example shows how to use `get-lf-tag`.

AWS CLI

To retrieve LF-tag definition

The following `get-lf-tag` example retrieves LF-tag definition.

```
aws lakeformation get-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup'
```

Output:

```
{
    "CatalogId": "123456789111",
    "TagKey": "usergroup",
    "TagValues": [
        "analyst",
        "campaign",
        "developer"
    ]
}
```

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see GetLfTag in *AWS CLI Command Reference*.

`get-query-state`

The following code example shows how to use `get-query-state`.

AWS CLI

To retrieve state of a submitted query

The following `get-query-state` example returns the state of a query previously submitted.

```
aws lakeformation get-query-state \
    --query-id='a1b2c3d4-5678-90ab-cdef-EXAMPLE11111'
```

Output:

```
{
    "State": "FINISHED"
}
```

- For API details, see GetQueryState in *AWS CLI Command Reference*.

`get-query-statistics`

The following code example shows how to use `get-query-statistics`.

AWS CLI

To retrieve query statistics

The following `get-query-statistics` example retrieves statistics on the planning and execution of a query.

```
aws lakeformation get-query-statistics \
    --query-id='a1b2c3d4-5678-90ab-cdef-EXAMPLE11111'
```

Output:

```
{
    "ExecutionStatistics": {
        "AverageExecutionTimeMillis": 0,
        "DataScannedBytes": 0,
```

```
        "WorkUnitsExecutedCount": 0
    },
    "PlanningStatistics": {
        "EstimatedDataToScanBytes": 43235,
        "PlanningTimeMillis": 2377,
        "QueueTimeMillis": 440,
        "WorkUnitsGeneratedCount": 1
    },
    "QuerySubmissionTime": "2022-08-11T02:14:38.641870+00:00"
}
```

- For API details, see GetQueryStatistics in *AWS CLI Command Reference*.

`get-table-objects`

The following code example shows how to use `get-table-objects`.

AWS CLI

To list objects of governed table

The following `get-table-objects` example returns the set of Amazon S3 objects that make up the specified governed table.

```
aws lakeformation get-table-objects \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789012",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_household_demographics_gov",
    "QueryAsOfTime": "2022-08-10T15:00:00"
}
```

Output:

```
{
    "Objects": [{
        "PartitionValues": [],
```

```
        "Objects": [{
            "Uri": "s3://amzn-s3-demo-bucket/target/
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-
ff26b17504414fe88b302cd795eabd00.parquet",
            "ETag": "12345b1fc50a316b149b4e1f21a73800",
            "Size": 43235
        }]
    }]
}
```

- For API details, see GetTableObjects in *AWS CLI Command Reference*.

`get-work-unit-results`

The following code example shows how to use `get-work-unit-results`.

AWS CLI

To retrieve work units of given query

The following `get-work-unit-results` example returns the work units resulting from the query.

```
aws lakeformation get-work-unit-results \
    --query-id='a1b2c3d4-5678-90ab-cdef-EXAMPLE11111' \
    --work-unit-id '0' \
    --work-unit-token 'B2fMSdmQXe9umX8Ux8XCo4=' outfile
```

This command produces no output. The results are saved to the file `outfile`.

- For API details, see GetWorkUnitResults in *AWS CLI Command Reference*.

`get-work-units`

The following code example shows how to use `get-work-units`.

AWS CLI

To retrieve work units

The following `get-work-units` example retrieves the work units generated by the StartQueryPlanning operation.

```
aws lakeformation get-work-units \
    --query-id='a1b2c3d4-5678-90ab-cdef-EXAMPLE11111'
```

Output:

```
{
    "WorkUnitRanges": [{
        "WorkUnitIdMax": 0,
        "WorkUnitIdMin": 0,
        "WorkUnitToken":

    }],
    "QueryId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

- For API details, see GetWorkUnits in *AWS CLI Command Reference*.

`grant-permissions`

The following code example shows how to use `grant-permissions`.

AWS CLI

Example 1: To grant permissions to the principal on resources using LF-Tags

The following `grant-permissions` example grants ALL permissions to the principal on database resource that matches the LF-Tag policy.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
    },
    "Resource": {
        "LFTagPolicy": {
            "CatalogId": "123456789111",
            "ResourceType": "DATABASE",
            "Expression": [{
                "TagKey": "usergroup",
                "TagValues": [
                    "analyst",
                    "developer"
                ]
            }]
        }
    },
    "Permissions": [
        "ALL"
    ],
    "PermissionsWithGrantOption": [
        "ALL"
    ]
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

Example 2: To grant column level permissions to the principal

The following `grant-permissions` example grants permission to select specific column to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
```

```
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "TableWithColumns": {
            "CatalogId": "123456789111",
            "ColumnNames": ["p_end_date_sk"],
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    },
    "Permissions": [
        "SELECT"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

Example 3: To grant table permissions to the principal

The following `grant-permissions` example grants select permission on all tables of given database to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
```

```
            "TableWildcard": {}
        }
    },
    "Permissions": [
        "SELECT"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

Example 4: To grant permissions on LF-Tags to the principal

The following `grant-permissions` example grants associate permission on LF-Tags to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "LFTag": {
            "CatalogId": "123456789111",
            "TagKey": "category",
            "TagValues": [
                "private", "public"
            ]
        }

    },
    "Permissions": [
        "ASSOCIATE"
    ],
```

```
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

Example 5: To grant permissions on data locations to the principal

The following `grant-permissions` example grants permission on data location to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "DataLocation": {
            "CatalogId": "123456789111",
            "ResourceArn": "arn:aws:s3:::amzn-s3-demo-bucket"
        }
    },
    "Permissions": [
        "DATA_LOCATION_ACCESS"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see GrantPermissions in *AWS CLI Command Reference*.

`list-data-cells-filter`

The following code example shows how to use `list-data-cells-filter`.

AWS CLI

To list data cell filters

The following `list-data-cells-filter` example list data cell filter for given table.

```
aws lakeformation list-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "MaxResults": 2,
    "Table": {
        "CatalogId": "123456789111",
        "DatabaseName": "tpc",
        "Name": "dl_tpc_promotion"
    }
}
```

Output:

```
{
    "DataCellsFilters": [{
            "TableCatalogId": "123456789111",
            "DatabaseName": "tpc",
            "TableName": "dl_tpc_promotion",
            "Name": "developer_promotion",
            "RowFilter": {
                "FilterExpression": "p_promo_name='ese'"
            },
            "ColumnNames": [
                "p_channel_details",
                "p_start_date_sk",
                "p_purpose",
                "p_promo_id",
                "p_promo_name",
                "p_end_date_sk",
                "p_discount_active"
```

```
            ]
        },
        {
            "TableCatalogId": "123456789111",
            "DatabaseName": "tpc",
            "TableName": "dl_tpc_promotion",
            "Name": "developer_promotion_allrows",
            "RowFilter": {
                "FilterExpression": "TRUE",
                "AllRowsWildcard": {}
            },
            "ColumnNames": [
                "p_channel_details",
                "p_start_date_sk",
                "p_promo_name"
            ]
        }
    ],
    "NextToken": "2MDA2MTgwNiwibmFub3MiOjE0MDAwMDAwMH19"
}
```

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

- For API details, see ListDataCellsFilter in *AWS CLI Command Reference*.

`list-lf-tags`

The following code example shows how to use `list-lf-tags`.

AWS CLI

To list LF-tags

The following `list-lf-tags` example returns list of LF-tags that the requester has permission to view.

```
aws lakeformation list-lf-tags \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
```

```
    "CatalogId": "123456789111",
    "ResourceShareType": "ALL",
    "MaxResults": 2
}
```

Output:

```
{
"LFTags": [{
        "CatalogId": "123456789111",
        "TagKey": "category",
        "TagValues": [
            "private",
            "public"
        ]
    },
    {
        "CatalogId": "123456789111",
        "TagKey": "group",
        "TagValues": [
            "analyst",
            "campaign",
            "developer"
        ]
    }],
    "NextToken": "kIiwiZXhwaXJhdGlvbiI6eyJzZWNvbmRzIjoxNjYwMDY4dCI6ZmFsc2V9"
}
```

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see ListLfTags in *AWS CLI Command Reference*.

`list-permissions`

The following code example shows how to use `list-permissions`.

AWS CLI

Example 1: To retrieve list of principal permissions on the resource

The following `list-permissions` example returns a list of principal permissions on the database resources.

```
aws lakeformation list-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "ResourceType": "DATABASE",
    "MaxResults": 2
}
```

Output:

```
{
    "PrincipalResourcePermissions": [{
        "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
campaign-manager"
        },
        "Resource": {
            "Database": {
                "CatalogId": "123456789111",
                "Name": "tpc"
            }
        },
        "Permissions": [
            "DESCRIBE"
        ],
        "PermissionsWithGrantOption": []
    }],
    "NextToken":
 "E5SlJDSTZleUp6SWpvaU9UQTNORE0zTXpFeE5Ua3pJbjE5TENKbGVIQnBjbUYwYVc5dUlqcDdJbk5sWTI5dVpITWlP
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

Example 2: To retrieve list of principal permissions on the table with data filters

The following `list-permissions` example list the permissions on the table with related data filters granted to the principal.

```
aws lakeformation list-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_customer"
        }
    },
    "IncludeRelated": "TRUE",
    "MaxResults": 10
}
```

Output:

```
{
    "PrincipalResourcePermissions": [{
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/
Admin"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "customer",
                    "Name": "customer_invoice"
                }
            },
            "Permissions": [
                "ALL",
                "ALTER",
                "DELETE",
                "DESCRIBE",
                "DROP",
                "INSERT"
            ],
            "PermissionsWithGrantOption": [
```

```
                "ALL",
                "ALTER",

```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

Example 3: To retrieve list of principal permissions on the LF-Tags

The following `list-permissions` example list the permissions on the LF-Tags granted to the principal.

```
aws lakeformation list-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "LFTag": {
            "CatalogId": "123456789111",
            "TagKey": "category",
            "TagValues": [
                "private"
            ]
        }
    },
    "MaxResults": 10
}
```

Output:

```
{
    "PrincipalResourcePermissions": [{
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
```

```
            },
            "Resource": {
                "LFTag": {
                    "CatalogId": "123456789111",
                    "TagKey": "category",
                    "TagValues": [
                        "*"
                    ]
                }
            },
            "Permissions": [
                "DESCRIBE"
            ],
            "PermissionsWithGrantOption": [
                "DESCRIBE"
            ]
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
            },
            "Resource": {
                "LFTag": {
                    "CatalogId": "123456789111",
                    "TagKey": "category",
                    "TagValues": [
                        "*"
                    ]
                }
            },
            "Permissions": [
                "ASSOCIATE"
            ],
            "PermissionsWithGrantOption": [
                "ASSOCIATE"
            ]
        }
    ],
    "NextToken": "EJwY21GMGFXOXVJanA3SW5Ocm1pc3Npb25zIjpmYWxzZX0="
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

- For API details, see ListPermissions in *AWS CLI Command Reference*.

`list-resources`

The following code example shows how to use `list-resources`.

AWS CLI

To lists the resources managed by the Lake Formation

The following `list-resources` example lists the resources matching the condition that is managed by the Lake Formation.

```
aws lakeformation list-resources \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "FilterConditionList": [{
        "Field": "ROLE_ARN",
        "ComparisonOperator": "CONTAINS",
        "StringValueList": [
            "123456789111"
        ]
    }],
    "MaxResults": 10
}
```

Output:

```
{
    "ResourceInfoList": [{
            "ResourceArn": "arn:aws:s3:::amzn-s3-demo-bucket1",
            "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole",
            "LastModified": "2022-07-21T02:12:46.669000+00:00"
        },
        {
            "ResourceArn": "arn:aws:s3:::amzn-s3-demo-bucket2",
```

```
            "RoleArn": "arn:aws:iam::123456789111:role/EMRLFS3Role",
            "LastModified": "2022-07-29T16:22:03.211000+00:00"
        }
    ]
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

- For API details, see ListResources in *AWS CLI Command Reference*.

`list-transactions`

The following code example shows how to use `list-transactions`.

AWS CLI

To list all transactions details

The following `list-transactions` example returns metadata about transactions and their status.

```
aws lakeformation list-transactions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "StatusFilter": "ALL",
    "MaxResults": 3
}
```

Output:

```
{
    "Transactions": [{
            "TransactionId": "1234569f08804cb790d950d4d0fe485e",
            "TransactionStatus": "committed",
            "TransactionStartTime": "2022-08-10T14:32:29.220000+00:00",
            "TransactionEndTime": "2022-08-10T14:32:33.751000+00:00"
```

```
        },
        {
            "TransactionId": "12345972ca8347b89825e33c5774aec4",
            "TransactionStatus": "committed",
            "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
            "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
        },
        {
            "TransactionId": "12345daf6cb047dbba8ad9b0414613b2",
            "TransactionStatus": "committed",
            "TransactionStartTime": "2022-08-10T13:56:51.261000+00:00",
            "TransactionEndTime": "2022-08-10T13:56:51.547000+00:00"
        }
    ],
    "NextToken": "77X1ebypsI7os+X2lhHsZLGNCDK3nNGpwRdFpicSOHgcX1/
QMoniUAKcpR3kj3ts3PVdMA=="
}
```

- For API details, see ListTransactions in *AWS CLI Command Reference*.

`put-data-lake-settings`

The following code example shows how to use `put-data-lake-settings`.

AWS CLI

To set AWS Lake Formation-managed data lake settings

The following `put-data-lake-settings` example sets the list of data lake administrators and other data lake settings.

```
aws lakeformation put-data-lake-settings \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "DataLakeSettings": {
        "DataLakeAdmins": [{
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
            }
```

```
        ],
        "CreateDatabaseDefaultPermissions": [],
        "CreateTableDefaultPermissions": [],
        "TrustedResourceOwners": [],
        "AllowExternalDataFiltering": true,
        "ExternalDataFilteringAllowList": [{
            "DataLakePrincipalIdentifier": "123456789111"
        }],
        "AuthorizedSessionTagValueList": ["Amazon EMR"]
    }
}
```

This command produces no output.

For more information, see Changing the default security settings for your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see PutDataLakeSettings in *AWS CLI Command Reference*.

`register-resource`

The following code example shows how to use `register-resource`.

AWS CLI

Example 1: To register data lake storage using Service Linked Role

The following `register-resource` example registers the resource as managed by the Lake Formation using Service linked role.

```
aws lakeformation register-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::amzn-s3-demo-bucket",
    "UseServiceLinkedRole": true
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the *AWS Lake Formation Developer Guide*.

Example 2: To register data lake storage using custom role

The following `register-resource` example registers the resource as managed by the Lake Formation using custom role.

```
aws lakeformation register-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::amzn-s3-demo-bucket",
    "UseServiceLinkedRole": false,
    "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole"
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see RegisterResource in *AWS CLI Command Reference*.

`remove-lf-tags-from-resource`

The following code example shows how to use `remove-lf-tags-from-resource`.

AWS CLI

To remove LF-Tag from a resource

The following `remove-lf-tags-from-resource` example removes the LF-Tag association with the table resource.

```
aws lakeformation remove-lf-tags-from-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    },
    "LFTags": [{
        "CatalogId": "123456789111",
        "TagKey": "usergroup",
        "TagValues": [
            "developer"
        ]
    }]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see Assigning LF-Tags to Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see RemoveLfTagsFromResource in *AWS CLI Command Reference*.

`revoke-permissions`

The following code example shows how to use `revoke-permissions`.

AWS CLI

To revoke permissions on resources from the principal

The following `revoke-permissions` example revoke principal access to specific table of a given database.

```
aws lakeformation revoke-permissions \
```

```
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    },
    "Permissions": [
        "ALL"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see RevokePermissions in *AWS CLI Command Reference*.

`search-databases-by-lf-tags`

The following code example shows how to use `search-databases-by-lf-tags`.

AWS CLI

To search on database resources by LFTags

The following `search-databases-by-lf-tags` example search on database resources matching LFTag expression.

```
aws lakeformation search-databases-by-lf-tags \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "MaxResults": 1,
    "CatalogId": "123456789111",
    "Expression": [{
        "TagKey": "usergroup",
        "TagValues": [
            "developer"
        ]
    }]
}
```

Output:

```
{
    "DatabaseList": [{
        "Database": {
            "CatalogId": "123456789111",
            "Name": "tpc"
        },
        "LFTags": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
        }]
    }]
}
```

For more information, see Viewing the resources that a LF-Tag is assigned to in the *AWS Lake Formation Developer Guide*.

- For API details, see SearchDatabasesByLfTags in *AWS CLI Command Reference*.

`search-tables-by-lf-tags`

The following code example shows how to use `search-tables-by-lf-tags`.

AWS CLI

To search on table resources by LFTags

The following `search-tables-by-lf-tags` example search on table resources matching LFTag expression.

```
aws lakeformation search-tables-by-lf-tags \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "MaxResults": 2,
    "CatalogId": "123456789111",
    "Expression": [{
        "TagKey": "usergroup",
        "TagValues": [
            "developer"
        ]
    }]
}
```

Output:

```
{
    "NextToken": "c2VhcmNoQWxsVGFnc0luVGFibGVzIjpmYWxzZX0=",
    "TableList": [{
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_item"
        },
        "LFTagOnDatabase": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
        }],
        "LFTagsOnTable": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
```

```
        }],
        "LFTagsOnColumns": [{
                "Name": "i_item_desc",
                "LFTags": [{
                    "CatalogId": "123456789111",
                    "TagKey": "usergroup",
                    "TagValues": [
                        "developer"
                    ]
                }]
            },
            {
                "Name": "i_container",
                "LFTags": [{

                    "TagValues": [
                        "developer"
                    ]
                }]
            },
            {
                "Name": "i_product_name",
                "LFTags": [{
                    "CatalogId": "123456789111",
                    "TagKey": "usergroup",
                    "TagValues": [
                        "developer"
                    ]
                }]
```

```
            }
        ]
    }]
}
```

For more information, see Viewing the resources that a LF-Tag is assigned to in the *AWS Lake Formation Developer Guide*.

- For API details, see SearchTablesByLfTags in *AWS CLI Command Reference*.

`start-query-planning`

The following code example shows how to use `start-query-planning`.

AWS CLI

To process query statement

The following `start-query-planning` example submits a request to process a query statement.

```
aws lakeformation start-query-planning \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "QueryPlanningContext": {
        "CatalogId": "123456789012",
        "DatabaseName": "tpc"
    },
    "QueryString": "select * from dl_tpc_household_demographics_gov where
 hd_income_band_sk=9"
}
```

Output:

```
{
    "QueryId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

- For API details, see StartQueryPlanning in *AWS CLI Command Reference*.

`start-transaction`

The following code example shows how to use `start-transaction`.

AWS CLI

To start new transaction

The following `start-transaction` example starts a new transaction and returns its transaction ID.

```
aws lakeformation start-transaction \
    --transaction-type 'READ_AND_WRITE'
```

Output:

```
{
    "TransactionId": "b014d972ca8347b89825e33c5774aec4"
}
```

- For API details, see StartTransaction in *AWS CLI Command Reference*.

`update-lf-tag`

The following code example shows how to use `update-lf-tag`.

AWS CLI

To update LF-Tag definition

The following `update-lf-tag` example updates LF-Tag definition.

```
aws lakeformation update-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup' \
    --tag-values-to-add '["admin"]'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see UpdateLfTag in *AWS CLI Command Reference*.

`update-table-objects`

The following code example shows how to use `update-table-objects`.

AWS CLI

To modify objects of governed table

The following `update-table-objects` example adds provided S3 objects to the specified governed table.

```
aws lakeformation update-table-objects \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789012",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_household_demographics_gov",
    "TransactionId": "12347a9f75424b9b915f6ff201d2a190",
    "WriteOperations": [{
        "AddObject": {
            "Uri": "s3://amzn-s3-demo-bucket/target/
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-
ff26b17504414fe88b302cd795eabd00.parquet",
            "ETag": "1234ab1fc50a316b149b4e1f21a73800",
            "Size": 42200
        }
    }]
}
```

This command produces no output.

- For API details, see UpdateTableObjects in *AWS CLI Command Reference*.

Lambda examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lambda.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-layer-version-permission`

The following code example shows how to use `add-layer-version-permission`.

AWS CLI

To add permissions to a layer version

The following `add-layer-version-permission` example grants permission for the specified account to use version 1 of the layer `my-layer`.

```
aws lambda add-layer-version-permission \
    --layer-name my-layer \
    --statement-id xaccount \
    --action lambda:GetLayerVersion  \
    --principal 123456789111 \
    --version-number 1
```

Output:

```
{
    "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Statement": "{\"Sid\":\"xaccount\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":
\"arn:aws:iam::123456789111:root\"},\"Action\":\"lambda:GetLayerVersion\",\"Resource
\":\"arn:aws:lambda:us-west-2:123456789012:layer:my-layer:1\"}"
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see AddLayerVersionPermission in *AWS CLI Command Reference*.

`add-permission`

The following code example shows how to use `add-permission`.

AWS CLI

To add permissions to an existing Lambda function

The following `add-permission` example grants the Amazon SNS service permission to invoke a function named `my-function`.

```
aws lambda add-permission \
    --function-name my-function \
    --action lambda:InvokeFunction \
    --statement-id sns \
    --principal sns.amazonaws.com
```

Output:

```
{
    "Statement": "{\"Sid\":\"sns\",\"Effect\":\"Allow\",\"Principal\":{\"Service
\":\"sns.amazonaws.com\"},\"Action\":\"lambda:InvokeFunction\",\"Resource\":
\"arn:aws:lambda:us-west-2:123456789012:function:my-function\"}"
}
```

For more information, see Using Resource-based Policies for AWS Lambda in the *AWS Lambda Developer Guide*.

- For API details, see AddPermission in *AWS CLI Command Reference*.

`create-alias`

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias for a Lambda function

The following `create-alias` example creates an alias named `LIVE` that points to version 1 of the `my-function` Lambda function.

```
aws lambda create-alias \
```

```
    --function-name my-function \
    --description "alias for live version of function" \
    --function-version 1 \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "1",
    "Name": "LIVE",
    "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",
    "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

`create-event-source-mapping`

The following code example shows how to use `create-event-source-mapping`.

AWS CLI

To create a mapping between an event source and an AWS Lambda function

The following `create-event-source-mapping` example creates a mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda create-event-source-mapping \
    --function-name my-function \
    --batch-size 5 \
    --event-source-arn arn:aws:sqs:us-west-2:123456789012:mySQSqueue
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
```

```
    "BatchSize": 5,
    "State": "Creating",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see CreateEventSourceMapping in *AWS CLI Command Reference*.

`create-function`

The following code example shows how to use `create-function`.

AWS CLI

To create a Lambda function

The following `create-function` example creates a Lambda function named `my-function`.

```
aws lambda create-function \
    --function-name my-function \
    --runtime nodejs22.x \
    --zip-file fileb://my-function.zip \
    --handler my-function.handler \
    --role arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-tges6bf4
```

Contents of `my-function.zip`:

```
This file is a deployment package that contains your function code and any
 dependencies.
```

Output:

```
{
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "PFn4S+er27qk+UuZSTKEQfNKG/XNn7QJs90mJgq6oH8=",
    "FunctionName": "my-function",
    "CodeSize": 308,
```

```
    "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "MemorySize": 128,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-
zgur6bf4",
    "Timeout": 3,
    "LastModified": "2025-10-14T22:26:11.234+0000",
    "Handler": "my-function.handler",
    "Runtime": "nodejs22.x",
    "Description": ""
}
```

For more information, see Configure Lambda function memory in the *AWS Lambda Developer Guide*.

- For API details, see CreateFunction in *AWS CLI Command Reference*.

`delete-alias`

The following code example shows how to use `delete-alias`.

AWS CLI

To delete an alias of a Lambda function

The following `delete-alias` example deletes the alias named `LIVE` from the `my-function` Lambda function.

```
aws lambda delete-alias \
    --function-name my-function \
    --name LIVE
```

This command produces no output.

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

`delete-event-source-mapping`

The following code example shows how to use `delete-event-source-mapping`.

AWS CLI

To delete the mapping between an event source and an AWS Lambda function

The following `delete-event-source-mapping` example deletes the mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda delete-event-source-mapping \
    --uuid  a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569285870.271,
    "BatchSize": 5,
    "State": "Deleting",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see DeleteEventSourceMapping in *AWS CLI Command Reference*.

`delete-function-concurrency`

The following code example shows how to use `delete-function-concurrency`.

AWS CLI

To remove the reserved concurrent execution limit from a function

The following `delete-function-concurrency` example deletes the reserved concurrent execution limit from the `my-function` function.

```
aws lambda delete-function-concurrency \
    --function-name  my-function
```

This command produces no output.

For more information, see Reserving Concurrency for a Lambda Function in the *AWS Lambda Developer Guide*.

- For API details, see DeleteFunctionConcurrency in *AWS CLI Command Reference*.

`delete-function-event-invoke-config`

The following code example shows how to use `delete-function-event-invoke-config`.

AWS CLI

To delete an asynchronous invocation configuration

The following `delete-function-event-invoke-config` example deletes the asynchronous invocation configuration for the `GREEN` alias of the specified function.

```
aws lambda delete-function-event-invoke-config \
    --function-name my-function:GREEN
```

This command produces no output.

For more information, see Configuring error handling settings for Lambda asynchronous invocations in the *AWS Lambda Developer Guide*.

- For API details, see DeleteFunctionEventInvokeConfig in *AWS CLI Command Reference*.

`delete-function`

The following code example shows how to use `delete-function`.

AWS CLI

Example 1: To delete a Lambda function by function name

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's name.

```
aws lambda delete-function \
    --function-name my-function
```

This command produces no output.

Example 2: To delete a Lambda function by function ARN

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's ARN.

```
aws lambda delete-function \
    --function-name arn:aws:lambda:us-west-2:123456789012:function:my-function
```

This command produces no output.

Example 3: To delete a Lambda function by partial function ARN

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's partial ARN.

```
aws lambda delete-function \
    --function-name 123456789012:function:my-function
```

This command produces no output.

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see DeleteFunction in *AWS CLI Command Reference*.

`delete-layer-version`

The following code example shows how to use `delete-layer-version`.

AWS CLI

To delete a version of a Lambda layer

The following `delete-layer-version` example deletes version 2 of the layer named `my-layer`.

```
aws lambda delete-layer-version \
    --layer-name my-layer \
    --version-number 2
```

This command produces no output.

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see DeleteLayerVersion in *AWS CLI Command Reference*.

`delete-provisioned-concurrency-config`

The following code example shows how to use `delete-provisioned-concurrency-config`.

AWS CLI

To delete a provisioned concurrency configuration

The following `delete-provisioned-concurrency-config` example deletes the provisioned concurrency configuration for the `GREEN` alias of the specified function.

```
aws lambda delete-provisioned-concurrency-config \
    --function-name my-function \
    --qualifier GREEN
```

This command produces no output.

For more information, see Configuring provisioned concurrency for an Event Function in the *AWS Lambda Developer Guide*.

- For API details, see DeleteProvisionedConcurrencyConfig in *AWS CLI Command Reference*.

`get-account-settings`

The following code example shows how to use `get-account-settings`.

AWS CLI

To retrieve details about your account in an AWS Region

The following `get-account-settings` example displays the Lambda limits and usage information for your account.

```
aws lambda get-account-settings
```

Output:

```
{
    "AccountLimit": {
        "CodeSizeUnzipped": 262144000,
        "UnreservedConcurrentExecutions": 1000,
        "ConcurrentExecutions": 1000,
```

```
        "CodeSizeZipped": 52428800,
        "TotalCodeSize": 80530636800
    },
    "AccountUsage": {
        "FunctionCount": 4,
        "TotalCodeSize": 9426
    }
}
```

For more information, see AWS Lambda Limits in the *AWS Lambda Developer Guide*.

- For API details, see GetAccountSettings in *AWS CLI Command Reference*.

`get-alias`

The following code example shows how to use `get-alias`.

AWS CLI

To retrieve details about a function alias

The following `get-alias` example displays details for the alias named `LIVE` on the `my-function` Lambda function.

```
aws lambda get-alias \
    --function-name my-function \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "3",
    "Name": "LIVE",
    "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",
    "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see GetAlias in *AWS CLI Command Reference*.

`get-event-source-mapping`

The following code example shows how to use `get-event-source-mapping`.

AWS CLI

To retrieve details about an event source mapping

The following `get-event-source-mapping` example displays the details for the mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda get-event-source-mapping \
    --uuid "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
    "BatchSize": 5,
    "State": "Enabled",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see GetEventSourceMapping in *AWS CLI Command Reference*.

`get-function-concurrency`

The following code example shows how to use `get-function-concurrency`.

AWS CLI

To view the reserved concurrency setting for a function

The following `get-function-concurrency` example retrieves the reserved concurrency setting for the specified function.

```
aws lambda get-function-concurrency \
    --function-name my-function
```

Output:

```
{
    "ReservedConcurrentExecutions": 250
}
```

For more information, see Configuring reserved concurrency for an Event Function in the *AWS Lambda Developer Guide*.

- For API details, see GetFunctionConcurrency in *AWS CLI Command Reference*.

`get-function-configuration`

The following code example shows how to use `get-function-configuration`.

AWS CLI

To retrieve the version-specific settings of a Lambda function

The following `get-function-configuration` example displays the settings for version 2 of the `my-function` function.

```
aws lambda get-function-configuration \
    --function-name  my-function:2
```

Output:

```
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "MemorySize": 256,
    "Version": "2",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
```

```
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "CodeSize": 304,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:2",
    "Handler": "index.handler"
}
```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see GetFunctionConfiguration in *AWS CLI Command Reference*.

`get-function-event-invoke-config`

The following code example shows how to use `get-function-event-invoke-config`.

AWS CLI

To view an asynchronous invocation configuration

The following `get-function-event-invoke-config` example retrieves the asynchronous invocation configuration for the BLUE alias of the specified function.

```
aws lambda get-function-event-invoke-config \
    --function-name my-function:BLUE
```

Output:

```
{
    "LastModified": 1577824396.653,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:BLUE",
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
    "DestinationConfig": {
        "OnSuccess": {},
```

```
        "OnFailure": {
            "Destination": "arn:aws:sqs:us-west-2:123456789012:failed-invocations"
        }
    }
}
```

For more information, see Configuring error handling settings for Lambda asynchronous invocations in the *AWS Lambda Developer Guide*.

- For API details, see GetFunctionEventInvokeConfig in *AWS CLI Command Reference*.

`get-function`

The following code example shows how to use `get-function`.

AWS CLI

To retrieve information about a function

The following `get-function` example displays information about the `my-function` function.

```
aws lambda get-function \
    --function-name  my-function
```

Output:

```
{
    "Concurrency": {
        "ReservedConcurrentExecutions": 100
    },
    "Code": {
        "RepositoryType": "S3",
        "Location": "https://awslambda-us-west-2-tasks.s3.us-west-2.amazonaws.com/
snapshots/123456789012/my-function..."
    },
    "Configuration": {
        "TracingConfig": {
            "Mode": "PassThrough"
        },
        "Version": "$LATEST",
        "CodeSha256": "5tT2qgzYUHoqwR616pZ2dpkn/0J1FrzJmlKidWaaCgk=",
        "FunctionName": "my-function",
        "VpcConfig": {
```

```
            "SubnetIds": [],
            "VpcId": "",
            "SecurityGroupIds": []
        },
        "MemorySize": 128,
        "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CodeSize": 304,
        "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
        "Handler": "index.handler",
        "Role": "arn:aws:iam::123456789012:role/service-role/helloWorldPython-role-
uy3l9qyq",
        "Timeout": 3,
        "LastModified": "2025-09-24T18:20:35.054+0000",
        "Runtime": "nodejs22.x",
        "Description": ""
    }
}
```

For more information, see Configure Lambda function memory in the *AWS Lambda Developer Guide*.

- For API details, see GetFunction in *AWS CLI Command Reference*.

`get-layer-version-by-arn`

The following code example shows how to use `get-layer-version-by-arn`.

AWS CLI

To retrieve information about a Lambda layer version

The following `get-layer-version-by-arn` example displays information about the layer version with the specified Amazon Resource Name (ARN).

```
aws lambda get-layer-version-by-arn \
    --arn "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-Python311-
SciPy1x:2"
```

Output:

```
{
    "LayerVersionArn": "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-
Python311-SciPy1x:2",
```

```
    "Description": "AWS Lambda SciPy layer for Python 3.11 (scipy-1.1.0,
 numpy-1.15.4) https://github.com/scipy/scipy/releases/tag/v1.1.0 https://
github.com/numpy/numpy/releases/tag/v1.15.4",
    "CreatedDate": "2023-10-12T10:09:38.398+0000",
    "LayerArn": "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-Python311-
SciPy1x",
    "Content": {
        "CodeSize": 41784542,
        "CodeSha256": "GGmv8ocUw4cly0T8HL0Vx/f5V4RmSCGNjDIslY4VskM=",
        "Location": "https://awslambda-us-west-2-layers.s3.us-west-2.amazonaws.com/
snapshots/123456789012/..."
    },
    "Version": 2,
    "CompatibleRuntimes": [
        "python3.11"
    ],
    "LicenseInfo": "SciPy: https://github.com/scipy/scipy/blob/main/LICENSE.txt,
 NumPy: https://github.com/numpy/numpy/blob/main/LICENSE.txt"
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see GetLayerVersionByArn in *AWS CLI Command Reference*.

`get-layer-version-policy`

The following code example shows how to use `get-layer-version-policy`.

AWS CLI

To retrieve the permissions policy for a Lambda layer version

The following `get-layer-version-policy` example displays policy information about version 1 for the layer named `my-layer`.

```
aws lambda get-layer-version-policy \
    --layer-name my-layer \
    --version-number 1
```

Output:

```
{
```

```
    "Policy": "{\"Version\":\"2012-10-17\",\"Id\":\"default\",\"Statement
\":[{\"Sid\":\"xaccount\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":
\"arn:aws:iam::123456789012:root\"},\"Action\":\"lambda:GetLayerVersion\",\"Resource
\":\"arn:aws:lambda:us-west-2:123456789012:layer:my-layer:1\"}]}",
    "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see GetLayerVersionPolicy in *AWS CLI Command Reference*.

`get-layer-version`

The following code example shows how to use `get-layer-version`.

AWS CLI

To retrieve information about a Lambda layer version

The following `get-layer-version` example displays information for version 1 of the layer named `my-layer`.

```
aws lambda get-layer-version \
    --layer-name my-layer \
    --version-number 1
```

Output:

```
{
    "Content": {
        "Location": "https://awslambda-us-west-2-layers.s3.us-west-2.amazonaws.com/
snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?
versionId=27iWyA73cCAYqyH...",
        "CodeSha256": "tv9jJO+rPbXUUXuRKi7CwHzKtLDkDRJLB3cC3Z/ouXo=",
        "CodeSize": 169
    },
    "LayerArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-layer",
    "LayerVersionArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-layer:1",
    "Description": "My Python layer",
    "CreatedDate": "2018-11-14T23:03:52.894+0000",
    "Version": 1,
    "LicenseInfo": "MIT",
```

```
    "CompatibleRuntimes": [
        "python3.10",
        "python3.11"
    ]
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see GetLayerVersion in *AWS CLI Command Reference*.

`get-policy`

The following code example shows how to use `get-policy`.

AWS CLI

To retrieve the resource-based IAM policy for a function, version, or alias

The following `get-policy` example displays policy information about the `my-function` Lambda function.

```
aws lambda get-policy \
    --function-name my-function
```

Output:

```
{
    "Policy": "{\"Version\":\"2012-10-17\",\"Id\":\"default\",\"Statement
\":[{\"Sid\":\"iot-events\",\"Effect\":\"Allow\",\"Principal\":{\"Service\":
\"iotevents.amazonaws.com\"},\"Action\":\"lambda:InvokeFunction\",\"Resource\":
\"arn:aws:lambda:us-west-2:123456789012:function:my-function\"}]}",
    "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Using Resource-based Policies for AWS Lambda in the *AWS Lambda Developer Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

`get-provisioned-concurrency-config`

The following code example shows how to use `get-provisioned-concurrency-config`.

AWS CLI

To view a provisioned concurrency configuration

The following `get-provisioned-concurrency-config` example displays details for the provisioned concurrency configuration for the BLUE alias of the specified function.

```
aws lambda get-provisioned-concurrency-config \
    --function-name my-function \
    --qualifier BLUE
```

Output:

```
{
    "RequestedProvisionedConcurrentExecutions": 100,
    "AvailableProvisionedConcurrentExecutions": 100,
    "AllocatedProvisionedConcurrentExecutions": 100,
    "Status": "READY",
    "LastModified": "2019-12-31T20:28:49+0000"
}
```

For more information, see Configuring provisioned concurrency for an Event Function in the *AWS Lambda Developer Guide*.

- For API details, see GetProvisionedConcurrencyConfig in *AWS CLI Command Reference*.

`invoke`

The following code example shows how to use `invoke`.

AWS CLI

Example 1: To invoke a Lambda function synchronously

The following `invoke` example invokes the `my-function` function synchronously. The `cli-binary-format` option is required if you're using AWS CLI version 2. For more information, see AWS CLI supported global command line options in the *AWS Command Line Interface User Guide*.

```
aws lambda invoke response.json \
    --function-name my-function \
```

```
    --cli-binary-format raw-in-base64-out \
    --payload '{ "name": "Bob" }'
```

Output:

```
{
    "ExecutedVersion": "$LATEST",
    "StatusCode": 200
}
```

For more information, see Invoke a Lambda function synchronously in the *AWS Lambda Developer Guide*.

Example 2: To invoke a Lambda function asynchronously

The following `invoke` example invokes the `my-function` function asynchronously. The `cli-binary-format` option is required if you're using AWS CLI version 2. For more information, see AWS CLI supported global command line options in the *AWS Command Line Interface User Guide*.

```
aws lambda invoke response.json \
    --function-name my-function \
    --invocation-type Event \
    --cli-binary-format raw-in-base64-out \
    --payload '{ "name": "Bob" }'
```

Output:

```
{
    "StatusCode": 202
}
```

For more information, see Invoking a Lambda function asynchronously in the *AWS Lambda Developer Guide*.

- For API details, see Invoke in *AWS CLI Command Reference*.

`list-aliases`

The following code example shows how to use `list-aliases`.

AWS CLI

To retrieve the list of aliases for a Lambda function

The following `list-aliases` example displays a list of the aliases for the `my-function` Lambda function.

```
aws lambda list-aliases \
    --function-name my-function
```

Output:

```
{
    "Aliases": [
        {
            "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:BETA",
            "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "FunctionVersion": "2",
            "Name": "BETA",
            "Description": "alias for beta version of function"
        },
        {
            "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:LIVE",
            "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FunctionVersion": "1",
            "Name": "LIVE",
            "Description": "alias for live version of function"
        }
    ]
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see ListAliases in *AWS CLI Command Reference*.

`list-event-source-mappings`

The following code example shows how to use `list-event-source-mappings`.

AWS CLI

To list the event source mappings for a function

The following `list-event-source-mappings` example displays a list of the event source mappings for the `my-function` Lambda function.

```
aws lambda list-event-source-mappings \
    --function-name my-function
```

Output:

```
{
    "EventSourceMappings": [
        {
            "UUID": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "StateTransitionReason": "USER_INITIATED",
            "LastModified": 1569284520.333,
            "BatchSize": 5,
            "State": "Enabled",
            "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function",
            "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
        }
    ]
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see ListEventSourceMappings in *AWS CLI Command Reference*.

`list-function-event-invoke-configs`

The following code example shows how to use `list-function-event-invoke-configs`.

AWS CLI

To view a list of asynchronous invocation configurations

The following `list-function-event-invoke-configs` example lists the asynchronous invocation configurations for the specified function.

```
aws lambda list-function-event-invoke-configs \
    --function-name my-function
```

Output:

```
{
    "FunctionEventInvokeConfigs": [
        {
            "LastModified": 1577824406.719,
            "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:GREEN",
            "MaximumRetryAttempts": 2,
            "MaximumEventAgeInSeconds": 1800
        },
        {
            "LastModified": 1577824396.653,
            "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:BLUE",
            "MaximumRetryAttempts": 0,
            "MaximumEventAgeInSeconds": 3600
        }
    ]
}
```

For more information, see Configuring error handling settings for Lambda asynchronous invocations in the *AWS Lambda Developer Guide*.

- For API details, see ListFunctionEventInvokeConfigs in *AWS CLI Command Reference*.

`list-functions`

The following code example shows how to use `list-functions`.

AWS CLI

To retrieve a list of Lambda functions

The following `list-functions` example displays a list of all of the functions for the current user.

```
aws lambda list-functions
```

Output:

```
{
    "Functions": [
        {
            "TracingConfig": {
                "Mode": "PassThrough"
            },
            "Version": "$LATEST",
            "CodeSha256": "dBG9m8SGdmlEjw/JYXlhhvCrAv5TxvXsbL/RMr0fT/I=",
            "FunctionName": "helloworld",

`list-layer-versions`

The following code example shows how to use `list-layer-versions`.

AWS CLI

To list the versions of an AWS Lambda layer

The following `list-layer-versions` example displays information about the versions for the layer named `my-layer`.

```
aws lambda list-layer-versions \
    --layer-name my-layer
```

Output:

```
{
    "LayerVersions": [
        {
            "LayerVersionArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-
layer:2",
            "Version": 2,
            "Description": "My layer",
            "CreatedDate": "2023-11-15T00:37:46.592+0000",
            "CompatibleRuntimes": [
                "python3.10",
                "python3.11"
            ]
        }
    ]
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see ListLayerVersions in *AWS CLI Command Reference*.

`list-layers`

The following code example shows how to use `list-layers`.

AWS CLI

To list the layers that are compatible with your function's runtime

The following `list-layers` example displays information about layers that are compatible with the Python 3.11 runtime.

```
aws lambda list-layers \
    --compatible-runtime python3.11
```

Output:

```
{
    "Layers": [
        {
            "LayerName": "my-layer",
            "LayerArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-layer",
            "LatestMatchingVersion": {
                "LayerVersionArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-
layer:2",
                "Version": 2,
                "Description": "My layer",
                "CreatedDate": "2023-11-15T00:37:46.592+0000",
                "CompatibleRuntimes": [
                    "python3.10",
                    "python3.11"
                ]
            }
        }
    ]
}
```

- For API details, see ListLayers in *AWS CLI Command Reference*.

`list-provisioned-concurrency-configs`

The following code example shows how to use `list-provisioned-concurrency-configs`.

AWS CLI

To get a list of provisioned concurrency configurations

The following `list-provisioned-concurrency-configs` example lists the provisioned concurrency configurations for the specified function.

```
aws lambda list-provisioned-concurrency-configs \
    --function-name my-function
```

Output:

```
{
    "ProvisionedConcurrencyConfigs": [
        {
            "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:GREEN",
            "RequestedProvisionedConcurrentExecutions": 100,
            "AvailableProvisionedConcurrentExecutions": 100,

            "Status": "READY",
            "LastModified": "2019-12-31T20:29:00+0000"
        },
        {
            "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:BLUE",
            "RequestedProvisionedConcurrentExecutions": 100,
            "AvailableProvisionedConcurrentExecutions": 100,
            "AllocatedProvisionedConcurrentExecutions": 100,
            "Status": "READY",
            "LastModified": "2019-12-31T20:28:49+0000"
        }
    ]
}
```

For more information, see Configuring provisioned concurrency for an Event Function in the *AWS Lambda Developer Guide*.

- For API details, see ListProvisionedConcurrencyConfigs in *AWS CLI Command Reference*.

`list-tags`

The following code example shows how to use `list-tags`.

AWS CLI

To retrieve the list of tags for a Lambda function

The following `list-tags` example displays the tags attached to the `my-function` Lambda function.

```
aws lambda list-tags \
    --resource arn:aws:lambda:us-west-2:123456789012:function:my-function
```

Output:

```
{
    "Tags": {
        "Category": "Web Tools",
        "Department": "Sales"
    }
}
```

For more information, see Tagging Lambda Functions in the *AWS Lambda Developer Guide*.

- For API details, see ListTags in *AWS CLI Command Reference*.

`list-versions-by-function`

The following code example shows how to use `list-versions-by-function`.

AWS CLI

To retrieve a list of versions of a function

The following `list-versions-by-function` example displays the list of versions for the `my-function` Lambda function.

```
aws lambda list-versions-by-function \
    --function-name my-function
```

Output:

```
{
    "Versions": [
        {
```

```
            "TracingConfig": {
                "Mode": "PassThrough"
            },

    ]
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see ListVersionsByFunction in *AWS CLI Command Reference*.

`publish-layer-version`

The following code example shows how to use `publish-layer-version`.

AWS CLI

To create a Lambda layer version

The following `publish-layer-version` example creates a new Python library layer version. The command retrieves the layer content a file named `layer.zip` in the specified S3 bucket.

```
aws lambda publish-layer-version \
    --layer-name my-layer \
    --description "My Python layer" \
    --license-info "MIT" \
    --content S3Bucket=lambda-layers-us-west-2-123456789012,S3Key=layer.zip \
    --compatible-runtimes python3.10 python3.11
```

Output:

```
{
    "Content": {
        "Location": "https://awslambda-us-west-2-layers.s3.us-west-2.amazonaws.com/
snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?

        "python3.10",
        "python3.11"
    ]
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see PublishLayerVersion in *AWS CLI Command Reference*.

`publish-version`

The following code example shows how to use `publish-version`.

AWS CLI

To publish a new version of a function

The following `publish-version` example publishes a new version of the `my-function` Lambda function.

```
aws lambda publish-version \
    --function-name my-function
```

Output:

```
{
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "dBG9m8SGdmlEjw/JYXlhhvCrAv5TxvXsbL/RMr0fT/I=",
    "FunctionName": "my-function",
    "CodeSize": 294,
    "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "MemorySize": 128,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:3",
    "Version": "2",

zgur6bf4",
    "Timeout": 3,
    "LastModified": "2019-09-23T18:32:33.857+0000",
    "Handler": "my-function.handler",
    "Runtime": "nodejs10.x",
    "Description": ""
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see PublishVersion in *AWS CLI Command Reference*.

`put-function-concurrency`

The following code example shows how to use `put-function-concurrency`.

AWS CLI

To configure a reserved concurrency limit for a function

The following `put-function-concurrency` example configures 100 reserved concurrent executions for the `my-function` function.

```
aws lambda put-function-concurrency \
    --function-name  my-function  \
    --reserved-concurrent-executions 100
```

Output:

```
{
    "ReservedConcurrentExecutions": 100
}
```

For more information, see Reserving Concurrency for a Lambda Function in the *AWS Lambda Developer Guide*.

- For API details, see PutFunctionConcurrency in *AWS CLI Command Reference*.

`put-function-event-invoke-config`

The following code example shows how to use `put-function-event-invoke-config`.

AWS CLI

To configure error handling for asynchronous invocation

The following `put-function-event-invoke-config` example sets a maximum event age of one hour and disables retries for the specified function.

```
aws lambda put-function-event-invoke-config \
    --function-name my-function \
    --maximum-event-age-in-seconds 3600 \
    --maximum-retry-attempts 0
```

Output:

```
{
    "LastModified": 1573686021.479,
```

```
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:
$LATEST",
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
    "DestinationConfig": {
        "OnSuccess": {},
        "OnFailure": {}
    }
}
```

For more information, see Configuring error handling settings for Lambda asynchronous invocations in the *AWS Lambda Developer Guide*.

- For API details, see PutFunctionEventInvokeConfig in *AWS CLI Command Reference*.

`put-provisioned-concurrency-config`

The following code example shows how to use `put-provisioned-concurrency-config`.

AWS CLI

To allocate provisioned concurrency

The following `put-provisioned-concurrency-config` example allocates 100 provisioned concurrency for the BLUE alias of the specified function.

```
aws lambda put-provisioned-concurrency-config \
    --function-name my-function \
    --qualifier BLUE \
    --provisioned-concurrent-executions 100
```

Output:

```
{
    "RequestedProvisionedConcurrentExecutions": 100,
    "AllocatedProvisionedConcurrentExecutions": 0,
    "Status": "IN_PROGRESS",
    "LastModified": "2019-11-21T19:32:12+0000"
}
```

For more information, see Configuring provisioned concurrency for an Event Function in the *AWS Lambda Developer Guide*.

- For API details, see PutProvisionedConcurrencyConfig in *AWS CLI Command Reference*.

`remove-layer-version-permission`

The following code example shows how to use `remove-layer-version-permission`.

AWS CLI

To delete layer-version permissions

The following `remove-layer-version-permission` example deletes permission for an account to configure a layer version.

```
aws lambda remove-layer-version-permission \
    --layer-name my-layer \
    --statement-id xaccount \
    --version-number 1
```

This command produces no output.

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see RemoveLayerVersionPermission in *AWS CLI Command Reference*.

`remove-permission`

The following code example shows how to use `remove-permission`.

AWS CLI

To remove permissions from an existing Lambda function

The following `remove-permission` example removes permission to invoke a function named `my-function`.

```
aws lambda remove-permission \
    --function-name my-function \
    --statement-id sns
```

This command produces no output.

For more information, see Using Resource-based Policies for AWS Lambda in the *AWS Lambda Developer Guide*.

- For API details, see RemovePermission in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to an existing Lambda function

The following `tag-resource` example adds a tag with the key name DEPARTMENT and a value of `Department A` to the specified Lambda function.

```
aws lambda tag-resource \
    --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \
    --tags "DEPARTMENT=Department A"
```

This command produces no output.

For more information, see Tagging Lambda Functions in the *AWS Lambda Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from an existing Lambda function

The following `untag-resource` example removes the tag with the key name DEPARTMENT tag from the `my-function` Lambda function.

```
aws lambda untag-resource \
    --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \
    --tag-keys DEPARTMENT
```

This command produces no output.

For more information, see Tagging Lambda Functions in the *AWS Lambda Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-alias`

The following code example shows how to use `update-alias`.

AWS CLI

To update a function alias

The following `update-alias` example updates the alias named `LIVE` to point to version 3 of the `my-function` Lambda function.

```
aws lambda update-alias \
    --function-name my-function \
    --function-version 3 \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "3",
    "Name": "LIVE",
    "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",
    "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see UpdateAlias in *AWS CLI Command Reference*.

`update-event-source-mapping`

The following code example shows how to use `update-event-source-mapping`.

AWS CLI

To update the mapping between an event source and an AWS Lambda function

The following `update-event-source-mapping` example updates the batch size to 8 in the specified mapping.

```
aws lambda update-event-source-mapping \
    --uuid  "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --batch-size 8
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
    "BatchSize": 8,
    "State": "Updating",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see UpdateEventSourceMapping in *AWS CLI Command Reference*.

`update-function-code`

The following code example shows how to use `update-function-code`.

AWS CLI

To update the code of a Lambda function

The following `update-function-code` example replaces the code of the unpublished ($LATEST) version of the `my-function` function with the contents of the specified zip file.

```
aws lambda update-function-code \
    --function-name  my-function \
```

```
    --zip-file fileb://my-function.zip
```

Output:

```
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see UpdateFunctionCode in *AWS CLI Command Reference*.

`update-function-configuration`

The following code example shows how to use `update-function-configuration`.

AWS CLI

To modify the configuration of a function

The following `update-function-configuration` example modifies the memory size to be 256 MB for the unpublished ($LATEST) version of the `my-function` function.

```
aws lambda update-function-configuration \
    --function-name  my-function \
    --memory-size 256
```

Output:

```
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "MemorySize": 256,
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "CodeSize": 304,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "Handler": "index.handler"
}
```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see UpdateFunctionConfiguration in *AWS CLI Command Reference*.

`update-function-event-invoke-config`

The following code example shows how to use `update-function-event-invoke-config`.

AWS CLI

To update an asynchronous invocation configuration

The following `update-function-event-invoke-config` example adds an on-failure destination to the existing asynchronous invocation configuration for the specified function.

```
aws lambda update-function-event-invoke-config \
    --function-name my-function \
    --destination-config '{"OnFailure":{"Destination": "arn:aws:sqs:us-
west-2:123456789012:destination"}}'
```

Output:

```
{
    "LastModified": 1573687896.493,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:
$LATEST",
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
    "DestinationConfig": {
        "OnSuccess": {},
        "OnFailure": {
            "Destination": "arn:aws:sqs:us-west-2:123456789012:destination"
        }
    }
}
```

For more information, see Invoking a Lambda Event Function asynchronously in the *AWS Lambda Developer Guide*.

- For API details, see UpdateFunctionEventInvokeConfig in *AWS CLI Command Reference*.

License Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with License Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-license-configuration`

The following code example shows how to use `create-license-configuration`.

AWS CLI

Example 1: To create a license configuration

The following `create-license-configuration` example creates a license configuration with a hard limit of 10 cores.

```
aws license-manager create-license-configuration \
    --name my-license-configuration \
    --license-counting-type Core \
    --license-count 10 \
    --license-count-hard-limit
```

Output:

```
{
    "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE1111"
}
```

For more information, see Create a self-managed license in License Manager in the *AWS License Manager User Guide*.

Example 2: To create a license configuration

The following `create-license-configuration` example creates a license configuration with a soft limit of 100 vCPUs. It uses a rule to enable vCPU optimization.

```
aws license-manager create-license-configuration \
    --name my-license-configuration \
    --license-counting-type vCPU \
    --license-count 100 \
    --license-rules "#honorVcpuOptimization=true"
```

Output:

```
{
    "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE2222"
}
```

For more information, see Create a self-managed license in License Manager in the *AWS License Manager User Guide*.

- For API details, see CreateLicenseConfiguration in *AWS CLI Command Reference*.

`delete-license-configuration`

The following code example shows how to use `delete-license-configuration`.

AWS CLI

To delete a license configuration

The following `delete-license-configuration` example deletes the specified license configuration.

```
aws license-manager delete-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

For more information, see Delete a self-managed license in License Manager in the *AWS License Manager User Guide*.

- For API details, see DeleteLicenseConfiguration in *AWS CLI Command Reference*.

`get-license-configuration`

The following code example shows how to use `get-license-configuration`.

AWS CLI

To get license configuration information

The following `get-license-configuration` example displays details for the specified license configuration.

```
aws license-manager get-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
    "LicenseConfigurationId": "lic-38b658717b87478aaa7c00883EXAMPLE",
    "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE",
    "Name": "my-license-configuration",
    "LicenseCountingType": "vCPU",
    "LicenseRules": [],
    "LicenseCountHardLimit": false,
    "ConsumedLicenses": 0,
    "Status": "AVAILABLE",
    "OwnerAccountId": "123456789012",
    "ConsumedLicenseSummaryList": [
        {
            "ResourceType": "EC2_INSTANCE",
            "ConsumedLicenses": 0
        },
        {
            "ResourceType": "EC2_HOST",
            "ConsumedLicenses": 0
        },
        {
            "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
            "ConsumedLicenses": 0
        }
    ],
    "ManagedResourceSummaryList": [
        {
            "ResourceType": "EC2_INSTANCE",
            "AssociationCount": 0
        },
        {
            "ResourceType": "EC2_HOST",
            "AssociationCount": 0
        },
```

```
        {
            "ResourceType": "EC2_AMI",
            "AssociationCount": 2
        },
        {
            "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
            "AssociationCount": 0
        }
    ]
}
```

For more information, see View self-managed licenses in License Manager in the *AWS License Manager User Guide*.

- For API details, see GetLicenseConfiguration in *AWS CLI Command Reference*.

`get-service-settings`

The following code example shows how to use `get-service-settings`.

AWS CLI

To get the License Manager settings

The following `get-service-settings` example displays the service settings for License Manager in the current Region.

```
aws license-manager get-service-settings
```

The following shows example output if cross-account resource discovery is disabled.

Output:

```
{
    "OrganizationConfiguration": {
        "EnableIntegration": false
    },
    "EnableCrossAccountsDiscovery": false
}
```

The following shows example output if cross-account resource discovery is enabled.

Output:

```
{
    "S3BucketArn": "arn:aws:s3:::aws-license-manager-service-c22d6279-35c4-47c4-bb",
    "OrganizationConfiguration": {
        "EnableIntegration": true
    },
    "EnableCrossAccountsDiscovery": true
}
```

For more information, see Settings in License Manager in the *AWS License Manager User Guide*.

- For API details, see GetServiceSettings in *AWS CLI Command Reference*.

`list-associations-for-license-configuration`

The following code example shows how to use `list-associations-for-license-configuration`.

AWS CLI

To get associations for a license configuration

The following `list-associations-for-license-configuration` example displays detailed information for the associations of the specified license configuration.

```
aws license-manager list-associations-for-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
    "LicenseConfigurationAssociations": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0",
            "ResourceType": "EC2_AMI",
            "ResourceOwnerId": "123456789012",
            "AssociationTime": 1568825118.617
        },
        {
            "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-0abcdef1234567890",
            "ResourceType": "EC2_AMI",
            "ResourceOwnerId": "123456789012",
```

```
            "AssociationTime": 1568825118.946
        }
    ]
}
```

For more information, see View self-managed licenses in License Manager in the *AWS License Manager User Guide*.

- For API details, see ListAssociationsForLicenseConfiguration in *AWS CLI Command Reference*.

`list-license-configurations`

The following code example shows how to use `list-license-configurations`.

AWS CLI

Example 1: To list all of your license configurations

The following `list-license-configurations` example lists all your license configurations.

```
aws license-manager list-license-configurations
```

Output:

```
{
    "LicenseConfigurations": [
        {
            "LicenseConfigurationId": "lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
            "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
            "Name": "my-license-configuration",
            "LicenseCountingType": "Core",
            "LicenseRules": [],
            "LicenseCount": 10,
            "LicenseCountHardLimit": true,
            "ConsumedLicenses": 0,
            "Status": "AVAILABLE",
            "OwnerAccountId": "123456789012",
            "ConsumedLicenseSummaryList": [
                {
                    "ResourceType": "EC2_INSTANCE",
                    "ConsumedLicenses": 0
                },
```

```
                {
                    "ResourceType": "EC2_HOST",
                    "ConsumedLicenses": 0
                },
                {
                    "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
                    "ConsumedLicenses": 0
                }
            ],
            "ManagedResourceSummaryList": [
                {
                    "ResourceType": "EC2_INSTANCE",
                    "AssociationCount": 0
                },
                {
                    "ResourceType": "EC2_HOST",
                    "AssociationCount": 0
                },
                {
                    "ResourceType": "EC2_AMI",
                    "AssociationCount": 0
                },
                {
                    "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
                    "AssociationCount": 0
                }
            ]
        }
    ]
}
```

For more information, see View self-managed licenses in License Manager in the *AWS License Manager User Guide*.

Example 2: To list a specific license configuration

The following `list-license-configurations` example lists only the specified license configuration.

```
aws license-manager list-license-configurations \
    --license-configuration-arns arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
    "LicenseConfigurations": [
        {
            "LicenseConfigurationId": "lic-38b658717b87478aaa7c00883EXAMPLE",
            "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE",
            "Name": "my-license-configuration",
            "LicenseCountingType": "vCPU",
            "LicenseRules": [],
            "LicenseCount": 10,
            "LicenseCountHardLimit": false,
            "ConsumedLicenses": 0,
            "Status": "AVAILABLE",
            "OwnerAccountId": "123456789012",
            "ConsumedLicenseSummaryList": [
                {
                    "ResourceType": "EC2_INSTANCE",
                    "ConsumedLicenses": 0
                }
            ],
            "ManagedResourceSummaryList": [
                {
                    "ResourceType": "EC2_INSTANCE",
                    "AssociationCount": 0
                }
            ]
        }
    ]
}
```

For more information, see View self-managed licenses in License Manager in the *AWS License Manager User Guide*.

- For API details, see ListLicenseConfigurations in *AWS CLI Command Reference*.

`list-license-specifications-for-resource`

The following code example shows how to use `list-license-specifications-for-resource`.

AWS CLI

To list the license configurations for a resource

The following `list-license-specifications-for-resource` example lists the license configurations associated with the specified Amazon Machine Image (AMI).

```
aws license-manager list-license-specifications-for-resource \
    --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0
```

Output:

```
{
    "LicenseSpecifications": [
        {
            "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE"
        }
    ]
}
```

For more information, see Self-managed licenses in License Manager in the *AWS License Manager User Guide*.

- For API details, see ListLicenseSpecificationsForResource in *AWS CLI Command Reference*.

`list-resource-inventory`

The following code example shows how to use `list-resource-inventory`.

AWS CLI

To list resources in the resource inventory

The following `list-resource-inventory` example lists the resources managed using Systems Manager inventory.

```
aws license-manager list-resource-inventory
```

Output:

```
{
```

```
    "ResourceInventoryList": [
        {
            "Platform": "Red Hat Enterprise Linux Server",
            "ResourceType": "EC2Instance",
            "PlatformVersion": "7.4",
            "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-05d3cdfb05bd36376",
            "ResourceId": "i-05d3cdfb05bd36376",
            "ResourceOwningAccountId": "1234567890129"
        },
        {
            "Platform": "Amazon Linux",
            "ResourceType": "EC2Instance",
            "PlatformVersion": "2",
            "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-0b1d036cfd4594808",
            "ResourceId": "i-0b1d036cfd4594808",
            "ResourceOwningAccountId": "1234567890129"
        },
        {
            "Platform": "Microsoft Windows Server 2019 Datacenter",
            "ResourceType": "EC2Instance",
            "PlatformVersion": "10.0.17763",
            "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-0cdb3b54a2a8246ad",
            "ResourceId": "i-0cdb3b54a2a8246ad",
            "ResourceOwningAccountId": "1234567890129"
        }
    ]
}
```

For more information, see Inventory search in License Manager in the *AWS License Manager User Guide*.

- For API details, see ListResourceInventory in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a license configuration

The following `list-tags-for-resource` example lists the tags for the specified license configuration.

```
aws license-manager list-tags-for-resource \
    --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

Output:

```
{
    "Tags": [
        {
            "Key": "project",
            "Value": "lima"
        }
    ]
}
```

For more information, see Self-managed licenses in License Manager in the *AWS License Manager User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-usage-for-license-configuration`

The following code example shows how to use `list-usage-for-license-configuration`.

AWS CLI

To list the licenses in use for a license configuration

The following `list-usage-for-license-configuration` example lists information about the resources using licenses for the specified license configuration. For example, if the license type is vCPU, any instances consume one license per vCPU.

```
aws license-manager list-usage-for-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
    "LicenseConfigurationUsageList": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-04a636d18e83cfacb",
            "ResourceType": "EC2_INSTANCE",
            "ResourceStatus": "running",
            "ResourceOwnerId": "123456789012",
            "AssociationTime": 1570892850.519,
            "ConsumedLicenses": 2
        }
    ]
}
```

For more information, see View self-managed licenses in License Manager in the *AWS License Manager User Guide*.

- For API details, see ListUsageForLicenseConfiguration in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag a license configuration

The following `tag-resource` example adds the specified tag (key name and value) to the specified license configuration.

```
aws license-manager tag-resource \
    --tags Key=project,Value=lima \
    --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

For more information, see Self-managed licenses in License Manager in the *AWS License Manager User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a license configuration

The following `untag-resource` example removes the specified tag (key name and resource) from the specified license configuration.

```
aws license-manager untag-resource \
    --tag-keys project \
    --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

For more information, see Self-managed licenses in License Manager in the *AWS License Manager User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-license-configuration`

The following code example shows how to use `update-license-configuration`.

AWS CLI

To update a license configuration

The following `update-license-configuration` example updates the specified license configuration to remove the hard limit.

```
aws license-manager update-license-configuration \
    --no-license-count-hard-limit \
    --license-configuration-arn arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

For more information, see Edit a self-managed license in License Manager in the *AWS License Manager User Guide*.

The following `update-license-configuration` example updates the specified license configuration to change its status to `DISABLED`.

```
aws license-manager update-license-configuration \
    --license-configuration-status DISABLED \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

For more information, see Deactivate a self-managed license in License Manager in the *AWS License Manager User Guide*.

- For API details, see UpdateLicenseConfiguration in *AWS CLI Command Reference*.

`update-license-specifications-for-resource`

The following code example shows how to use `update-license-specifications-for-resource`.

AWS CLI

To update the license configurations for a resource

The following `update-license-specifications-for-resource` example replaces the license configuration associated with the specified Amazon Machine Image (AMI) by removing one license configuration and adding another.

```
aws license-manager update-license-specifications-for-resource \
    --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0 \
    --remove-license-specifications LicenseConfigurationArn=arn:aws:license-
manager:us-west-2:123456789012:license-
configuration:lic-38b658717b87478aaa7c00883EXAMPLE \
    --add-license-specifications LicenseConfigurationArn=arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-42b6deb06e5399a980d555927EXAMPLE
```

This command produces no output.

For more information, see Self-managed licenses in License Manager in the *AWS License Manager User Guide*.

- For API details, see UpdateLicenseSpecificationsForResource in *AWS CLI Command Reference*.

`update-service-settings`

The following code example shows how to use `update-service-settings`.

AWS CLI

To update the License Manager settings

The following `update-service-settings` example enables cross-account resource discovery for License Manager in the current AWS Region. The Amazon S3 bucket is the Resource Data Sync required for Systems Manager inventory.

```
aws license-manager update-service-settings \
    --organization-configuration EnableIntegration=true \
    --enable-cross-accounts-discovery \
    --s3-bucket-arn arn:aws:s3:::aws-license-manager-service-abcd1234EXAMPLE
```

This command produces no output.

For more information, see Settings in License Manager in the *AWS License Manager User Guide*.

- For API details, see UpdateServiceSettings in *AWS CLI Command Reference*.

Lightsail examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lightsail.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`allocate-static-ip`

The following code example shows how to use `allocate-static-ip`.

AWS CLI

To create a static IP

The following `allocate-static-ip` example creates the specified static IP, which can be attached to an instance.

```
aws lightsail allocate-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571071325.076,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "AllocateStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571071325.274
        }
    ]
}
```

For more information, see Static IP addresses in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see AllocateStaticIp in *AWS CLI Command Reference*.

attach-disk

The following code example shows how to use `attach-disk`.

AWS CLI

To attach a block storage disk to an instance

The following `attach-disk` example attaches disk `Disk-1` to instance `WordPress_Multisite-1` with the disk path of `/dev/xvdf`.

```
aws lightsail attach-disk \
    --disk-name Disk-1 \
    --disk-path /dev/xvdf \
    --instance-name WordPress_Multisite-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1571071465.472,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "WordPress_Multisite-1",
            "operationType": "AttachDisk",
            "status": "Started",
            "statusChangedAt": 1571071465.472
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "WordPress_Multisite-1",
            "resourceType": "Instance",
            "createdAt": 1571071465.474,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
```

```
            },
            "isTerminal": false,
            "operationDetails": "Disk-1",
            "operationType": "AttachDisk",
            "status": "Started",
            "statusChangedAt": 1571071465.474
        }
    ]
}
```

For more information, see Create and attach Lightsail block storage disks to Linux instances in the *Amazon Lightsail User Guide*.

- For API details, see AttachDisk in *AWS CLI Command Reference*.

`attach-instances-to-load-balancer`

The following code example shows how to use `attach-instances-to-load-balancer`.

AWS CLI

To attach instances to a load balancer

The following `attach-instances-to-load-balancer` example attaches instances `MEAN-1`, `MEAN-2`, and `MEAN-3` to the load balancer `LoadBalancer-1`.

```
aws lightsail attach-instances-to-load-balancer \
    --instance-names {"MEAN-1","MEAN-2","MEAN-3"} \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1571071699.892,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
```

```
            "isTerminal": false,
            "operationDetails": "MEAN-2",
            "operationType": "AttachInstancesToLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1571071699.892
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "MEAN-2",
            "resourceType": "Instance",
            "createdAt": 1571071699.887,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "LoadBalancer-1",
            "operationType": "AttachInstancesToLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1571071699.887
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1571071699.882,
            "location": {
                "availabilityZone": "all",

            "operationDetails": "LoadBalancer-1",
            "operationType": "AttachInstancesToLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1571071699.901
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1571071699.885,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "MEAN-1",
            "operationType": "AttachInstancesToLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1571071699.885
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE66666",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571071699.901,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "LoadBalancer-1",
            "operationType": "AttachInstancesToLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1571071699.901
        }
    ]
}
```

For more information, see Distribute web traffic with a Lightsail load balancer in the *Amazon Lightsail User Guide*.

- For API details, see AttachInstancesToLoadBalancer in *AWS CLI Command Reference*.

attach-load-balancer-tls-certificate

The following code example shows how to use attach-load-balancer-tls-certificate.

AWS CLI

To attach a TLS certificate to a load balancer

The following attach-load-balancer-tls-certificate example attaches the load balancer TLS certificate Certificate2 to the load balancer LoadBalancer-1.

```
aws lightsail attach-load-balancer-tls-certificate \
    --certificate-name Certificate2 \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1571072255.416,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "Certificate2",
            "operationType": "AttachLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1571072255.416
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "Certificate2",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1571072255.416,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
```

```
            "isTerminal": true,
            "operationDetails": "LoadBalancer-1",
            "operationType": "AttachLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1571072255.416
        }
    ]
}
```

For more information, see Enable HTTPS with an SSL/TLS certificate for your Lightsail load balancer in the *Amazon Lightsail User Guide*.

- For API details, see AttachLoadBalancerTlsCertificate in *AWS CLI Command Reference*.

`attach-static-ip`

The following code example shows how to use `attach-static-ip`.

AWS CLI

To attach a static IP to an instance

The following `attach-static-ip` example attaches static IP `StaticIp-1` to instance `MEAN-1`.

```
aws lightsail attach-static-ip \
    --static-ip-name StaticIp-1 \
    --instance-name MEAN-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571072569.375,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
```

```
            "operationDetails": "MEAN-1",
            "operationType": "AttachStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571072569.375
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571072569.376,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "StaticIp-1",
            "operationType": "AttachStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571072569.376
        }
    ]
}
```

For more information, see Create and attach a static IP to your Lightsail instance in the *Amazon Lightsail User Guide*.

- For API details, see AttachStaticIp in *AWS CLI Command Reference*.

`close-instance-public-ports`

The following code example shows how to use `close-instance-public-ports`.

AWS CLI

To close firewall ports for an instance

The following `close-instance-public-ports` example closes TCP port 22 on instance `MEAN-2`.

```
aws lightsail close-instance-public-ports \
    --instance-name MEAN-2 \
    --port-info fromPort=22,protocol=TCP,toPort=22
```

Output:

```
{
    "operation": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceName": "MEAN-2",
        "resourceType": "Instance",
        "createdAt": 1571072845.737,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationDetails": "22/tcp",
        "operationType": "CloseInstancePublicPorts",
        "status": "Succeeded",
        "statusChangedAt": 1571072845.737
    }
}
```

For more information, see Control instance traffic with firewalls in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see CloseInstancePublicPorts in *AWS CLI Command Reference*.

`copy-snapshot`

The following code example shows how to use `copy-snapshot`.

AWS CLI

Example 1: To copy a snapshot within the same AWS Region

The following `copy-snapshot` example copies instance snapshot `MEAN-1-1571075291` as instance snapshot `MEAN-1-Copy` within the same AWS Region `us-west-2`.

```
aws lightsail copy-snapshot \
    --source-snapshot-name MEAN-1-1571075291 \
    --target-snapshot-name MEAN-1-Copy \
    --source-region us-west-2
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "MEAN-1-Copy",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571075581.498,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:MEAN-1-1571075291",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571075581.498
        }
    ]
}
```

For more information, see Copying snapshots from one AWS Region to another in Amazon Lightsail in the *Lightsail Dev Guide*.

Example 2: To copy a snapshot from one AWS Region to another

The following `copy-snapshot` example copies instance snapshot `MEAN-1-1571075291` as instance snapshot `MEAN-1-1571075291-Copy` from AWS Region `us-west-2` to `us-east-1`.

```
aws lightsail copy-snapshot \
    --source-snapshot-name MEAN-1-1571075291 \
    --target-snapshot-name MEAN-1-1571075291-Copy \
    --source-region us-west-2 \
    --region us-east-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "MEAN-1-1571075291-Copy",
            "resourceType": "InstanceSnapshot",
```

```
            "createdAt": 1571075695.069,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-east-1"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:MEAN-1-1571075291",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571075695.069
        }
    ]
}
```

For more information, see Copying snapshots from one AWS Region to another in Amazon Lightsail in the *Lightsail Dev Guide*.

Example 3: To copy an automatic snapshot within the same AWS Region

The following `copy-snapshot` example copies automatic snapshot `2019-10-14` of instance `WordPress-1` as a manual snapshot `WordPress-1-10142019` in the AWS Region `us-west-2`.

```
aws lightsail copy-snapshot \
    --source-resource-name WordPress-1 \
    --restore-date 2019-10-14 \
    --target-snapshot-name WordPress-1-10142019 \
    --source-region us-west-2
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "resourceName": "WordPress-1-10142019",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571082412.311,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
```

```
            "operationDetails": "us-west-2:WordPress-1",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571082412.311
        }
    ]
}
```

For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

Example 4: To copy an automatic snapshot from one AWS Region to another

The following `copy-snapshot` example copies automatic snapshot `2019-10-14` of instance `WordPress-1` as a manual snapshot `WordPress-1-10142019` from the AWS Region `us-west-2` to `us-east-1`.

```
aws lightsail copy-snapshot \
    --source-resource-name WordPress-1 \
    --restore-date 2019-10-14 \
    --target-snapshot-name WordPress-1-10142019 \
    --source-region us-west-2 \
    --region us-east-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "resourceName": "WordPress-1-10142019",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571082493.422,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-east-1"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:WordPress-1",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571082493.422
```

```
        }
    ]
}
```

For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see CopySnapshot in *AWS CLI Command Reference*.

`create-disk-from-snapshot`

The following code example shows how to use `create-disk-from-snapshot`.

AWS CLI

To create a create a disk from a disk snapshot

The following `create-disk-from-snapshot` example creates a block storage disk named `Disk-2` from the specified block storage disk snapshot. The disk is created in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```
aws lightsail create-disk-from-snapshot \
    --disk-name Disk-2 \
    --disk-snapshot-name Disk-1-1566839161 \
    --availability-zone us-west-2a \
    --size-in-gb 32
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Disk-2",
            "resourceType": "Disk",
            "createdAt": 1569624941.471,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateDiskFromSnapshot",
```

```
            "status": "Started",
            "statusChangedAt": 1569624941.791
        }
    ]
}
```

For more information, see Creating a block storage disk from a snapshot in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDiskFromSnapshot in *AWS CLI Command Reference*.

`create-disk-snapshot`

The following code example shows how to use `create-disk-snapshot`.

AWS CLI

Example 1: To create a snapshot of a disk

The following `create-disk-snapshot` example creates a snapshot named `DiskSnapshot-1` of the specified block storage disk.

```
aws lightsail create-disk-snapshot \
    --disk-name Disk-1 \
    --disk-snapshot-name DiskSnapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "DiskSnapshot-1",
            "resourceType": "DiskSnapshot",
            "createdAt": 1569625129.739,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "Disk-1",
            "operationType": "CreateDiskSnapshot",
```

```
            "status": "Started",
            "statusChangedAt": 1569625129.739
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",

            "statusChangedAt": 1569625129.739
        }
    ]
}
```

Example 2: To create a snapshot of an instance's system disk

The following `create-disk-snapshot` example creates a snapshot of the specified instance's system disk.

```
aws lightsail create-disk-snapshot \
    --instance-name WordPress-1 \
    --disk-snapshot-name SystemDiskSnapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "resourceName": "SystemDiskSnapshot-1",
            "resourceType": "DiskSnapshot",
            "createdAt": 1569625294.685,

            "statusChangedAt": 1569625294.685
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1569625294.685,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "SystemDiskSnapshot-1",
            "operationType": "CreateDiskSnapshot",
            "status": "Started",
            "statusChangedAt": 1569625294.685
        }
    ]
}
```

For more information, see Snapshots in Amazon Lightsail and Creating a snapshot of an instance root volume in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDiskSnapshot in *AWS CLI Command Reference*.

`create-disk`

The following code example shows how to use `create-disk`.

AWS CLI

To create a block storage disk

The following `create-disk` example creates a block storage disk `Disk-1` in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```
aws lightsail create-disk \
    --disk-name Disk-1 \
    --availability-zone us-west-2a \
```

```
    --size-in-gb 32
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569449220.36,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateDisk",
            "status": "Started",
            "statusChangedAt": 1569449220.588
        }
    ]
}
```

For more information, see Create and attach Lightsail block storage disks to Linux instances in the *Amazon Lightsail User Guide*.

- For API details, see CreateDisk in *AWS CLI Command Reference*.

`create-domain-entry`

The following code example shows how to use `create-domain-entry`.

AWS CLI

To create a domain entry (DNS record)

The following `create-domain-entry` example creates a DNS record (A) for the apex of the specified domain that points to an instance's IP address.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail create-domain-entry \
    --region us-east-1 \
    --domain-name example.com \
    --domain-entry name=example.com,type=A,target=192.0.2.0
```

Output:

```
{
    "operation": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceName": "example.com",
        "resourceType": "Domain",
        "createdAt": 1569865296.519,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "CreateDomainEntry",
        "status": "Succeeded",
        "statusChangedAt": 1569865296.519
    }
}
```

For more information, see DNS in Amazon Lightsail and Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDomainEntry in *AWS CLI Command Reference*.

`create-domain`

The following code example shows how to use `create-domain`.

AWS CLI

To create a domain (DNS zone)

The following `create-domain` example creates a DNS zone for the specified domain.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail create-domain \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "operation": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceName": "example.com",
        "resourceType": "Domain",
        "createdAt": 1569864291.92,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "CreateDomain",
        "status": "Succeeded",
        "statusChangedAt": 1569864292.109
    }
}
```

For more information, see DNS in Amazon Lightsail and Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDomain in *AWS CLI Command Reference*.

`create-instance-snapshot`

The following code example shows how to use `create-instance-snapshot`.

AWS CLI

To create a snapshot of an instance

The following `create-instance-snapshot` example creates a snapshot from the specified instance.

```
aws lightsail create-instance-snapshot \
    --instance-name WordPress-1 \
```

```
    --instance-snapshot-name WordPress-Snapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "WordPress-Snapshot-1",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1569866438.48,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "WordPress-1",
            "operationType": "CreateInstanceSnapshot",
            "status": "Started",
            "statusChangedAt": 1569866438.48
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1569866438.48,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "WordPress-Snapshot-1",
            "operationType": "CreateInstanceSnapshot",
            "status": "Started",
            "statusChangedAt": 1569866438.48
        }
    ]
}
```

For more information, see Back up Linux/Unix Lightsail instances with snapshots in the *Amazon Lightsail User Guide*.

- For API details, see CreateInstanceSnapshot in *AWS CLI Command Reference*.

`create-instances-from-snapshot`

The following code example shows how to use `create-instances-from-snapshot`.

AWS CLI

To create an instance from a snapshot

The following `create-instances-from-snapshot` example creates an instance from the specified instance snapshot, in the specified AWS Region and Availability Zone, using the $12 USD bundle.

Note: The bundle that you specify must be equal to or greater in specifications than the bundle of the original source instance used to create the snapshot.

```
aws lightsail create-instances-from-snapshot \
    --instance-snapshot-name WordPress-1-1569866208 \
    --instance-names WordPress-2 \
    --availability-zone us-west-2a \
    --bundle-id small_3_0
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "WordPress-2",
            "resourceType": "Instance",
            "createdAt": 1569865914.908,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstancesFromSnapshot",
            "status": "Started",
            "statusChangedAt": 1569865914.908
        }
    ]
}
```

For more information, see Create Lightsail instances from snapshots in the *Amazon Lightsail User Guide*.

- For API details, see CreateInstancesFromSnapshot in *AWS CLI Command Reference*.

`create-instances`

The following code example shows how to use `create-instances`.

AWS CLI

Example 1: To create a single instance

The following `create-instances` example creates an instance in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the $5.00 USD bundle.

```
aws lightsail create-instances \
    --instance-names Instance-1 \
    --availability-zone us-west-2a \
    --blueprint-id wordpress \
    --bundle-id nano_3_0
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Instance-1",
            "resourceType": "Instance",
            "createdAt": 1569447986.061,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstance",
            "status": "Started",
            "statusChangedAt": 1569447986.061
        }
    ]
}
```

For more information, see Create a Lightsail instance in the *Amazon Lightsail User Guide*.

Example 2: To create multiple instances at one time

The following `create-instances` example creates three instances in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the $5.00 USD bundle.

```
aws lightsail create-instances \
    --instance-names {"Instance1","Instance2","Instance3"} \
    --availability-zone us-west-2a \
    --blueprint-id wordpress \
    --bundle-id nano_3_0
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "Instance1",
            "resourceType": "Instance",
            "createdAt": 1569448780.054,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstance",
            "status": "Started",
            "statusChangedAt": 1569448780.054
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "resourceName": "Instance2",
            "resourceType": "Instance",
            "createdAt": 1569448780.054,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstance",
            "status": "Started",
```

```
            "statusChangedAt": 1569448780.054
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "resourceName": "Instance3",
            "resourceType": "Instance",
            "createdAt": 1569448780.054,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstance",
            "status": "Started",
            "statusChangedAt": 1569448780.054
        }
    ]
}
```

For more information, see Create a Lightsail instance in the *Amazon Lightsail User Guide*.

- For API details, see CreateInstances in *AWS CLI Command Reference*.

`create-key-pair`

The following code example shows how to use `create-key-pair`.

AWS CLI

To create a key pair

The following `create-key-pair` example creates a key pair that you can use to authenticate and connect to an instance.

```
aws lightsail create-key-pair \
    --key-pair-name MyPersonalKeyPair
```

The output provides the private key base64 value that you can use to authenticate to instances that use the created key pair. **Note:** Copy and paste the private key base64 value to a safe location because you cannot retrieve it later.

Output:

```
{
    "keyPair": {
        "name": "MyPersonalKeyPair",
        "arn": "arn:aws:lightsail:us-west-2:123456789012:KeyPair/a1b2c3d4-5678-90ab-

- For API details, see CreateKeyPair in *AWS CLI Command Reference*.

`create-load-balancer-tls-certificate`

The following code example shows how to use `create-load-balancer-tls-certificate`.

AWS CLI

To create a TLS certificate for a load balancer

The following `create-load-balancer-tls-certificate` example creates a TLS certificate that is attached to the specified load balancer. The certificate created applies to the specified domains. **Note:** Only two certificates can be created for a load balancer.

```
aws lightsail create-load-balancer-tls-certificate \
    --certificate-alternative-names abc.example.com \
    --certificate-domain-name example.com \
    --certificate-name MySecondCertificate \
    --load-balancer-name MyFirstLoadBalancer
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "MySecondCertificate",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569867364.971,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
```

```
            "isTerminal": true,
            "operationDetails": "MyFirstLoadBalancer",
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867365.219
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569867364.971,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "MySecondCertificate",
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867365.219
        }
    ]
}
```

For more information, see Enable HTTPS with an SSL/TLS certificate for your Lightsail load balancer in the *Amazon Lightsail User Guide*.

- For API details, see CreateLoadBalancerTlsCertificate in *AWS CLI Command Reference*.

`create-load-balancer`

The following code example shows how to use `create-load-balancer`.

AWS CLI

To create a load balancer

The following `create-load-balancer` example creates a load balancer with a TLS certificate. The TLS certificate applies to the specified domains, and routes traffic to instances on port 80.

```
aws lightsail create-load-balancer \
    --certificate-alternative-names www.example.com test.example.com \
    --certificate-domain-name example.com \
```

```
    --certificate-name Certificate-1 \
    --instance-port 80 \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1569867169.406,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1569867169.406
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569867170.193,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "LoadBalancer-1",
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867170.54
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1569867170.193,
            "location": {
```

```
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "Certificate-1",
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867170.54
        }
    ]
}
```

For more information, see Lightsail load balancers in the *Lightsail Developer Guide*.

- For API details, see CreateLoadBalancer in *AWS CLI Command Reference*.

`create-relational-database-from-snapshot`

The following code example shows how to use `create-relational-database-from-snapshot`.

AWS CLI

To create a managed database from a snapshot

The following `create-relational-database-from-snapshot` example creates a managed database from the specified snapshot in the specified AWS Region and Availability Zone, using the $15 USD standard database bundle. **Note:** The bundle that you specify must be equal to or greater in specifications than the bundle of the original source database used to create the snapshot.

```
aws lightsail create-relational-database-from-snapshot \
    --relational-database-snapshot-name Database-Oregon-1-1566839359 \
    --relational-database-name Database-1 \
    --availability-zone us-west-2a \
    --relational-database-bundle-id micro_1_0 \
    --no-publicly-accessible
```

Output:

```
{
    "operations": [
```

```
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1569867916.938,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateRelationalDatabaseFromSnapshot",
            "status": "Started",
            "statusChangedAt": 1569867918.643
        }
    ]
}
```

For more information, see Create a managed database from a snapshot in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see CreateRelationalDatabaseFromSnapshot in *AWS CLI Command Reference*.

`create-relational-database-snapshot`

The following code example shows how to use `create-relational-database-snapshot`.

AWS CLI

To create a snapshot of a managed database

The following `create-relational-database-snapshot` example creates a snapshot of the specified managed database.

```
aws lightsail create-relational-database-snapshot \
    --relational-database-name Database1 \
    --relational-database-snapshot-name RelationalDatabaseSnapshot1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
            "resourceName": "RelationalDatabaseSnapshot1",
            "resourceType": "RelationalDatabaseSnapshot",
            "createdAt": 1569868074.645,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "Database1",
            "operationType": "CreateRelationalDatabaseSnapshot",
            "status": "Started",
            "statusChangedAt": 1569868074.645
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "Database1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1569868074.645,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "RelationalDatabaseSnapshot1",
            "operationType": "CreateRelationalDatabaseSnapshot",
            "status": "Started",
            "statusChangedAt": 1569868074.645
        }
    ]
}
```

For more information, see Back up your Lightsail database with snapshots in the *Amazon Lightsail User Guide*.

- For API details, see CreateRelationalDatabaseSnapshot in *AWS CLI Command Reference*.

`create-relational-database`

The following code example shows how to use `create-relational-database`.

AWS CLI

To create a managed database

The following `create-relational-database` example creates a managed database in the specified AWS Region and Availability Zone, using the MySQL 5.6 database engine (mysql_5_6), and the $15 USD standard database bundle (micro_1_0). The managed database is pre-populated a master user name, and is not publicly accessible.

```
aws lightsail create-relational-database \
    --relational-database-name Database-1 \
    --availability-zone us-west-2a \
    --relational-database-blueprint-id mysql_5_6 \
    --relational-database-bundle-id micro_1_0 \
    --master-database-name dbmaster \
    --master-username user \
    --no-publicly-accessible
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1569450017.244,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1569450018.637
        }
    ]
}
```

For more information, see Create a Lightsail database in the *Amazon Lightsail User Guide*.

- For API details, see CreateRelationalDatabase in *AWS CLI Command Reference*.

`delete-auto-snapshot`

The following code example shows how to use `delete-auto-snapshot`.

AWS CLI

To delete an automatic snapshot

The following `delete-auto-snapshot` example deletes the automatic snapshot `2019-10-10` of instance `WordPress-1`.

```
aws lightsail delete-auto-snapshot \
    --resource-name WordPress-1 \
    --date 2019-10-10
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1571088141.501,
            "location": {
                "availabilityZone": "us-west-2",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "DeleteAutoSnapshot-2019-10-10",
            "operationType": "DeleteAutoSnapshot",
            "status": "Succeeded"
        }
    ]
}
```

For more information, see Deleting automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see DeleteAutoSnapshot in *AWS CLI Command Reference*.

`delete-disk-snapshot`

The following code example shows how to use `delete-disk-snapshot`.

AWS CLI

To delete a snapshot of a block storage disk

The following `delete-disk-snapshot` example deletes the specified snapshot of a block storage disk.

```
aws lightsail delete-disk-snapshot \
    --disk-snapshot-name DiskSnapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "DiskSnapshot-1",
            "resourceType": "DiskSnapshot",
            "createdAt": 1569873552.79,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteDiskSnapshot",
            "status": "Succeeded",
            "statusChangedAt": 1569873552.79
        }
    ]
}
```

For more information, see Delete unused Lightsail snapshots to avoid monthly charges in the *Amazon Lightsail User Guide*.

- For API details, see DeleteDiskSnapshot in *AWS CLI Command Reference*.

`delete-disk`

The following code example shows how to use `delete-disk`.

AWS CLI

To delete a block storage disk

The following `delete-disk` example deletes the specified block storage disk.

```
aws lightsail delete-disk \
    --disk-name Disk-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569872887.864,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteDisk",
            "status": "Succeeded",
            "statusChangedAt": 1569872887.864
        }
    ]
}
```

For more information, see Detach and delete Lightsail block storage disks in the *Amazon Lightsail User Guide*.

- For API details, see DeleteDisk in *AWS CLI Command Reference*.

`delete-domain-entry`

The following code example shows how to use `delete-domain-entry`.

AWS CLI

To delete a domain entry (DNS record)

The following `delete-domain-entry` example deletes the specified domain entry from an existing domain.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail delete-domain-entry \
    --region us-east-1 \
    --domain-name example.com \
    --domain-entry name=123.example.com,target=192.0.2.0,type=A
```

Output:

```
{
    "operation": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceName": "example.com ",
        "resourceType": "Domain",
        "createdAt": 1569874157.005,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "DeleteDomainEntry",
        "status": "Succeeded",
        "statusChangedAt": 1569874157.005
    }
}
```

For more information, see Edit a Lightsail DNS zone in the *Amazon Lightsail User Guide*.

- For API details, see DeleteDomainEntry in *AWS CLI Command Reference*.

`delete-domain`

The following code example shows how to use `delete-domain`.

AWS CLI

To delete a domain (DNS zone)

The following `delete-domain` example deletes the specified domain and all of the entries in the domain (DNS records).

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail delete-domain \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "operation": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceName": "example.com",
        "resourceType": "Domain",
        "createdAt": 1569873788.13,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "DeleteDomain",
        "status": "Succeeded",
        "statusChangedAt": 1569873788.13
    }
}
```

For more information, see Delete a DNS zone in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see DeleteDomain in *AWS CLI Command Reference*.

`delete-instance-snapshot`

The following code example shows how to use `delete-instance-snapshot`.

AWS CLI

To delete a snapshot of an instance

The following `delete-instance-snapshot` example deletes the specified snapshot of an instance.

```
aws lightsail delete-instance-snapshot \
    --instance-snapshot-name WordPress-1-Snapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "WordPress-1-Snapshot-1",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1569874524.562,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteInstanceSnapshot",
            "status": "Succeeded",
            "statusChangedAt": 1569874524.562
        }
    ]
}
```

For more information, see Delete unused Lightsail snapshots to avoid monthly charges in the *Amazon Lightsail User Guide*.

- For API details, see DeleteInstanceSnapshot in *AWS CLI Command Reference*.

`delete-instance`

The following code example shows how to use `delete-instance`.

AWS CLI

To delete an instance

The following `delete-instance` example deletes the specified instance.

```
aws lightsail delete-instance \
    --instance-name WordPress-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569874357.469,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },

            "resourceType": "Instance",
            "createdAt": 1569874357.829,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
```

```
            "operationType": "DeleteInstance",
            "status": "Succeeded",
            "statusChangedAt": 1569874357.829
        }
    ]
}
```

For more information, see Delete Lightsail instances in the *Amazon Lightsail User Guide*.

- For API details, see DeleteInstance in *AWS CLI Command Reference*.

`delete-key-pair`

The following code example shows how to use `delete-key-pair`.

AWS CLI

To delete a key pair

The following `delete-key-pair` example deletes the specified key pair.

```
aws lightsail delete-key-pair \
    --key-pair-name MyPersonalKeyPair
```

Output:

```
{
    "operation": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceName": "MyPersonalKeyPair",
        "resourceType": "KeyPair",
        "createdAt": 1569874626.466,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationType": "DeleteKeyPair",
        "status": "Succeeded",
        "statusChangedAt": 1569874626.685
    }
}
```

For more information, see Control secure instance connectivity with Lightsail SSH keys in the *Amazon Lightsail User Guide*.

- For API details, see DeleteKeyPair in *AWS CLI Command Reference*.

`delete-known-host-keys`

The following code example shows how to use `delete-known-host-keys`.

AWS CLI

To delete known host keys from an instance

The following `delete-known-host-keys` example deletes the known host key from the specified instance.

```
aws lightsail delete-known-host-keys \
    --instance-name Instance-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Instance-1",
            "resourceType": "Instance",
            "createdAt": 1569874760.201,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteKnownHostKeys",
            "status": "Succeeded",
            "statusChangedAt": 1569874760.201
        }
    ]
}
```

For more information, see Troubleshooting connection issues with the Amazon Lightsail browser-based SSH or RDP client in the *Lightsail Dev Guide*.

- For API details, see DeleteKnownHostKeys in *AWS CLI Command Reference*.

`delete-load-balancer-tls-certificate`

The following code example shows how to use `delete-load-balancer-tls-certificate`.

AWS CLI

To delete a TLS certificate for a load balancer

The following `delete-load-balancer-tls-certificate` example deletes the specifie TLS certificate from the specified load balancer.

```
aws lightsail delete-load-balancer-tls-certificate \
    --load-balancer-name MyFirstLoadBalancer \
    --certificate-name MyFirstCertificate
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "MyFirstCertificate",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569874989.48,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569874989.48
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569874989.48,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
```

```
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569874989.48
        }
    ]
}
```

For more information, see SSL/TLS certificates in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see DeleteLoadBalancerTlsCertificate in *AWS CLI Command Reference*.

`delete-load-balancer`

The following code example shows how to use `delete-load-balancer`.

AWS CLI

To delete a load balancer

The following `delete-load-balancer` example deletes the specified load balancer and any associated TLS certificates.

```
aws lightsail delete-load-balancer \
    --load-balancer-name MyFirstLoadBalancer
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569875092.125,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteLoadBalancer",
            "status": "Succeeded",
```

```
            "statusChangedAt": 1569875092.125
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "MySecondCertificate",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569875091.938,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569875091.938
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569875091.94,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569875091.94
        }
    ]
}
```

For more information, see Delete Lightsail load balancers in the *Amazon Lightsail User Guide*.

- For API details, see DeleteLoadBalancer in *AWS CLI Command Reference*.

`delete-relational-database-snapshot`

The following code example shows how to use `delete-relational-database-snapshot`.

AWS CLI

To delete a snapshot of a managed database

The following `delete-relational-database-snapshot` example deletes the specified snapshot of a managed database.

```
aws lightsail delete-relational-database-snapshot \
    --relational-database-snapshot-name Database-Oregon-1-1566839359
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Database-Oregon-1-1566839359",
            "resourceType": "RelationalDatabaseSnapshot",
            "createdAt": 1569875293.58,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteRelationalDatabaseSnapshot",
            "status": "Succeeded",
            "statusChangedAt": 1569875293.58
        }
    ]
}
```

For more information, see Delete unused Lightsail snapshots to avoid monthly charges in the *Amazon Lightsail User Guide*.

- For API details, see DeleteRelationalDatabaseSnapshot in *AWS CLI Command Reference*.

`delete-relational-database`

The following code example shows how to use `delete-relational-database`.

AWS CLI

To delete a managed database

The following `delete-relational-database` example deletes the specified managed database.

```
aws lightsail delete-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",

        }
    ]
}
```

For more information, see Delete a Lightsail database and create a final snapshot in the *Amazon Lightsail User Guide*.

- For API details, see DeleteRelationalDatabase in *AWS CLI Command Reference*.

`detach-static-ip`

The following code example shows how to use `detach-static-ip`.

AWS CLI

To detach a static IP from an instance

The following `detach-static-ip` example detaches static IP `StaticIp-1` from any attached instance.

```
aws lightsail detach-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571088261.999,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
```

```
            },
            "isTerminal": true,
            "operationDetails": "MEAN-1",
            "operationType": "DetachStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571088261.999
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571088262.022,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "StaticIp-1",
            "operationType": "DetachStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571088262.022
        }
    ]
}
```

For more information, see Static IP addresses in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see DetachStaticIp in *AWS CLI Command Reference*.

`get-active-names`

The following code example shows how to use `get-active-names`.

AWS CLI

To get active resource names

The following `get-active-names` example returns the active resource names in the configured AWS Region.

```
aws lightsail get-active-names
```

Output:

```
{
    "activeNames": [
        "WordPress-1",
        "StaticIp-1",
        "MEAN-1",
        "Plesk_Hosting_Stack_on_Ubuntu-1"
    ]
}
```

For more information, see What is Amazon Lightsail? in the *Amazon Lightsail User Guide*.

- For API details, see GetActiveNames in *AWS CLI Command Reference*.

`get-auto-snapshots`

The following code example shows how to use `get-auto-snapshots`.

AWS CLI

To get the available automatic snapshots for an instance

The following `get-auto-snapshots` example returns the available automatic snapshots for instance `WordPress-1`.

```
aws lightsail get-auto-snapshots \
    --resource-name WordPress-1
```

Output:

```
{
    "resourceName": "WordPress-1",
    "resourceType": "Instance",
    "autoSnapshots": [
        {
            "date": "2019-10-14",
            "createdAt": 1571033872.0,
            "status": "Success",
            "fromAttachedDisks": []
        },
        {
            "date": "2019-10-13",
            "createdAt": 1570947473.0,
```

```
            "status": "Success",
            "fromAttachedDisks": []
        },
        {
            "date": "2019-10-12",
            "createdAt": 1570861072.0,
            "status": "Success",
            "fromAttachedDisks": []
        },
        {
            "date": "2019-10-11",
            "createdAt": 1570774672.0,
            "status": "Success",
            "fromAttachedDisks": []
        }
    ]
}
```

For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see GetAutoSnapshots in *AWS CLI Command Reference*.

`get-blueprints`

The following code example shows how to use `get-blueprints`.

AWS CLI

To get the blueprints for new instances

The following `get-blueprints` example displays details about all of the available blueprints that can be used to create new instances in Amazon Lightsail.

```
aws lightsail get-blueprints
```

Output:

```
{
    "blueprints": [
        {
            "blueprintId": "wordpress",
            "name": "WordPress",
```

```
            "group": "wordpress",
            "type": "app",
            "description": "Bitnami, the leaders in application packaging, and
 Automattic, the experts behind WordPress, have teamed up to offer this official
 WordPress image. This image is a pre-configured, ready-to-run image for running
 WordPress on Amazon Lightsail. WordPress is the world's most popular content
 management platform. Whether it's for an enterprise or small business website, or
 a personal or corporate blog, content authors can easily create content using its
 new Gutenberg editor, and developers can extend the base platform with additional
 features. Popular plugins like Jetpack, Akismet, All in One SEO Pack, WP Mail,
 Google Analytics for WordPress, and Amazon Polly are all pre-installed in this
 image. Let's Encrypt SSL certificates are supported through an auto-configuration
 script.",

`get-bundles`

The following code example shows how to use `get-bundles`.

AWS CLI

To get the bundles for new instances

The following `get-bundles` example displays details about all of the available bundles that can be used to create new instances in Amazon Lightsail.

```
aws lightsail get-bundles
```

Output:

```
{
    "bundles": [
        {
            "price": 5.0,
            "cpuCount": 2,
            "diskSizeInGb": 20,
            "bundleId": "nano_3_0",

        }
    ]
}
```

For more information, see Lightsail instance bundles in the *Amazon Lightsail User Guide*.

- For API details, see GetBundles in *AWS CLI Command Reference*.

`get-cloud-formation-stack-records`

The following code example shows how to use `get-cloud-formation-stack-records`.

AWS CLI

To get the CloudFormation stack records and their associated stacks

The following `get-cloud-formation-stack-records` example displays details about the CloudFormation stack records and their associated stacks used to create Amazon EC2 resources from exported Amazon Lightsail snapshots.

```
aws lightsail get-cloud-formation-stack-records
```

Output:

```
{
    "cloudFormationStackRecords": [
        {
            "name": "CloudFormationStackRecord-588a4243-

For more information, see View CloudFormation stacks for Lightsail instances in the *Amazon Lightsail User Guide*.

- For API details, see GetCloudFormationStackRecords in *AWS CLI Command Reference*.

`get-disk-snapshot`

The following code example shows how to use `get-disk-snapshot`.

AWS CLI

To get information about a disk snapshot

The following `get-disk-snapshot` example displays details about the disk snapshot `Disk-1-1566839161`.

```
aws lightsail get-disk-snapshot \
    --disk-snapshot-name Disk-1-1566839161
```

Output:

```
{
    "diskSnapshot": {
        "name": "Disk-1-1566839161",
```

```
        "arn": "arn:aws:lightsail:us-west-2:123456789012:DiskSnapshot/

        "supportCode": "6EXAMPLE3362/snap-0EXAMPLE06100d09",
        "createdAt": 1566839163.749,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "DiskSnapshot",
        "tags": [],
        "sizeInGb": 8,
        "state": "completed",
        "progress": "100%",
        "fromDiskName": "Disk-1",
        "fromDiskArn": "arn:aws:lightsail:us-west-2:123456789012:Disk/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "isFromAutoSnapshot": false
    }
}
```

For more information, see Create Lightsail block storage disk snapshots for backup or baseline in the *Amazon Lightsail User Guide*.

- For API details, see GetDiskSnapshot in *AWS CLI Command Reference*.

`get-disk-snapshots`

The following code example shows how to use `get-disk-snapshots`.

AWS CLI

To get information about all disk snapshots

The following `get-disk-snapshots` example displays details about all of the disk snapshots in the configured AWS Region.

```
aws lightsail get-disk-snapshots
```

Output:

```
{
    "diskSnapshots": [
        {
```

```
            "name": "Disk-2-1571090588",

            "fromDiskArn": "arn:aws:lightsail:us-west-2:123456789012:Disk/
a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "isFromAutoSnapshot": false
        }
    ]
}
```

For more information, see Create Lightsail block storage disk snapshots for backup or baseline in the *Amazon Lightsail User Guide*.

- For API details, see GetDiskSnapshots in *AWS CLI Command Reference*.

`get-disk`

The following code example shows how to use `get-disk`.

AWS CLI

To get information about a block storage disk

The following `get-disk` example displays details about the disk `Disk-1`.

```
aws lightsail get-disk \
    --disk-name Disk-1
```

Output:

```
{
    "disk": {
        "name": "Disk-1",
        "arn": "arn:aws:lightsail:us-west-2:123456789012:Disk/a1b2c3d4-5678-90ab-

            "isAttached": true,
            "attachmentState": "attached"
        }
    ]
}
```

For more information, see Expand storage and performance with Lightsail block storage disks in the *Amazon Lightsail User Guide*.

- For API details, see GetDisks in *AWS CLI Command Reference*.

`get-domain`

The following code example shows how to use `get-domain`.

AWS CLI

To get information about a domain

The following `get-domain` example displays details about the domain `example.com`.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` AWS Region. If your CLI profile is configured to use a different Region, you must include the `` `` --region us-east-1 `` `` parameter or the command fails.

```
aws lightsail get-domain \
    --domain-name example.com \
    --region us-east-1
```

Output:

```
{
    "domain": {
        "name": "example.com",
        "arn": "arn:aws:lightsail:global:123456789012:Domain/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "supportCode": "6EXAMPLE3362//hostedzone/ZEXAMPLEONGSC1",
        "createdAt": 1570728588.6,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "resourceType": "Domain",
        "tags": [],
        "domainEntries": [
            {

        ]
    }
}
```

For more information, see Understanding DNS in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetDomain in *AWS CLI Command Reference*.

`get-domains`

The following code example shows how to use `get-domains`.

AWS CLI

To get information about all domains

The following `get-domains` example displays details about all of the domains in the configured AWS Region.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` AWS Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail get-domains \
    --region us-east-1
```

Output:

```
{
    "domains": [
        {
            "name": "example.com",

`get-instance-metric-data`

The following code example shows how to use `get-instance-metric-data`.

AWS CLI

To get metric data for an instance

The following `get-instance-metric-data` example returns the average percent of `CPUUtilization` every `7200` seconds (2 hours) between `1571342400` and `1571428800` for instance `MEAN-1`.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-instance-metric-data \
    --instance-name MEAN-1 \
    --metric-name CPUUtilization \
    --period 7200 \
    --start-time 1571342400 \
    --end-time 1571428800 \
    --unit Percent \
    --statistics Average
```

Output:

```
{
    "metricName": "CPUUtilization",
    "metricData": [
        {
            "average": 0.26113718770120725,
            "timestamp": 1571342400.0,
            "unit": "Percent"
        },
        {
            "average": 0.26861268928111953,
            "timestamp": 1571392800.0,
            "unit": "Percent"
        },
        {
            "average": 0.28187475104748777,
            "timestamp": 1571378400.0,
            "unit": "Percent"
        },
        {
            "average": 0.2651936960458352,
            "timestamp": 1571421600.0,
            "unit": "Percent"
        },
        {
            "average": 0.2561856213712188,
            "timestamp": 1571371200.0,
```

```
            "unit": "Percent"
        },
        {
            "average": 0.3021383254607764,
            "timestamp": 1571356800.0,
            "unit": "Percent"
        },
        {
            "average": 0.2618381649223539,
            "timestamp": 1571407200.0,
            "unit": "Percent"
        },
        {
            "average": 0.26331929394825787,
            "timestamp": 1571400000.0,
            "unit": "Percent"
        },
        {
            "average": 0.2576348407007818,
            "timestamp": 1571385600.0,
            "unit": "Percent"
        },
        {
            "average": 0.2513008454658378,
            "timestamp": 1571364000.0,
            "unit": "Percent"
        },
        {
            "average": 0.26329974562758346,
            "timestamp": 1571414400.0,
            "unit": "Percent"
        },
        {
            "average": 0.2667092536656445,
            "timestamp": 1571349600.0,
            "unit": "Percent"
        }
    ]
}
```

For more information, see Monitor Lightsail instance performance with metrics in the *Amazon Lightsail User Guide*.

- For API details, see GetInstanceMetricData in *AWS CLI Command Reference*.

`get-instance-port-states`

The following code example shows how to use `get-instance-port-states`.

AWS CLI

To get firewall information for an instance

The following `get-instance-port-states` example returns the firewall ports configured for instance `MEAN-1`.

```
aws lightsail get-instance-port-states \
    --instance-name MEAN-1
```

Output:

```
{
    "portStates": [
        {
            "fromPort": 80,
            "toPort": 80,
            "protocol": "tcp",
            "state": "open"
        },
        {
            "fromPort": 22,
            "toPort": 22,
            "protocol": "tcp",
            "state": "open"
        },
        {
            "fromPort": 443,
            "toPort": 443,
            "protocol": "tcp",
            "state": "open"
        }
    ]
}
```

For more information, see Control instance traffic with firewalls in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetInstancePortStates in *AWS CLI Command Reference*.

`get-instance-snapshot`

The following code example shows how to use `get-instance-snapshot`.

AWS CLI

To get information about a specified instance snapshot

The following `get-instance-snapshot` example displays details about the specified instance snapshot.

```
aws lightsail get-instance-snapshot \
    --instance-snapshot-name MEAN-1-1571419854
```

Output:

```
{
    "instanceSnapshot": {
        "name": "MEAN-1-1571419854",
        "arn": "arn:aws:lightsail:us-west-2:123456789012:InstanceSnapshot/

        "fromBundleId": "medium_3_0",
        "isFromAutoSnapshot": false,
        "sizeInGb": 80
    }
}
```

For more information, see Snapshots in Amazon Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetInstanceSnapshot in *AWS CLI Command Reference*.

`get-instance-snapshots`

The following code example shows how to use `get-instance-snapshots`.

AWS CLI

To get information about all of your instance snapshots

The following `get-instance-snapshots` example displays details about all of the instance snapshots in the configured AWS Region.

```
aws lightsail get-instance-snapshots
```

Output:

```
{
    "instanceSnapshots": [
        {
            "name": "MEAN-1-1571421498",

        }
    ]
}
```

For more information, see Snapshots in Amazon Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetInstanceSnapshots in *AWS CLI Command Reference*.

`get-instance-state`

The following code example shows how to use `get-instance-state`.

AWS CLI

To get information about the state of an instance

The following `get-instance-state` example returns the state of the specified instance.

```
aws lightsail get-instance-state \
    --instance-name MEAN-1
```

Output:

```
{
    "state": {
        "code": 16,
        "name": "running"
    }
}
```

For more information, see Virtual private server instances in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetInstanceState in *AWS CLI Command Reference*.

`get-instance`

The following code example shows how to use `get-instance`.

AWS CLI

To get information about an instance

The following `get-instance` example displays details about the instance `MEAN-1`.

```
aws lightsail get-instance \
    --instance-name MEAN-1
```

Output:

```
{
    "instance": {
        "name": "MEAN-1",
        "arn": "arn:aws:lightsail:us-west-2:123456789012:Instance/

For more information, see Virtual private server instances in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetInstance in *AWS CLI Command Reference*.

`get-instances`

The following code example shows how to use `get-instances`.

AWS CLI

To get information about all instances

The following `get-instances` example displays details about all of the instances in the configured AWS Region.

```
aws lightsail get-instances
```

Output:

```
{
    "instances": [
        {
            "name": "Windows_Server_2022-1",
```

```
            "arn": "arn:aws:lightsail:us-west-2:123456789012:Instance/

- For API details, see GetLoadBalancers in *AWS CLI Command Reference*.

`get-operation`

The following code example shows how to use `get-operation`.

AWS CLI

To get information about a single operation

The following `get-operation` example displays details about the specified operation.

```
aws lightsail get-operation \
    --operation-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "operation": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceName": "Instance-1",
        "resourceType": "Instance",
        "createdAt": 1571679872.404,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationType": "CreateInstance",
        "status": "Succeeded",
        "statusChangedAt": 1571679890.304
    }
}
```

For more information, see Virtual private server instances in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetOperation in *AWS CLI Command Reference*.

`get-operations-for-resource`

The following code example shows how to use `get-operations-for-resource`.

AWS CLI

To get all operations for a resource

The following `get-operations-for-resource` example displays details about all operations for the specified resource.

```
aws lightsail get-operations-for-resource \
    --resource-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

    ]
}
```

For more information, see Virtual private server instances in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetOperations in *AWS CLI Command Reference*.

`get-regions`

The following code example shows how to use `get-regions`.

AWS CLI

To get all AWS Regions for Amazon Lightsail

The following `get-regions` example displays details about all of the AWS Regions for Amazon Lightsail.

```
aws lightsail get-regions
```

Output:

```
{
    "regions": [
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the eastern
 United States",
            "displayName": "Virginia",
            "name": "us-east-1",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
        },
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the eastern
 United States",
            "displayName": "Ohio",
```

```
            "name": "us-east-2",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
        },
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the
 northwestern United States, Alaska, and western Canada",
            "displayName": "Oregon",
            "name": "us-west-2",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
        }
    ]
}
```

For more information, see Regions and Availability Zones for Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetRegions in *AWS CLI Command Reference*.

`get-relational-database-blueprints`

The following code example shows how to use `get-relational-database-blueprints`.

AWS CLI

To get the blueprints for new relational databases

The following `get-relational-database-blueprints` example displays details about all of the available relational database blueprints that can be used to create new relational databases in Amazon Lightsail.

```
aws lightsail get-relational-database-blueprints
```

Output:

```
{
    "blueprints": [
        {
            "blueprintId": "mysql_5_6",
            "engine": "mysql",
            "engineVersion": "5.6.44",
```

```
            "engineDescription": "MySQL Community Edition",
            "engineVersionDescription": "MySQL 5.6.44",
            "isEngineDefault": false
        },
        {
            "blueprintId": "mysql_5_7",
            "engine": "mysql",
            "engineVersion": "5.7.26",
            "engineDescription": "MySQL Community Edition",
            "engineVersionDescription": "MySQL 5.7.26",
            "isEngineDefault": true
        },
        {
            "blueprintId": "mysql_8_0",
            "engine": "mysql",
            "engineVersion": "8.0.16",
            "engineDescription": "MySQL Community Edition",
            "engineVersionDescription": "MySQL 8.0.16",
            "isEngineDefault": false
        },
        {
            "blueprintId": "postgres_9_6",
            "engine": "postgres",
            "engineVersion": "9.6.15",
            "engineDescription": "PostgreSQL",
            "engineVersionDescription": "PostgreSQL 9.6.15-R1",
            "isEngineDefault": false
        },
        {
            "blueprintId": "postgres_10",
            "engine": "postgres",
            "engineVersion": "10.10",
            "engineDescription": "PostgreSQL",
            "engineVersionDescription": "PostgreSQL 10.10-R1",
            "isEngineDefault": false
        },
        {
            "blueprintId": "postgres_11",
            "engine": "postgres",
            "engineVersion": "11.5",
            "engineDescription": "PostgreSQL",
            "engineVersionDescription": "PostgreSQL 11.5-R1",
            "isEngineDefault": true
        }
```

```
    ]
}
```

For more information, see Select the right Lightsail database engine for your project in the *Amazon Lightsail User Guide*.

- For API details, see GetRelationalDatabaseBlueprints in *AWS CLI Command Reference*.

`get-relational-database-bundles`

The following code example shows how to use `get-relational-database-bundles`.

AWS CLI

To get the bundles for new relational databases

The following `get-relational-database-bundles` example displays details about all of the available relational database bundles that can be used to create new relational databases in Amazon Lightsail. Note that the response does not include inactive bundles because the `--include-inactive` flag is not specified in the command. You cannot use inactive bundles to create new relational databases.

```
aws lightsail get-relational-database-bundles
```

Output:

```
{
    "bundles": [
        {
            "bundleId": "micro_2_0",
            "name": "Micro",
            "price": 15.0,
            "ramSizeInGb": 1.0,
            "diskSizeInGb": 40,
            "transferPerMonthInGb": 100,
            "cpuCount": 2,
            "isEncrypted": true,
            "isActive": true
        },
        {
            "bundleId": "micro_ha_2_0",
            "name": "Micro with High Availability",
```

```
            "price": 30.0,
            "ramSizeInGb": 1.0,
            "diskSizeInGb": 40,
            "transferPerMonthInGb": 100,
            "cpuCount": 2,
            "isEncrypted": true,
            "isActive": true
        },
        {

        }
    ]
}
```

For more information, see Creating a database in Amazon Lightsail in the *Amazon Lightsail Developer Guide*.

- For API details, see GetRelationalDatabaseBundles in *AWS CLI Command Reference*.

`get-relational-database-events`

The following code example shows how to use `get-relational-database-events`.

AWS CLI

To get the events for a relational database

The following `get-relational-database-events` example displays details about events in the last 17 hours (1020 minutes) for the specified relational database.

```
aws lightsail get-relational-database-events \
    --relational-database-name Database-1 \
    --duration-in-minutes 1020
```

Output:

```
{
    "relationalDatabaseEvents": [
        {
            "resource": "Database-1",
            "createdAt": 1571654146.553,
            "message": "Backing up Relational Database",
            "eventCategories": [
                "backup"
            ]
        },
        {
            "resource": "Database-1",
            "createdAt": 1571654249.98,
            "message": "Finished Relational Database backup",
            "eventCategories": [
                "backup"
            ]
        }
    ]
}
```

For more information, see Create and manage relational databases in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetRelationalDatabaseEvents in *AWS CLI Command Reference*.

`get-relational-database-log-events`

The following code example shows how to use `get-relational-database-log-events`.

AWS CLI

To get log events for a relational database

The following `get-relational-database-log-events` example displays details about the specified log between 1570733176 and 1571597176 for relational database `Database1`. The information returned is configured to start from `head`.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-relational-database-log-events \
    --relational-database-name Database1 \
    --log-stream-name error \
    --start-from-head \
    --start-time 1570733176 \
    --end-time 1571597176
```

Output:

```
{
    "resourceLogEvents": [
        {
            "createdAt": 1570820267.0,
            "message": "2019-10-11 18:57:47 20969 [Warning] IP address '192.0.2.0'

```

For more information, see Monitor MySQL query performance with general and slow query logs in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetRelationalDatabaseLogEvents in *AWS CLI Command Reference*.

`get-relational-database-log-streams`

The following code example shows how to use `get-relational-database-log-streams`.

AWS CLI

To get the log streams for a relational database

The following `get-relational-database-log-streams` example returns all of the available log streams for the specified relational database.

```
aws lightsail get-relational-database-log-streams \
    --relational-database-name Database1
```

Output:

```
{
    "logStreams": [
        "audit",
        "error",
        "general",
        "slowquery"
    ]
}
```

For more information, see Monitor MySQL query performance with general and slow query logs in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetRelationalDatabaseLogStreams in *AWS CLI Command Reference*.

`get-relational-database-master-user-password`

The following code example shows how to use `get-relational-database-master-user-password`.

AWS CLI

To get the master user password for a relational database

The following `get-relational-database-master-user-password` example returns information about the master user password for the specified relational database.

```
aws lightsail get-relational-database-master-user-password \
    --relational-database-name Database-1
```

Output:

```
{
    "masterUserPassword": "VEXAMPLEec.9qvx,_t<)Wkf)kwboM,>2",
    "createdAt": 1571259453.959
}
```

For more information, see Change your Lightsail database password in the *Amazon Lightsail User Guide*.

- For API details, see GetRelationalDatabaseMasterUserPassword in *AWS CLI Command Reference*.

`get-relational-database-metric-data`

The following code example shows how to use `get-relational-database-metric-data`.

AWS CLI

To get metric data for a relational database

The following `get-relational-database-metric-data` example returns the count sum of the metric `DatabaseConnections` over the period of 24 hours (`86400` seconds) between `1570733176` and `1571597176` for relational database `Database1`.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-relational-database-metric-data \
    --relational-database-name Database1 \
    --metric-name DatabaseConnections \
    --period 86400 \
    --start-time 1570733176 \
    --end-time 1571597176 \
    --unit Count \
    --statistics Sum
```

Output:

```
{
    "metricName": "DatabaseConnections",
    "metricData": [
        {
            "sum": 1.0,
            "timestamp": 1571510760.0,
            "unit": "Count"
        },
        {
            "sum": 1.0,
            "timestamp": 1570733160.0,
            "unit": "Count"
        },
        {
```

```
            "sum": 1.0,
            "timestamp": 1570992360.0,
            "unit": "Count"
        },
        {
            "sum": 0.0,
            "timestamp": 1571251560.0,
            "unit": "Count"
        },
        {
            "sum": 721.0,
            "timestamp": 1570819560.0,
            "unit": "Count"
        },
        {
            "sum": 1.0,
            "timestamp": 1571078760.0,
            "unit": "Count"
        },
        {
            "sum": 2.0,
            "timestamp": 1571337960.0,
            "unit": "Count"
        },
        {
            "sum": 684.0,
            "timestamp": 1570905960.0,
            "unit": "Count"
        },
        {
            "sum": 0.0,
            "timestamp": 1571165160.0,
            "unit": "Count"
        },
        {
            "sum": 1.0,
            "timestamp": 1571424360.0,
            "unit": "Count"
        }
    ]
}
```

For more information, see Monitor Lightsail database performance metrics in the *Amazon Lightsail User Guide*.

- For API details, see GetRelationalDatabaseMetricData in *AWS CLI Command Reference*.

`get-relational-database-parameters`

The following code example shows how to use `get-relational-database-parameters`.

AWS CLI

To get parameters for a relational database

The following `get-relational-database-parameters` example returns information about all of the available parameters for the specified relational database.

```
aws lightsail get-relational-database-parameters \
    --relational-database-name Database-1
```

Output:

```
{
    "parameters": [
        {
            "allowedValues": "0,1",
            "applyMethod": "pending-reboot",

 an xxx symbol for the main function can be loaded",
            "isModifiable": false,
            "parameterName": "allow-suspicious-udfs"
```

```
        },
        {
            "allowedValues": "0,1",
            "applyMethod": "pending-reboot",
            "applyType": "dynamic",
            "dataType": "boolean",
            "description": "Sets the autocommit mode",
            "isModifiable": true,
            "parameterName": "autocommit"
        },
        {
            "allowedValues": "0,1",
            "applyMethod": "pending-reboot",
            "applyType": "static",
            "dataType": "boolean",
            "description": "Controls whether the server autogenerates SSL key and
 certificate files in the data directory, if they do not already exist.",
            "isModifiable": false,
            "parameterName": "auto_generate_certs"
        }
    ]
}
```

For more information, see Updating database parameters in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see GetRelationalDatabaseParameters in *AWS CLI Command Reference*.

`get-relational-database-snapshot`

The following code example shows how to use `get-relational-database-snapshot`.

AWS CLI

To get information about a relational database snapshot

The following `get-relational-database-snapshot` example displays details about the specified relational database snapshot.

```
aws lightsail get-relational-database-snapshot \
    --relational-database-snapshot-name Database-1-1571350042
```

Output:

```
{
    "relationalDatabaseSnapshot": {
        "name": "Database-1-1571350042",
        "arn": "arn:aws:lightsail:us-

        "fromRelationalDatabaseBundleId": "micro_1_0",
        "fromRelationalDatabaseBlueprintId": "mysql_8_0"
    }
}
```

For more information, see Back up your Lightsail database with snapshots in the *Amazon Lightsail User Guide*.

- For API details, see GetRelationalDatabaseSnapshot in *AWS CLI Command Reference*.

`get-relational-database-snapshots`

The following code example shows how to use `get-relational-database-snapshots`.

AWS CLI

To get information about all relational database snapshots

The following `get-relational-database-snapshots` example displays details about all of the relational database snapshots in the configured AWS Region.

```
aws lightsail get-relational-database-snapshots
```

Output:

```
{
    "relationalDatabaseSnapshots": [
        {

`get-relational-database`

The following code example shows how to use `get-relational-database`.

AWS CLI

To get information about a relational database

The following `get-relational-database` example displays details about the specified relational database.

```
aws lightsail get-relational-database \
    --relational-database-name Database-1
```

Output:

`get-static-ip`

The following code example shows how to use `get-static-ip`.

AWS CLI

To get information about a static IP

The following `get-static-ip` example displays details about the specified static IP.

```
aws lightsail get-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
    "staticIp": {
        "name": "StaticIp-1",
        "arn": "arn:aws:lightsail:us-west-2:123456789012:StaticIp/

                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "resourceType": "StaticIp",
            "ipAddress": "192.0.2.2",
            "attachedTo": "WordPress-1",
            "isAttached": true
        }
    ]
}
```

For more information, see Static IP addresses in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see GetStaticIps in *AWS CLI Command Reference*.

`is-vpc-peered`

The following code example shows how to use `is-vpc-peered`.

AWS CLI

To identify if your Amazon Lightsail virtual private cloud is peered

The following `is-vpc-peered` example returns the peering status of the Amazon Lightsail virtual private cloud (VPC) for the current AWS Region.

```
aws lightsail is-vpc-peered
```

Output:

```
{
    "isPeered": true
}
```

For more information, see Connect Lightsail resources to AWS services using VPC peering in the *Amazon Lightsail User Guide*.

- For API details, see IsVpcPeered in *AWS CLI Command Reference*.

`open-instance-public-ports`

The following code example shows how to use `open-instance-public-ports`.

AWS CLI

To open firewall ports for an instance

The following `open-instance-public-ports` example opens TCP port 22 on the specified instance.

```
aws lightsail open-instance-public-ports \
    --instance-name MEAN-2 \
    --port-info fromPort=22,protocol=TCP,toPort=22
```

Output:

```
{
    "operation": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceName": "MEAN-2",
        "resourceType": "Instance",
        "createdAt": 1571072906.849,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationDetails": "22/tcp",
        "operationType": "OpenInstancePublicPorts",
        "status": "Succeeded",
        "statusChangedAt": 1571072906.849
    }
}
```

For more information, see Control instance traffic with firewalls in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see OpenInstancePublicPorts in *AWS CLI Command Reference*.

`peer-vpc`

The following code example shows how to use `peer-vpc`.

AWS CLI

To peer the Amazon Lightsail virtual private cloud

The following `peer-vpc` example peers the Amazon Lightsail virtual private cloud (VPC) for the current AWS Region.

```
aws lightsail peer-vpc
```

Output:

```
{
    "operation": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceName": "vpc-0EXAMPLEa5261efb3",
        "resourceType": "PeeredVpc",
        "createdAt": 1571694233.104,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationDetails": "vpc-e2b3eb9b",
        "operationType": "PeeredVpc",
        "status": "Succeeded",
        "statusChangedAt": 1571694233.104
    }
}
```

For more information, see Connect Lightsail resources to AWS services using VPC peering in the *Amazon Lightsail User Guide*.

- For API details, see PeerVpc in *AWS CLI Command Reference*.

`reboot-instance`

The following code example shows how to use `reboot-instance`.

AWS CLI

To reboot an instance

The following `reboot-instance` example reboots the specified instance.

```
aws lightsail reboot-instance \
    --instance-name MEAN-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571694445.49,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "",
            "operationType": "RebootInstance",
            "status": "Succeeded",
            "statusChangedAt": 1571694445.49
        }
    ]
}
```

For more information, see Start, stop, or reboot your Lightsail instance in the *Amazon Lightsail User Guide*.

- For API details, see RebootInstance in *AWS CLI Command Reference*.

`reboot-relational-database`

The following code example shows how to use `reboot-relational-database`.

AWS CLI

To reboot a relational database

The following `reboot-relational-database` example reboots the specified relational database.

```
aws lightsail reboot-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1571694532.91,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "",
            "operationType": "RebootRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1571694532.91
        }
    ]
}
```

For more information, see Create and manage relational databases in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see RebootRelationalDatabase in *AWS CLI Command Reference*.

`release-static-ip`

The following code example shows how to use `release-static-ip`.

AWS CLI

To delete a static IP

The following `release-static-ip` example deletes the specified static IP.

```
aws lightsail release-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571694962.003,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "ReleaseStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571694962.003
        }
    ]
}
```

For more information, see Static IP addresses in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see ReleaseStaticIp in *AWS CLI Command Reference*.

`start-instance`

The following code example shows how to use `start-instance`.

AWS CLI

To start an instance

The following `start-instance` example starts the specified instance.

```
aws lightsail start-instance \
    --instance-name WordPress-1
```

Output:

```
{
    "operations": [
```

```
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1571695583.463,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StartInstance",
            "status": "Started",
            "statusChangedAt": 1571695583.463
        }
    ]
}
```

For more information, see Start, stop, or reboot your Lightsail instance in the *Amazon Lightsail User Guide*.

- For API details, see StartInstance in *AWS CLI Command Reference*.

`start-relational-database`

The following code example shows how to use `start-relational-database`.

AWS CLI

To start a relational database

The following `start-relational-database` example starts the specified relational database.

```
aws lightsail start-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1571695998.822,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StartRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1571695998.822
        }
    ]
}
```

For more information, see Create and manage relational databases in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see StartRelationalDatabase in *AWS CLI Command Reference*.

`stop-instance`

The following code example shows how to use `stop-instance`.

AWS CLI

To stop an instance

The following `stop-instance` example stops the specified instance.

```
aws lightsail stop-instance \
    --instance-name WordPress-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1571695471.134,
```

```
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StopInstance",
            "status": "Started",
            "statusChangedAt": 1571695471.134
        }
    ]
}
```

For more information, see Start, stop, or reboot your Lightsail instance in the *Amazon Lightsail User Guide*.

- For API details, see StopInstance in *AWS CLI Command Reference*.

`stop-relational-database`

The following code example shows how to use `stop-relational-database`.

AWS CLI

To stop a relational database

The following `stop-relational-database` example stops the specified relational database.

```
aws lightsail stop-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1571695526.29,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
```

```
            },
            "isTerminal": false,
            "operationType": "StopRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1571695526.29
        }
    ]
}
```

For more information, see Create and manage relational databases in Lightsail in the *Amazon Lightsail User Guide*.

- For API details, see StopRelationalDatabase in *AWS CLI Command Reference*.

`unpeer-vpc`

The following code example shows how to use `unpeer-vpc`.

AWS CLI

To unpeer the Amazon Lightsail virtual private cloud

The following `unpeer-vpc` example unpeers the Amazon Lightsail virtual private cloud (VPC) for the current AWS Region.

```
aws lightsail unpeer-vpc
```

Output:

```
{
    "operation": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceName": "vpc-0EXAMPLEa5261efb3",
        "resourceType": "PeeredVpc",
        "createdAt": 1571694109.945,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationDetails": "vpc-e2b3eb9b",
        "operationType": "UnpeeredVpc",
```

```
        "status": "Succeeded",
        "statusChangedAt": 1571694109.945
    }
}
```

For more information, see Connect Lightsail resources to AWS services using VPC peering in the *Amazon Lightsail User Guide*.

- For API details, see UnpeerVpc in *AWS CLI Command Reference*.

Macie examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Macie.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

`describe-buckets`

The following code example shows how to use `describe-buckets`.

AWS CLI

To query data about one or more S3 buckets that Amazon Macie monitors and analyzes for your account

The following `describe-buckets` example queries metadata for all S3 buckets whose names begin with amzn-s3-demo-bucket and are in the current AWS Region.

```
aws macie2 describe-buckets \
    --criteria '{"bucketName":{"prefix":"amzn-s3-demo-bucket"}}'
```

Output:

```
{
    "buckets": [
        {
            "accountId": "123456789012",
            "allowsUnencryptedObjectUploads": "FALSE",

`add-flow-outputs`

The following code example shows how to use `add-flow-outputs`.

AWS CLI

To add outputs to a flow

The following `add-flow-outputs` example adds outputs to the specified flow.

```
aws mediaconnect add-flow-outputs \
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --outputs Description='NYC
 stream',Destination=192.0.2.12,Name=NYC,Port=3333,Protocol=rtp-
fec,SmoothingLatency=100 Description='LA
 stream',Destination=203.0.113.9,Name=LA,Port=4444,Protocol=rtp-
fec,SmoothingLatency=100
```

Output:

```
{
    "Outputs": [
        {
            "Port": 3333,
            "OutputArn": "arn:aws:mediaconnect:us-
west-2:123456789012:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC",
            "Name": "NYC",
            "Description": "NYC stream",
            "Destination": "192.0.2.12",
            "Transport": {
                "Protocol": "rtp-fec",
                "SmoothingLatency": 100
            }
        },
        {
            "Port": 4444,
            "OutputArn": "arn:aws:mediaconnect:us-
west-2:123456789012:output:2-987655dEF67hiJ89-c34de5fG678h:LA",
            "Name": "LA",
            "Description": "LA stream",
            "Destination": "203.0.113.9",
            "Transport": {
                "Protocol": "rtp-fec",
                "SmoothingLatency": 100
            }
        }
    ],
    "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame"
}
```

For more information, see Adding Outputs to a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see AddFlowOutputs in *AWS CLI Command Reference*.

`create-flow`

The following code example shows how to use `create-flow`.

AWS CLI

To create a flow

The following `create-flow` example creates a flow with the specified configuration.

```
aws mediaconnect create-flow \
    --availability-zone us-west-2c \
    --name ExampleFlow \
    --source "Description='Example source,
 backup',IngestPort=1055,Name=BackupSource,Protocol=rtp,WhitelistCidr=10.24.34.0/23"
```

Output:

```
{
    "Flow": {
        "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:ExampleFlow",

            "Transport": {
                "Protocol": "rtp",
                "MaxBitrate": 80000000
            },
            "Description": "Example source, backup",
            "IngestIp": "54.245.71.21",
            "WhitelistCidr": "10.24.34.0/23",
            "Name": "mySource"
        },
        "Entitlements": [],
        "Name": "ExampleFlow",
        "Outputs": [],
        "Status": "STANDBY",
        "Description": "Example source, backup"
    }
}
```

For more information, see Creating a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see CreateFlow in *AWS CLI Command Reference*.

`delete-flow`

The following code example shows how to use `delete-flow`.

AWS CLI

To delete a flow

The following `delete-flow` example deletes the specified flow.

```
aws mediaconnect delete-flow \
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
    "Status": "DELETING"
}
```

For more information, see Deleting a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see DeleteFlow in *AWS CLI Command Reference*.

`describe-flow`

The following code example shows how to use `describe-flow`.

AWS CLI

To view the details of a flow

The following `describe-flow` example displays the specified flow's details, such as ARN, Availability Zone, status, source, entitlements, and outputs.

```
aws mediaconnect describe-flow \
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{
    "Flow": {
        "EgressIp": "54.201.4.39",
        "AvailabilityZone": "us-west-2c",
        "Status": "ACTIVE",
        "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
        "Entitlements": [
            {
                "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:123456789012:entitlement:1-AaBb11CcDd22EeFf-34DE5fG12AbC:MyEntitlement",
                "Description": "Assign to this account",
                "Name": "MyEntitlement",
                "Subscribers": [
                    "123456789111"
                ]
            }
        ],
        "Description": "NYC awards show",
        "Name": "AwardsShow",
        "Outputs": [
            {
                "Port": 2355,
                "Name": "NYC",
                "Transport": {
                    "SmoothingLatency": 0,
                    "Protocol": "rtp-fec"

            "Transport": {
                "MaxBitrate": 80000000,
                "Protocol": "rtp"
            },
            "IngestPort": 1069,
            "Description": "Saturday night show",
            "Name": "ShowSource",
            "WhitelistCidr": "10.24.34.0/23"
        }
    }
}
```

For more information, see Viewing the Details of a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see DescribeFlow in *AWS CLI Command Reference*.

`grant-flow-entitlements`

The following code example shows how to use `grant-flow-entitlements`.

AWS CLI

To grant an entitlement on a flow

The following `grant-flow-entitlements` example grants an entitlement to the specified existing flow to share your content with another AWS account.

```
aws mediaconnect grant-flow-entitlements \
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --entitlements Description='For
 AnyCompany',Encryption={"Algorithm=aes128,KeyType=static-
key,RoleArn=arn:aws:iam::123456789012:role/MediaConnect-
ASM,SecretArn=arn:aws:secretsmanager:us-
west-2:123456789012:secret:mySecret1"},Name=AnyCompany_Entitlement,Subscribers=123456789111
 Description='For Example Corp',Name=ExampleCorp,Subscribers=123456789222
```

Output:

```
{
    "Entitlements": [
        {
            "Name": "AnyCompany_Entitlement",
            "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:123456789012:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement",
            "Subscribers": [
                "123456789111"
            ],
            "Description": "For AnyCompany",
            "Encryption": {
                "SecretArn": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:mySecret1",
                "Algorithm": "aes128",
                "RoleArn": "arn:aws:iam::123456789012:role/MediaConnect-ASM",
                "KeyType": "static-key"
            }
        },
        {
            "Name": "ExampleCorp",
            "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:123456789012:entitlement:1-3333cccc4444dddd-1111aaaa2222:ExampleCorp",
            "Subscribers": [
                "123456789222"
            ],
            "Description": "For Example Corp"
        }
    ],
    "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame"
}
```

For more information, see Granting an Entitlement on a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see GrantFlowEntitlements in *AWS CLI Command Reference*.

`list-entitlements`

The following code example shows how to use `list-entitlements`.

AWS CLI

To view a list of entitlements

The following `list-entitlements` example displays a list of all entitlements that have been granted to the account.

```
aws mediaconnect list-entitlements
```

Output:

```
{
    "Entitlements": [
        {
            "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:123456789012:entitlement:1-11aa22bb11aa22bb-3333cccc4444:MyEntitlement",
            "EntitlementName": "MyEntitlement"
        }
    ]
}
```

For more information, see Managing entitlements in MediaConnect in the *AWS Elemental MediaConnect User Guide*.

- For API details, see ListEntitlements in *AWS CLI Command Reference*.

`list-flows`

The following code example shows how to use `list-flows`.

AWS CLI

To view a list of flows

The following `list-flows` example displays a list of flows.

```
aws mediaconnect list-flows
```

Output:

```
{
    "Flows": [
```

```
        {
            "Status": "STANDBY",
            "SourceType": "OWNED",
            "AvailabilityZone": "us-west-2a",
            "Description": "NYC awards show",
            "Name": "AwardsShow",
            "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow"
        },
        {
            "Status": "STANDBY",
            "SourceType": "OWNED",
            "AvailabilityZone": "us-west-2c",
            "Description": "LA basketball game",
            "Name": "BasketballGame",
            "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame"
        }
    ]
}
```

For more information, see Viewing a List of Flows in the *AWS Elemental MediaConnect User Guide*.

- For API details, see ListFlows in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a MediaConnect resource

The following `list-tags-for-resource` example displays the tag keys and values associated with the specified MediaConnect resource.

```
aws mediaconnect list-tags-for-resource \
    --resource-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame
```

Output:

```
{
    "Tags": {
        "region": "west",
        "stage": "prod"
    }
}
```

For more information, see Tagging AWS Elemental MediaConnect resources in the *AWS Elemental MediaConnect User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`remove-flow-output`

The following code example shows how to use `remove-flow-output`.

AWS CLI

To remove an output from a flow

The following `remove-flow-output` example removes an output from the specified flow.

```
aws mediaconnect remove-flow-output \
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --output-arn arn:aws:mediaconnect:us-
west-2:123456789012:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "OutputArn": "arn:aws:mediaconnect:us-
west-2:123456789012:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC"
}
```

For more information, see Removing Outputs from a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see RemoveFlowOutput in *AWS CLI Command Reference*.

`revoke-flow-entitlement`

The following code example shows how to use `revoke-flow-entitlement`.

AWS CLI

To revoke an entitlement

The following `revoke-flow-entitlement` example revokes an entitlement on the specified flow.

```
aws mediaconnect revoke-flow-entitlement \
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --entitlement-arn arn:aws:mediaconnect:us-
west-2:123456789012:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:123456789012:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement"
}
```

For more information, see Revoking an Entitlement in the *AWS Elemental MediaConnect User Guide*.

- For API details, see RevokeFlowEntitlement in *AWS CLI Command Reference*.

`start-flow`

The following code example shows how to use `start-flow`.

AWS CLI

To start a flow

The following `start-flow` example starts the specified flow.

```
aws mediaconnect start-flow \
```

```
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

This command produces no output. Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
    "Status": "STARTING"
}
```

For more information, see Starting a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see StartFlow in *AWS CLI Command Reference*.

`stop-flow`

The following code example shows how to use `stop-flow`.

AWS CLI

To stop a flow

The following `stop-flow` example stops the specified flow.

```
aws mediaconnect stop-flow \
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{
    "Status": "STOPPING",
    "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow"
}
```

For more information, see Stopping a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see StopFlow in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a MediaConnect resource

The following `tag-resource` example adds a tag with a key name and value to the specified MediaConnect resource.

```
aws mediaconnect tag-resource \
    --resource-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame \
    --tags region=west
```

This command produces no output.

For more information, see Tagging AWS Elemental MediaConnect resources in the *AWS Elemental MediaConnect User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a MediaConnect resource

The following `untag-resource` example remove the tag with the specified key name and its associated value from a MediaConnect resource.

```
aws mediaconnect untag-resource \
    --resource-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame \
    --tag-keys region
```

This command produces no output.

For more information, see Tagging AWS Elemental MediaConnect resources in the *AWS Elemental MediaConnect User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-flow-entitlement`

The following code example shows how to use `update-flow-entitlement`.

AWS CLI

To update an entitlement

The following `update-flow-entitlement` example updates the specified entitlement with a new description and subscriber.

```
aws mediaconnect update-flow-entitlement \
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --entitlement-arn arn:aws:mediaconnect:us-
west-2:123456789012:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement
 \
    --description 'For AnyCompany Affiliate' \
    --subscribers 123456789222
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "Entitlement": {
        "Name": "AnyCompany_Entitlement",
        "Description": "For AnyCompany Affiliate",
        "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:123456789012:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement",
        "Encryption": {
            "KeyType": "static-key",
            "Algorithm": "aes128",
            "RoleArn": "arn:aws:iam::123456789012:role/MediaConnect-ASM",
            "SecretArn": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:mySecret1"
        },
        "Subscribers": [
            "123456789222"
        ]
    }
```

```
}
```

For more information, see Updating an Entitlement in the *AWS Elemental MediaConnect User Guide*.

- For API details, see UpdateFlowEntitlement in *AWS CLI Command Reference*.

`update-flow-output`

The following code example shows how to use `update-flow-output`.

AWS CLI

To update an output on a flow

The following `update-flow-output` example update an output on the specified flow.

```
aws mediaconnect update-flow-output \
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --output-arn arn:aws:mediaconnect:us-
west-2:123456789012:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC \
    --port 3331
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "Output": {
        "Name": "NYC",
        "Port": 3331,
        "Description": "NYC stream",
        "Transport": {
            "Protocol": "rtp-fec",
            "SmoothingLatency": 100
        },
        "OutputArn": "arn:aws:mediaconnect:us-
west-2:123456789012:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC",
        "Destination": "192.0.2.12"
    }
}
```

For more information, see Updating Outputs on a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see UpdateFlowOutput in *AWS CLI Command Reference*.

`update-flow-source`

The following code example shows how to use `update-flow-source`.

AWS CLI

To update the source of an existing flow

The following `update-flow-source` example updates the source of an existing flow.

```
aws mediaconnect update-flow-source \
    --flow-arn arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow \
    --source-arn arn:aws:mediaconnect:us-
west-2:123456789012:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource \
    --description 'Friday night show' \
    --ingest-port 3344 \
    --protocol rtp-fec \
    --whitelist-cidr 10.24.34.0/23
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
west-2:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
    "Source": {
        "IngestIp": "34.210.136.56",
        "WhitelistCidr": "10.24.34.0/23",
        "Transport": {
            "Protocol": "rtp-fec"
        },
        "IngestPort": 3344,
        "Name": "ShowSource",
        "Description": "Friday night show",
        "SourceArn": "arn:aws:mediaconnect:us-
west-2:123456789012:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource"
    }
}
```

For more information, see Updating the Source of a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see UpdateFlowSource in *AWS CLI Command Reference*.

MediaConvert examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaConvert.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`cancel-job`

The following code example shows how to use `cancel-job`.

AWS CLI

To cancel a job that is in a queue

The following `cancel-job` example cancels the job with ID `1234567891234-abc123`. You can't cancel a job that the service has started processing.

```
aws mediaconvert cancel-job \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --id 1234567891234-abc123
```

This command produces no output.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see Working with jobs in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CancelJob in *AWS CLI Command Reference*.

`create-job-template`

The following code example shows how to use `create-job-template`.

AWS CLI

To create a job template

The following `create-job-template` example creates a job template with the transcoding settings that are specified in the file `job-template.json` that resides on your system.

```
aws mediaconvert create-job-template \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --name JobTemplate1 \
    --cli-input-json file://~/job-template.json
```

Contents of `job-template.json`:

```
{
    "Description": "Job template that creates an MP4 output with H.264 video and AAC
 audio",
    "Settings": {
        "TimecodeConfig": {
            "Source": "ZEROBASED"
        },
        "Inputs": [
            {
                "AudioSelectors": {
                    "Audio Selector 1": {
                        "DefaultSelection": "DEFAULT"
                    }
                },
                "VideoSelector": {},
                "TimecodeSource": "ZEROBASED"
            }
        ],
        "OutputGroups": [
            {
                "Name": "File Group",
```

```
                "OutputGroupSettings": {
                    "Type": "FILE_GROUP_SETTINGS",
                    "FileGroupSettings": {
                        "Destination": "s3://amzn-s3-demo-bucket/output/"
                    }
                },
                "Outputs": [
                    {
                        "ContainerSettings": {
                            "Container": "MP4"
                        },
                        "VideoDescription": {
                            "CodecSettings": {
                                "Codec": "H_264",
                                "H264Settings": {
                                    "RateControlMode": "QVBR",
                                    "MaxBitrate": 5000000,

                                }
                            }
                        },
                        "AudioDescriptions": [
                            {
                                "CodecSettings": {
                                    "Codec": "AAC",
                                    "AacSettings": {
                                        "Bitrate": 96000,
                                        "CodingMode": "CODING_MODE_2_0",
                                        "SampleRate": 48000
                                    }
                                }
                            }
                        ]
                    }
                ]
            }
        ]
    }
}
```

If you create your job template JSON file by using `get-job-template` and then modifying the file, remove the `JobTemplate` object, but keep the Settings child object inside it. Also,

make sure to remove the following key-value pairs: `LastUpdated`, `Arn`, `Type`, and `CreatedAt`. You can specific the category, description, name, and queue either in the JSON file or at the command line.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON specification for the job template that you created.

Output:

```
{
    "JobTemplate": {
        "Arn": "arn:aws:mediaconvert:region-name-1:123456789012:jobTemplates/
JobTemplate1",
        "CreatedAt": "2024-04-01T17:20:31+00:00",
        "LastUpdated": "2024-04-01T17:20:31+00:00",
        "Name": "JobTemplate1",
        "Priority": 0,
        "Settings": {
            "OutputGroups": [
                {
                    "Name": "File Group",
                    "OutputGroupSettings": {
                        "Type": "FILE_GROUP_SETTINGS",
                        "FileGroupSettings": {}
                    },
                    "Outputs": [
                        {
                            "ContainerSettings": {
                                "Container": "MP4",
                                "Mp4Settings": {
                                    "CslgAtom": "INCLUDE",
                                    "FreeSpaceBox": "EXCLUDE",
                                    "MoovPlacement": "PROGRESSIVE_DOWNLOAD"
                                }
                            },
                            "VideoDescription": {
                                "Width": 1920,
                                "Height": 1080,
                                "CodecSettings": {
                                    "Codec": "H_264",
```

```
                                "H264Settings": {
                                    "MaxBitrate": 10000000,

                                }
                            }
                        },
                        "AudioDescriptions": [
                            {
                                "CodecSettings": {
                                    "Codec": "AAC",
                                    "AacSettings": {
                                        "Bitrate": 96000,
                                        "CodingMode": "CODING_MODE_2_0",
                                        "SampleRate": 48000
                                    }
                                }
                            }
                        ]
                    }
                ]
            }
        ]
    },
    "StatusUpdateInterval": "SECONDS_60",
    "Type": "CUSTOM"
  }
}
```

For more information, see Working with job templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreateJobTemplate in *AWS CLI Command Reference*.

`create-job`

The following code example shows how to use `create-job`.

AWS CLI

To create a job

The following `create-job` example creates a transcoding job with the settings that are specified in a file `job.json` that resides on the system that you send the command from. This

JSON job specification might specify each setting individually, reference a job template, or reference output presets.

```
aws mediaconvert create-job \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --cli-input-json file://~/job.json
```

Contents of `job.json`:

```
{
    "Role": "arn:aws:iam::123456789012:role/MediaConvert_Default_Role",
    "Settings": {
        "TimecodeConfig": {
            "Source": "ZEROBASED"
        },
        "Inputs": [
            {
                "FileInput": "s3://amzn-s3-demo-bucket1/input/video.mp4",
                "AudioSelectors": {
                    "Audio Selector 1": {
                        "DefaultSelection": "DEFAULT"
                    }
                },
                "VideoSelector": {},
                "TimecodeSource": "ZEROBASED"
            }
        ],
        "OutputGroups": [
            {
                "Name": "File Group",
                "OutputGroupSettings": {
                    "Type": "FILE_GROUP_SETTINGS",
                    "FileGroupSettings": {
                        "Destination": "s3://amzn-s3-demo-bucket2/output/"
                    }
                },
                "Outputs": [
                    {
                        "ContainerSettings": {
                            "Container": "MP4"
                        },
                        "VideoDescription": {
                            "CodecSettings": {
```

```
                                "Codec": "H_264",
                                "H264Settings": {
                                    "RateControlMode": "QVBR",
                                    "MaxBitrate": 5000000,
                                    "SceneChangeDetect": "TRANSITION_DETECTION",
                                    "QualityTuningLevel": "SINGLE_PASS"
                                }
                            }
                        },
                        "AudioDescriptions": [
                            {
                                "CodecSettings": {
                                    "Codec": "AAC",
                                    "AacSettings": {
                                        "Bitrate": 96000,
                                        "CodingMode": "CODING_MODE_2_0",
                                        "SampleRate": 48000
                                    }
                                }
                            }
                        ]
                    }
                ]
            }
        ]
    }
}
```

You can use the AWS Elemental MediaConvert console to generate the JSON job specification by choosing your job settings, and then choosing **Show job JSON** at the bottom of the **Job** section.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON job specification that you sent with your request.

Output:

```
{
    "Job": {
        "AccelerationStatus": "NOT_APPLICABLE",
```

```
        "Arn": "arn:aws:mediaconvert:region-name-1:123456789012:jobs/1234567891234-

        "Status": "SUBMITTED",
        "StatusUpdateInterval": "SECONDS_60",
        "Timing": {
            "SubmitTime": "2024-04-01T17:35:12+00:00"
        },
        "UserMetadata": {}
    }
}
```

For more information, see Working with jobs in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreateJob in *AWS CLI Command Reference*.

`create-preset`

The following code example shows how to use `create-preset`.

AWS CLI

To create a custom output preset

The following `create-preset` example creates a custom output preset based on the output settings that are specified in the file `preset.json`. You can specify the category, description, and name either in the JSON file or at the command line.

```
aws mediaconvert create-preset \
```

```
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --cli-input-json file://~/preset.json
```

Contents of `preset.json`:

```
{
    "Name": "SimpleMP4",
    "Description": "MP4 output with H.264 video and AAC audio",
    "Settings": {
        "ContainerSettings": {
            "Container": "MP4"
        },
        "VideoDescription": {
            "CodecSettings": {
                "Codec": "H_264",
                "H264Settings": {
                    "RateControlMode": "QVBR",
                    "MaxBitrate": 5000000,
                    "SceneChangeDetect": "TRANSITION_DETECTION",
                    "QualityTuningLevel": "SINGLE_PASS"
                }
            }
        },
        "AudioDescriptions": [
            {
                "CodecSettings": {
                    "Codec": "AAC",
                    "AacSettings": {
                        "Bitrate": 96000,
                        "CodingMode": "CODING_MODE_2_0",
                        "SampleRate": 48000
                    }
                }
            }
        ]
    }
}
```

If you create your preset JSON file by using `get-preset` and then modifying the output file, ensure that you remove the following key-value pairs: `LastUpdated`, `Arn`, `Type`, and `CreatedAt`.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

Output:

```
{
    "Preset": {
        "Arn": "arn:aws:mediaconvert:region-name-1:123456789012:presets/SimpleMP4",
        "CreatedAt": "2024-04-01T17:22:05+00:00",
        "Description": "Creates basic MP4 file. No filtering or preprocessing.",
        "LastUpdated": "2024-04-01T17:22:05+00:00",
        "Name": "SimpleMP4",
        "Settings": {
            "ContainerSettings": {
                "Container": "MP4",
                "Mp4Settings": {
                    "CslgAtom": "INCLUDE",
                    "FreeSpaceBox": "EXCLUDE",
                    "MoovPlacement": "PROGRESSIVE_DOWNLOAD"
                }
            },
            "VideoDescription": {
                "CodecSettings": {
                    "Codec": "H_264",
                    "H264Settings": {
                        "Bitrate": 400000,
                        "CodecProfile": "MAIN",
                        "RateControlMode": "CBR"
                    }
                }
            },
            "AudioDescriptions": [
                {
                    "CodecSettings": {
                        "Codec": "AAC",
                        "AacSettings": {
                            "Bitrate": 96000,
                            "CodingMode": "CODING_MODE_2_0",
                            "SampleRate": 48000
                        }
                    }
                }
            ]
        },
```

```
        "Type": "CUSTOM"
    }
}
```

For more information, see Working with output presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreatePreset in *AWS CLI Command Reference*.

`create-queue`

The following code example shows how to use `create-queue`.

AWS CLI

To create a custom queue

The following `create-queue` example creates a custom transcoding queue.

```
aws mediaconvert create-queue \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --name Queue1 \
    --description "Keep this queue empty unless job is urgent."
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

Output:

```
{
    "Queue": {
        "Status": "ACTIVE",
        "Name": "Queue1",
        "LastUpdated": 1518034928,
        "Arn": "arn:aws:mediaconvert:region-name-1:123456789012:queues/Queue1",
        "Type": "CUSTOM",
        "CreatedAt": 1518034928,
        "Description": "Keep this queue empty unless job is urgent."
    }
}
```

For more information, see Working with queues in AWS Elemental MediaConvert in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreateQueue in *AWS CLI Command Reference*.

`delete-job-template`

The following code example shows how to use `delete-job-template`.

AWS CLI

To delete a job template

The following `delete-job-template` example deletes the specified custom job template.

```
aws mediaconvert delete-job-template \
    --name "DASH Streaming" \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-job-templates` to confirm that your template was deleted.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see DeleteJobTemplate in *AWS CLI Command Reference*.

`delete-preset`

The following code example shows how to use `delete-preset`.

AWS CLI

To delete a custom on-demand queue

The following `delete-preset` example deletes the specified custom preset.

```
aws mediaconvert delete-preset \
    --name SimpleMP4 \
    --endpoint-url  https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-presets` to confirm that your preset was deleted.

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see DeletePreset in *AWS CLI Command Reference*.

`delete-queue`

The following code example shows how to use `delete-queue`.

AWS CLI

To delete a custom on-demand queue

The following `delete-queue` example deletes the specified custom on-demand queue.

You can't delete your default queue. You can't delete a reserved queue that has an active pricing plan or that contains unprocessed jobs.

```
aws mediaconvert delete-queue \
    --name Customer1 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-queues` to confirm that your queue was deleted.

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see DeleteQueue in *AWS CLI Command Reference*.

`describe-endpoints`

The following code example shows how to use `describe-endpoints`.

AWS CLI

To get your account-specific endpoint

The following `describe-endpoints` example retrieves the endpoint that you need to send any other request to the service.

```
aws mediaconvert describe-endpoints
```

Output:

```
{
    "Endpoints": [
        {
            "Url": "https://abcd1234.mediaconvert.region-name-1.amazonaws.com"
        }
    ]
}
```

For more information, see Getting started with MediaConvert in the *AWS Elemental MediaConvert User Guide*.

- For API details, see DescribeEndpoints in *AWS CLI Command Reference*.

`get-job-template`

The following code example shows how to use `get-job-template`.

AWS CLI

To get details for a job template

The following `get-job-template` example displays the JSON definition of the specified custom job template.

```
aws mediaconvert get-job-template \
    --name "DASH Streaming" \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "JobTemplate": {
        "StatusUpdateInterval": "SECONDS_60",
        "LastUpdated": 1568652998,
        "Description": "Create a DASH streaming ABR stack",
        "CreatedAt": 1568652998,
        "Priority": 0,
        "Name": "DASH Streaming",
```

```
        "Settings": {
            "OutputGroups": [
                {
                    "Name": "DASH ISO",
                    "OutputGroupSettings": {
                        "Type": "DASH_ISO_GROUP_SETTINGS",
                        "DashIsoGroupSettings": {
                            "FragmentLength": 2,
                            "SegmentControl": "SEGMENTED_FILES",
                            "SegmentLength": 30
                        }
                    },
                    "Outputs": [
                        {
                            "NameModifier": "_1080p",
                            "ContainerSettings": {
                                "Container": "MPD"
                            },
                            "VideoDescription": {
                                "Width": 1920,
                                "Height": 1080,
                                "CodecSettings": {
                                    "Codec": "H_264",
                                    "H264Settings": {
                                        "MaxBitrate": 6000000,
                                        "RateControlMode": "QVBR"
                                    }
                                }
                            }
                        },
                        {
                            "NameModifier": "_720p",
                            "ContainerSettings": {
                                "Container": "MPD"
                            },
                            "VideoDescription": {
                                "Width": 1280,
                                "Height": 720,
                                "CodecSettings": {
                                    "Codec": "H_264",
                                    "H264Settings": {
                                        "MaxBitrate": 3500000,

                                            "SampleRate": 48000
                                        }
                                    }
                                }
                            ]
                        }
                    ]
                }
            ]
        },
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:jobTemplates/DASH
 Streaming",
        "Type": "CUSTOM"
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see GetJobTemplate in *AWS CLI Command Reference*.

`get-job`

The following code example shows how to use `get-job`.

AWS CLI

To get details for a particular job

The following `get-job` example requests the information for the job with ID `1234567890987-1ab2c3`, which in this example ended in an error.

```
aws mediaconvert get-job \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --id 1234567890987-1ab2c3
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns a JSON file with job information, including job settings, any returned errors, and other job data.

Output:

```
{
    "Job": {
        "Status": "ERROR",
        "Queue": "arn:aws:mediaconvert:region-name-1:123456789012:queues/Queue1",
        "Settings": {
            "Inputs": [
                {
                    "FileInput": "s3://amzn-s3-demo-bucket/file-name.mp4"
                }
            ],
            "OutputGroups": [
                {
                    "Name": "File Group",
                    "OutputGroupSettings": {
                        "Type": "FILE_GROUP_SETTINGS",
                        "FileGroupSettings": {
                            "Destination": "s3://amzn-s3-demo-bucket/output/"
                        }
                    },
                    "Outputs": [
                        {
                            "Extension": "mp4",
                            "NameModifier": "_720p",
                            "Preset": "System-
Generic_Hd_Mp4_Avc_Aac_16x9_Sdr_1280x720p_30Hz_5Mbps_Qvbr_Vq9"
                        }
                    ]
                }
```

```
            ]
        },
        "ErrorMessage": "Unable to open input file [s3://amzn-s3-demo-bucket/file-
name.mp4]: [Failed probe/open: [Failed to read data: AssumeRole failed]]",
        "ErrorCode": 1434,
        "Role": "arn:aws:iam::123456789012:role/MediaConvertServiceRole",
        "Arn": "arn:aws:mediaconvert:us-
west-2:123456789012:jobs/1234567890987-1ab2c3",
        "UserMetadata": {},
        "Timing": {
            "FinishTime": 1517442131,
            "SubmitTime": 1517442103,
            "StartTime": 1517442104
        },
        "Id": "1234567890987-1ab2c3",
        "CreatedAt": 1517442103
    }
}
```

For more information, see Working with jobs in the *AWS Elemental MediaConvert User Guide*.

- For API details, see GetJob in *AWS CLI Command Reference*.

`get-preset`

The following code example shows how to use `get-preset`.

AWS CLI

To get details for a particular preset

The following `get-preset` example requests the JSON definition of the specified custom preset.

```
aws mediaconvert get-preset \
    --name SimpleMP4 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Preset": {
        "Description": "Creates basic MP4 file. No filtering or preproccessing.",
```

```
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4",
        "LastUpdated": 1568843141,
        "Name": "SimpleMP4",
        "Settings": {
            "ContainerSettings": {
                "Mp4Settings": {
                    "FreeSpaceBox": "EXCLUDE",
                    "CslgAtom": "INCLUDE",
                    "MoovPlacement": "PROGRESSIVE_DOWNLOAD"
                },
                "Container": "MP4"
            },
            "AudioDescriptions": [
                {
                    "LanguageCodeControl": "FOLLOW_INPUT",
                    "AudioTypeControl": "FOLLOW_INPUT",
                    "CodecSettings": {
                        "AacSettings": {
                            "RawFormat": "NONE",
                            "CodecProfile": "LC",

`get-queue`

The following code example shows how to use `get-queue`.

AWS CLI

To get details for a queue

The following `get-queue` example retrieves the details of the specified custom queue.

```
aws mediaconvert get-queue \
    --name Customer1 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Queue": {
        "LastUpdated": 1526428502,
        "Type": "CUSTOM",
        "SubmittedJobsCount": 0,
        "Status": "ACTIVE",
        "PricingPlan": "ON_DEMAND",
        "CreatedAt": 1526428502,
        "ProgressingJobsCount": 0,
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/Customer1",
        "Name": "Customer1"
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see GetQueue in *AWS CLI Command Reference*.

`list-job-templates`

The following code example shows how to use `list-job-templates`.

AWS CLI

Example 1: To list your custom job templates

The following `list-job-templates` example lists all custom job templates in the current Region. To list the system job templates, see the next example.

```
aws mediaconvert list-job-templates \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "JobTemplates": [
        {
            "Description": "Create a DASH streaming ABR stack",

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListJobTemplates in *AWS CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

AWS CLI

To get details for all jobs in a region

The following `list-jobs` example requests the information for all of your jobs in the specified region.

```
aws mediaconvert list-jobs \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

Output:

```
{
    "Jobs": [
        {
            "AccelerationStatus": "NOT_APPLICABLE",
            "Arn": "arn:aws:mediaconvert:region-

`list-presets`

The following code example shows how to use `list-presets`.

AWS CLI

Example 1: To list your custom output presets

The following `list-presets` example lists your custom output presets. To list the system presets, see the next example.

```
aws mediaconvert list-presets \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Presets": [
        {
            "Name": "SimpleMP4",
            "CreatedAt": 1568841521,

```

Example 2: To list the system output presets

The following `list-presets` example lists the available MediaConvert system presets. To list your custom presets, see the previous example.

```
aws mediaconvert list-presets \
    --list-by SYSTEM \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Presets": [
        {
            "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/System-
Avc_16x9_1080p_29_97fps_8500kbps",
```

```

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListPresets in *AWS CLI Command Reference*.

`list-queues`

The following code example shows how to use `list-queues`.

AWS CLI

To list your queues

The following `list-queues` example lists all of your MediaConvert queues.

```
aws mediaconvert list-queues \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Queues": [
        {
            "PricingPlan": "ON_DEMAND",
            "Type": "SYSTEM",
            "Status": "ACTIVE",

}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListQueues in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags on a MediaConvert queue, job template, or output preset

The following `list-tags-for-resource` example lists the tags on the specified output preset.

```
aws mediaconvert list-tags-for-resource \
    --arn arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4 \
```

```
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "ResourceTags": {
        "Tags": {
            "customer": "zippyVideo"
        },
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4"
    }
}
```

For more information, see Tagging AWS Elemental MediaConvert Queues, Job Templates, and Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`update-job-template`

The following code example shows how to use `update-job-template`.

AWS CLI

To change a job template

The following `update-job-template` example replaces the JSON definition of the specified custom job template with the JSON definition in the provided file.

aws mediaconvert update-job-template --name File1 --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com --cli-input-json file://~/job-template-update.json

Contents of `job-template-update.json`:

```

The system returns the JSON payload that you send with your request, even when the request results in an error. Therefore, the JSON returned is not necessarily the new definition of the job template.

Because the JSON payload can be long, you might need to scroll up to see any error messages.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see UpdateJobTemplate in *AWS CLI Command Reference*.

`update-preset`

The following code example shows how to use `update-preset`.

AWS CLI

To change a preset

The following `update-preset` example replaces the description for the specified preset.

```
aws mediaconvert update-preset \
    --name Customer1 \
    --description "New description text." \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Preset": {
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4",
        "Settings": {
            "ContainerSettings": {
                "Container": "MP4",
                "Mp4Settings": {
                    "CslgAtom": "INCLUDE",
                    "FreeSpaceBox": "EXCLUDE",
                    "MoovPlacement": "PROGRESSIVE_DOWNLOAD"
                }
            },
```

```
            "VideoDescription": {
                "CodecSettings": {
                    "Codec": "H_264",
                    "H264Settings": {
                        "Bitrate": 400000,
                        "CodecProfile": "MAIN",
                        "RateControlMode": "CBR"
                    }
                }
            },
            "AudioDescriptions": [
                {
                    "CodecSettings": {
                        "Codec": "AAC",
                        "AacSettings": {
                            "Bitrate": 96000,

    }
}
```

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see UpdatePreset in *AWS CLI Command Reference*.

`update-queue`

The following code example shows how to use `update-queue`.

AWS CLI

To change a queue

The following `update-queue` example pauses the specified queue, by changing its status to PAUSED.

```
aws mediaconvert update-queue \
    --name Customer1 \
    --status PAUSED \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Queue": {
        "LastUpdated": 1568839845,
        "Status": "PAUSED",
        "ProgressingJobsCount": 0,
        "CreatedAt": 1526428516,
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/Customer1",
        "Name": "Customer1",
        "SubmittedJobsCount": 0,
        "PricingPlan": "ON_DEMAND",
        "Type": "CUSTOM"
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see UpdateQueue in *AWS CLI Command Reference*.

MediaLive examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaLive.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-channel`

The following code example shows how to use `create-channel`.

AWS CLI

To create a channel

The following `create-channel` example creates a channel by passing in a JSON file that contains the parameters that you want to specify.

The channel in this example ingests an HLS PULL input that connects to a source that contains video, audio, and embedded captions. The channel creates one HLS output group with an Akamai server as the destination. The output group contains two outputs: one for the H.265 video and AAC audio, and one for the Web-VTT captions, in English only.

The JSON for this example channel includes the minimum required parameters for a channel that uses an HLS PULL input and that produces an HLS output group with Akamai as the destination. The JSON contains these main sections:

`InputAttachments`, which specifies one source for the audio, and one source for the captions. It does not specify a video selector, which means that MediaLive extracts the first video it finds in the source.`Destinations`, which contains the two IP addresses (URLs) for the single output group in this channel. These addresses require passwords.`EncoderSettings`, which contains subsections.`AudioDescriptions`, which specifies that the channel contains one audio output asset, which uses the source from InputAttachments, and produces audio in AAC format.`CaptionDescriptions`, which specifies that the channel contains one captions output asset, which uses the source from InputAttachments, and produces captions in Web-VTT format.`VideoDescriptions`, which specifies that the channel contains one video output asset, with the specified resolution.`OutputGroups`, which specifies the output groups. In this example there is one group named `Akamai`. The connection is made using HLS PUT. The output group contains two outputs. One output is for the video asset (named `Video_high`) and the audio asset (named `Audio_EN`). One output is for the captions asset (named `WebVTT_EN`).

In this example, some of the parameters contain no value or contain nested empty parameters. For example, OutputSettings for the `Video_and_audio` output contains several nested

parameters that end at an empty parameter M3u8Settings. This parameter must be included, but you can omit one, several, or all its children, which means that the child will take its default value or be null.

All the parameters that apply to this example channel but that aren't specified in this file will either take the default value, be set to null, or take a unique value generated by MediaLive.

```
aws medialive create-channel \
    --cli-input-json file://channel-in-hls-out-hls-akamai.json
```

Contents of `channel-in-hls-out-hls-akamai.json`:

                                "NameModifier": "_2"
                            }
                        }
                    }
                ]
            }
```

```
        ],
        "TimecodeConfig": {
            "Source": "EMBEDDED"
        }
    }
}
```

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

ARN for the channel. The last part of the ARN is the unique channel ID.`EgressEndpoints` is blank in this example channel because it used only for PUSH inputs. When it applies it shows the addresses on MediaLive that content is pushed to.`OutputGroups`, `Outputs`. These show all the parameters for the output group and outputs, including those that you didn't include but that are relevant to this channel. The parameters might be empty (perhaps indicating the parameter or feature is disabled in this channel configuration) or might show the default value that will apply.`LogLevel` is set to the default (DISABLED).`Tags` is empty (the default for this parameter).`PipelinesRunningCount` and `State` show the current status of the channel.

Output:

```
{
    "Channel": {
        "Arn": "arn:aws:medialive:us-west-2:123456789012:channel/8765432",

    }
}
```

For more information, see Creating a Channel from Scratch in the *AWS Elemental MediaLive User Guide*.

- For API details, see CreateChannel in *AWS CLI Command Reference*.

`create-input`

The following code example shows how to use `create-input`.

AWS CLI

To create an input

The following `create-input` example creates an `HLS PULL` input by passing in a JSON file that contains the parameters that apply to this type of input. The JSON for this example input specifies two sources (addresses) to the input, in order to support redundancy in the ingest. These addresses require passwords.

```
aws medialive create-input \
    --cli-input-json file://input-hls-pull-news.json
```

Contents of `input-hls-pull-news.json`:

```
{
    "Name": "local_news",
    "RequestId": "cli000059",
    "Sources": [
        {
            "Url": "https://203.0.113.13/newschannel/anytownusa.m3u8",
            "Username": "examplecorp",
            "PasswordParam": "/medialive/examplecorp1"
        },
        {
            "Url": "https://198.51.100.54/fillervideos/oceanwaves.mp4",
            "Username": "examplecorp",
            "PasswordParam": "examplecorp2"
        }
    ],
    "Type": "URL_PULL"
}
```

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

`Arn` for the input. The last part of the ARN is the unique input ID.`Attached Channels`, which is always empty for a newly created input.`Destinations`, which is empty in this example because it is used only with a PUSH input.`Id` for the input, the same as the ID in the ARN.`MediaConnectFlows`, which is empty in this example because it is used only with an input of type MediaConnect.`SecurityGroups`, which is empty in this example because it is used only with a PUSH input.`State` of this input.`Tags`, which is empty (the default for this parameter).

Output:

```
{
    "Input": {
        "Arn": "arn:aws:medialive:us-west-2:123456789012:input/1234567",
        "AttachedChannels": [],
        "Destinations": [],
        "Id": "1234567",
        "InputClass": "STANDARD",
        "InputSourceType": "STATIC",
        "MediaConnectFlows": [],
        "Name": "local_news",
        "SecurityGroups": [],
        "Sources": [
            {
                "PasswordParam": "/medialive/examplecorp1",
                "Url": "https://203.0.113.13/newschannel/anytownusa.m3u8",
                "Username": "examplecorp"
            },
            {
                "PasswordParam": "examplecorp2",
                "Url": "https://198.51.100.54/fillervideos/oceanwaves.mp4",
                "Username": "examplecorp"
            }
        ],
        "State": "DETACHED",
        "Tags": {},
        "Type": "URL_PULL"
    }
}
```

For more information, see Creating an Input in the *AWS Elemental MediaLive User Guide*.

MediaPackage examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaPackage.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`create-channel`

The following code example shows how to use `create-channel`.

AWS CLI

To create a channel

The following `create-channel` example creates a channel named `sportschannel` in the current account.

```
aws mediapackage create-channel \
    --id sportschannel
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "6d345804ec3f46c9b454a91d4a80d0e0",
                "Password": "generatedwebdavpassword1",
                "Url": "https://f31c86aed53b815a.mediapackage.us-
west-2.amazonaws.com/in/
v2/6d345804ec3f46c9b454a91d4a80d0e0/6d345804ec3f46c9b454a91d4a80d0e0/channel",
                "Username": "generatedwebdavusername1"
            },
            {
                "Id": "2daa32878af24803b24183727211b8ff",
                "Password": "generatedwebdavpassword2",
```

```
                "Url": "https://6ebbe7e04c4b0afa.mediapackage.us-
west-2.amazonaws.com/in/
v2/6d345804ec3f46c9b454a91d4a80d0e0/2daa32878af24803b24183727211b8ff/channel",
                "Username": "generatedwebdavusername2"
            }
        ]
    },
    "Id": "sportschannel",
    "Tags": {
        "region": "west"
    }
}
```

For more information, see Creating a Channel in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreateChannel in *AWS CLI Command Reference*.

`create-origin-endpoint`

The following code example shows how to use `create-origin-endpoint`.

AWS CLI

To create an origin endpoint

The following `create-origin-endpoint` example creates an origin endpoint named `cmafsports` with the package settings provided in a JSON file and specified endpoint settings.

```
aws mediapackage create-origin-endpoint \
    --channel-id sportschannel \
    --id cmafsports \
    --cmaf-package file://file/path/cmafpkg.json \
    --description "cmaf output of sports" \
    --id cmaf_sports \
    --manifest-name sports_channel \
    --startover-window-seconds 300 \
    --tags region=west,media=sports \
    --time-delay-seconds 10
```

Contents of `cmafpkg.json`:

```
{
```

```
    "HlsManifests": [
        {
            "AdMarkers": "PASSTHROUGH",
            "Id": "cmaf_sports_endpoint",
            "IncludeIframeOnlyStream": true,
            "ManifestName": "index",
            "PlaylistType": "EVENT",
            "PlaylistWindowSeconds": 300,
            "ProgramDateTimeIntervalSeconds": 300
        }
    ],
    "SegmentDurationSeconds": 2,
    "SegmentPrefix": "sportschannel"
}
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
    "ChannelId": "sportschannel",
    "CmafPackage": {
        "HlsManifests": [
            {
                "AdMarkers": "PASSTHROUGH",
                "Id": "cmaf_sports_endpoint",
                "IncludeIframeOnlyStream": true,
                "ManifestName": "index",
                "PlaylistType": "EVENT",
                "PlaylistWindowSeconds": 300,
                "ProgramDateTimeIntervalSeconds": 300,
                "Url": "https://c4af3793bf76b33c.mediapackage.us-
west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/
index.m3u8"
            }
        ],
        "SegmentDurationSeconds": 2,
        "SegmentPrefix": "sportschannel"
    },
    "Description": "cmaf output of sports",
    "Id": "cmaf_sports",
    "ManifestName": "sports_channel",
    "StartoverWindowSeconds": 300,
```

```
    "Tags": {
        "region": "west",
        "media": "sports"
    },
    "TimeDelaySeconds": 10,
    "Url": "",
    "Whitelist": []
}
```

For more information, see Creating an Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreateOriginEndpoint in *AWS CLI Command Reference*.

`delete-channel`

The following code example shows how to use `delete-channel`.

AWS CLI

To delete a channel

The following `delete-channel` example deletes the channel named `test`.

```
aws mediapackage delete-channel \
    --id test
```

This command produces no output.

For more information, see Deleting a Channel in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeleteChannel in *AWS CLI Command Reference*.

`delete-origin-endpoint`

The following code example shows how to use `delete-origin-endpoint`.

AWS CLI

To delete an origin endpoint

The following `delete-origin-endpoint` example deletes the origin endpoint named `tester2`.

```
aws mediapackage delete-origin-endpoint \
    --id tester2
```

This command produces no output.

For more information, see Deleting an Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeleteOriginEndpoint in *AWS CLI Command Reference*.

`describe-channel`

The following code example shows how to use `describe-channel`.

AWS CLI

To describe a channel

The following `describe-channel` example displays all of the details of the channel named `test`.

```
aws mediapackage describe-channel \
    --id test
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/584797f1740548c389a273585dd22a63",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "584797f1740548c389a273585dd22a63",
                "Password": "webdavgeneratedpassword1",

            }
        ],
        "SegmentDurationSeconds": 2,
        "SegmentPrefix": "sportschannel"
    },
    "Id": "cmaf_sports",
    "ManifestName": "index",
    "StartoverWindowSeconds": 0,
    "Tags": {
        "region": "west",
        "media": "sports"
    },
    "TimeDelaySeconds": 0,
    "Url": "",
    "Whitelist": []
}
```

For more information, see Viewing a Single Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribeOriginEndpoint in *AWS CLI Command Reference*.

`list-channels`

The following code example shows how to use `list-channels`.

AWS CLI

To list all channels

The following `list-channels` example lists all of the channels that are configured on the current AWS account.

```
aws mediapackage list-channels
```

Output:

```
{
    "Channels": [
        {
            "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/584797f1740548c389a273585dd22a63",
            "HlsIngest": {
                "IngestEndpoints": [
                    {
                        "Id": "584797f1740548c389a273585dd22a63",
                        "Password": "webdavgeneratedpassword1",
                        "Url": "https://9be9c4405c474882.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
                        "Username": "webdavgeneratedusername1"
                    },
                    {
                        "Id": "7d187c8616fd455f88aaa5a9fcf74442",
                        "Password": "webdavgeneratedpassword2",
                        "Url": "https://7bf454c57220328d.mediapackage.us-

                        "Username": "webdavgeneratedusername2"
                    }
                ]
            },
            "Id": "test",
            "Tags": {}
        }
    ]
}
```

For more information, see Viewing Channel Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListChannels in *AWS CLI Command Reference*.

`list-origin-endpoints`

The following code example shows how to use `list-origin-endpoints`.

AWS CLI

To list all origin-endpoints on a channel

The following `list-origin-endpoints` example lists all of the origin endpoints that are configured on the channel named `test`.

```
aws mediapackage list-origin-endpoints \
    --channel-id test
```

Output:

```
{
    "OriginEndpoints": [
        {
            "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/247cff871f2845d3805129be22f2c0a2",
            "ChannelId": "test",
            "DashPackage": {
                "ManifestLayout": "FULL",

- For API details, see ListOriginEndpoints in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags assigned to a resource

The following `list-tags-for-resource` example lists the tags that are assigned to the specified resource.

```
aws mediapackage list-tags-for-resource \
```

```
    --resource-arn arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0
```

Output:

```
{
    "Tags": {
        "region": "west"
    }
}
```

For more information, see Tagging Resources in AWS Elemental MediaPackage in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`rotate-ingest-endpoint-credentials`

The following code example shows how to use `rotate-ingest-endpoint-credentials`.

AWS CLI

To rotate ingest credentials

The following `rotate-ingest-endpoint-credentials` example rotates the WebDAV username and password for the specified ingest endpoint.

```
aws mediapackage rotate-ingest-endpoint-credentials \
    --id test \
    --ingest-endpoint-id 584797f1740548c389a273585dd22a63
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/584797f1740548c389a273585dd22a63",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "584797f1740548c389a273585dd22a63",
```

```
                "Password": "webdavregeneratedpassword1",
                "Url": "https://9be9c4405c474882.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
                "Username": "webdavregeneratedusername1"
            },
            {
                "Id": "7d187c8616fd455f88aaa5a9fcf74442",
                "Password": "webdavgeneratedpassword2",
                "Url": "https://7bf454c57220328d.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/7d187c8616fd455f88aaa5a9fcf74442/channel",
                "Username": "webdavgeneratedusername2"
            }
        ]
    },
    "Id": "test",
    "Tags": {}
}
```

For more information, see Rotating Credentials on an Input URL in the *AWS Elemental MediaPackage User Guide*.

- For API details, see RotateIngestEndpointCredentials in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a resource

The following `tag-resource` example adds a `region=west` key and value pair to the specified resource.

```
aws mediapackage tag-resource \
    --resource-arn arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \
    --tags region=west
```

This command produces no output.

For more information, see Tagging Resources in AWS Elemental MediaPackage in the *AWS Elemental MediaPackage User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes the tag with the key `region` from the specified channel.

```
aws mediapackage untag-resource \
    --resource-arn arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \
    --tag-keys region
```

This command produces no output.

For more information, see Tagging Resources in AWS Elemental MediaPackage in the *AWS Elemental MediaPackage User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-channel`

The following code example shows how to use `update-channel`.

AWS CLI

To update a channel

The following `update-channel` example updates the channel named `sportschannel` to include the description `24x7 sports`.

```
aws mediapackage update-channel \
    --id sportschannel \
    --description "24x7 sports"
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",
    "Description": "24x7 sports",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "6d345804ec3f46c9b454a91d4a80d0e0",
                "Password": "generatedwebdavpassword1",

                "Username": "generatedwebdavusername2"
            }
        ]
    },
    "Id": "sportschannel",
    "Tags": {}
}
```

For more information, see Editing a Channel in the *AWS Elemental MediaPackage User Guide*.

- For API details, see UpdateChannel in *AWS CLI Command Reference*.

`update-origin-endpoint`

The following code example shows how to use `update-origin-endpoint`.

AWS CLI

To update an origin endpoint

The following `update-origin-endpoint` example updates the origin endpoint named `cmaf_sports`. It changes the time delay to `0` seconds.

```
aws mediapackage update-origin-endpoint \
    --id cmaf_sports \
    --time-delay-seconds 0
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
    "ChannelId": "sportschannel",
    "CmafPackage": {
        "HlsManifests": [
            {
                "AdMarkers": "NONE",
                "Id": "cmaf_sports_endpoint",
                "IncludeIframeOnlyStream": false,
                "PlaylistType": "EVENT",
                "PlaylistWindowSeconds": 60,
                "ProgramDateTimeIntervalSeconds": 0,
                "Url": "https://c4af3793bf76b33c.mediapackage.us-
west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/
index.m3u8"
            }
        ],
        "SegmentDurationSeconds": 2,
        "SegmentPrefix": "sportschannel"
    },
    "Id": "cmaf_sports",
    "ManifestName": "index",
    "StartoverWindowSeconds": 0,
    "Tags": {
        "region": "west",
        "media": "sports"
    },
    "TimeDelaySeconds": 0,
    "Url": "",
    "Whitelist": []
}
```

For more information, see Editing an Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see UpdateOriginEndpoint in *AWS CLI Command Reference*.

MediaPackage VOD examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaPackage VOD.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-asset`

The following code example shows how to use `create-asset`.

AWS CLI

To create an asset

The following `create-asset` example creates an asset named `Chicken_Asset` in the current AWS account. The asset ingests the file `30sec_chicken.smil` to MediaPackage.

```
aws mediapackage-vod create-asset \
    --id chicken_asset \
    --packaging-group-id hls_chicken_gp \
    --source-role-arn arn:aws:iam::123456789012:role/EMP_Vod \
    --source-arn arn:aws:s3::123456789012:video-bucket/A/30sec_chicken.smil
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:123456789012:assets/chicken_asset",
```

```
    "Id":"chicken_asset",
    "PackagingGroupId":"hls_chicken_gp",
    "SourceArn":"arn:aws:s3::123456789012:video-bucket/A/30sec_chicken.smil",
    "SourceRoleArn":"arn:aws:iam::123456789012:role/EMP_Vod",
    "EgressEndpoints":[
        {
            "PackagingConfigurationId":"New_config_1",
            "Url":"https://c75ea2668ab49d02bca7ae10ef31c59e.egress.mediapackage-
vod.us-west-2.amazonaws.com/out/
v1/6644b55df1744261ab3732a8e5cdaf07/904b06a58c7645e08d57d40d064216ac/
f5b2e633ff4942228095d164c10074f3/index.m3u8"
        },
        {
            "PackagingConfigurationId":"new_hls",
            "Url":" https://c75ea2668ab49d02bca7ae10ef31c59e.egress.mediapackage-
vod.us-west-2.amazonaws.com/out/v1/6644b55df1744261ab3732a8e5cdaf07/
fe8f1f00a80e424cb4f8da4095835e9e/7370ec57432343af816332356d2bd5c6/string.m3u8"
        }
    ]
}
```

For more information, see Ingest an Asset in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreateAsset in *AWS CLI Command Reference*.

`create-packaging-configuration`

The following code example shows how to use `create-packaging-configuration`.

AWS CLI

To create a packaging configuration

The following `create-packaging-configuration` example creates a packaging configuration named `new_hls` in the packaging group named `hls_chicken`. This example uses a file on disk named `hls_pc.json` to provide the details.

```
aws mediapackage-vod create-packaging-configuration \
    --id new_hls \
    --packaging-group-id hls_chicken \
    --hls-package file://hls_pc.json
```

Contents of `hls_pc.json`:

```
{
    "HlsManifests":[
        {
            "AdMarkers":"NONE",
            "IncludeIframeOnlyStream":false,
            "ManifestName":"string",
            "ProgramDateTimeIntervalSeconds":60,
            "RepeatExtXKey":true,
            "StreamSelection":{
                "MaxVideoBitsPerSecond":1000,
                "MinVideoBitsPerSecond":0,
                "StreamOrder":"ORIGINAL"
            }
        }
    ],
    "SegmentDurationSeconds":6,
    "UseAudioRenditionGroup":false
}
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:123456789012:packaging-configurations/
new_hls",
    "Id":"new_hls",
    "PackagingGroupId":"hls_chicken",
    "HlsPackage":{
        "SegmentDurationSeconds":6,
        "UseAudioRenditionGroup":false,
        "HlsManifests":[
            {
                "AdMarkers":"NONE",
                "IncludeIframeOnlyStream":false,
                "ManifestName":"string",
                "ProgramDateTimeIntervalSeconds":60,
                "RepeatExtXKey":true,
                "StreamSelection":{
                    "MaxVideoBitsPerSecond":1000,
                    "MinVideoBitsPerSecond":0,
                    "StreamOrder":"ORIGINAL"
                }
            }
        ]
```

```
    }
}
```

For more information, see Creating a Packaging Configuration in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreatePackagingConfiguration in *AWS CLI Command Reference*.

`create-packaging-group`

The following code example shows how to use `create-packaging-group`.

AWS CLI

To create a packaging group

The following `create-packaging-group` example lists all of the packaging groups that are configured in the current AWS account.

```
aws mediapackage-vod create-packaging-group \
    --id hls_chicken
```

Output:

```
{
    "Arn": "arn:aws:mediapackage-vod:us-west-2:123456789012:packaging-groups/
hls_chicken",
    "Id": "hls_chicken"
}
```

For more information, see Creating a Packaging Group in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreatePackagingGroup in *AWS CLI Command Reference*.

`delete-asset`

The following code example shows how to use `delete-asset`.

AWS CLI

To delete an asset

The following `delete-asset` example deletes the asset named `30sec_chicken`.

```
aws mediapackage-vod delete-asset \
    --id 30sec_chicken
```

This command produces no output.

For more information, see Deleting an Asset in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeleteAsset in *AWS CLI Command Reference*.

`delete-packaging-configuration`

The following code example shows how to use `delete-packaging-configuration`.

AWS CLI

To delete a packaging configuration

The following `delete-packaging-configuration` example deletes the packaging configuration named `CMAF`.

```
aws mediapackage-vod delete-packaging-configuration \
    --id CMAF
```

This command produces no output.

For more information, see Deleting a Packaging Configuration in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeletePackagingConfiguration in *AWS CLI Command Reference*.

`delete-packaging-group`

The following code example shows how to use `delete-packaging-group`.

AWS CLI

To delete a packaging group

The following `delete-packaging-group` example deletes the packaging group named `Dash_widevine`.

```
aws mediapackage-vod delete-packaging-group \
    --id Dash_widevine
```

This command produces no output.

For more information, see Deleting a Packaging Group in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeletePackagingGroup in *AWS CLI Command Reference*.

`describe-asset`

The following code example shows how to use `describe-asset`.

AWS CLI

To describe an asset

The following `describe-asset` example displays all of the details of the asset named `30sec_chicken`.

```
aws mediapackage-vod describe-asset \
    --id 30sec_chicken
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:123456789012:assets/30sec_chicken",
    "Id":"30sec_chicken",
    "PackagingGroupId":"Packaging_group_1",
    "SourceArn":"arn:aws:s3::123456789012:video-bucket/A/30sec_chicken.smil",
    "SourceRoleArn":"arn:aws:iam::123456789012:role/EMP_Vod",
    "EgressEndpoints":[
        {
            "PackagingConfigurationId":"DASH",
            "Url":"https://a5f46a44118ba3e3724ef39ef532e701.egress.mediapackage-

index.m3u8"
        }
    ]
}
```

For more information, see Viewing Asset Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribeAsset in *AWS CLI Command Reference*.

`describe-packaging-configuration`

The following code example shows how to use `describe-packaging-configuration`.

AWS CLI

To describe a packaging configuration

The following `describe-packaging-configuration` example displays all of the details of the packaging configuration named DASH.

```
aws mediapackage-vod describe-packaging-configuration \
    --id DASH
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:123456789012:packaging-configurations/
DASH",
    "Id":"DASH",
    "PackagingGroupId":"Packaging_group_1",
    "DashPackage":{
```

```
        "SegmentDurationSeconds":2,
        "DashManifests":[
            {
                "ManifestName":"index",
                "MinBufferTimeSeconds":30,
                "Profile":"NONE"
            }
        ]
    }
}
```

For more information, see Viewing Packaging Configuration Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribePackagingConfiguration in *AWS CLI Command Reference*.

`describe-packaging-group`

The following code example shows how to use `describe-packaging-group`.

AWS CLI

To describe a packaging group

The following `describe-packaging-group` example displays all of the details of the packaging group named `Packaging_group_1`.

```
aws mediapackage-vod describe-packaging-group \
    --id Packaging_group_1
```

Output:

```
{
    "Arn": "arn:aws:mediapackage-vod:us-west-2:123456789012:packaging-groups/
Packaging_group_1",
    "Id": "Packaging_group_1"
}
```

For more information, see Viewing Packaging Group Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribePackagingGroup in *AWS CLI Command Reference*.

`list-assets`

The following code example shows how to use `list-assets`.

AWS CLI

To list all assets

The following `list-assets` example lists all of the assets that are configured in the current AWS account.

```
aws mediapackage-vod list-assets
```

Output:

```
{
    "Assets": [
        {
            "Arn": "arn:aws:mediapackage-vod:us-
west-2:123456789012:assets/30sec_chicken",
            "Id": "30sec_chicken",
            "PackagingGroupId": "Packaging_group_1",
            "SourceArn": "arn:aws:s3::123456789012:video-bucket/
A/30sec_chicken.smil",
            "SourceRoleArn": "arn:aws:iam::123456789012:role/EMP_Vod"
        }
    ]
}
```

For more information, see Viewing Asset Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListAssets in *AWS CLI Command Reference*.

`list-packaging-configurations`

The following code example shows how to use `list-packaging-configurations`.

AWS CLI

To list all packaging configurations

The following `list-packaging-configurations` example lists all of the packaging configurations that are configured on the packaging group named `Packaging_group_1`.

```
aws mediapackage-vod list-packaging-configurations \
    --packaging-group-id Packaging_group_1
```

Output:

```
{
    "PackagingConfigurations":[
        {
            "Arn":"arn:aws:mediapackage-vod:us-west-2:123456789012:packaging-
configurations/CMAF",
            "Id":"CMAF",
            "PackagingGroupId":"Packaging_group_1",
            "CmafPackage":{

```
                    }
                ]
            }
        }
    ]
}
```

For more information, see Viewing Packaging Configuration Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListPackagingConfigurations in *AWS CLI Command Reference*.

`list-packaging-groups`

The following code example shows how to use `list-packaging-groups`.

AWS CLI

To list all packaging groups

The following `list-packaging-groups` example lists all of the packaging groups that are configured in the current AWS account.

```
aws mediapackage-vod list-packaging-groups
```

Output:

```
{
    "PackagingGroups": [
        {
            "Arn": "arn:aws:mediapackage-vod:us-west-2:123456789012:packaging-
groups/Dash_widevine",
            "Id": "Dash_widevine"
        },
        {
            "Arn": "arn:aws:mediapackage-vod:us-west-2:123456789012:packaging-
groups/Encrypted_HLS",
            "Id": "Encrypted_HLS"
        },
        {
            "Arn": "arn:aws:mediapackage-vod:us-west-2:123456789012:packaging-
groups/Packaging_group_1",
            "Id": "Packaging_group_1"
```

```
        }
    ]
}
```

For more information, see Viewing Packaging Group Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListPackagingGroups in *AWS CLI Command Reference*.

MediaStore Data Plane examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore Data Plane.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-object`

The following code example shows how to use `delete-object`.

AWS CLI

To delete an object

The following `delete-object` example deletes the specified object.

```
aws mediastore-data delete-object \
    --endpoint-url=https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path=/folder_name/README.md
```

This command produces no output.

- For API details, see DeleteObject in *AWS CLI Command Reference*.

`describe-object`

The following code example shows how to use `describe-object`.

AWS CLI

To view the headers for an object

The following `describe-object` example displays the headers for an object at the specified path.

```
aws mediastore-data describe-object \
    --endpoint-url https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball/setup.jpg
```

Output:

```
{
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",
    "ContentType": "image/jpeg",
    "ContentLength": 3860266,
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f55555a555555da6d3"
}
```

- For API details, see DescribeObject in *AWS CLI Command Reference*.

`get-object`

The following code example shows how to use `get-object`.

AWS CLI

Example 1: To download an entire object

The following `get-object` example downloads the specified object.

```
aws mediastore-data get-object \
    --endpoint-url https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball/setup.jpg setup.jpg
```

Output:

```
{
    "ContentType": "image/jpeg",
    "StatusCode": 200,
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f55555a555555da6d3",
    "ContentLength": 3860266,
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT"
}
```

Example 2: To download part of an object

The following `get-object` example downloads the specified part of an object.

```
aws mediastore-data get-object \
    --endpoint-url https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball/setup.jpg setup.jpg \
    --range "bytes=0-100"
```

Output:

```
{
    "StatusCode": 206,
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",
    "ContentType": "image/jpeg",
    "ContentRange": "bytes 0-100/3860266",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f55555a555555da6d3",
    "ContentLength": 101
}
```

- For API details, see GetObject in *AWS CLI Command Reference*.

`list-items`

The following code example shows how to use `list-items`.

AWS CLI

Example 1: To view a list of items (objects and folders) stored in a container

The following `list-items` example displays a list of items (objects and folders) stored in the specified container.

```
aws mediastore-data list-items \
```

```
    --endpoint-url https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```
{
    "Items": [
        {
            "Type": "OBJECT",
            "ContentLength": 3784,
            "Name": "setup.jpg",
            "ETag":
 "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f55555a555555da6d3",
            "ContentType": "image/jpeg",
            "LastModified": 1563571859.379
        },
        {
            "Type": "FOLDER",
            "Name": "events"
        }
    ]
}
```

Example 2: To view a list of items (objects and folders) stored in a folder

The following `list-items` example displays a list of items (objects and folders) stored in the specified folder.

```
aws mediastore-data list-items \
    --endpoint-url https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball
```

Output:

```
{
    "Items": [
        {
            "ETag":
 "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f55555a555555da6d3",
            "ContentType": "image/jpeg",
            "Type": "OBJECT",
            "ContentLength": 3860266,
            "LastModified": 1563573031.872,
```

```
            "Name": "setup.jpg"
        }
    ]
}
```

- For API details, see ListItems in *AWS CLI Command Reference*.

`put-object`

The following code example shows how to use `put-object`.

AWS CLI

Example 1: To upload an object to a container

The following `put-object` example upload an object to the specified container.

```
aws mediastore-data put-object \
    --endpoint-url https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --body ReadMe.md \
    --path ReadMe.md \
    --cache-control "max-age=6, public" \
    --content-type binary/octet-stream
```

Output:

```
{
    "ContentSHA256":
 "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
    "StorageClass": "TEMPORAL",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f55555a555555da6d3"
}
```

Example 2: To upload an object to a folder within a container

The following `put-object` example upload an object to the specified folder within a container.

```
aws mediastore-data put-object \
    --endpoint-url https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --body ReadMe.md \
    --path /september-events/ReadMe.md \
    --cache-control "max-age=6, public" \
```

```
    --content-type binary/octet-stream
```

Output:

```
{
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f55555a555555da6d3",
    "ContentSHA256":
 "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
    "StorageClass": "TEMPORAL"
}
```

- For API details, see PutObject in *AWS CLI Command Reference*.

MediaTailor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaTailor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-playback-configuration`

The following code example shows how to use `delete-playback-configuration`.

AWS CLI

To delete a configuration

The following `delete-playback-configuration` example deletes a configuration named `campaign_short`.

```
aws mediatailor delete-playback-configuration \
```

```
    --name campaign_short
```

This command produces no output.

For more information, see Deleting a Configuration in the *AWS Elemental MediaTailor User Guide*.

- For API details, see DeletePlaybackConfiguration in *AWS CLI Command Reference*.

`get-playback-configuration`

The following code example shows how to use `get-playback-configuration`.

AWS CLI

To describe a configuration

The following `get-playback-configuration` example displays all of the details of the configuration named `west_campaign`.

```
aws mediatailor get-playback-configuration \
    --name west_campaign
```

Output:

```
{
    "AdDecisionServerUrl": "http://your.ads.url",

`put-playback-configuration`

The following code example shows how to use `put-playback-configuration`.

AWS CLI

To create a configuration

The following `put-playback-configuration` example creates a configuration named `campaign_short`.

```
aws mediatailor put-playback-configuration \
    --name campaign_short \
    --ad-decision-server-url http://your.ads.url \
    --video-content-source-url http://video.bucket/index.m3u8
```

Output:

```
{
    "AdDecisionServerUrl": "http://your.ads.url",
    "CdnConfiguration": {},
    "DashConfiguration": {
        "ManifestEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/
dash/1cbfeaaecb69778e0c167d0505a2bc57da2b1754/campaign_short/",
        "MpdLocation": "EMT_DEFAULT",
        "OriginManifestType": "MULTI_PERIOD"
    },
    "HlsConfiguration": {
        "ManifestEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/
master/1cbfeaaecb69778e0c167d0505a2bc57da2b1754/campaign_short/"
    },
```

```
    "Name": "campaign_short",
    "PlaybackConfigurationArn": "arn:aws:mediatailor:us-
west-2:123456789012:playbackConfiguration/campaign_short",
    "PlaybackEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com",
    "SessionInitializationEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/
session/1cbfeaaecb69778e0c167d0505a2bc57da2b1754/campaign_short/",
    "Tags": {},
    "VideoContentSourceUrl": "http://video.bucket/index.m3u8"
}
```

For more information, see Creating a Configuration in the *AWS Elemental MediaTailor User Guide*.

- For API details, see PutPlaybackConfiguration in *AWS CLI Command Reference*.

MemoryDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MemoryDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`copy-snapshot`

The following code example shows how to use `copy-snapshot`.

AWS CLI

To copy a snapshot

The following `copy-snapshot` example creates a copy of a snapshot.

```
aws memorydb copy-snapshot \
    --source-snapshot-name my-cluster-snapshot \
    --target-snapshot-name my-cluster-snapshot-copy
```

Output:

```
{
    "Snapshot": {
        "Name": "my-cluster-snapshot-copy",
        "Status": "creating",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:snapshot/my-cluster-
snapshot-copy",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": " ",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-xx2574fc",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
        }
    }
}
```

For more information, see Copying a snapshot in the *MemoryDB User Guide*.

- For API details, see CopySnapshot in *AWS CLI Command Reference*.

`create-acl`

The following code example shows how to use `create-acl`.

AWS CLI

To create an ACL

The following `create-acl` example creates a new Access control list.

```
aws memorydb create-acl \
    --acl-name "new-acl-1" \
    --user-names "my-user"
```

Output:

```
{
    "ACL": {
        "Name": "new-acl-1",
        "Status": "creating",
        "UserNames": [
            "my-user"
        ],
        "MinimumEngineVersion": "6.2",
        "Clusters": [],
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:acl/new-acl-1"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see CreateAcl in *AWS CLI Command Reference*.

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

To create a cluster

The following `create-cluster` example creates a new cluster.

```
aws memorydb create-cluster \
    --cluster-name my-new-cluster \
    --node-type db.r6g.large \
    --acl-name my-acl \
    --subnet-group-name my-sg
```

Output:

```
{
    "Cluster": {
        "Name": "my-new-cluster",
        "Status": "creating",
        "NumberOfShards": 1,
        "AvailabilityMode": "MultiAZ",
        "ClusterEndpoint": {
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SubnetGroupName": "my-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-west-2:49165xxxxxx:cluster/my-new-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "sat:10:00-sat:11:00",
        "SnapshotWindow": "07:30-08:30",
        "ACLName": "my-acl",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Managing Clusters in the *MemoryDB User Guide*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

`create-parameter-group`

The following code example shows how to use `create-parameter-group`.

AWS CLI

To create a parameter group

The following `create-parameter-group` example creates a parameter group.

```
aws memorydb create-parameter-group \
    --parameter-group-name myRedis6x \
```

```
    --family memorydb_redis6 \
    --description "my-parameter-group"
```

Output:

```
{
    "ParameterGroup": {
        "Name": "myredis6x",
        "Family": "memorydb_redis6",
        "Description": "my-parameter-group",
        "ARN": "arn:aws:memorydb:us-west-2:49165xxxxxx:parametergroup/myredis6x"
    }
}
```

For more information, see Creating a parameter group in the *MemoryDB User Guide*.

- For API details, see CreateParameterGroup in *AWS CLI Command Reference*.

`create-snapshot`

The following code example shows how to use `create-snapshot`.

AWS CLI

To create a snapshot

The following `create-snapshot` example creates a snapshot.

```
aws memorydb create-snapshot \
    --cluster-name my-cluster \
    --snapshot-name my-cluster-snapshot
```

Output:

```
{
    "Snapshot": {
        "Name": "my-cluster-snapshot1",
        "Status": "creating",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-west-2:49165xxxxxx:snapshot/my-cluster-
snapshot",
        "ClusterConfiguration": {
```

```
            "Name": "my-cluster",
            "Description": "",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-862xxxxc",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
        }
    }
}
```

For more information, see Making manual snapshots in the *MemoryDB User Guide*.

- For API details, see CreateSnapshot in *AWS CLI Command Reference*.

`create-subnet-group`

The following code example shows how to use `create-subnet-group`.

AWS CLI

To create a subnet group

The following `create-subnet-group` example creates a subnet group.

```
aws memorydb create-subnet-group \
    --subnet-group-name mysubnetgroup \
    --description "my subnet group" \
    --subnet-ids subnet-5623xxxx
```

Output:

```
{
    "SubnetGroup": {
        "Name": "mysubnetgroup",
        "Description": "my subnet group",
        "VpcId": "vpc-86257xxx",
```

```
        "Subnets": [
            {
                "Identifier": "subnet-5623xxxx",
                "AvailabilityZone": {
                    "Name": "us-west-2a"
                }
            }
        ],
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:subnetgroup/mysubnetgroup"
    }
}
```

For more information, see Creating a subnet group in the *MemoryDB User Guide*.

- For API details, see CreateSubnetGroup in *AWS CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

To creat a user

The following `create-user` example creates a new user.

```
aws memorydb create-user \
    --user-name user-name-1 \
    --access-string "~objects:* ~items:* ~public:*" \
    --authentication-mode Passwords="enterapasswordhere",Type=password
```

Output:

```
{
    "User": {
        "Name": "user-name-1",
        "Status": "active",
        "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
        "ACLNames": [],
        "MinimumEngineVersion": "6.2",
        "Authentication": {
            "Type": "password",
            "PasswordCount": 1
```

```
        },
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:user/user-name-1"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

`delete-acl`

The following code example shows how to use `delete-acl`.

AWS CLI

To delete an ACL

The following `delete-acl` example deletes an Access control list.

```
aws memorydb delete-acl \
    --acl-name "new-acl-1"
```

Output:

```
{
    "ACL": {
        "Name": "new-acl-1",
        "Status": "deleting",
        "UserNames": [
            "pat"
        ],
        "MinimumEngineVersion": "6.2",
        "Clusters": [],
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:acl/new-acl-1"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DeleteAcl in *AWS CLI Command Reference*.

`delete-cluster`

The following code example shows how to use `delete-cluster`.

AWS CLI

To delete a cluster

The following `delete-cluster` example deletes a cluster.

```
aws memorydb delete-cluster \
    --cluster-name my-new-cluster
```

Output:

```
{
    "Cluster": {
        "Name": "my-new-cluster",
        "Status": "deleting",
        "NumberOfShards": 1,
        "ClusterEndpoint": {
            "Address": "clustercfg.my-new-cluster.xxxxx.memorydb.us-
west-2.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SubnetGroupName": "my-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:cluster/my-new-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "sat:10:00-sat:11:00",
        "SnapshotWindow": "07:30-08:30",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Getting started with MemoryDB in the *MemoryDB User Guide*.

- For API details, see DeleteCluster in *AWS CLI Command Reference*.

`delete-parameter-group`

The following code example shows how to use `delete-parameter-group`.

AWS CLI

To delete a parameter group

The following `delete-parameter-group` example deletes a parameter group.

```
aws memorydb delete-parameter-group \
    --parameter-group-name myRedis6x
```

Output:

```
{
    "ParameterGroup": {
        "Name": "myredis6x",
        "Family": "memorydb_redis6",
        "Description": "my-parameter-group",
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:parametergroup/myredis6x"
    }
}
```

For more information, see Deleting a parameter group in the *MemoryDB User Guide*.

- For API details, see DeleteParameterGroup in *AWS CLI Command Reference*.

`delete-snapshot`

The following code example shows how to use `delete-snapshot`.

AWS CLI

To delete a snapshot

The following `delete-snapshot` example deletes a snapshot.

```
aws memorydb delete-snapshot \
    --snapshot-name my-cluster-snapshot
```

Output:

```
{
    "Snapshot": {
        "Name": "my-cluster-snapshot",
        "Status": "deleting",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-west-2:49165xxxxxx:snapshot/my-cluster-
snapshot",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": "",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-862xxxxc",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
        }
    }
}
```

For more information, see Deleting a snapshot in the *MemoryDB User Guide*.

- For API details, see DeleteSnapshot in *AWS CLI Command Reference*.

`delete-subnet-group`

The following code example shows how to use `delete-subnet-group`.

AWS CLI

To delete a subnet group

The following `delete-subnet-group` example deletes a subnet.

```
aws memorydb delete-subnet-group \
    --subnet-group-name mysubnetgroup
```

Output:

```
{
    "SubnetGroup": {
        "Name": "mysubnetgroup",
        "Description": "my subnet group",
        "VpcId": "vpc-86xxxx4fc",
        "Subnets": [
            {
                "Identifier": "subnet-56xxx61b",
                "AvailabilityZone": {
                    "Name": "us-west-2a"
                }
            }
        ],
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:subnetgroup/mysubnetgroup"
    }
}
```

For more information, see Deleting a subnet group in the *MemoryDB User Guide*.

- For API details, see DeleteSubnetGroup in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes a user.

```
aws memorydb delete-user \
    --user-name my-user
```

Output:

```
{
    "User": {
        "Name": "my-user",
        "Status": "deleting",
        "AccessString": "on ~app::* resetchannels -@all +@read",
        "ACLNames": [
```

```
            "my-acl"
        ],
        "MinimumEngineVersion": "6.2",
        "Authentication": {
            "Type": "password",
            "PasswordCount": 1
        },
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:user/my-user"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`describe-acls`

The following code example shows how to use `describe-acls`.

AWS CLI

To return a list of ACLs

The following `describe-acls` example returns a list of ACLs.

```
aws memorydb describe-acls
```

Output:

```
{
    "ACLs": [
        {
            "Name": "open-access",
            "Status": "active",
            "UserNames": [
                "default"
            ],
            "MinimumEngineVersion": "6.2",
            "Clusters": [],
            "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:acl/open-access"
        },
        {
```

```
            "Name": "my-acl",
            "Status": "active",
            "UserNames": [],
            "MinimumEngineVersion": "6.2",
            "Clusters": [
                "my-cluster"
            ],
            "ARN": "arn:aws:memorydb:us-west-2:49165xxxxxxx:acl/my-acl"
        }
    ]
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DescribeAcls in *AWS CLI Command Reference*.

`describe-clusters`

The following code example shows how to use `describe-clusters`.

AWS CLI

To return a list of clusters

The following `describe-clusters` example returns a list of clusters.

```
aws memorydb describe-clusters
```

Output:

```
{
    "Clusters": [
        {
                "Name": "my-cluster",
                "Status": "available",
                "NumberOfShards": 2,
                "ClusterEndpoint": {
                    "Address": "clustercfg.my-cluster.llru6f.memorydb.us-
west-2.amazonaws.com",
                    "Port": 6379
                },
                "NodeType": "db.r6g.large",
```

```
                "EngineVersion": "6.2",
                "EnginePatchVersion": "6.2.6",
                "ParameterGroupName": "default.memorydb-redis6",
                "ParameterGroupStatus": "in-sync",
                "SecurityGroups": [
                    {
                        "SecurityGroupId": "sg-0a1434xxxxxc9fae",
                        "Status": "active"
                    }
                ],
                "SubnetGroupName": "pat-sg",
                "TLSEnabled": true,
                "ARN": "arn:aws:memorydb:us-west-2:49165xxxxxx:cluster/my-cluster",

- For API details, see DescribeClusters in *AWS CLI Command Reference*.

`describe-engine-versions`

The following code example shows how to use `describe-engine-versions`.

AWS CLI

To return a list of engine versions

The following `describe-engine-versions` example returns a list of engine versions.

```
aws memorydb describe-engine-versions
```

Output:

```
{
    "EngineVersions": [
        {
```

```
            "EngineVersion": "6.2",
            "EnginePatchVersion": "6.2.6",
            "ParameterGroupFamily": "memorydb_redis6"
        }
    ]
}
```

For more information, see Engine versions in the *MemoryDB User Guide*.

- For API details, see DescribeEngineVersions in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To return a list of events

The following `describe-events` example returns a list of events.

```
aws memorydb describe-events
```

Output:

```
{
    "Events": [
        {
            "SourceName": "my-cluster",
            "SourceType": "cluster",
            "Message": "Increase replica count started for replication group my-
cluster on 2022-07-22T14:09:01.440Z",
            "Date": "2022-07-22T07:09:01.443000-07:00"
        },
        {
            "SourceName": "my-user",
            "SourceType": "user",
            "Message": "Create user my-user operation completed.",
            "Date": "2022-07-22T07:00:02.975000-07:00"
        }
    ]
}
```

For more information, see Monitoring events in the *MemoryDB User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-parameter-groups`

The following code example shows how to use `describe-parameter-groups`.

AWS CLI

To return a list of parameter groups

The following `describe-parameter-groups` example returns a list of parameter groups.

```
aws memorydb describe-parameter-groups
```

Output:

```
{
    "ParameterGroups": [
        {
            "Name": "default.memorydb-redis6",
            "Family": "memorydb_redis6",
            "Description": "Default parameter group for memorydb_redis6",
            "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:parametergroup/
default.memorydb-redis6"
        }
    ]
}
```

For more information, see Configuring engine parameters using parameter groups in the *MemoryDB User Guide*.

- For API details, see DescribeParameterGroups in *AWS CLI Command Reference*.

`describe-parameters`

The following code example shows how to use `describe-parameters`.

AWS CLI

To return a list of parameters

The following `describe-parameters` example returns a list of parameters.

```
aws memorydb describe-parameters \
    --parameter-group-name default.memorydb-redis6
```

Output:

```
{
    "Parameters": [
        {
            "Name": "acllog-max-len",
            "Value": "128",

        }
    ]
}
```

For more information, see Configuring engine parameters using parameter groups in the *MemoryDB User Guide*.

- For API details, see DescribeParameters in *AWS CLI Command Reference*.

`describe-snapshots`

The following code example shows how to use `describe-snapshots`.

AWS CLI

To return a list of snapshots

The following `describe-snapshots` example returns a list of snapshots.

```
aws memorydb describe-snapshots
```

Output:

```
{
    "Snapshots": [
        {
            "Name": "my-cluster-snapshot",
            "Status": "available",
            "Source": "manual",
            "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx2:snapshot/my-cluster-
snapshot",
            "ClusterConfiguration": {
                "Name": "my-cluster",
                "Description": " ",
                "NodeType": "db.r6g.large",
                "EngineVersion": "6.2",
                "MaintenanceWindow": "wed:03:00-wed:04:00",
                "Port": 6379,
                "ParameterGroupName": "default.memorydb-redis6",
                "SubnetGroupName": "my-sg",
                "VpcId": "vpc-862574fc",
                "SnapshotRetentionLimit": 0,
                "SnapshotWindow": "04:30-05:30",
                "NumShards": 2
            }
        }
    ]
}
```

For more information, see Snapshot and restore in the *MemoryDB User Guide*.

- For API details, see DescribeSnapshots in *AWS CLI Command Reference*.

`describe-subnet-groups`

The following code example shows how to use `describe-subnet-groups`.

AWS CLI

To return a list of subnet groups

The following `describe-subnet-groups` example returns a list of subnet groups.

```
aws memorydb describe-subnet-groups
```

Output:

```
{
    "SubnetGroups": [
        {
            "Name": "my-sg",
            "Description": "pat-sg",
            "VpcId": "vpc-86xxx4fc",
            "Subnets": [
                {
                    "Identifier": "subnet-faxx84a6",
                    "AvailabilityZone": {
                        "Name": "us-west-2b"
                    }
                },
                {
                    "Identifier": "subnet-56xxf61b",
                    "AvailabilityZone": {
                        "Name": "us-west-2a"
                    }
                }
            ],
            "ARN": "arn:aws:memorydb:us-west-2:49165xxxxxx:subnetgroup/my-sg"
        }
    ]
}
```

For more information, see Subnets and subnet groups in the *MemoryDB User Guide*.

- For API details, see DescribeSubnetGroups in *AWS CLI Command Reference*.

`describe-users`

The following code example shows how to use `describe-users`.

AWS CLI

To return a list of users

The following `describe-users` example returns a list of users.

```
aws memorydb describe-users
```

Output:

```
{
    "Users": [
        {
            "Name": "default",
            "Status": "active",
            "AccessString": "on ~* &* +@all",
            "ACLNames": [
                "open-access"
            ],
            "MinimumEngineVersion": "6.0",
            "Authentication": {
                "Type": "no-password"
            },
            "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:user/default"
        },
        {
            "Name": "my-user",
            "Status": "active",
            "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
            "ACLNames": [],
            "MinimumEngineVersion": "6.2",
            "Authentication": {
                "Type": "password",
                "PasswordCount": 2
            },
            "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:user/my-user"
        }
    ]
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DescribeUsers in *AWS CLI Command Reference*.

`failover-shard`

The following code example shows how to use `failover-shard`.

AWS CLI

To fail over a shard

The following `failover-shard` example fails over a shard.

```
aws memorydb failover-shard \
    --cluster-name my-cluster \
    --shard-name 0001
```

Output:

```
{
    "Cluster": {
        "Name": "my-cluster",
        "Status": "available",
        "NumberOfShards": 2,
        "ClusterEndpoint": {
            "Address": "clustercfg.my-cluster.xxxxxx.memorydb.us-
west-2.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-0a143xxxx45c9fae",
                "Status": "active"
            }
        ],
        "SubnetGroupName": "my-sg",
```

```
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:cluster/my-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "wed:03:00-wed:04:00",
        "SnapshotWindow": "04:30-05:30",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Minimizing downtime with MultiAZ in the *MemoryDB User Guide*.

- For API details, see FailoverShard in *AWS CLI Command Reference*.

`list-allowed-node-type-updates`

The following code example shows how to use `list-allowed-node-type-updates`.

AWS CLI

To return a list of allowed node type updates

The following `list-allowed-node-type-updates` example returns a list of available node type updates.

```
aws memorydb list-allowed-node-type-updates \
    --cluster-name my-cluster
```

Output:

```
{
    "ScaleUpNodeTypes": [
        "db.r6g.xlarge",
        "db.r6g.2xlarge",
        "db.r6g.4xlarge"
    ],
    "ScaleDownNodeTypes": [
        "db.t4g.medium"
    ]
}
```

For more information, see Scaling in the *MemoryDB User Guide*.

- For API details, see ListAllowedNodeTypeUpdates in *AWS CLI Command Reference*.

`list-tags`

The following code example shows how to use `list-tags`.

AWS CLI

To return a list of tags

The following `list-tags` example returns a list of tags.

```
aws memorydb list-tags \
    --resource-arn arn:aws:memorydb:us-west-2:491658xxxxxx:cluster/my-cluster
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the *MemoryDB User Guide*.

- For API details, see ListTags in *AWS CLI Command Reference*.

`reset-parameter-group`

The following code example shows how to use `reset-parameter-group`.

AWS CLI

To reset a parameter group

The following `reset-parameter-group` example resets a parameter group.

```
aws memorydb reset-parameter-group \
    --parameter-group-name my-parameter-group \
```

```
    --all-parameters
```

Output:

```
{
    "ParameterGroup": {
        "Name": "my-parameter-group",
        "Family": "memorydb_redis6",
        "Description": "my parameter group",
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:parametergroup/my-parameter-
group"
    }
}
```

For more information, see Configuring engine parameters using parameter groups in the *MemoryDB User Guide*.

- For API details, see ResetParameterGroup in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example adds a tag to a resource.

```
aws memorydb tag-resource \
    --resource-arn arn:aws:memorydb:us-west-2:491658xxxxxx:cluster/my-cluster \
    --tags Key="mykey",Value="myvalue"
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        },
        {
```

```
            "Key": "mykey",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the *MemoryDB User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes a tag from a resource.

```
aws memorydb untag-resource \
    --resource-arn arn:aws:memorydb:us-west-2:491658xxxxx:cluster/my-cluster \
    --tag-keys mykey
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the *MemoryDB User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-cluster`

The following code example shows how to use `update-cluster`.

AWS CLI

To update a cluster

The following `update-cluster` example updates the parameter group of a cluster to my-parameter-group.

```
aws memorydb update-cluster \
    --cluster-name my-cluster \
    --parameter-group-name my-parameter-group
```

Output:

```
{
    "Cluster": {
        "Name": "my-cluster",
        "Status": "available",
        "NumberOfShards": 2,
        "AvailabilityMode": "MultiAZ",
        "ClusterEndpoint": {
            "Address": "clustercfg.my-cluster.llru6f.memorydb.us-
west-2.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "my-parameter-group",
        "ParameterGroupStatus": "in-sync",
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-0a143xxxxxc9fae",
                "Status": "active"
            }
        ],
        "SubnetGroupName": "pat-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:cluster/my-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "wed:03:00-wed:04:00",
        "SnapshotWindow": "04:30-05:30",
        "ACLName": "my-acl",
        "AutoMinorVersionUpgrade": true
```

```
    }
}
```

For more information, see Modifying a cluster in the *MemoryDB User Guide*.

- For API details, see UpdateCluster in *AWS CLI Command Reference*.

`update-parameter-group`

The following code example shows how to use `update-parameter-group`.

AWS CLI

To update a parameter group

The following `update-parameter-group` example updates a parameter group.

```
aws memorydb update-parameter-group \
    --parameter-group-name my-parameter-group \
    --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```
{
    "ParameterGroup": {
        "Name": "my-parameter-group",
        "Family": "memorydb_redis6",
        "Description": "my parameter group",
        "ARN": "arn:aws:memorydb:us-west-2:49165xxxxxx:parametergroup/my-parameter-
group"
    }
}
```

For more information, see Modifying a parameter group in the *MemoryDB User Guide*.

- For API details, see UpdateParameterGroup in *AWS CLI Command Reference*.

`update-subnet-group`

The following code example shows how to use `update-subnet-group`.

AWS CLI

To update a subnet group

The following `update-subnet-group` example updates a subnet group's subnet ID.

```
aws memorydb update-subnet-group \
    --subnet-group-name my-sg \
    --subnet-ids subnet-01f29d458f3xxxxx
```

Output:

```
{
    "SubnetGroup": {
        "Name": "my-sg-1",
        "Description": "my-sg",
        "VpcId": "vpc-09d2cfc01xxxxxxx",
        "Subnets": [
            {
                "Identifier": "subnet-01f29d458fxxxxxx",
                "AvailabilityZone": {
                    "Name": "us-west-2a"
                }
            }
        ],
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:subnetgroup/my-sg"
    }
}
```

For more information, see Subnets and subnet groups in the *MemoryDB User Guide*.

- For API details, see UpdateSubnetGroup in *AWS CLI Command Reference*.

`update-user`

The following code example shows how to use `update-user`.

AWS CLI

To update a user

The following `update-user` example modifies a user's access string.

```
aws memorydb update-user \
    --user-name my-user \
    --access-string "off ~objects:* ~items:* ~public:* resetchannels -@all"
```

Output:

```
{
    "User": {
        "Name": "my-user",
        "Status": "modifying",
        "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
        "ACLNames": [
            "myt-acl"
        ],
        "MinimumEngineVersion": "6.2",
        "Authentication": {
            "Type": "password",
            "PasswordCount": 2
        },
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:user/my-user"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see UpdateUser in *AWS CLI Command Reference*.

Amazon MSK examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon MSK.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

To create an Amazon MSK cluster

The following `create-cluster` example creates an MSK cluster named `MessagingCluster` with three broker nodes. A JSON file named `brokernodegroupinfo.json` specifies the three subnets over which you want Amazon MSK to distribute the broker nodes. This example doesn't specify the monitoring level, so the cluster gets the `DEFAULT` level.

```
aws kafka create-cluster \
    --cluster-name "MessagingCluster" \
    --broker-node-group-info file://brokernodegroupinfo.json \
    --kafka-version "2.2.1" \
    --number-of-broker-nodes 3
```

Contents of `brokernodegroupinfo.json`:

```
{
    "InstanceType": "kafka.m5.xlarge",
    "BrokerAZDistribution": "DEFAULT",
    "ClientSubnets": [
        "subnet-0123456789111abcd",
        "subnet-0123456789222abcd",
        "subnet-0123456789333abcd"
    ]
}
```

Output:

```
{
    "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "ClusterName": "MessagingCluster",
    "State": "CREATING"
}
```

For more information, see Create an MSK Provisioned cluster in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

`create-configuration`

The following code example shows how to use `create-configuration`.

AWS CLI

To create a custom Amazon MSK configuration

The following `create-configuration` example creates a custom MSK configuration with the server properties that are specified in the input file.

```
aws kafka create-configuration \
    --name "CustomConfiguration" \
    --description "Topic autocreation enabled; Apache ZooKeeper timeout 2000 ms; Log
 rolling 604800000 ms." \
    --kafka-versions "2.2.1" \
    --server-properties fileb://configuration.txt
```

Contents of `configuration.txt`:

```
auto.create.topics.enable = true
zookeeper.connection.timeout.ms = 2000
log.roll.ms = 604800000
```

This command produces no output. Output:

```
{
    "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "CreationTime": "2019-10-09T15:26:05.548Z",
    "LatestRevision":
        {
            "CreationTime": "2019-10-09T15:26:05.548Z",
            "Description": "Topic autocreation enabled; Apache ZooKeeper timeout
 2000 ms; Log rolling 604800000 ms.",
            "Revision": 1
```

```
        },
    "Name": "CustomConfiguration"
}
```

For more information, see Amazon MSK Configuration Operations in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see CreateConfiguration in *AWS CLI Command Reference*.

`describe-cluster`

The following code example shows how to use `describe-cluster`.

AWS CLI

To describe a cluster

The following `describe-cluster` example describes an Amazon MSK cluster.

```
aws kafka describe-cluster \
    --cluster-arn arn:aws:kafka:us-west-2:123456789012:cluster/demo-cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```
{
    "ClusterInfo": {
        "BrokerNodeGroupInfo": {
            "BrokerAZDistribution": "DEFAULT",
            "ClientSubnets": [
                "subnet-cbfff283",
                "subnet-6746046b"
            ],
            "InstanceType": "kafka.m5.large",
            "SecurityGroups": [
                "sg-f839b688"
            ],
            "StorageInfo": {
                "EbsStorageInfo": {
                    "VolumeSize": 100
                }
            }
```

```
        },
        "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",

                },
                "NodeExporter": {
                    "EnabledInBroker": false
                }
            }
        },
        "NumberOfBrokerNodes": 2,
        "State": "ACTIVE",
        "Tags": {},
        "ZookeeperConnectString": "z-2.demo-cluster-1.xuy0sb.c5.kafka.us-
west-2.amazonaws.com:2181,z-1.demo-cluster-1.xuy0sb.c5.kafka.us-
west-2.amazonaws.com:2181,z-3.demo-cluster-1.xuy0sb.c5.kafka.us-
west-2.amazonaws.com:2181"
    }
}
```

For more information, see Listing Amazon MSK Clusters in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see DescribeCluster in *AWS CLI Command Reference*.

`get-bootstrap-brokers`

The following code example shows how to use `get-bootstrap-brokers`.

AWS CLI

To get bootstrap brokers

The following `get-bootstrap-brokers` example retrieves the bootstrap broker information for an Amazon MSK cluster.

```
aws kafka get-bootstrap-brokers \
    --cluster-arn arn:aws:kafka:us-west-2:123456789012:cluster/demo-cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```
{
    "BootstrapBrokerString": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-west-2.amazonaws.com:9092,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-west-2.amazonaws.com:9092",
    "BootstrapBrokerStringTls": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-west-2.amazonaws.com:9094,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-west-2.amazonaws.com:9094"
}
```

For more information, see Getting the Bootstrap Brokers in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see GetBootstrapBrokers in *AWS CLI Command Reference*.

`list-clusters`

The following code example shows how to use `list-clusters`.

AWS CLI

To list the available clusters

The following `list-clusters` example lists the Amazon MSK clusters in your AWS account.

```
aws kafka list-clusters
```

Output:

```
{
    "ClusterInfoList": [
        {
            "BrokerNodeGroupInfo": {
                "BrokerAZDistribution": "DEFAULT",
                "ClientSubnets": [
                    "subnet-cbfff283",
                    "subnet-6746046b"
                ],
                "InstanceType": "kafka.m5.large",
                "SecurityGroups": [
                    "sg-f839b688"
                ],
                "StorageInfo": {
                    "EbsStorageInfo": {
                        "VolumeSize": 100
                    }
                }
            },
            "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",
            "ClusterName": "demo-cluster-1",
            "CreationTime": "2020-07-09T02:31:36.223000+00:00",
            "CurrentBrokerSoftwareInfo": {
                "KafkaVersion": "2.2.1"
            },
            "CurrentVersion": "K3AEGXETSR30VB",
            "EncryptionInfo": {
                "EncryptionAtRest": {
                    "DataVolumeKMSKeyId": "arn:aws:kms:us-west-2:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                },
                "EncryptionInTransit": {
                    "ClientBroker": "TLS_PLAINTEXT",
                    "InCluster": true
                }
            },
            "EnhancedMonitoring": "DEFAULT",
            "OpenMonitoring": {
                "Prometheus": {
                    "JmxExporter": {
                        "EnabledInBroker": false
```

```
                    },
                    "NodeExporter": {
                        "EnabledInBroker": false
                    }
                }
            },
            "NumberOfBrokerNodes": 2,
            "State": "ACTIVE",
            "Tags": {},
            "ZookeeperConnectString": "z-2.demo-cluster-1.xuy0sb.c5.kafka.us-
west-2.amazonaws.com:2181,z-1.demo-cluster-1.xuy0sb.c5.kafka.us-
west-2.amazonaws.com:2181,z-3.demo-cluster-1.xuy0sb.c5.kafka.us-
west-2.amazonaws.com:2181"
        }
    ]
}
```

For more information, see Listing Amazon MSK Clusters in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see ListClusters in *AWS CLI Command Reference*.

`update-broker-storage`

The following code example shows how to use `update-broker-storage`.

AWS CLI

To update the EBS storage for brokers

The following `update-broker-storage` example updates the amount of EBS storage for all the brokers in the cluster. Amazon MSK sets the target storage amount for each broker to the amount specified in the example. You can get the current version of the cluster by describing the cluster or by listing all of the clusters.

```
aws kafka update-broker-storage \
    --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2" \
    --current-version "K21V3IB1VIZYYH" \
    --target-broker-ebs-volume-info "KafkaBrokerNodeId=ALL,VolumeSizeGB=1100"
```

Output:

```
{
    "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "ClusterOperationArn": "arn:aws:kafka:us-west-2:123456789012:cluster-operation/
V123450123/a1b2c3d4-1234-abcd-cdef-22222EXAMPLE-2/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333"
}
```

The output returns an ARN for this `update-broker-storage` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.

For more information, see Update the EBS Storage for Brokers in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see UpdateBrokerStorage in *AWS CLI Command Reference*.

`update-cluster-configuration`

The following code example shows how to use `update-cluster-configuration`.

AWS CLI

To update the configuration of an Amazon MSK cluster

The following `update-cluster-configuration` example updates the configuration of the specified existing MSK cluster. It uses a custom MSK configuration.

```
aws kafka update-cluster-configuration \
    --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2" \
    --configuration-info file://configuration-info.json \
    --current-version "K21V3IB1VIZYYH"
```

Contents of `configuration-info.json`:

```
{
    "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "Revision": 1
```

```
}
```

Output:

```
{
    "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "ClusterOperationArn": "arn:aws:kafka:us-west-2:123456789012:cluster-operation/
V123450123/a1b2c3d4-1234-abcd-cdef-22222EXAMPLE-2/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333"
}
```

The output returns an ARN for this `update-cluster-configuration` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.

For more information, see Update the configuration of an Amazon MSK cluster in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see UpdateClusterConfiguration in *AWS CLI Command Reference*.

Network Flow Monitor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Network Flow Monitor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-monitor`

The following code example shows how to use `create-monitor`.

AWS CLI

To create a monitor

The following `create-monitor` example creates a monitor named demo in the specified account.

```
aws networkflowmonitor create-monitor \
    --monitor-name demo \
    --local-resources type="AWS::EC2::VPC",identifier="arn:aws:ec2:us-
west-2:123456789012:vpc/vpc-03ea55eeda25adbb0"  \
    --scope-arn arn:aws:networkflowmonitor:us-west-2:123456789012:scope/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "monitorArn": "arn:aws:networkflowmonitor:us-west-2:123456789012:monitor/demo",
    "monitorName": "demo",
    "monitorStatus": "ACTIVE",
    "tags": {}
}
```

For more information, see Create a monitor in Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see CreateMonitor in *AWS CLI Command Reference*.

`create-scope`

The following code example shows how to use `create-scope`.

AWS CLI

To create a scope

The following `create-scope` example creates a scope that includes a set of resources for which Network Flow Monitor will generate network traffic metrics.

```
aws networkflowmonitor create-scope \
```

```
    --targets '[{"targetIdentifier":{"targetId":
{"accountId":"123456789012"},"targetType":"ACCOUNT"},"region":"us-west-2"}]'
```

Output:

```
{
    "scopeId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "status": "IN_PROGRESS",
    "tags": {}
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see CreateScope in *AWS CLI Command Reference*.

`delete-monitor`

The following code example shows how to use `delete-monitor`.

AWS CLI

To delete a monitor

The following `delete-monitor` example deletes a monitor named demo in the specified account.

```
aws networkflowmonitor delete-monitor \
    --monitor-name demo
```

This command produces no output.

For more information, see Delete a monitor in Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see DeleteMonitor in *AWS CLI Command Reference*.

`delete-scope`

The following code example shows how to use `delete-scope`.

AWS CLI

To delete a scope

The following `delete-scope` example deletes a specified scope.

```
aws networkflowmonitor delete-scope \
    --scope-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see DeleteScope in *AWS CLI Command Reference*.

`get-monitor`

The following code example shows how to use `get-monitor`.

AWS CLI

To retrieve information about a monitor

The following `get-monitor` example displays information about the monitor named demo in the specified account.

```
aws networkflowmonitor get-monitor \
    --monitor-name Demo
```

Output:

```
{
    "monitorArn": "arn:aws:networkflowmonitor:us-west-2:123456789012:monitor/Demo",
    "monitorName": "Demo",
    "monitorStatus": "ACTIVE",
    "localResources": [
        {
            "type": "AWS::EC2::VPC",
            "identifier": "arn:aws:ec2:us-west-2:123456789012:vpc/
vpc-03ea55eeda25adbb0"
```

```
        }
    ],
    "remoteResources": [],
    "createdAt": "2024-12-09T12:21:51.616000-06:00",
    "modifiedAt": "2024-12-09T12:21:55.412000-06:00",
    "tags": {}
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see GetMonitor in *AWS CLI Command Reference*.

`get-query-results-workload-insights-top-contributors-data`

The following code example shows how to use `get-query-results-workload-insights-top-contributors-data`.

AWS CLI

To retrieve the top contributor data on workload insights

The following `get-query-results-workload-insights-top-contributors-data` example returns the data for the specified query.

```
aws networkflowmonitor get-query-results-workload-insights-top-contributors-data \
    --scope-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --query-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "datapoints": [
        {
            "timestamps": [
                "2024-12-09T19:00:00+00:00",
                "2024-12-09T19:05:00+00:00",
                "2024-12-09T19:10:00+00:00"
            ],
            "values": [
                259943.0,
                194856.0,
```

```
                216432.0
            ],
            "label": "use1-az6"
        }
    ],
    "unit": "Bytes"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see GetQueryResultsWorkloadInsightsTopContributorsData in *AWS CLI Command Reference*.

`get-query-results-workload-insights-top-contributors`

The following code example shows how to use `get-query-results-workload-insights-top-contributors`.

AWS CLI

To retrieve the top contributors on workload insights

The following `get-query-results-workload-insights-top-contributors` example returns the data for the specified query.

```
aws networkflowmonitor get-query-results-workload-insights-top-contributors \
    --scope-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --query-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "topContributors": [
        {
            "accountId": "123456789012",
            "localSubnetId": "subnet-0a5b30fb95dca2c14",
            "localAz": "use1-az6",
            "localVpcId": "vpc-03ea55eeda25adbb0",
            "localRegion": "us-west-2",
            "remoteIdentifier": "",
```

```
            "value": 908443,
            "localSubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0a5b30fb95dca2c14",
            "localVpcArn": "arn:aws:ec2:us-west-2:123456789012:vpc/
vpc-03ea55eeda25adbb0"
        }
    ]
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see GetQueryResultsWorkloadInsightsTopContributors in *AWS CLI Command Reference*.

`get-query-status-monitor-top-contributors`

The following code example shows how to use `get-query-status-monitor-top-contributors`.

AWS CLI

To retrieve the status of the query

The following `get-query-status-monitor-top-contributors` example displays the current status of the query in the specified account.

```
aws networkflowmonitor get-query-status-monitor-top-contributors \
    --monitor-name Demo \
    --query-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "status": "SUCCEEDED"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see GetQueryStatusMonitorTopContributors in *AWS CLI Command Reference*.

`get-query-status-workload-insights-top-contributors-data`

The following code example shows how to use `get-query-status-workload-insights-top-contributors-data`.

AWS CLI

To retrieve the status of the query

The following `get-query-status-workload-insights-top-contributors-data` example displays the current status of the query in the specified account.

```
aws networkflowmonitor get-query-status-workload-insights-top-contributors-data \
    --scope-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --query-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "status": "SUCCEEDED"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see GetQueryStatusWorkloadInsightsTopContributorsData in *AWS CLI Command Reference*.

`get-query-status-workload-insights-top-contributors`

The following code example shows how to use `get-query-status-workload-insights-top-contributors`.

AWS CLI

To retrieve the status of the query

The following `get-query-status-workload-insights-top-contributors` example displays the current status of the query in the specified account.

```
aws networkflowmonitor get-query-status-workload-insights-top-contributors \
```

```
    --scope-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --query-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "status": "SUCCEEDED"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see GetQueryStatusWorkloadInsightsTopContributors in *AWS CLI Command Reference*.

`get-scope`

The following code example shows how to use `get-scope`.

AWS CLI

To retrieve information about a scope

The following `get-scope` example displays information about a scope, such as status, tags, name and target details.

```
aws networkflowmonitor get-scope \
    --scope-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "scopeId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "status": "SUCCEEDED",
    "scopeArn": "arn:aws:networkflowmonitor:us-west-2:123456789012:scope/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "targets": [
        {
            "targetIdentifier": {
                "targetId": {
                    "accountId": "123456789012"
```

```
                },
                "targetType": "ACCOUNT"
            },
            "region": "us-west-2"
        }
    ],
    "tags": {}
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see GetScope in *AWS CLI Command Reference*.

`list-monitors`

The following code example shows how to use `list-monitors`.

AWS CLI

To retrieve a list of monitors

The following `list-monitors` example returns returns all the monitors in the specified account.

```
aws networkflowmonitor list-monitors
```

Output:

```
{
    "monitors": [
        {
            "monitorArn": "arn:aws:networkflowmonitor:us-
west-2:123456789012:monitor/Demo",
            "monitorName": "Demo",
            "monitorStatus": "ACTIVE"
        }
    ]
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see ListMonitors in *AWS CLI Command Reference*.

`list-scopes`

The following code example shows how to use `list-scopes`.

AWS CLI

To retrieve a list of scopes

The following `list-scopes` example lists all scopes in the specified account.

```
aws networkflowmonitor list-scopes
```

Output:

```
{
    "scopes": [
        {
            "scopeId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "status": "SUCCEEDED",
            "scopeArn": "arn:aws:networkflowmonitor:us-west-2:123456789012:scope/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see ListScopes in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags

The following `list-tags-for-resource` example returns all the tags associated with the specified resource.

```
aws networkflowmonitor list-tags-for-resource \
    --resource-arn arn:aws:networkflowmonitor:us-west-2:123456789012:monitor/Demo
```

Output:

```
{
    "tags": {
        "Value": "Production",
        "Key": "stack"
    }
}
```

For more information, see Tagging your Amazon CloudWatch resources in the *Amazon CloudWatch User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-query-monitor-top-contributors`

The following code example shows how to use `start-query-monitor-top-contributors`.

AWS CLI

To start a query

The following `start-query-monitor-top-contributors` example starts the query which returns a query ID to retrieve the top contributors.

```
aws networkflowmonitor start-query-monitor-top-contributors \
    --monitor-name Demo \
    --start-time 2024-12-09T19:00:00Z \
    --end-time 2024-12-09T19:15:00Z \
    --metric-name DATA_TRANSFERRED \
    --destination-category UNCLASSIFIED
```

Output:

```
{
    "queryId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see StartQueryMonitorTopContributors in *AWS CLI Command Reference*.

`start-query-workload-insights-top-contributors-data`

The following code example shows how to use `start-query-workload-insights-top-contributors-data`.

AWS CLI

To start a query

The following `start-query-workload-insights-top-contributors-data` example starts the query which returns a query ID to retrieve the top contributors.

```
aws networkflowmonitor start-query-workload-insights-top-contributors-data \
    --scope-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --start-time 2024-12-09T19:00:00Z \
    --end-time 2024-12-09T19:15:00Z \
    --metric-name DATA_TRANSFERRED \
    --destination-category UNCLASSIFIED
```

Output:

```
{
    "queryId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see StartQueryWorkloadInsightsTopContributorsData in *AWS CLI Command Reference*.

`start-query-workload-insights-top-contributors`

The following code example shows how to use `start-query-workload-insights-top-contributors`.

AWS CLI

To start a query

The following `start-query-workload-insights-top-contributors` example starts the query which returns a query ID to retrieve the top contributors.

```
aws networkflowmonitor start-query-workload-insights-top-contributors \
    --scope-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --start-time 2024-12-09T19:00:00Z \
    --end-time 2024-12-09T19:15:00Z \
    --metric-name DATA_TRANSFERRED \
    --destination-category UNCLASSIFIED
```

Output:

```
{
    "queryId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see StartQueryWorkloadInsightsTopContributors in *AWS CLI Command Reference*.

`stop-query-monitor-top-contributors`

The following code example shows how to use `stop-query-monitor-top-contributors`.

AWS CLI

To stop a query

The following `stop-query-monitor-top-contributors` example stops the query in the specified account.

```
aws networkflowmonitor stop-query-monitor-top-contributors \
    --monitor-name Demo \
    --query-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see StopQueryMonitorTopContributors in *AWS CLI Command Reference*.

`stop-query-workload-insights-top-contributors-data`

The following code example shows how to use `stop-query-workload-insights-top-contributors-data`.

AWS CLI

To stop a query

The following `stop-query-workload-insights-top-contributors-data` example stops the query in the specified account.

```
aws networkflowmonitor stop-query-workload-insights-top-contributors-data \
    --scope-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --query-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see StopQueryWorkloadInsightsTopContributorsData in *AWS CLI Command Reference*.

`stop-query-workload-insights-top-contributors`

The following code example shows how to use `stop-query-workload-insights-top-contributors`.

AWS CLI

To stop a query

The following `stop-query-workload-insights-top-contributors` example stops the query in the specified account.

```
aws networkflowmonitor stop-query-workload-insights-top-contributors \
    --scope-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --query-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see StopQueryWorkloadInsightsTopContributors in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to the specified resource

The following `tag-resource` example adds a tag to the monitor in the specified account.

```
aws networkflowmonitor tag-resource \
    --resource-arn arn:aws:networkflowmonitor:us-west-2:123456789012:monitor/Demo \
    --tags Key=stack,Value=Production
```

This command produces no output.

For more information, see Tagging your Amazon CloudWatch resources in the *Amazon CloudWatch User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from the specified resource

The following `untag-resource` example removes a tag from the monitor in the specified account.

```
aws networkflowmonitor untag-resource \
    --resource-arn arn:aws:networkflowmonitor:us-west-2:123456789012:monitor/Demo \
    --tag-keys stack
```

This command produces no output.

For more information, see Tagging your Amazon CloudWatch resources in the *Amazon CloudWatch User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-monitor`

The following code example shows how to use `update-monitor`.

AWS CLI

To update an existing monitor

The following `update-monitor` example updates the monitor named `Demo` in the specified account.

```
aws networkflowmonitor update-monitor \
    --monitor-name Demo \
    --local-resources-to-add type="AWS::EC2::VPC",identifier="arn:aws:ec2:us-
west-2:123456789012:vpc/vpc-048d08dfbec623f94"
```

Output:

```
{
    "monitorArn": "arn:aws:networkflowmonitor:us-west-2:123456789012:monitor/Demo",
    "monitorName": "Demo",
    "monitorStatus": "ACTIVE",
    "tags": {
        "Value": "Production",
        "Key": "stack"
    }
```

```
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see UpdateMonitor in *AWS CLI Command Reference*.

Network Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Network Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-customer-gateway`

The following code example shows how to use `associate-customer-gateway`.

AWS CLI

To associate a customer gateway

The following `associate-customer-gateway` example associates customer gateway `cgw-11223344556677889` in the specified global network with device `device-07f6fd08867abc123`.

```
aws networkmanager associate-customer-gateway \
    --customer-gateway-arn arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889 \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123
```

Output:

```
{
    "CustomerGatewayAssociation": {
        "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889",
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "State": "PENDING"
    }
}
```

For more information, see Gateway associations in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see AssociateCustomerGateway in *AWS CLI Command Reference*.

`associate-link`

The following code example shows how to use `associate-link`.

AWS CLI

To associate a link

The following `associate-link` example associates link `link-11112222aaaabbbb1` with device `device-07f6fd08867abc123`. The link and device are in the specified global network.

```
aws networkmanager associate-link \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --link-id link-11112222aaaabbbb1
```

Output:

```
{
    "LinkAssociation": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "LinkId": "link-11112222aaaabbbb1",
        "LinkAssociationState": "PENDING"
    }
```

```
}
```

For more information, see Associate or disassociate a device link using AWS Network Manager in the *Transit Gateway Network Manager Guide*.

- For API details, see AssociateLink in *AWS CLI Command Reference*.

`create-core-network`

The following code example shows how to use `create-core-network`.

AWS CLI

To create a core network

The following `create-core-network` example creates a core network using an optional description and tags within an AWS Cloud WAN global network.

```
aws networkmanager create-core-network \
    --global-network-id global-network-0d59060f16a73bc41 \
    --description "Main headquarters location" \
    --tags Key=Name,Value="New York City office"
```

Output:

```
{
    "CoreNetwork": {
        "GlobalNetworkId": "global-network-0d59060f16a73bc41",
        "CoreNetworkId": "core-network-0fab62fe438d94db6",
        "CoreNetworkArn": "arn:aws:networkmanager::123456789012:core-network/core-
network-0fab62fe438d94db6",
        "Description": "Main headquarters location",
        "CreatedAt": "2022-01-10T19:53:59+00:00",
        "State": "AVAILABLE",
        "Tags": [
            {
                "Key": "Name",
                "Value": "New York City office"
            }
        ]
    }
}
```

For more information, see Global and core networks in AWS Cloud WAN in the *AWS Cloud WAN User Guide*.

- For API details, see CreateCoreNetwork in *AWS CLI Command Reference*.

`create-device`

The following code example shows how to use `create-device`.

AWS CLI

To create a device

The following `create-device` example creates a device in the specified global network. The device details include a description, the type, vendor, model, and serial number.

```
aws networkmanager create-device \
    --global-network-id global-network-01231231231231231 \
    --description "New York office device" \
    --type "office device" \
    --vendor "anycompany" \
    --model "abcabc" \
    --serial-number "1234"
```

Output:

```
{
    "Device": {
        "DeviceId": "device-07f6fd08867abc123",
        "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York office device",
        "Type": "office device",
        "Vendor": "anycompany",
        "Model": "abcabc",
        "SerialNumber": "1234",
        "CreatedAt": 1575554005.0,
        "State": "PENDING"
    }
}
```

For more information, see Devices in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see CreateDevice in *AWS CLI Command Reference*.

`create-global-network`

The following code example shows how to use `create-global-network`.

AWS CLI

To create a global network

The following `create-global-network` examples creates a new global network. The initial state upon creation is `PENDING`.

```
aws networkmanager create-global-network
```

Output:

```
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-00a77fc0f722dae74",
        "GlobalNetworkArn": "arn:aws:networkmanager::123456789012:global-network/
global-network-00a77fc0f722dae74",
        "CreatedAt": "2022-03-14T20:31:56+00:00",
        "State": "PENDING"
    }
}
```

For more information, see Global networks in AWS Global Networks for Transit Gateways in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see CreateGlobalNetwork in *AWS CLI Command Reference*.

`create-link`

The following code example shows how to use `create-link`.

AWS CLI

To create a link

The following `create-link` example creates a link in the specified global network. The link includes a description and details about the link type, bandwidth, and provider. The site ID indicates the site to which the link is associated.

```
aws networkmanager create-link \
    --global-network-id global-network-01231231231231231 \
    --description "VPN Link" \
    --type "broadband" \
    --bandwidth UploadSpeed=10,DownloadSpeed=20 \
    --provider "AnyCompany" \
    --site-id site-444555aaabbb11223
```

Output:

```
{
    "Link": {
        "LinkId": "link-11112222aaaabbbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 10,
            "DownloadSpeed": 20
        },
        "Provider": "AnyCompany",
        "CreatedAt": 1575555811.0,
        "State": "PENDING"
    }
}
```

For more information, see Sites and links in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see CreateLink in *AWS CLI Command Reference*.

`create-site`

The following code example shows how to use `create-site`.

AWS CLI

To create a site

The following `create-site` example creates a site in the specified global network. The site details include a description and the location information.

```
aws networkmanager create-site \
    --global-network-id global-network-01231231231231231 \
    --description "New York head office" \
    --location Latitude=40.7128,Longitude=-74.0060
```

Output:

```
{
    "Site": {
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York head office",
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554300.0,
        "State": "PENDING"
    }
}
```

For more information, see Sites and links in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see CreateSite in *AWS CLI Command Reference*.

`create-vpc-attachment`

The following code example shows how to use `create-vpc-attachment`.

AWS CLI

To create a VPC attachment

The following `create-vpc-attachment` example creates a VPC attachment with IPv6 support in a core network.

```
aws networkmanager create-vpc-attachment \
    --core-network-id core-network-0fab62fe438d94db6 \
    --vpc-arn arn:aws:ec2:us-west-2:123456789012:vpc/vpc-09f37f69e2786eeb8  \
    --subnet-arns arn:aws:ec2:us-west-2:123456789012:subnet/subnet-04ca4e010857e7bb7
 \
    --options Ipv6Support=true
```

Output:

```
{
    "VpcAttachment": {
        "Attachment": {
            "CoreNetworkId": "core-network-0fab62fe438d94db6",
            "AttachmentId": "attachment-05e1da6eba87a06e6",
            "OwnerAccountId": "123456789012",
            "AttachmentType": "VPC",
            "State": "CREATING",
            "EdgeLocation": "us-west-2",
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:vpc/
vpc-09f37f69e2786eeb8",
            "Tags": [],
            "CreatedAt": "2022-03-10T20:59:14+00:00",
            "UpdatedAt": "2022-03-10T20:59:14+00:00"
        },
        "SubnetArns": [
            "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-04ca4e010857e7bb7"
        ],
        "Options": {
            "Ipv6Support": true
        }
    }
}
```

For more information, see Create an attachment in the *Cloud WAN User Guide*.

- For API details, see CreateVpcAttachment in *AWS CLI Command Reference*.

`delete-attachment`

The following code example shows how to use `delete-attachment`.

AWS CLI

To delete an attachment

The following `delete-attachment` example deletes a Connect attachment.

```
aws networkmanager delete-attachment \
    --attachment-id attachment-01feddaeae26ab68c
```

Output:

```
{
    "Attachment": {
        "CoreNetworkId": "core-network-0f4b0a9d5ee7761d1",
        "AttachmentId": "attachment-01feddaeae26ab68c",
        "OwnerAccountId": "123456789012",
        "AttachmentType": "CONNECT",
        "State": "DELETING",
        "EdgeLocation": "us-west-2",
        "ResourceArn": "arn:aws:networkmanager::123456789012:attachment/
attachment-02c3964448fedf5aa",
        "CreatedAt": "2022-03-15T19:18:41+00:00",
        "UpdatedAt": "2022-03-15T19:28:59+00:00"
    }
}
```

For more information, see Delete an AWS Cloud WAN core network attachment in the *Cloud WAN User Guide*.

- For API details, see DeleteAttachment in *AWS CLI Command Reference*.

`delete-core-network`

The following code example shows how to use `delete-core-network`.

AWS CLI

To delete a core network

The following `delete-core-network` example deletes a core network from a Cloud WAN global network.

```
aws networkmanager delete-core-network \
    --core-network-id core-network-0fab62fe438d94db6
```

Output:

```
{
    "CoreNetwork": {
        "GlobalNetworkId": "global-network-0d59060f16a73bc41",
        "CoreNetworkId": "core-network-0fab62fe438d94db6",
        "Description": "Main headquarters location",
        "CreatedAt": "2021-12-09T18:31:11+00:00",
        "State": "DELETING",
        "Segments": [
            {
                "Name": "dev",
                "EdgeLocations": [
                    "us-west-2"
                ],
                "SharedSegments": []
            }
        ],
        "Edges": [
            {
                "EdgeLocation": "us-west-2",
                "Asn": 64512,
                "InsideCidrBlocks": []
            }
        ]
    }
}
```

For more information, see Core networks in the *Cloud WAN User Guide*.

- For API details, see DeleteCoreNetwork in *AWS CLI Command Reference*.

`delete-device`

The following code example shows how to use `delete-device`.

AWS CLI

To delete a device

The following `delete-device` example deletes the specified device from the specified global network.

```
aws networkmanager delete-device \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123
```

Output:

```
{
    "Device": {
        "DeviceId": "device-07f6fd08867abc123",
        "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York office device",
        "Type": "office device",
        "Vendor": "anycompany",
        "Model": "abcabc",
        "SerialNumber": "1234",
        "SiteId": "site-444555aaabbb11223",
        "CreatedAt": 1575554005.0,
        "State": "DELETING"
    }
}
```

For more information, see Devices in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see DeleteDevice in *AWS CLI Command Reference*.

`delete-global-network`

The following code example shows how to use `delete-global-network`.

AWS CLI

To delete a global network

The following `delete-global-network` example deletes a global network.

```
aws networkmanager delete-global-network \
    --global-network-id global-network-052bedddccb193b6b
```

Output:

```
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-052bedddccb193b6b",
        "GlobalNetworkArn": "arn:aws:networkmanager::123456789012:global-network/
global-network-052bedddccb193b6b",
        "CreatedAt": "2021-12-09T18:19:12+00:00",
        "State": "DELETING"
    }
}
```

For more information, see Global networks in AWS Global Networks for Transit Gateways in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see DeleteGlobalNetwork in *AWS CLI Command Reference*.

`delete-link`

The following code example shows how to use `delete-link`.

AWS CLI

To delete a link

The following `delete-link` example deletes the specified link from the specified global network.

```
aws networkmanager delete-link \
    --global-network-id global-network-01231231231231231 \
    --link-id link-11112222aaaabbbb1
```

Output:

```
{
```

```
    "Link": {
        "LinkId": "link-11112222aaaabbbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 20,
            "DownloadSpeed": 20
        },
        "Provider": "AnyCompany",
        "CreatedAt": 1575555811.0,
        "State": "DELETING"
    }
}
```

For more information, see Sites and links in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see DeleteLink in *AWS CLI Command Reference*.

`delete-site`

The following code example shows how to use `delete-site`.

AWS CLI

To delete a site

The following `delete-site` example deletes the specified site (`site-444555aaabbb11223`) in the specified global network.

```
aws networkmanager delete-site \
    --global-network-id global-network-01231231231231231 \
    --site-id site-444555aaabbb11223
```

Output:

```
{
    "Site": {
```

```
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York head office",
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554300.0,
        "State": "DELETING"
    }
}
```

For more information, see Sites and links in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see DeleteSite in *AWS CLI Command Reference*.

`deregister-transit-gateway`

The following code example shows how to use `deregister-transit-gateway`.

AWS CLI

To deregister a transit gateway from a global network

The following `deregister-transit-gateway` example deregisters the specified transit gateway from the specified global network.

```
aws networkmanager deregister-transit-gateway \
    --global-network-id global-network-01231231231231231 \
    --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc
```

Output:

```
{
    "TransitGatewayRegistration": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc",
```

```
        "State": {
            "Code": "DELETING"
        }
    }
}
```

For more information, see Transit Gateway Registrations in the *Transit Gateway Network Manager Guide*.

- For API details, see DeregisterTransitGateway in *AWS CLI Command Reference*.

`describe-global-networks`

The following code example shows how to use `describe-global-networks`.

AWS CLI

To describe your global networks

The following `describe-global-networks` example describes all of your global networks in your account.

```
aws networkmanager describe-global-networks
```

Output:

```
{
    "GlobalNetworks": [
        {
            "GlobalNetworkId": "global-network-01231231231231231",
            "GlobalNetworkArn": "arn:aws:networkmanager::123456789012:global-
network/global-network-01231231231231231",
            "Description": "Company 1 global network",
            "CreatedAt": 1575553525.0,
            "State": "AVAILABLE"
        }
    ]
}
```

For more information, see Global networks in AWS Global Networks for Transit Gateways in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see DescribeGlobalNetworks in *AWS CLI Command Reference*.

`disassociate-customer-gateway`

The following code example shows how to use `disassociate-customer-gateway`.

AWS CLI

To disassociate a customer gateway

The following `disassociate-customer-gateway` example disassociates the specified customer gateway (`cgw-11223344556677889`) from the specified global network.

```
aws networkmanager disassociate-customer-gateway \
    --global-network-id global-network-01231231231231231 \
    --customer-gateway-arn arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889
```

Output:

```
{
    "CustomerGatewayAssociation": {
        "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889",
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "State": "DELETING"
    }
}
```

For more information, see Gateway associations in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see DisassociateCustomerGateway in *AWS CLI Command Reference*.

`disassociate-link`

The following code example shows how to use `disassociate-link`.

AWS CLI

To disassociate a link

The following `disassociate-link` example disassociates the specified link from device `device-07f6fd08867abc123` in the specified global network.

```
aws networkmanager disassociate-link \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --link-id link-11112222aaaabbbb1
```

Output:

```
{
    "LinkAssociation": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "LinkId": "link-11112222aaaabbbb1",
        "LinkAssociationState": "DELETING"
    }
}
```

For more information, see Associate or disassociate a device link using AWS Network Manager in the *Transit Gateway Network Manager Guide*.

- For API details, see DisassociateLink in *AWS CLI Command Reference*.

`get-customer-gateway-associations`

The following code example shows how to use `get-customer-gateway-associations`.

AWS CLI

To get your customer gateway associations

The following `get-customer-gateway-associations` example gets the customer gateway associations for the specified global network.

```
aws networkmanager get-customer-gateway-associations \
    --global-network-id global-network-01231231231231231
```

Output:

```
{
```

```
    "CustomerGatewayAssociations": [
        {
            "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-
gateway/cgw-11223344556677889",
            "GlobalNetworkId": "global-network-01231231231231231",
            "DeviceId": "device-07f6fd08867abc123",
            "State": "AVAILABLE"
        }
    ]
}
```

For more information, see Associate a customer gateway using AWS Network Manager in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see GetCustomerGatewayAssociations in *AWS CLI Command Reference*.

`get-devices`

The following code example shows how to use `get-devices`.

AWS CLI

To get your devices

The following `get-devices` example gets the devices in the specified global network.

```
aws networkmanager get-devices \
    --global-network-id global-network-01231231231231231
```

Output:

```
{
    "Devices": [
        {
            "DeviceId": "device-07f6fd08867abc123",
            "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
            "GlobalNetworkId": "global-network-01231231231231231",
            "Description": "NY office device",
            "Type": "office device",
            "Vendor": "anycompany",
            "Model": "abcabc",
```

```
            "SerialNumber": "1234",
            "CreatedAt": 1575554005.0,
            "State": "AVAILABLE"
        }
    ]
}
```

For more information, see Devices in AWS Global Networks for Transit Gateways in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see GetDevices in *AWS CLI Command Reference*.

`get-link-associations`

The following code example shows how to use `get-link-associations`.

AWS CLI

To get your link associations

The following `get-link-associations` example gets the link associations in the specified global network.

```
aws networkmanager get-link-associations \
    --global-network-id global-network-01231231231231231
```

Output:

```
{
    "LinkAssociations": [
        {
            "GlobalNetworkId": "global-network-01231231231231231",
            "DeviceId": "device-07f6fd08867abc123",
            "LinkId": "link-11112222aaaabbbb1",
            "LinkAssociationState": "AVAILABLE"
        }
    ]
}
```

For more information, see Associate or disassociate a device link using AWS Network Manager in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see GetLinkAssociations in *AWS CLI Command Reference*.

`get-links`

The following code example shows how to use `get-links`.

AWS CLI

To get your links

The following `get-links` example gets the links in the specified global network.

```
aws networkmanager get-links \
    --global-network-id global-network-01231231231231231
```

Output:

```
{
    "Links": [
        {
            "LinkId": "link-11112222aaaabbbb1",
            "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
            "GlobalNetworkId": "global-network-01231231231231231",
            "SiteId": "site-444555aaabbb11223",
            "Description": "VPN Link",
            "Type": "broadband",
            "Bandwidth": {
                "UploadSpeed": 10,
                "DownloadSpeed": 20
            },
            "Provider": "AnyCompany",
            "CreatedAt": 1575555811.0,
            "State": "AVAILABLE"
        }
    ]
}
```

For more information, see Sites and links in AWS Global Networks for Transit Gateways in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see GetLinks in *AWS CLI Command Reference*.

`get-sites`

The following code example shows how to use `get-sites`.

AWS CLI

To get your sites

The following `get-sites` example gets the sites in the specified global network.

```
aws networkmanager get-sites \
    --global-network-id global-network-01231231231231231
```

Output:

```
{
    "Sites": [
        {
            "SiteId": "site-444555aaabbb11223",
            "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
            "GlobalNetworkId": "global-network-01231231231231231",
            "Description": "NY head office",
            "Location": {
                "Latitude": "40.7128",
                "Longitude": "-74.0060"
            },
            "CreatedAt": 1575554528.0,
            "State": "AVAILABLE"
        }
    ]
}
```

For more information, see Sites and links in AWS Global Networks for Transit Gateways in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see GetSites in *AWS CLI Command Reference*.

`get-transit-gateway-registrations`

The following code example shows how to use `get-transit-gateway-registrations`.

AWS CLI

To get your transit gateway registrations

The following `get-transit-gateway-registrations` example gets the transit gateways that are registered to the specified global network.

```
aws networkmanager get-transit-gateway-registrations \
    --global-network-id global-network-01231231231231231
```

Output:

```
{
    "TransitGatewayRegistrations": [
        {
            "GlobalNetworkId": "global-network-01231231231231231",
            "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-
gateway/tgw-123abc05e04123abc",
            "State": {
                "Code": "AVAILABLE"
            }
        }
    ]
}
```

For more information, see Transit gateway registrations in AWS Global Networks for Transit Gateways in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see GetTransitGatewayRegistrations in *AWS CLI Command Reference*.

`get-vpc-attachment`

The following code example shows how to use `get-vpc-attachment`.

AWS CLI

To get a VPC attachment

The following `get-vpc-attachment` example returns information about a VPC attachment.

```
aws networkmanager get-vpc-attachment \
```

```
    --attachment-id  attachment-03b7ea450134787da
```

Output:

```
{
    "VpcAttachment": {
        "Attachment": {
            "CoreNetworkId": "core-network-0522de1b226a5d7b3",
            "AttachmentId": "attachment-03b7ea450134787da",
            "OwnerAccountId": "123456789012",
            "AttachmentType": "VPC",
            "State": "CREATING",
            "EdgeLocation": "us-west-2",
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:vpc/vpc-a7c4bbda",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "DevVPC"
                }
            ],
            "CreatedAt": "2022-03-11T17:48:58+00:00",
            "UpdatedAt": "2022-03-11T17:48:58+00:00"
        },
        "SubnetArns": [
            "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-202cde6c",
            "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-e5022dba",
            "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-2387ae02",
            "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-cda9dffc"
        ],
        "Options": {
            "Ipv6Support": false
        }
    }
}
```

For more information, see Attachments in AWS Cloud WAN in the *Cloud WAN User Guide*.

- For API details, see GetVpcAttachment in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for the specified device resource (`device-07f6fd08867abc123`).

```
aws networkmanager list-tags-for-resource \
    --resource-arn arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123
```

Output:

```
{
    "TagList": [
        {
            "Key": "Network",
            "Value": "Northeast"
        }
    ]
}
```

For more information, see Resource tags in AWS Global Networks for Transit Gateways in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`register-transit-gateway`

The following code example shows how to use `register-transit-gateway`.

AWS CLI

To register a transit gateway in a global network

The following `register-transit-gateway` example registers transit gateway `tgw-123abc05e04123abc` in the specified global network.

```
aws networkmanager register-transit-gateway \
    --global-network-id global-network-01231231231231231 \
```

```
    --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc
```

Output:

```
{
    "TransitGatewayRegistration": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc",
        "State": {
            "Code": "PENDING"
        }
    }
}
```

For more information, see Transit Gateway Registrations in the *Transit Gateway Network Manager Guide*.

- For API details, see RegisterTransitGateway in *AWS CLI Command Reference*.

`reject-attachment`

The following code example shows how to use `reject-attachment`.

AWS CLI

To reject an attachment

The following `reject-attachment` example rejects a VPC attachment request.

```
aws networkmanager reject-attachment \
    --attachment-id  attachment-03b7ea450134787da
```

Output:

```
{
    "Attachment": {
        "CoreNetworkId": "core-network-0522de1b226a5d7b3",
        "AttachmentId": "attachment-03b7ea450134787da",
        "OwnerAccountId": "123456789012",
```

```
        "AttachmentType": "VPC",
        "State": "AVAILABLE",
        "EdgeLocation": "us-west-2",
        "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:vpc/vpc-a7c4bbda",
        "CreatedAt": "2022-03-11T17:48:58+00:00",
        "UpdatedAt": "2022-03-11T17:51:25+00:00"
    }
}
```

For more information, see Accept or reject an AWS Cloud WAN core network attachment in the *Cloud WAN User Guide*.

- For API details, see RejectAttachment in *AWS CLI Command Reference*.

`start-route-analysis`

The following code example shows how to use `start-route-analysis`.

AWS CLI

To start route analysis

The following `start-route-analysis` example starts the analysis between a source and destination, including the optional `include-return-path`.

```
aws networkmanager start-route-analysis \
    --global-network-id global-network-00aa0aaa0b0aaa000 \
    --source TransitGatewayAttachmentArn=arn:aws:ec2:us-east-1:123456789012:transit-gateway-attachment/tgw-attach-0d4a2d491bf68c093,IpAddress=10.0.0.0 \
    --destination TransitGatewayAttachmentArn=arn:aws:ec2:us-west-1:123456789012:transit-gateway-attachment/tgw-attach-002577f30bb181742,IpAddress=11.0.0.0 \
    --include-return-path
```

Output:

```
{
    "RouteAnalysis": {
        "GlobalNetworkId": "global-network-00aa0aaa0b0aaa000",
        "OwnerAccountId": "1111222233333",
        "RouteAnalysisId": "a1873de1-273c-470c-1a2bc2345678",
        "StartTimestamp": 1695760154.0,
```

```
        "Status": "RUNNING",
        "Source": {
            "TransitGatewayAttachmentArn": "arn:aws:ec2:us-
east-1:123456789012:transit-gateway-attachment/tgw-attach-1234567890abcdef0",
            "TransitGatewayArn": "arn:aws:ec2:us-east-1:123456789012:transit-
gateway/tgw-abcdef01234567890",
            "IpAddress": "10.0.0.0"
        },
        "Destination": {
            "TransitGatewayAttachmentArn": "arn:aws:ec2:us-
west-1:123456789111:transit-gateway-attachment/tgw-attach-021345abcdef6789",
            "TransitGatewayArn": "arn:aws:ec2:us-west-1:123456789012:transit-
gateway/tgw-09876543210fedcba0",
            "IpAddress": "11.0.0.0"
        },
        "IncludeReturnPath": true,
        "UseMiddleboxes": false
    }
}
```

For more information, see Route Analyzer in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see StartRouteAnalysis in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To apply tags to a resource

The following `tag-resource` example applies the tag `Network=Northeast` to the device `device-07f6fd08867abc123`.

```
aws networkmanager tag-resource \
    --resource-arn arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123 \
    --tags Key=Network,Value=Northeast
```

This command produces no output.

For more information, see Resource tags in AWS Global Networks for Transit Gateways in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource

The following `untag-resource` example removes the tag with the key `Network` from the device `device-07f6fd08867abc123`.

```
aws networkmanager untag-resource \
    --resource-arn arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123 \
    --tag-keys Network
```

This command produces no output.

For more information, see Resource tags in AWS Global Networks for Transit Gateways in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-device`

The following code example shows how to use `update-device`.

AWS CLI

To update a device

The following `update-device` example updates device `device-07f6fd08867abc123` by specifying a site ID for the device.

```
aws networkmanager update-device \
    --global-network-id global-network-01231231231231231 \
```

```
    --device-id device-07f6fd08867abc123 \
    --site-id site-444555aaabbb11223
```

Output:

```
{
    "Device": {
        "DeviceId": "device-07f6fd08867abc123",
        "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "NY office device",
        "Type": "Office device",
        "Vendor": "anycompany",
        "Model": "abcabc",
        "SerialNumber": "1234",
        "SiteId": "site-444555aaabbb11223",
        "CreatedAt": 1575554005.0,
        "State": "UPDATING"
    }
}
```

For more information, see Devices in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateDevice in *AWS CLI Command Reference*.

update-global-network

The following code example shows how to use `update-global-network`.

AWS CLI

To update a global network

The following `update-global-network` example updates the description for global network `global-network-01231231231231231`.

```
aws networkmanager update-global-network \
    --global-network-id global-network-01231231231231231 \
    --description "Head offices"
```

Output:

```
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "GlobalNetworkArn": "arn:aws:networkmanager::123456789012:global-network/
global-network-01231231231231231",
        "Description": "Head offices",
        "CreatedAt": 1575553525.0,
        "State": "UPDATING"
    }
}
```

For more information, see Global Networks in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateGlobalNetwork in *AWS CLI Command Reference*.

`update-link`

The following code example shows how to use `update-link`.

AWS CLI

To update a link

The following `update-link` example updates the bandwidth information for link `link-11112222aaaabbbb1`.

```
aws networkmanager update-link \
    --global-network-id global-network-01231231231231231 \
    --link-id link-11112222aaaabbbb1 \
    --bandwidth UploadSpeed=20,DownloadSpeed=20
```

Output:

```
{
    "Link": {
        "LinkId": "link-11112222aaaabbbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
```

```
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 20,
            "DownloadSpeed": 20
        },
        "Provider": "AnyCompany",
        "CreatedAt": 1575555811.0,
        "State": "UPDATING"
    }
}
```

For more information, see Sites and links in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateLink in *AWS CLI Command Reference*.

`update-site`

The following code example shows how to use `update-site`.

AWS CLI

To update a site

The following `update-site` example updates the description for site `site-444555aaabbb11223` in the specified global network.

```
aws networkmanager update-site \
    --global-network-id global-network-01231231231231231 \
    --site-id site-444555aaabbb11223 \
    --description "New York Office site"
```

Output:

```
{
    "Site": {
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York Office site",
```

```
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554528.0,
        "State": "UPDATING"
    }
}
```

For more information, see Sites and links in AWS Global Networks for Transit Gateways in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateSite in *AWS CLI Command Reference*.

OpenSearch Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with OpenSearch Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-elasticsearch-domain`

The following code example shows how to use `create-elasticsearch-domain`.

AWS CLI

To create an Amazon Elasticsearch Service domain

The following `create-elasticsearch-domain` example creates a new Amazon Elasticsearch Service domain within a VPC and restricts access to a single user. Amazon ES infers the VPC ID from the specified subnet and security group IDs.

```
aws es create-elasticsearch-domain \
    --domain-name vpc-cli-example \
    --elasticsearch-version 6.2 \
    --elasticsearch-cluster-
config InstanceType=m4.large.elasticsearch,InstanceCount=1 \
    --ebs-options EBSEnabled=true,VolumeType=standard,VolumeSize=10 \
    --access-policies '{"Version":"2012-10-17",        "Statement": [ { "Effect":
 "Allow", "Principal": {"AWS": "arn:aws:iam::123456789012:root" }, "Action":"es:*",
 "Resource": "arn:aws:es:us-west-2:123456789012:domain/vpc-cli-example/*" } ] }' \
    --vpc-options SubnetIds=subnet-1a2a3a4a,SecurityGroupIds=sg-2a3a4a5a
```

Output:

```
{
    "DomainStatus": {
        "ElasticsearchClusterConfig": {
            "DedicatedMasterEnabled": false,
            "InstanceCount": 1,
            "ZoneAwarenessEnabled": false,
            "InstanceType": "m4.large.elasticsearch"
        },
        "DomainId": "123456789012/vpc-cli-example",
        "CognitoOptions": {
            "Enabled": false
        },
        "VPCOptions": {
            "SubnetIds": [
                "subnet-1a2a3a4a"
            ],
            "VPCId": "vpc-3a4a5a6a",
            "SecurityGroupIds": [
                "sg-2a3a4a5a"
            ],
            "AvailabilityZones": [
                "us-west-2c"
            ]
        },
        "Created": true,
        "Deleted": false,
        "EBSOptions": {
            "VolumeSize": 10,
            "VolumeType": "standard",
            "EBSEnabled": true
```

```
        },
        "Processing": true,
        "DomainName": "vpc-cli-example",
        "SnapshotOptions": {
            "AutomatedSnapshotStartHour": 0
        },
        "ElasticsearchVersion": "6.2",

    }
}
```

For more information, see Creating and Managing Amazon Elasticsearch Service Domains in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see CreateElasticsearchDomain in *AWS CLI Command Reference*.

`describe-elasticsearch-domain-config`

The following code example shows how to use `describe-elasticsearch-domain-config`.

AWS CLI

To get domain configuration details

The following `describe-elasticsearch-domain-config` example provides configuration details for a given domain, along with status information for each individual domain component.

```
aws es describe-elasticsearch-domain-config \
    --domain-name cli-example
```

Output:

```
{
    "DomainConfig": {
        "ElasticsearchVersion": {
            "Options": "7.4",
            "Status": {

For more information, see Creating and Managing Amazon Elasticsearch Service Domains in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see DescribeElasticsearchDomainConfig in *AWS CLI Command Reference*.

describe-elasticsearch-domain

The following code example shows how to use `describe-elasticsearch-domain`.

AWS CLI

To get details for a single domain

The following `describe-elasticsearch-domain` example provides configuration details for a given domain.

```
aws es describe-elasticsearch-domain \
    --domain-name cli-example
```

Output:

```
{
    "DomainStatus": {
        "DomainId": "123456789012/cli-example",
        "DomainName": "cli-example",
        "ARN": "arn:aws:es:us-west-2:123456789012:domain/cli-example",
        "Created": true,
        "Deleted": false,
        "Endpoint": "search-cli-example-1a2a3a4a5a6a7a8a9a0a.us-
west-2.es.amazonaws.com",
        "Processing": false,
        "UpgradeProcessing": false,
        "ElasticsearchVersion": "7.4",
        "ElasticsearchClusterConfig": {
            "InstanceType": "c5.large.elasticsearch",
            "InstanceCount": 1,
            "DedicatedMasterEnabled": true,
            "ZoneAwarenessEnabled": false,
            "DedicatedMasterType": "c5.large.elasticsearch",
            "DedicatedMasterCount": 3,
            "WarmEnabled": true,
            "WarmType": "ultrawarm1.medium.elasticsearch",
            "WarmCount": 2
        },
        "EBSOptions": {
            "EBSEnabled": true,
            "VolumeType": "gp2",
            "VolumeSize": 10
```

```
        },

- For API details, see DescribeElasticsearchDomain in *AWS CLI Command Reference*.

`describe-elasticsearch-domains`

The following code example shows how to use `describe-elasticsearch-domains`.

AWS CLI

To get details for one or more domains

The following `describe-elasticsearch-domains` example provides configuration details for one or more domains.

```
aws es describe-elasticsearch-domains \
    --domain-names cli-example-1 cli-example-2
```

Output:

```
{
    "DomainStatusList": [{
            "DomainId": "123456789012/cli-example-1",
            "DomainName": "cli-example-1",

`describe-reserved-elasticsearch-instances`

The following code example shows how to use `describe-reserved-elasticsearch-instances`.

AWS CLI

To view all reserved instances

The following `describe-reserved-elasticsearch-instances` example provides a summary of all instances you have reserved in a region.

```
aws es describe-reserved-elasticsearch-instances
```

Output:

```
{
    "ReservedElasticsearchInstances": [{
        "FixedPrice": 100.0,
        "ReservedElasticsearchInstanceOfferingId":
 "1a2a3a4a5-1a2a-3a4a-5a6a-1a2a3a4a5a6a",
```

```
        "ReservationName": "my-reservation",
        "PaymentOption": "PARTIAL_UPFRONT",
        "UsagePrice": 0.0,
        "ReservedElasticsearchInstanceId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "RecurringCharges": [{
            "RecurringChargeAmount": 0.603,
            "RecurringChargeFrequency": "Hourly"
        }],
        "State": "payment-pending",
        "StartTime": 1522872571.229,
        "ElasticsearchInstanceCount": 3,
        "Duration": 31536000,
        "ElasticsearchInstanceType": "m4.2xlarge.elasticsearch",
        "CurrencyCode": "USD"
    }]
}
```

For more information, see Reserved Instances in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see DescribeReservedElasticsearchInstances in *AWS CLI Command Reference*.

`list-domain-names`

The following code example shows how to use `list-domain-names`.

AWS CLI

To list all domains

The following `list-domain-names` example provides a quick summary of all domains in the region.

```
aws es list-domain-names
```

Output:

```
{
    "DomainNames": [{
            "DomainName": "cli-example-1"
        },
        {
```

```
            "DomainName": "cli-example-2"
        }
    ]
}
```

For more information, see Creating and Managing Amazon Elasticsearch Service Domains in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see ListDomainNames in *AWS CLI Command Reference*.

Organizations examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Organizations.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-handshake`

The following code example shows how to use `accept-handshake`.

AWS CLI

To accept a handshake from another account

The following `accept-handshake` example accepts a handshake on behalf of Juan's account and thus agrees to the invitation. Bill, the owner of an organization, has previously invited Juan's account to join his organization.

```
aws organizations accept-handshake \
    --handshake-id h-examplehandshakeid111
```

Output:

```
{
    "Handshake": {
        "Action": "INVITE",
        "Arn": "arn:aws:organizations::123456789012:handshake/o-exampleorgid/invite/
h-examplehandshakeid111",
        "RequestedTimestamp": 1481656459.257,
        "ExpirationTimestamp": 1482952459.257,
        "Id": "h-examplehandshakeid111",
        "Parties": [
            {
                "Id": "o-exampleorgid",
                "Type": "ORGANIZATION"
            },
            {
                "Id": "juan@example.com",
                "Type": "EMAIL"
            }
        ],
        "Resources": [
            {
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@amazon.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Org Master Account"
                    },
                    {
                        "Type": "ORGANIZATION_FEATURE_SET",
                        "Value": "ALL"
                    }
                ],
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid"
            },
            {
                "Type": "EMAIL",
                "Value": "juan@example.com"
            }
        ],
```

```
        "State": "ACCEPTED"
    }
}
```

For more information, see Accepting or declining account invitations with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see AcceptHandshake in *AWS CLI Command Reference*.

`attach-policy`

The following code example shows how to use `attach-policy`.

AWS CLI

Example 1: To attach a policy to an OU

The following `attach-policy` example attaches a service control policy (SCP) to an OU.

```
aws organizations attach-policy \
    --policy-id p-examplepolicyid111 \
    --target-id ou-examplerootid111-exampleouid111
```

For more information, see Attaching organization policies with AWS Organizations in the *AWS Organizations User Guide*.

This command produces no output.

Example 2: To attach a policy to an account

The following `attach-policy` example attaches a service control policy directly to an account.

```
aws organizations attach-policy \
    --policy-id p-examplepolicyid111 \
    --target-id 123456789222
```

This command produces no output.

For more information, see Attaching organization policies with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see AttachPolicy in *AWS CLI Command Reference*.

`cancel-handshake`

The following code example shows how to use `cancel-handshake`.

AWS CLI

To cancel a handshake sent from another account

The following `cancel-handshake` example cancels a handshake that Bill previously sent to invite Susan's account to join his organization. He changes his mind and decides to cancel the invitation before Susan accepts it. The output shows that the handshake state is now CANCELED.

```
aws organizations cancel-handshake \
    --handshake-id h-examplehandshakeid111
```

Output:

```
{
    "Handshake": {
        "Id": "h-examplehandshakeid111",
        "State":"CANCELED",
        "Action": "INVITE",
        "Arn": "arn:aws:organizations::123456789012:handshake/o-exampleorgid/invite/
h-examplehandshakeid111",
        "Parties": [
            {
                "Id": "o-exampleorgid",
                "Type": "ORGANIZATION"
            },
            {
                "Id": "susan@example.com",
                "Type": "EMAIL"
            }
        ],
        "Resources": [
            {
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid",
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
```

```
                        "Value": "bill@example.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Master Account"
                    },
                    {
                        "Type": "ORGANIZATION_FEATURE_SET",
                        "Value": "CONSOLIDATED_BILLING"
                    }
                ]
            },
            {
                "Type": "EMAIL",
                "Value": "anika@example.com"
            },
            {
                "Type": "NOTES",
                "Value": "This is a request for Susan's account to join Bob's
 organization."
            }
        ],
        "RequestedTimestamp": 1.47008383521E9,
        "ExpirationTimestamp": 1.47137983521E9
    }
}
```

For more information, see Managing pending account invitations with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see CancelHandshake in *AWS CLI Command Reference*.

`create-account`

The following code example shows how to use `create-account`.

AWS CLI

To create a member account that is automatically part of the organization

The following `create-account` example creates a member account in an organization. The member account is configured with the name Production Account and the email address of susan@example.com. Organizations automatically creates an IAM role using the default name

of OrganizationAccountAccessRole because the roleName parameter is not specified. Also, the setting that allows IAM users or roles with sufficient permissions to access account billing data is set to the default value of ALLOW because the IamUserAccessToBilling parameter is not specified. Organizations automatically sends Susan a "Welcome to AWS" email. The output shows that the request status is IN_PROGRESS.

```
aws organizations create-account \
    --email susan@example.com \
    --account-name "Production Account"
```

Output:

```
{
    "CreateAccountStatus": {
        "State": "IN_PROGRESS",
        "Id": "car-examplecreateaccountrequestid111"
    }
}
```

You can later query the current status of the request by providing the Id response value to the describe-create-account-status command as the value for the create-account-request-id parameter.

For more information, see Creating a member account in an organization with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see CreateAccount in *AWS CLI Command Reference*.

`create-organization`

The following code example shows how to use `create-organization`.

AWS CLI

Example 1: To create a new organization

The following `create-organization` example creates an organization using credentials from Bill's account 111111111111. The account becomes the master account in the new organization. Because he does not specify a features set, the new organization defaults to all features enabled and service control policies are enabled on the root.

```
aws organizations create-organization
```

Output:

```
{
    "Organization": {
        "AvailablePolicyTypes": [
            {
                "Status": "ENABLED",
                "Type": "SERVICE_CONTROL_POLICY"
            }
        ],
        "MasterAccountId": "123456789012",
        "MasterAccountArn": "arn:aws:organizations::123456789012:account/o-
exampleorgid/123456789012",
        "MasterAccountEmail": "bill@example.com",
        "FeatureSet": "ALL",
        "Id": "o-exampleorgid",
        "Arn": "arn:aws:organizations::123456789012:organization/o-exampleorgid"
    }
}
```

For more information, see Creating an organization with AWS Organizations in the *AWS Organizations User Guide*.

Example 2: To create a new organization with only consolidated billing features enabled

The following `create-organization` example creates an organization that supports only the consolidated billing features.

```
aws organizations create-organization \
    --feature-set CONSOLIDATED_BILLING
```

Output:

```
{
    "Organization": {
        "Arn": "arn:aws:organizations::123456789012:organization/o-exampleorgid",
        "AvailablePolicyTypes": [],
        "Id": "o-exampleorgid",
        "MasterAccountArn": "arn:aws:organizations::123456789012:account/o-
exampleorgid/123456789012",
```

```
        "MasterAccountEmail": "bill@example.com",
        "MasterAccountId": "123456789012",
        "FeatureSet": "CONSOLIDATED_BILLING"
    }
}
```

For more information, see Creating an organization with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see CreateOrganization in *AWS CLI Command Reference*.

`create-organizational-unit`

The following code example shows how to use `create-organizational-unit`.

AWS CLI

To create an OU in a root or parent OU

The following `create-organizational-unit` example creates an OU that is named AccountingOU.

```
aws organizations create-organizational-unit \
    --parent-id r-examplerootid111 \
    --name AccountingOU
```

Output:

```
{
    "OrganizationalUnit": {
        "Id": "ou-examplerootid111-exampleouid111",
        "Arn": "arn:aws:organizations::123456789012:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111",
        "Name": "AccountingOU"
    }
}
```

For more information, see Creating an organizational unit (OU) with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see CreateOrganizationalUnit in *AWS CLI Command Reference*.

create-policy

The following code example shows how to use `create-policy`.

AWS CLI

Example 1: To create a policy with a text source file for the JSON policy

The following `create-policy` example creates a service control policy (SCP) named `AllowAllS3Actions`. The policy contents are taken from a file on the local computer called `policy.json`.

```
aws organizations create-policy \
    --content file://policy.json \
    --name AllowAllS3Actions \
    --type SERVICE_CONTROL_POLICY \
    --description "Allows delegation of all S3 actions"
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:*"
            ],
            "Resource": [
                "*"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "Content": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Action\":[\"s3:*\"],\"Resource\":[\"*\"]}]}",
        "PolicySummary": {
```

```
            "Arn": "arn:aws:organizations::o-exampleorgid:policy/
service_control_policy/p-examplepolicyid111",
            "Description": "Allows delegation of all S3 actions",
            "Name": "AllowAllS3Actions",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```

For more information, see Creating organization policies with AWS Organizations in the *AWS Organizations User Guide*.

Example 2: To create a policy with a JSON policy as a parameter

The following `create-policy` example creates the same SCP, this time by embedding the policy contents as a JSON string in the parameter. The string must be escaped with backslashes before the double quotes to ensure that they are treated as literals in the parameter, which itself is surrounded by double quotes.

```
aws organizations create-policy \
    --content "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow\",
\"Action\":[\"s3:*\"],\"Resource\":[\"*\"]}]}" \
    --name AllowAllS3Actions \
    --type SERVICE_CONTROL_POLICY \
    --description "Allows delegation of all S3 actions"
```

Output:

```
{
    "Policy": {
        "Content": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Action\":[\"s3:*\"],\"Resource\":[\"*\"]}]}",
        "PolicySummary": {
            "Arn": "arn:aws:organizations::o-exampleorgid:policy/
service_control_policy/p-examplepolicyid111",
            "Description": "Allows delegation of all S3 actions",
            "Name": "AllowAllS3Actions",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```

For more information, see Creating organization policies with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see CreatePolicy in *AWS CLI Command Reference*.

`decline-handshake`

The following code example shows how to use `decline-handshake`.

AWS CLI

To decline a handshake sent from another account

The following `decline-handshake` example declines an invitation to join Bill's organization on behalf of Susan, an admin who is the owner of account 222222222222. The DeclineHandshake operation returns a handshake object, showing that the state is now DECLINED.

```
aws organizations decline-handshake \
    --handshake-id h-examplehandshakeid111
```

Output:

```
{
    "Handshake": {
        "Id": "h-examplehandshakeid111",
        "State": "DECLINED",
        "Resources": [
            {
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid",
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@example.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Master Account"
                    }
                ]
            },
```

```
            {
                "Type": "EMAIL",
                "Value": "susan@example.com"
            },
            {
                "Type": "NOTES",
                "Value": "This is an invitation to Susan's account to join the
 Bill's organization."
            }
        ],
        "Parties": [
            {
                "Type": "EMAIL",
                "Id": "susan@example.com"
            },
            {
                "Type": "ORGANIZATION",
                "Id": "o-exampleorgid"
            }
        ],
        "Action": "INVITE",
        "RequestedTimestamp": 1470684478.687,
        "ExpirationTimestamp": 1471980478.687,
        "Arn": "arn:aws:organizations::123456789012:handshake/o-exampleorgid/invite/
h-examplehandshakeid111"
    }
}
```

For more information, see Accepting or declining account invitations with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see DeclineHandshake in *AWS CLI Command Reference*.

`delete-organization`

The following code example shows how to use `delete-organization`.

AWS CLI

To delete an organization

The following `delete-organization` example deletes an organization. To perform this operation, you must be an admin of the master account in the organization. The example

assumes that you previously removed all the member accounts, OUs, and policies from the organization.

```
aws organizations delete-organization
```

This command produces no output.

For more information, see Deleting an organization with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see DeleteOrganization in *AWS CLI Command Reference*.

`delete-organizational-unit`

The following code example shows how to use `delete-organizational-unit`.

AWS CLI

To delete an OU

The following `delete-organizational-unit` example deletes an OU. The example assumes that you previously removed all accounts and other OUs from the OU.

```
aws organizations delete-organizational-unit \
    --organizational-unit-id ou-examplerootid111-exampleouid111
```

This command produces no output.

For more information, see Deleting an organizational unit (OU) with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see DeleteOrganizationalUnit in *AWS CLI Command Reference*.

`delete-policy`

The following code example shows how to use `delete-policy`.

AWS CLI

To delete a policy

The following `delete-policy` example deletes a policy from an organization. The example assumes that you previously detached the policy from all entities.

```
aws organizations delete-policy \
    --policy-id p-examplepolicyid111
```

This command produces no output.

For more information, see Deleting organization policies with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

`describe-account`

The following code example shows how to use `describe-account`.

AWS CLI

To get the details about an account

The following `describe-account` example requests details about an account.

```
aws organizations describe-account \
    --account-id 123456789444
```

Output:

```
{
    "Account": {
        "Id": "123456789444",
        "Arn": "arn:aws:organizations::123456789012:account/o-
exampleorgid/123456789444",
        "Name": "Beta account",
        "Email": "anika@example.com",
        "JoinedMethod": "INVITED",
        "JoinedTimestamp": 1481756563.134,
        "Paths": [
            "o-exampleorgid/r-examplerootid111/123456789444/"
        ],
        "State": "ACTIVE",
        "Status": "ACTIVE"
```

```
    }
}
```

For more information, see View details of an account in AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see DescribeAccount in *AWS CLI Command Reference*.

`describe-create-account-status`

The following code example shows how to use `describe-create-account-status`.

AWS CLI

To get the latest status about a request to create an account

The following `describe-create-account-status` example requests the latest status for a previous request to create an account in an organization. The specified `--create-account-request-id` comes from the response of the original call to create-account. The account creation request shows by the status field that Organizations successfully completed the creation of the account.

```
aws organizations describe-create-account-status \
    --create-account-request-id car-examplecreateaccountrequestid111
```

Output:

```
{
    "CreateAccountStatus": {
        "State": "SUCCEEDED",
        "AccountId": "123456789444",
        "AccountName": "Beta account",
        "RequestedTimestamp": 1470684478.687,
        "CompletedTimestamp": 1470684532.472,
        "Id": "car-examplecreateaccountrequestid111"
    }
}
```

For more information, see Creating a member account in an organization with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see DescribeCreateAccountStatus in *AWS CLI Command Reference*.

describe-handshake

The following code example shows how to use `describe-handshake`.

AWS CLI

To get information about a handshake

The following `describe-handshake` example requests details about a handshake. The handshake ID comes either from the original call to `InviteAccountToOrganization`, or from a call to `ListHandshakesForAccount` or `ListHandshakesForOrganization`.

```
aws organizations describe-handshake \
    --handshake-id h-examplehandshakeid111
```

Output:

```
{
    "Handshake": {
        "Id": "h-examplehandshakeid111",
        "State": "OPEN",
        "Resources": [
            {
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid",
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@example.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Master Account"
                    }
                ]
            },
            {
                "Type": "EMAIL",
                "Value": "anika@example.com"
            }
        ],
        "Parties": [
            {
```

```
                "Type": "ORGANIZATION",
                "Id": "o-exampleorgid"
            },
            {
                "Type": "EMAIL",
                "Id": "anika@example.com"
            }
        ],
        "Action": "INVITE",
        "RequestedTimestamp": 1470158698.046,
        "ExpirationTimestamp": 1471454698.046,
        "Arn": "arn:aws:organizations::123456789012:handshake/o-exampleorgid/invite/
h-examplehandshakeid111"
    }
}
```

For more information, see Managing account invitations with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see DescribeHandshake in *AWS CLI Command Reference*.

`describe-organization`

The following code example shows how to use `describe-organization`.

AWS CLI

To get information about the current organization

The following `describe-organization` example requests details about an organization.

```
aws organizations describe-organization
```

Output:

```
{
    "Organization": {
        "MasterAccountArn": "arn:aws:organizations::123456789012:account/o-
exampleorgid/123456789012",
        "MasterAccountEmail": "bill@example.com",
        "MasterAccountId": "123456789012",
        "Id": "o-exampleorgid",
```

```
        "FeatureSet": "ALL",
        "Arn": "arn:aws:organizations::123456789012:organization/o-exampleorgid",
        "AvailablePolicyTypes": [
            {
                "Status": "ENABLED",
                "Type": "SERVICE_CONTROL_POLICY"
            }
        ]
    }
}
```

For more information, see Viewing details of an organization from the management account in the *AWS Organizations User Guide*.

- For API details, see DescribeOrganization in *AWS CLI Command Reference*.

`describe-organizational-unit`

The following code example shows how to use `describe-organizational-unit`.

AWS CLI

To get information about an OU

The following `describe-organizational-unit` example requests details about an OU.

```
aws organizations describe-organizational-unit \
    --organizational-unit-id ou-examplerootid111-exampleouid111
```

Output:

```
{
    "OrganizationalUnit": {
        "Name": "Accounting Group",
        "Arn": "arn:aws:organizations::123456789012:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111",
        "Id": "ou-examplerootid111-exampleouid111"
    }
}
```

For more information, see Viewing details of an organizational unit (OU) with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see DescribeOrganizationalUnit in *AWS CLI Command Reference*.

`describe-policy`

The following code example shows how to use `describe-policy`.

AWS CLI

To get information about a policy

The following `describe-policy` example requests information about a policy.

```
aws organizations describe-policy \
    --policy-id p-examplepolicyid111
```

Output:

```
{
    "Policy": {
        "Content": "{\n  \"Version\": \"2012-10-17\",\n  \"Statement\": [\n    {\n
     \"Effect\": \"Allow\",\n      \"Action\": \"*\",\n      \"Resource\": \"*\"\n
  }\n  ]\n}",
        "PolicySummary": {
            "Arn": "arn:aws:organizations::123456789012:policy/o-exampleorgid/
service_control_policy/p-examplepolicyid111",
            "Type": "SERVICE_CONTROL_POLICY",
            "Id": "p-examplepolicyid111",
            "AwsManaged": false,
            "Name": "AllowAllS3Actions",
            "Description": "Enables admins to delegate S3 permissions"
        }
    }
}
```

For more information, see Getting information about your organization's policies in the *AWS Organizations User Guide*.

- For API details, see DescribePolicy in *AWS CLI Command Reference*.

`detach-policy`

The following code example shows how to use `detach-policy`.

AWS CLI

To detach a policy from a root, OU, or account

The following `detach-policy` example detaches a policy from an OU.

```
aws organizations detach-policy \
    --target-id ou-examplerootid111-exampleouid111 \
    --policy-id p-examplepolicyid111
```

This command produces no output.

For more information, see Detaching organization policies with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see DetachPolicy in *AWS CLI Command Reference*.

`disable-policy-type`

The following code example shows how to use `disable-policy-type`.

AWS CLI

To disable a policy type in a root

The following `disable-policy-type` example disables the service control policy (SCP) policy type in a root. The output shows that the `PolicyTypes` response element no longer includes `SERVICE_CONTROL_POLICY`.

```
aws organizations disable-policy-type \
    --root-id r-examplerootid111 \
    --policy-type SERVICE_CONTROL_POLICY
```

Output:

```
{
    "Root": {
        "PolicyTypes": [],
        "Name": "Root",
        "Id": "r-examplerootid111",
        "Arn": "arn:aws:organizations::123456789012:root/o-exampleorgid/r-
examplerootid111"
```

```
    }
}
```

For more information, see Disabling a policy type in the *AWS Organizations User Guide*.

- For API details, see DisablePolicyType in *AWS CLI Command Reference*.

`enable-all-features`

The following code example shows how to use `enable-all-features`.

AWS CLI

To enable all features in an organization

The following `enable-all-features` example asks all the invited accounts in the organization to approve enabling all features in the organization. AWS Organizations sends an email to the address that is registered with every invited member account asking the owner to approve the change to all features by accepting the handshake that is sent. After all invited member accounts accept the handshake, the organization administrator can finalize the change to all features, and those with appropriate permissions can create policies and apply them to roots, OUs, and accounts.

```
aws organizations enable-all-features
```

The output is a handshake object that is sent to all invited member accounts for approval.

Output:

```
{
    "Handshake": {
        "Action": "ENABLE_ALL_FEATURES",
        "Arn": "arn:aws:organizations::123456789012:handshake/o-exampleorgid/
enable_all_features/h-examplehandshakeid111",
        "ExpirationTimestamp": 1483127868.609,
        "Id": "h-examplehandshakeid111",
        "Parties": [
            {
                "Id": "o-exampleorgid",
                "Type": "ORGANIZATION"
            }
        ],
```

```
        "RequestedTimestamp": 1481831868.609,
        "Resources": [
            {
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid"
            }
        ],
        "State": "REQUESTED"
    }
}
```

For more information, see Enabling all features for an organization with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see EnableAllFeatures in *AWS CLI Command Reference*.

`enable-policy-type`

The following code example shows how to use `enable-policy-type`.

AWS CLI

To enable the use of a policy type in a root

The following `enable-policy-type` example enables the service control policy (SCP) policy type in a root.

```
aws organizations enable-policy-type \
    --root-id r-examplerootid111 \
    --policy-type SERVICE_CONTROL_POLICY
```

The output shows a root object with a policyTypes response element showing that SCPs are now enabled.

Output:

```
{
    "Root": {
        "PolicyTypes": [
            {
                "Status": "ENABLED",
                "Type": "SERVICE_CONTROL_POLICY"
            }
```

```
        ],
        "Id": "r-examplerootid111",
        "Name": "Root",
        "Arn": "arn:aws:organizations::123456789012:root/o-exampleorgid/r-
examplerootid111"
    }
}
```

For more information, see Enabling a policy type in the *AWS Organizations User Guide*.

- For API details, see EnablePolicyType in *AWS CLI Command Reference*.

`invite-account-to-organization`

The following code example shows how to use `invite-account-to-organization`.

AWS CLI

To invite an account to join an organization

The following `invite-account-to-organization` example invites the account owned by juan@example.com to join an organization from the master account owned by bill@example.com.

```
aws organizations invite-account-to-organization \
    --target '{"Type": "EMAIL", "Id": "juan@example.com"}' \
    --notes "This is a request for Juan's account to join Bill's organization."
```

The output includes a handshake structure that shows what is sent to the invited account.

Output:

```
{
    "Handshake": {
        "Action": "INVITE",
        "Arn": "arn:aws:organizations::123456789012:handshake/o-exampleorgid/invite/
h-examplehandshakeid111",
        "ExpirationTimestamp": 1482952459.257,
        "Id": "h-examplehandshakeid111",
        "Parties": [
            {
                "Id": "o-exampleorgid",
                "Type": "ORGANIZATION"
```

```
            },
            {
                "Id": "juan@example.com",
                "Type": "EMAIL"
            }
        ],
        "RequestedTimestamp": 1481656459.257,
        "Resources": [
            {
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@amazon.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Org Master Account"
                    },
                    {
                        "Type": "ORGANIZATION_FEATURE_SET",
                        "Value": "FULL"
                    }
                ],
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid"
            },
            {
                "Type": "EMAIL",
                "Value": "juan@example.com"
            }
        ],
        "State": "OPEN"
    }
}
```

For more information, see Managing account invitations with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see InviteAccountToOrganization in *AWS CLI Command Reference*.

`leave-organization`

The following code example shows how to use `leave-organization`.

AWS CLI

To leave an organization as a member account

The following `leave-organization` example requests that a member account leave the organization it is currently a member of.

```
aws organizations leave-organization
```

This command produces no output.

For more information, see Leaving an organization from a member account with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see LeaveOrganization in *AWS CLI Command Reference*.

`list-accounts-for-parent`

The following code example shows how to use `list-accounts-for-parent`.

AWS CLI

To retrieve a list of all of the accounts in a specified parent root or OU

The following `list-accounts-for-parent` example requests a list of the accounts in an OU.

```
aws organizations list-accounts-for-parent \
    --parent-id ou-examplerootid111-exampleouid111
```

The output includes a list of account summary objects.

Output:

```
{
    "Accounts": [
        {
            "Arn": "arn:aws:organizations::123456789012:account/o-
exampleorgid/123456789222",
            "JoinedMethod": "INVITED",
            "JoinedTimestamp": 1481835795.536,
            "Id": "123456789222",
```

```
            "Name": "Development Account",
            "Email": "juan@example.com",
            "Paths": [
                "o-exampleorgid/r-examplerootid111/123456789012/"
            ],
            "State": "ACTIVE",
            "Status": "ACTIVE"
        },
        {
            "Arn": "arn:aws:organizations::123456789012:account/o-
exampleorgid/123456789333",
            "JoinedMethod": "INVITED",
            "JoinedTimestamp": 1481835812.143,
            "Id": "123456789333",
            "Name": "Test Account",
            "Email": "anika@example.com",
            "Paths": [

            ],
            "State": "ACTIVE",
            "Status": "ACTIVE"
        }
    ]
}
```

For more information, see Managing accounts in an organization with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see ListAccountsForParent in *AWS CLI Command Reference*.

`list-accounts`

The following code example shows how to use `list-accounts`.

AWS CLI

To retrieve a list of all of the accounts in an organization

The following `list-accounts` example requests a list of the accounts in an organization.

```
aws organizations list-accounts
```

The output includes a list of account summary objects.

Output:

```
{
    "Accounts": [
        {

            "Name": "Test Account",
            "Email": "anika@example.com",
            "Paths": [
                "o-exampleorgid/r-examplerootid111/123456789012/"
            ],
            "State": "ACTIVE",
            "Status": "ACTIVE"
        }
    ]
}
```

For more information, see Managing accounts in an organization with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see ListAccounts in *AWS CLI Command Reference*.

`list-children`

The following code example shows how to use `list-children`.

AWS CLI

To retrieve the child accounts and OUs of a parent OU or root

The following `list-children` example lists the child OUs of a parent OU.

```
aws organizations list-children \
    --child-type ORGANIZATIONAL_UNIT \
    --parent-id ou-examplerootid111-exampleouid111
```

The output shows the two child OUs that are contained by the parent.

Output:

```
{
```

```
    "Children": [
        {
            "Id": "ou-examplerootid111-exampleouid111",
            "Type": "ORGANIZATIONAL_UNIT"
        },
        {
            "Id": "ou-examplerootid111-exampleouid222",
            "Type": "ORGANIZATIONAL_UNIT"
        }
    ]
}
```

For more information, see Managing organizational units (OUs) with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see ListChildren in *AWS CLI Command Reference*.

`list-create-account-status`

The following code example shows how to use `list-create-account-status`.

AWS CLI

Example 1: To retrieve a list of the account creation requests made in the current organization

The following `list-create-account-status` example requests a list of account creation requests for an organization that have completed successfully.

```
aws organizations list-create-account-status \
    --states SUCCEEDED
```

The output includes an array of objects with information about each request.

Output:

```
{
    "CreateAccountStatuses": [
        {
            "AccountId": "123456789333",
            "AccountName": "Developer Test Account",
            "CompletedTimestamp": 1481835812.143,
```

```
            "Id": "car-examplecreateaccountrequestid111",
            "RequestedTimestamp": 1481829432.531,
            "State": "SUCCEEDED"
        }
    ]
}
```

For more information, see Creating a member account in an organization with AWS Organizations in the *AWS Organizations User Guide*.

Example 2: To retrieve a list of the in progress account creation requests made in the current organization

The following `list-create-account-status` example gets a list of in-progress account creation requests for an organization.

```
aws organizations list-create-account-status \
    --states IN_PROGRESS
```

The output includes an array of objects with information about each request.

Output:

```
{
    "CreateAccountStatuses": [
        {
            "State": "IN_PROGRESS",
            "Id": "car-examplecreateaccountrequestid111",
            "RequestedTimestamp": 1481829432.531,
            "AccountName": "Production Account"
        }
    ]
}
```

For more information, see Creating a member account in an organization with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see ListCreateAccountStatus in *AWS CLI Command Reference*.

`list-handshakes-for-account`

The following code example shows how to use `list-handshakes-for-account`.

AWS CLI

To retrieve a list of the handshakes sent to an account

The following `list-handshakes-for-account` example gets a list of all handshakes that are associated with the account of the credentials that were used to call the operation.

```
aws organizations list-handshakes-for-account
```

The output includes a list of handshake structures with information about each handshake including its current state.

Output:

```
{
    "Handshakes": [
        {
        "Action": "INVITE",
        "Arn": "arn:aws:organizations::123456789012:handshake/o-exampleorgid/invite/
h-examplehandshakeid111",
        "ExpirationTimestamp": 1482952459.257,
        "Id": "h-examplehandshakeid111",
        "Parties": [
            {
                "Id": "o-exampleorgid",
                "Type": "ORGANIZATION"
            },
            {
                "Id": "juan@example.com",
                "Type": "EMAIL"
            }
        ],
        "RequestedTimestamp": 1481656459.257,
        "Resources": [
            {
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@amazon.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Org Master Account"
```

```
                    },
                    {
                        "Type": "ORGANIZATION_FEATURE_SET",
                        "Value": "FULL"
                    }
                ],
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid"
            },
            {
                "Type": "EMAIL",
                "Value": "juan@example.com"
            }
        ],
        "State": "OPEN"
    }
    ]
}
```

For more information, see Managing account invitations with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see ListHandshakesForAccount in *AWS CLI Command Reference*.

`list-handshakes-for-organization`

The following code example shows how to use `list-handshakes-for-organization`.

AWS CLI

To retrieve a list of the handshakes associated with an organization

The following `list-handshakes-for-organization` example gets a list of handshakes that are associated with the current organization.

```
aws organizations list-handshakes-for-organization
```

The output shows two handshakes. The first one is an invitation to Juan's account and shows a state of OPEN. The second is an invitation to Anika's account and shows a state of ACCEPTED.

Output:

```
{
```

```
    "Handshakes": [
        {
            "Action": "INVITE",
            "Arn": "arn:aws:organizations::123456789012:handshake/o-exampleorgid/
invite/h-examplehandshakeid111",
            "ExpirationTimestamp": 1482952459.257,
            "Id": "h-examplehandshakeid111",
            "Parties": [
                {
                    "Id": "o-exampleorgid",
                    "Type": "ORGANIZATION"
                },
                {
                    "Id": "juan@example.com",
                    "Type": "EMAIL"
                }
            ],

                {
                    "Type": "EMAIL",
                    "Value": "anika@example.com"
                },
                {
```

```
                    "Type": "NOTES",
                    "Value": "This is an invitation to Anika's account to join
 Bill's organization."
                }
            ]
        }
    ]
}
```

For more information, see Managing account invitations with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see ListHandshakesForOrganization in *AWS CLI Command Reference*.

`list-organizational-units-for-parent`

The following code example shows how to use `list-organizational-units-for-parent`.

AWS CLI

To retrieve a list of the OUs in a parent OU or root

The following `list-organizational-units-for-parent` example gets a list of OUs in a specified root.

```
aws organizations list-organizational-units-for-parent \
    --parent-id r-examplerootid111
```

The output shows that the specified root contains two OUs and shows details of each.

Output:

```
{
    "OrganizationalUnits": [
        {
            "Name": "AccountingDepartment",
            "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-examplerootid111/ou-
examplerootid111-exampleouid111"
        },
        {
            "Name": "ProductionDepartment",
```

```
            "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-examplerootid111/ou-
examplerootid111-exampleouid222"
        }
    ]
}
```

For more information, see Managing organizational units (OUs) with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see ListOrganizationalUnitsForParent in *AWS CLI Command Reference*.

`list-parents`

The following code example shows how to use `list-parents`.

AWS CLI

To list the parent OUs or roots for an account or child OU

The following `list-parents` example lists the root or parent OU that contains the account 444444444444.

```
aws organizations list-parents \
    --child-id 123456789333
```

The output shows that the specified account is in the OU with specified ID.

Output:

```
{
    "Parents": [
        {
            "Id": "ou-examplerootid111-exampleouid111",
            "Type": "ORGANIZATIONAL_UNIT"
        }
    ]
}
```

For more information, see Managing organizational units (OUs) with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see ListParents in *AWS CLI Command Reference*.

`list-policies-for-target`

The following code example shows how to use `list-policies-for-target`.

AWS CLI

To retrieve a list of the SCPs attached directly to an account

The following `list-policies-for-target` example gets a list of all service control policies (SCPs), as specified by the `--filter` parameter, that are directly attached to an account.

```
aws organizations list-policies-for-target \
    --filter SERVICE_CONTROL_POLICY \
    --target-id 123456789333
```

The output includes a list of policy structures with summary information about the policies. The list does not include policies that apply to the account because of inheritance from its location in an OU hierarchy.

Output:

```
{
    "Policies": [
        {
            "Type": "SERVICE_CONTROL_POLICY",
            "Name": "AllowAllEC2Actions",
            "AwsManaged": false,
            "Id": "p-examplepolicyid222",
            "Arn": "arn:aws:organizations::o-exampleorgid:policy/
service_control_policy/p-examplepolicyid222",
            "Description": "Enables account admins to delegate permissions for any
 EC2 actions to users and roles in their accounts."
        }
    ]
}
```

For more information, see Getting information about your organization's policies in the *AWS Organizations User Guide*.

- For API details, see ListPoliciesForTarget in *AWS CLI Command Reference*.

`list-policies`

The following code example shows how to use `list-policies`.

AWS CLI

To retrieve a list of all policies in an organization of a certain type

The following `list-policies` example gets a list of SCPs, as specified by the `--filter` parameter.

```
aws organizations list-policies \
    --filter SERVICE_CONTROL_POLICY
```

The output includes a list of policies with summary information.

Output:

```
{
    "Policies": [
        {
            "Type": "SERVICE_CONTROL_POLICY",
            "Name": "AllowAllS3Actions",
            "AwsManaged": false,
            "Id": "p-examplepolicyid111",
            "Arn": "arn:aws:organizations::123456789012:policy/
service_control_policy/p-examplepolicyid111",
            "Description": "Enables account admins to delegate permissions for any
 S3 actions to users and roles in their accounts."
        },
        {
            "Type": "SERVICE_CONTROL_POLICY",
            "Name": "AllowAllEC2Actions",
            "AwsManaged": false,
            "Id": "p-examplepolicyid222",
            "Arn": "arn:aws:organizations::123456789012:policy/
service_control_policy/p-examplepolicyid222",
            "Description": "Enables account admins to delegate permissions for any
 EC2 actions to users and roles in their accounts."
        },
        {
            "AwsManaged": true,
            "Description": "Allows access to every operation",
```

```
            "Type": "SERVICE_CONTROL_POLICY",
            "Id": "p-FullAWSAccess",
            "Arn": "arn:aws:organizations::aws:policy/service_control_policy/p-
FullAWSAccess",
            "Name": "FullAWSAccess"
        }
    ]
}
```

For more information, see Getting information about your organization's policies in the *AWS Organizations User Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

`list-roots`

The following code example shows how to use `list-roots`.

AWS CLI

To retrieve a list of the roots in an organization

The following `list-roots` example gets the list of roots for an organization.

```
aws organizations list-roots
```

The output includes a list of root structures with summary information.

Output:

```
{
    "Roots": [
        {
            "Name": "Root",
            "Arn": "arn:aws:organizations::123456789012:root/o-exampleorgid/r-
examplerootid111",
            "Id": "r-examplerootid111",
            "PolicyTypes": [
                {
                    "Status": "ENABLED",
                    "Type": "SERVICE_CONTROL_POLICY"
                }
```

```
            ]
        }
    ]
}
```

For more information, see Terminology and concepts for AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see ListRoots in *AWS CLI Command Reference*.

`list-targets-for-policy`

The following code example shows how to use `list-targets-for-policy`.

AWS CLI

To retrieve a list of the roots, OUs, and accounts that a policy is attached to

The following `list-targets-for-policy` example gets a list of the roots, OUs, and accounts that the specified policy is attached to. The output includes a list of attachment objects with summary information about the roots, OUs, and accounts the policy is attached to.

```
aws organizations list-targets-for-policy \
    --policy-id p-FullAWSAccess
```

Output:

```
{
    "Targets": [
        {
            "Arn": "arn:aws:organizations::123456789012:root/o-exampleorgid/r-
examplerootid111",
            "Name": "Root",
            "TargetId": "r-examplerootid111",
            "Type": "ROOT"
        },
        {
            "Arn": "arn:aws:organizations::123456789012:account/o-
exampleorgid/123456789222",
            "Name": "Developer Test Account",
            "TargetId": "123456789222",
            "Type": "ACCOUNT"
```

```
        },
        {
            "Arn": "arn:aws:organizations::123456789012:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111",
            "Name": "Accounting",
            "TargetId": "ou-examplerootid111-exampleouid111",
            "Type": "ORGANIZATIONAL_UNIT"
        }
    ]
}
```

For more information, see Getting information about your organization's policies in the *AWS Organizations User Guide*.

- For API details, see ListTargetsForPolicy in *AWS CLI Command Reference*.

`move-account`

The following code example shows how to use `move-account`.

AWS CLI

To move an account between roots or OUs

The following `move-account` example moves the management account in the organization from the root to an OU.

```
aws organizations move-account \
    --account-id 123456789222 \
    --source-parent-id r-examplerootid111 \
    --destination-parent-id ou-examplerootid111-exampleouid111
```

This command produces no output.

For more information, see Moving accounts to an organizational unit (OU) or between the root and OUs with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see MoveAccount in *AWS CLI Command Reference*.

`remove-account-from-organization`

The following code example shows how to use `remove-account-from-organization`.

AWS CLI

To remove an account from an organization as the master account

The following `remove-account-from-organization` example removes an account from an organization.

```
aws organizations remove-account-from-organization \
    --account-id 123456789222
```

This command produces no output.

For more information, see Removing a member account from an organization with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see RemoveAccountFromOrganization in *AWS CLI Command Reference*.

`update-organizational-unit`

The following code example shows how to use `update-organizational-unit`.

AWS CLI

To rename an OU

The following `update-organizational-unit` example renames an OU to `AccountingOU`. The output shows the new name.

```
aws organizations update-organizational-unit \
    --organizational-unit-id ou-examplerootid111-exampleouid111 \
    --name AccountingOU
```

Output:

```
{
    "OrganizationalUnit": {
        "Id": "ou-examplerootid111-exampleouid111",
        "Name": "AccountingOU",
        "Arn": "arn:aws:organizations::123456789012:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111"
    }
}
```

For more information, see Managing organizational units (OUs) with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see UpdateOrganizationalUnit in *AWS CLI Command Reference*.

`update-policy`

The following code example shows how to use `update-policy`.

AWS CLI

Example 1: To rename a policy

The following `update-policy` example renames a policy and gives it a new description. The output shows the new name and description.

```
aws organizations update-policy \
    --policy-id p-examplepolicyid111 \
    --name Renamed-Policy \
    --description "This description replaces the original."
```

Output:

```
{
    "Policy": {
        "Content": "{\n  \"Version\":\"2012-10-17\",\n  \"Statement\":{\n
  \"Effect\":\"Allow\",\n    \"Action\":\"ec2:*\",\n    \"Resource\":\"*\"\n
  }\n}\n",
        "PolicySummary": {
            "Id": "p-examplepolicyid111",
            "AwsManaged": false,
            "Arn": "arn:aws:organizations::123456789012:policy/o-exampleorgid/
service_control_policy/p-examplepolicyid111",
            "Description": "This description replaces the original.",
            "Name": "Renamed-Policy",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```

For more information, see Updating organization policies with AWS Organizations in the *AWS Organizations User Guide*.

Example 2: To replace a policy's JSON text content

The following `update-policy` example replaces the JSON text of the SCP in the previous example with a new JSON policy text string that allows S3 instead of EC2. The output shows the new content.

```
aws organizations update-policy \
    --policy-id p-examplepolicyid111 \
    --content "{\"Version\":\"2012-10-17\",\"Statement\":{\"Effect\":\"Allow\",
\"Action\":\"s3:*\",\"Resource\":\"*\"}}"
```

Output:

```
{
    "Policy": {
        "Content": "{ \"Version\": \"2012-10-17\", \"Statement\": { \"Effect\":
 \"Allow\", \"Action\": \"s3:*\", \"Resource\": \"*\" } }",
        "PolicySummary": {
            "Arn": "arn:aws:organizations::123456789012:policy/o-exampleorgid/
service_control_policy/p-examplepolicyid111",
            "AwsManaged": false,
            "Description": "This description replaces the original.",
            "Id": "p-examplepolicyid111",
            "Name": "Renamed-Policy",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```

For more information, see Updating organization policies with AWS Organizations in the *AWS Organizations User Guide*.

- For API details, see UpdatePolicy in *AWS CLI Command Reference*.

AWS Outposts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Outposts.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`get-outpost-instance-types`

The following code example shows how to use `get-outpost-instance-types`.

AWS CLI

To get the instance types on your Outpost

The following `get-outpost-instance-types` example gets the instance types for the specified Outpost.

```
aws outposts get-outpost-instance-types \
    --outpost-id op-0ab23c4567EXAMPLE
```

Output:

```
{
    "InstanceTypes": [
        {
            "InstanceType": "c5d.large"
        },
        {
            "InstanceType": "i3en.24xlarge"
        },
        {
            "InstanceType": "m5d.large"
        },
        {
            "InstanceType": "r5d.large"
        }
    ],
    "OutpostId": "op-0ab23c4567EXAMPLE",
    "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE"
```

```
}
```

For more information, see Launch an instance on your Outpost in the *AWS Outposts User Guide*.

- For API details, see GetOutpostInstanceTypes in *AWS CLI Command Reference*.

`get-outpost`

The following code example shows how to use `get-outpost`.

AWS CLI

To get Outpost details

The following `get-outpost` example displays the details for the specified Outpost.

```
aws outposts get-outpost \
    --outpost-id op-0ab23c4567EXAMPLE
```

Output:

```
{
    "Outpost": {
        "OutpostId": "op-0ab23c4567EXAMPLE",
        "OwnerId": "123456789012",
        "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE",
        "SiteId": "os-0ab12c3456EXAMPLE",
        "Name": "EXAMPLE",
        "LifeCycleStatus": "ACTIVE",
        "AvailabilityZone": "us-west-2a",
        "AvailabilityZoneId": "usw2-az1",
        "Tags": {}
    }
}
```

For more information, see What is AWS Outposts? in the *AWS Outposts User Guide*.

- For API details, see GetOutpost in *AWS CLI Command Reference*.

`list-outposts`

The following code example shows how to use `list-outposts`.

AWS CLI

To list Outposts

The following `list-outposts` example lists the Outposts in your AWS account.

```
aws outposts list-outposts
```

Output:

```
{
    "Outposts": [
        {
            "OutpostId": "op-0ab23c4567EXAMPLE",
            "OwnerId": "123456789012",
            "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE",
            "SiteId": "os-0ab12c3456EXAMPLE",
            "Name": "EXAMPLE",
            "Description": "example",
            "LifeCycleStatus": "ACTIVE",
            "AvailabilityZone": "us-west-2a",
            "AvailabilityZoneId": "usw2-az1",
            "Tags": {
                "Name": "EXAMPLE"
            }
        },
        {
            "OutpostId": "op-4fe3dc21baEXAMPLE",
            "OwnerId": "123456789012",
            "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-4fe3dc21baEXAMPLE",
            "SiteId": "os-0ab12c3456EXAMPLE",
            "Name": "EXAMPLE2",
            "LifeCycleStatus": "ACTIVE",
            "AvailabilityZone": "us-west-2a",
            "AvailabilityZoneId": "usw2-az1",
            "Tags": {}
        }
    ]
}
```

For more information, see What is AWS Outposts? in the *AWS Outposts User Guide*.

- For API details, see ListOutposts in *AWS CLI Command Reference*.

`list-sites`

The following code example shows how to use `list-sites`.

AWS CLI

To list sites

The following `list-sites` example lists the available Outpost sites in your AWS account.

```
aws outposts list-sites
```

Output:

```
{
    "Sites": [
        {
            "SiteId": "os-0ab12c3456EXAMPLE",
            "AccountId": "123456789012",
            "Name": "EXAMPLE",
            "Description": "example",
            "Tags": {}
        }
    ]
}
```

For more information, see What is AWS Outposts? in the *AWS Outposts User Guide*.

- For API details, see ListSites in *AWS CLI Command Reference*.

AWS Payment Cryptography examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`create-alias`

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias for a key

The following `create-alias` example creates an alias for a key.

```
aws payment-cryptography create-alias \
    --alias-name alias/sampleAlias1 \
    --key-arn arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h"
    }
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

`create-key`

The following code example shows how to use `create-key`.

AWS CLI

To create a key

The following `create-key` example generates a 2KEY TDES key you can use to generate and verify CVV/CVV2 values.

```
aws payment-cryptography create-key \
    --exportable \
    --key-
attributes KeyAlgorithm=TDES_2KEY,KeyUsage=TR31_C0_CARD_VERIFICATION_KEY,KeyClass=SYMMETRIC_
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": false,
                "Verify": true,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "CREATE_COMPLETE",
        "UsageStartTimestamp": "1686800690"
    }
}
```

For more information, see Generating keys in the *AWS Payment Cryptography User Guide*.

- For API details, see CreateKey in *AWS CLI Command Reference*.

`delete-alias`

The following code example shows how to use `delete-alias`.

AWS CLI

To delete an alias

The following `delete-alias` example deletes an alias. It does not affect the key.

```
aws payment-cryptography delete-alias \
    --alias-name alias/sampleAlias1
```

This command produces no output.

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

`delete-key`

The following code example shows how to use `delete-key`.

AWS CLI

To delete a key

The following `delete-key` example schedules a key for deletion after 7 days, which is the default waiting period.

```
aws payment-cryptography delete-key \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686801198",
        "DeletePendingTimestamp": "1687405998",
```

```
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": false,
                "Verify": true,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "DELETE_PENDING",
        "UsageStartTimestamp": "1686801190"
    }
}
```

For more information, see Deleting keys in the *AWS Payment Cryptography User Guide*.

- For API details, see DeleteKey in *AWS CLI Command Reference*.

`export-key`

The following code example shows how to use `export-key`.

AWS CLI

To export a key

The following `export-key` example exports a key.

```
aws payment-cryptography export-key \
```

```
    --export-key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
lco3w6agsk7zgu2l \
    --key-material file://key-material.json
```

Contents of `key-material.json`:

```
{
    "Tr34KeyBlock": {
        "CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-cryptography:us-

For more information, see Export keys in the *AWS Payment Cryptography User Guide*.

- For API details, see ExportKey in *AWS CLI Command Reference*.

`get-alias`

The following code example shows how to use `get-alias`.

AWS CLI

To get an alias

The following `get-alias` example returns the ARN of the key associated with the alias.

```
aws payment-cryptography get-alias \
```

```
    --alias-name alias/sampleAlias1
```

Output:

```
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h"
    }
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see GetAlias in *AWS CLI Command Reference*.

`get-key`

The following code example shows how to use `get-key`.

AWS CLI

To get the metadata of a key

The following `get-key` example returns the metadata of the key associated with the alias. This operation does not return cryptographic material.

```
aws payment-cryptography get-key \
    --key-identifier alias/sampleAlias1
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "DeletePendingTimestamp": "1687405998",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
```

```
            "KeyAlgorithm": "TDES_2KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": false,
                "Verify": true,
                "Wrap": false
            },

        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "DELETE_PENDING",
        "UsageStartTimestamp": "1686801190"
    }
}
```

For more information, see Get keys in the *AWS Payment Cryptography User Guide*.

- For API details, see GetKey in *AWS CLI Command Reference*.

`get-parameters-for-export`

The following code example shows how to use `get-parameters-for-export`.

AWS CLI

To initialize the export process

The following `get-parameters-for-export` example generates a key pair, signs the key, and then returns the certificate and certificate root.

```
aws payment-cryptography get-parameters-for-export \
    --signing-key-algorithm RSA_2048 \
    --key-material-type TR34_KEY_BLOCK
```

Output:

```
{
    "ExportToken": "export-token-ep5cwyzune7oya53",
    "ParametersValidUntilTimestamp": "1687415640",
    "SigningKeyAlgorithm": "RSA_2048",

For more information, see Export keys in the *AWS Payment Cryptography User Guide*.

- For API details, see GetParametersForExport in *AWS CLI Command Reference*.

`get-parameters-for-import`

The following code example shows how to use `get-parameters-for-import`.

AWS CLI

To initialize the import process

The following `get-parameters-for-import` example generates a key pair, signs the key, and then returns the certificate and certificate root.

```
aws payment-cryptography get-parameters-for-import \
    --key-material-type TR34_KEY_BLOCK \
    --wrapping-key-algorithm RSA_2048
```

Output:

```
{
    "ImportToken": "import-token-qgmafpaa7nt2kfbb",
    "ParametersValidUntilTimestamp": "1687415640",
```

```
    "WrappingKeyAlgorithm": "RSA_2048",

```

For more information, see Import keys in the *AWS Payment Cryptography User Guide*.

- For API details, see GetParametersForImport in *AWS CLI Command Reference*.

`get-public-key-certificate`

The following code example shows how to use `get-public-key-certificate`.

AWS CLI

To return the public key

The following `get-public-key-certificate` example returns the public key portion of a key pair.

```
aws payment-cryptography get-public-key-certificate \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "KeyCertificate":
 "MIICiTCCAfICCQD6m7oRw0uXOjANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMCVVMxCzAJBgNVBAgTAldBMRAwDg

}
```

For more information, see Get the public key/certificate associated with a key pair in the *AWS Payment Cryptography User Guide*.

- For API details, see GetPublicKeyCertificate in *AWS CLI Command Reference*.

`import-key`

The following code example shows how to use `import-key`.

AWS CLI

To import a TR-34 key

The following `import-key` example imports a TR-34 key.

```
aws payment-cryptography import-key \
    --key-material file://key-material.json
```

Contents of `key-material.json`:

```
{
    "Tr34KeyBlock": {
        "CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-cryptography:us-
west-2:123456789012:key/rmm5wn2q564njnjm",
        "ImportToken": "import-token-5ott6ho5nts7bbcg",
        "KeyBlockFormat": "X9_TR34_2012",
        "SigningKeyCertificate":

        },
        "KeyCheckValue": "D9B20E",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "EXTERNAL",
        "KeyState": "CREATE_COMPLETE",
        "UsageStartTimestamp": "2023-06-09T16:56:27.621000-07:00"
    }
}
```

For more information, see Import keys in the *AWS Payment Cryptography User Guide*.

- For API details, see ImportKey in *AWS CLI Command Reference*.

`list-aliases`

The following code example shows how to use `list-aliases`.

AWS CLI

To get a list of aliases

The following `list-aliases` example shows all of the aliases in your account in this Region.

```
aws payment-cryptography list-aliases
```

Output:

```
{
    "Aliases": [
        {
            "AliasName": "alias/sampleAlias1",
            "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h"
        },
        {
            "AliasName": "alias/sampleAlias2",
            "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h"
        }
    ]
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see ListAliases in *AWS CLI Command Reference*.

`list-keys`

The following code example shows how to use `list-keys`.

AWS CLI

To get a list of keys

The following `list-keys` example shows all of the keys in your account in this Region.

```
aws payment-cryptography list-keys
```

Output:

```
{
    "Keys": [
    {
        "Enabled": false,
        "Exportable": true,
```

```
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_3KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": true,
                "DeriveKey": false,
                "Encrypt": true,
                "Generate": false,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": true,
                "Verify": false,
                "Wrap": true
            },
            "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
        },
        "KeyCheckValue": "369D",
        "KeyState": "CREATE_COMPLETE"
    }
    ]
}
```

For more information, see List keys in the *AWS Payment Cryptography User Guide*.

- For API details, see ListKeys in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To get the list of tags for a key

The following `list-tags-for-resource` example gets the tags for a key.

```
aws payment-cryptography list-tags-for-resource \
    --resource-arn arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Tags": [
        {
            "Key": "BIN",
            "Value": "20151120"
        },
        {
            "Key": "Project",
            "Value": "Production"
        }
    ]
}
```

For more information, see Managing key tags with API operations in the *AWS Payment Cryptography User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`restore-key`

The following code example shows how to use `restore-key`.

AWS CLI

To restore a key that is scheduled for deletion

The following `restore-key` example cancels the deletion of a key.

```
aws payment-cryptography restore-key \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyUsage": "TR31_V2_VISA_PIN_VERIFICATION_KEY",
            "KeyClass": "SYMMETRIC_KEY",
```

```
            "KeyAlgorithm": "TDES_3KEY",
            "KeyModesOfUse": {
                "Encrypt": false,
                "Decrypt": false,
                "Wrap": false,
                "Unwrap": false,
                "Generate": true,
                "Sign": false,
                "Verify": true,
                "DeriveKey": false,
                "NoRestrictions": false
            }
        },
        "KeyCheckValue": "",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "Enabled": false,
        "Exportable": true,
        "KeyState": "CREATE_COMPLETE",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "CreateTimestamp": "1686800690",
        "UsageStopTimestamp": "1687405998"
    }
}
```

For more information, see Deleting keys in the *AWS Payment Cryptography User Guide*.

- For API details, see RestoreKey in *AWS CLI Command Reference*.

`start-key-usage`

The following code example shows how to use `start-key-usage`.

AWS CLI

To enable a key

The following `start-key-usage` example enables a key to be used.

```
aws payment-cryptography start-key-usage \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
alsuwfxug3pgy6xh",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_3KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": true,
                "DeriveKey": false,
                "Encrypt": true,
                "Generate": false,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": true,
                "Verify": false,
                "Wrap": true
            },
            "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
        },
        "KeyCheckValue": "369D",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "CREATE_COMPLETE",
        "UsageStartTimestamp": "1686800690"
    }
}
```

For more information, see Enabling and disabling keys in the *AWS Payment Cryptography User Guide*.

- For API details, see StartKeyUsage in *AWS CLI Command Reference*.

`stop-key-usage`

The following code example shows how to use `stop-key-usage`.

AWS CLI

To disable a key

The following `stop-key-usage` example disables a key.

```
aws payment-cryptography stop-key-usage \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
alsuwfxug3pgy6xh",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_3KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": true,
                "DeriveKey": false,
                "Encrypt": true,
                "Generate": false,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": true,
                "Verify": false,
                "Wrap": true
            },
            "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
        },
        "KeyCheckValue": "369D",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "CREATE_COMPLETE",
        "UsageStartTimestamp": "1686800690"
    }
}
```

For more information, see Enabling and disabling keys in the *AWS Payment Cryptography User Guide*.

- For API details, see StopKeyUsage in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a key

The following `tag-resource` example tags a key.

```
aws payment-cryptography tag-resource \
    --resource-arn arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h \
    --tags Key=sampleTag,Value=sampleValue
```

This command produces no output.

For more information, see Managing key tags in the *AWS Payment Cryptography User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a key

The following `untag-resource` example removes a tag from a key.

```
aws payment-cryptography untag-resource \
    --resource-arn arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h \
    --tag-keys sampleTag
```

This command produces no output.

For more information, see Managing key tags in the *AWS Payment Cryptography User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

update-alias

The following code example shows how to use `update-alias`.

AWS CLI

To update an alias

The following `update-alias` example associates the alias with a different key.

```
aws payment-cryptography update-alias \
    --alias-name alias/sampleAlias1 \
    --key-arn arn:aws:payment-cryptography:us-west-2:123456789012:key/
tqv5yij6wtxx64pi
```

Output:

```
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
tqv5yij6wtxx64pi "
    }
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see UpdateAlias in *AWS CLI Command Reference*.

AWS Payment Cryptography Data Plane examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography Data Plane.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`decrypt-data`

The following code example shows how to use `decrypt-data`.

AWS CLI

To decrypt ciphertext

The following `decrypt-data` example decrypts ciphertext data using a symmetric key. For this operation, the key must have `KeyModesOfUse` set to `Decrypt` and `KeyUsage` set to `TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY`.

```
aws payment-cryptography-data decrypt-data \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h \
    --cipher-text 33612AB9D6929C3A828EB6030082B2BD \
    --decryption-attributes 'Symmetric={Mode=CBC}'
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
    "KeyCheckValue": "71D7AE",
    "PlainText": "31323334313233343132333431323334"
}
```

For more information, see Decrypt data in the *AWS Payment Cryptography User Guide*.

- For API details, see DecryptData in *AWS CLI Command Reference*.

`encrypt-data`

The following code example shows how to use `encrypt-data`.

AWS CLI

To encrypt data

The following `encrypt-data` example encrypts plaintext data using a symmetric key. For this operation, the key must have `KeyModesOfUse` set to `Encrypt` and `KeyUsage` set to `TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY`.

```
aws payment-cryptography-data encrypt-data \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h \
    --plain-text 31323334313233343132333431323334 \
    --encryption-attributes 'Symmetric={Mode=CBC}'
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
    "KeyCheckValue": "71D7AE",
    "CipherText": "33612AB9D6929C3A828EB6030082B2BD"
}
```

For more information, see Encrypt data in the *AWS Payment Cryptography User Guide*.

- For API details, see EncryptData in *AWS CLI Command Reference*.

`generate-card-validation-data`

The following code example shows how to use `generate-card-validation-data`.

AWS CLI

To generate a CVV

The following `generate-card-validation-data` example generates a CVV/CVV2.

```
aws payment-cryptography-data generate-card-validation-data \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h \
    --primary-account-number=171234567890123 \
    --generation-attributes CardVerificationValue2={CardExpiryDate=0123}
```

Output:

```
{
```

```
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
    "KeyCheckValue": "CADDA1",
    "ValidationData": "801"
}
```

For more information, see Generate card data in the *AWS Payment Cryptography User Guide*.

- For API details, see GenerateCardValidationData in *AWS CLI Command Reference*.

`generate-mac`

The following code example shows how to use `generate-mac`.

AWS CLI

To generate a MAC

The following `generate-mac` example generates a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key. The key must have `KeyUsage` set to `TR31_M7_HMAC_KEY` and `KeyModesOfUse` to `Generate`.

```
aws payment-cryptography-data generate-mac \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h \
    --message-
data "3b3130383834393030313037333934313533d32343038323236303030373030303f33" \
    --generation-attributes Algorithm=HMAC_SHA256
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
    "KeyCheckValue": "2976E7",
    "Mac": "ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C"
}
```

For more information, see Generate MAC in the *AWS Payment Cryptography User Guide*.

- For API details, see GenerateMac in *AWS CLI Command Reference*.

`generate-pin-data`

The following code example shows how to use `generate-pin-data`.

AWS CLI

To generate a PIN

The following `generate-pin-data` example generates a new random PIN using the Visa PIN scheme.

```
aws payment-cryptography-data generate-pin-data \
    --generation-key-identifier arn:aws:payment-cryptography:us-
west-2:123456789012:key/37y2tsl45p5zjbh2 \
    --encryption-key-identifier arn:aws:payment-cryptography:us-
west-2:123456789012:key/ivi5ksfsuplneuyt \
    --primary-account-number 171234567890123 \
    --pin-block-format ISO_FORMAT_0 \
    --generation-attributes VisaPin={PinVerificationKeyIndex=1}
```

Output:

```
{
    "GenerationKeyArn": "arn:aws:payment-cryptography:us-
west-2:123456789012:key/37y2tsl45p5zjbh2",
    "GenerationKeyCheckValue": "7F2363",
    "EncryptionKeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
ivi5ksfsuplneuyt",
    "EncryptionKeyCheckValue": "7CC9E2",
    "EncryptedPinBlock": "AC17DC148BDA645E",
    "PinData": {
        "VerificationValue": "5507"
    }
}
```

For more information, see Generate PIN data in the *AWS Payment Cryptography User Guide*.

- For API details, see GeneratePinData in *AWS CLI Command Reference*.

`re-encrypt-data`

The following code example shows how to use `re-encrypt-data`.

AWS CLI

To re-encrypt data with a different key

The following `re-encrypt-data` example decrypts cipher text that was encrypted using an AES symmetric key and re-encrypts it using a Derived Unique Key Per Transaction (DUKPT) key.

```
aws payment-cryptography-data re-encrypt-data \
    --incoming-key-identifier arn:aws:payment-cryptography:us-
west-2:123456789012:key/hyvv7ymboitd4vfy \
    --outgoing-key-identifier arn:aws:payment-cryptography:us-
west-2:123456789012:key/jl6ythkcvzesbxen \
    --cipher-
text 4D2B0BDBA192D5AEFEAA5B3EC28E4A65383C313FFA25140101560F75FE1B99F27192A90980AB9334
 \
    --incoming-encryption-
attributes "Dukpt={Mode=ECB,KeySerialNumber=0123456789111111}" \
    --outgoing-encryption-attributes '{"Symmetric": {"Mode": "ECB"}}'
```

Output:

```
{
    "CipherText":
 "F94959DA30EEFF0C035483C6067667CF6796E3C1AD28C2B61F9CFEB772A8DD41C0D6822931E0D3B1",
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
jl6ythkcvzesbxen",
    "KeyCheckValue": "2E8CD9"
}
```

For more information, see Encrypt and decrypt data in the *AWS Payment Cryptography User Guide*.

- For API details, see ReEncryptData in *AWS CLI Command Reference*.

`translate-pin-data`

The following code example shows how to use `translate-pin-data`.

AWS CLI

To translate PIN data

The following `translate-pin-data` example translates a PIN from PEK TDES encryption using ISO 0 PIN block to an AES ISO 4 PIN Block using the DUKPT algorithm.

```
aws payment-cryptography-data translate-pin-data \
    --encrypted-pin-block "AC17DC148BDA645E" \
    --incoming-translation-
attributes=IsoFormat0='{PrimaryAccountNumber=171234567890123}' \
    --incoming-key-identifier arn:aws:payment-cryptography:us-
west-2:123456789012:key/ivi5ksfsuplneuyt \
    --outgoing-key-identifier arn:aws:payment-cryptography:us-
west-2:123456789012:key/4pmyquwjs3yj4vwe \
    --outgoing-translation-attributes
 IsoFormat4="{PrimaryAccountNumber=171234567890123}" \
    --outgoing-dukpt-attributes KeySerialNumber="FFFF9876543210E00008"
```

Output:

```
{
    "PinBlock": "1F4209C670E49F83E75CC72E81B787D9",
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
ivi5ksfsuplneuyt",
    "KeyCheckValue": "7CC9E2"
}
```

For more information, see Translate PIN data in the *AWS Payment Cryptography User Guide*.

- For API details, see TranslatePinData in *AWS CLI Command Reference*.

`verify-auth-request-cryptogram`

The following code example shows how to use `verify-auth-request-cryptogram`.

AWS CLI

To verify an auth request

The following `verify-auth-request-cryptogram` example verifies an Authorization Request Cryptogram (ARQC).

```
aws payment-cryptography-data verify-auth-request-cryptogram \
    --auth-request-cryptogram F6E1BD1E6037FB3E \
```

```
    --auth-response-attributes '{"ArpcMethod1": {"AuthResponseCode": "1111"}}' \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
pboipdfzd4mdklya \
    --major-key-derivation-mode "EMV_OPTION_A" \
    --session-key-derivation-attributes '{"EmvCommon":
 {"ApplicationTransactionCounter": "1234","PanSequenceNumber":
 "01","PrimaryAccountNumber": "471234567890123"}}' \
    --transaction-data "123456789ABCDEF"
```

Output:

```
{
    "AuthResponseValue": "D899B8C6FBF971AA",
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
pboipdfzd4mdklya",
    "KeyCheckValue": "985792"
}
```

For more information, see Verify auth request (ARQC) cryptogram in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyAuthRequestCryptogram in *AWS CLI Command Reference*.

`verify-card-validation-data`

The following code example shows how to use `verify-card-validation-data`.

AWS CLI

To validate a CVV

The following `verify-card-validation-data` example validates a CVV/CVV2 for a PAN.

```
aws payment-cryptography-data verify-card-validation-data \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
tqv5yij6wtxx64pi \
    --primary-account-number=171234567890123 \
    --verification-attributes CardVerificationValue2={CardExpiryDate=0123} \
    --validation-data 801
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
tqv5yij6wtxx64pi",
    "KeyCheckValue": "CADDA1"
}
```

For more information, see Verify card data in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyCardValidationData in *AWS CLI Command Reference*.

`verify-mac`

The following code example shows how to use `verify-mac`.

AWS CLI

To verify a MAC

The following `verify-mac` example verifies a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key.

```
aws payment-cryptography-data verify-mac \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
qnobl5lghrzunce6 \
    --message-
data "3b343038383439303031303733393431353d323430383232363030303730303f33" \
    --verification-attributes='Algorithm=HMAC_SHA256' \
    --mac ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
qnobl5lghrzunce6",
    "KeyCheckValue": "2976E7"
}
```

For more information, see Verify MAC in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyMac in *AWS CLI Command Reference*.

`verify-pin-data`

The following code example shows how to use `verify-pin-data`.

AWS CLI

To verify a PIN

The following `verify-pin-data` example validates a PIN for a PAN.

```
aws payment-cryptography-data verify-pin-data \
    --verification-key-identifier arn:aws:payment-cryptography:us-
west-2:123456789012:key/37y2tsl45p5zjbh2 \
    --encryption-key-identifier arn:aws:payment-cryptography:us-
west-2:123456789012:key/ivi5ksfsuplneuyt \
    --primary-account-number 171234567890123 \
    --pin-block-format ISO_FORMAT_0 \
    --verification-attributes
 VisaPin="{PinVerificationKeyIndex=1,VerificationValue=5507}" \
    --encrypted-pin-block AC17DC148BDA645E
```

Output:

```
{
    "VerificationKeyArn": "arn:aws:payment-cryptography:us-
west-2:123456789012:key/37y2tsl45p5zjbh2",
    "VerificationKeyCheckValue": "7F2363",
    "EncryptionKeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
ivi5ksfsuplneuyt",
    "EncryptionKeyCheckValue": "7CC9E2"
}
```

For more information, see Verify PIN data in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyPinData in *AWS CLI Command Reference*.

Amazon Pinpoint examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Pinpoint.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-app`

The following code example shows how to use `create-app`.

AWS CLI

Example 1: To create an application

The following `create-app` example creates a new application (project).

```
aws pinpoint create-app \
    --create-application-request Name=ExampleCorp
```

Output:

```
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {}
    }
}
```

Example 2: To create an application that is tagged

The following `create-app` example creates a new application (project) and associates a tag (key and value) with the application.

```
aws pinpoint create-app \
    --create-application-request Name=ExampleCorp,tags={"Stack"="Test"}
```

Output:

```
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {
            "Stack": "Test"
        }
    }
}
```

For more information, see Managing Amazon Pinpoint projects in the *Amazon Pinpoint User Guide*.

- For API details, see CreateApp in *AWS CLI Command Reference*.

`create-sms-template`

The following code example shows how to use `create-sms-template`.

AWS CLI

To create a message template for messages that are sent through the SMS channel

The following `create-sms-template` example creates a SMS message template.

```
aws pinpoint create-sms-template \
    --template-name TestTemplate \
    --sms-template-request file://myfile.json
```

Contents of `myfile.json`:

```
{
    "Body": "hello\n how are you?\n food is good",
    "TemplateDescription": "Test SMS Template"
```

```
}
```

Output:

```
{
    "CreateTemplateMessageBody": {
        "Arn": "arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:templates/
TestTemplate/SMS",
        "Message": "Created",
        "RequestID": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Amazon Pinpoint message templates in the *Amazon Pinpoint User Guide*.

- For API details, see CreateSmsTemplate in *AWS CLI Command Reference*.

`delete-app`

The following code example shows how to use `delete-app`.

AWS CLI

To delete an application

The following `delete-app` example deletes an application (project).

```
aws pinpoint delete-app \
    --application-id 810c7aab86d42fb2b56c8c966example
```

Output:

```
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {}
    }
```

```
}
```

For more information, see Managing Amazon Pinpoint projects in the *Amazon Pinpoint User Guide*.

- For API details, see DeleteApp in *AWS CLI Command Reference*.

`get-apns-channel`

The following code example shows how to use `get-apns-channel`.

AWS CLI

To retrieve information about the status and settings of the APNs channel for an application

The following `get-apns-channel` example retrieves information about the status and settings of the APNs channel for an application.

```
aws pinpoint get-apns-channel \
    --application-id 9ab1068eb0a6461c86cce7f27ce0efd7
```

Output:

```
{
    "APNSChannelResponse": {
        "ApplicationId": "9ab1068eb0a6461c86cce7f27ce0efd7",
        "CreationDate": "2019-05-09T21:54:45.082Z",
        "DefaultAuthenticationMethod": "CERTIFICATE",
        "Enabled": true,
        "HasCredential": true,
        "HasTokenKey": false,
        "Id": "apns",
        "IsArchived": false,
        "LastModifiedDate": "2019-05-09T22:04:01.067Z",
        "Platform": "APNS",
        "Version": 2
    }
}
```

For more information, see Amazon Pinpoint push notifications in the *Amazon Pinpoint User Guide*.

- For API details, see GetApnsChannel in *AWS CLI Command Reference*.

get-app

The following code example shows how to use `get-app`.

AWS CLI

To retrieve information about an application (project)

The following `get-app` example retrieves information about an application (project).

```
aws pinpoint get-app \
    --application-id 810c7aab86d42fb2b56c8c966example
```

Output:

```
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {
                "Year": "2019",
                "Stack": "Production"
            }
    }
}
```

For more information, see Managing Amazon Pinpoint projects in the *Amazon Pinpoint User Guide*.

- For API details, see GetApp in *AWS CLI Command Reference*.

get-apps

The following code example shows how to use `get-apps`.

AWS CLI

To retrieve information about all of your applications

The following `get-apps` example retrieves information about all of your applications (projects).

```
aws pinpoint get-apps
```

Output:

```
{
    "ApplicationsResponse": {
        "Item": [
            {
                "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",

}
```

The presence of the `NextToken` response value indicates that there is more output available. Call the command again and supply that value as the `NextToken` input parameter.

For more information, see Managing Amazon Pinpoint projects in the *Amazon Pinpoint User Guide*.

- For API details, see GetApps in *AWS CLI Command Reference*.

`get-campaign`

The following code example shows how to use `get-campaign`.

AWS CLI

To retrieve information about the status, configuration, and other settings for a campaign

The following `get-campaign` example retrieves information about the status, configuration, and other settings for a campaign.

```
aws pinpoint get-campaign \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --campaign-id a1e63c6cc0eb43ed826ffcc3cc90b30d
```

Output:

```
{
    "CampaignResponse": {
        "AdditionalTreatments": [],
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "Arn": "arn:aws:mobiletargeting:us-

            }
        }
    }
}
```

For more information, see Amazon Pinpoint channels in the *Amazon Pinpoint User Guide*.

- For API details, see GetChannels in *AWS CLI Command Reference*.

`get-email-channel`

The following code example shows how to use `get-email-channel`.

AWS CLI

To retrieve information about the status and settings of the Email channel for an application

The following `get-email-channel` example retrieves status and settings of the Email channel for an application.

```
aws pinpoint get-email-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7
```

Output:

```
{
    "EmailChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:27:23.990Z",
```

```
        "Enabled": true,
        "FromAddress": "sender@example.com",
        "Id": "email",
        "Identity": "arn:aws:ses:us-west-2:AIDACKCEVSQ6C2EXAMPLE:identity/
sender@example.com",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:27:23.990Z",
        "MessagesPerSecond": 1,
        "Platform": "EMAIL",
        "RoleArn": "arn:aws:iam::AIDACKCEVSQ6C2EXAMPLE:role/pinpoint-events",
        "Version": 1
    }
}
```

For more information, see Amazon Pinpoint email channel in the *Amazon Pinpoint User Guide*.

- For API details, see GetEmailChannel in *AWS CLI Command Reference*.

`get-endpoint`

The following code example shows how to use `get-endpoint`.

AWS CLI

To retrieve information about the settings and attributes of a specific endpoint for an application

The following `get-endpoint` example retrieves information about the settings and attributes of a specific endpoint for an application.

```
aws pinpoint get-endpoint \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --endpoint-id testendpoint
```

Output:

```
{
    "EndpointResponse": {
        "Address": "+11234567890",
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "Attributes": {},
        "ChannelType": "SMS",
```

```
        "CohortId": "63",
        "CreationDate": "2019-01-28T23:55:11.534Z",
        "EffectiveDate": "2021-08-06T00:04:51.763Z",
        "EndpointStatus": "ACTIVE",
        "Id": "testendpoint",
        "Location": {
            "Country": "USA"
        },
        "Metrics": {
            "SmsDelivered": 1.0
        },
        "OptOut": "ALL",
        "RequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "User": {
            "UserAttributes": {
                "Age": [
                    "24"
                ]
            },
        "UserId": "testuser"
        }
    }
}
```

For more information, see Add endpoints to Amazon Pinpoint in the *Amazon Pinpoint Developer Guide*.

- For API details, see GetEndpoint in *AWS CLI Command Reference*.

`get-gcm-channel`

The following code example shows how to use `get-gcm-channel`.

AWS CLI

To retrieve information about the status and settings of the GCM channel for an application

The following `get-gcm-channel` example retrieves information about the status and settings of the GCM channel for an application.

```
aws pinpoint get-gcm-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7
```

Output:

```
{
    "GCMChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:28:23.182Z",
        "Enabled": true,
        "HasCredential": true,
        "Id": "gcm",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:28:23.182Z",
        "Platform": "GCM",
        "Version": 1
    }
}
```

For more information, see Amazon Pinpoint push notifications in the *Amazon Pinpoint User Guide*.

- For API details, see GetGcmChannel in *AWS CLI Command Reference*.

`get-sms-channel`

The following code example shows how to use `get-sms-channel`.

AWS CLI

To retrieve information about the status and settings of the SMS channel for an application

The following `get-sms-channel` example retrieves status and settings of the sms channel for an application.

```
aws pinpoint get-sms-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7
```

Output:

```
{
    "SMSChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:39:18.511Z",
        "Enabled": true,
```

```
        "Id": "sms",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:39:18.511Z",
        "Platform": "SMS",
        "PromotionalMessagesPerSecond": 20,
        "TransactionalMessagesPerSecond": 20,
        "Version": 1
    }
}
```

For more information, see Managing the Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see GetSmsChannel in *AWS CLI Command Reference*.

`get-sms-template`

The following code example shows how to use `get-sms-template`.

AWS CLI

To retrieve the content and settings of a message template for messages that are sent through the SMS channel

The following `get-sms-template` example retrieves the content and settings of a SMS message template.

```
aws pinpoint get-sms-template \
    --template-name TestTemplate
```

Output:

```
{
    "SMSTemplateResponse": {
        "Arn": "arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:templates/
TestTemplate/SMS",
        "Body": "hello\n how are you?\n food is good",
        "CreationDate": "2023-06-20T21:37:30.124Z",
        "LastModifiedDate": "2023-06-20T21:37:30.124Z",
        "tags": {},
        "TemplateDescription": "Test SMS Template",
        "TemplateName": "TestTemplate",
```

```
        "TemplateType": "SMS",
        "Version": "1"
    }
}
```

For more information, see Amazon Pinpoint message templates in the *Amazon Pinpoint User Guide*.

- For API details, see GetSmsTemplate in *AWS CLI Command Reference*.

`get-voice-channel`

The following code example shows how to use `get-voice-channel`.

AWS CLI

To retrieve information about the status and settings of the voice channel for an application

The following `get-voice-channel` example retrieves status and settings of the voice channel for an application.

```
aws pinpoint get-voice-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7
```

Output:

```
{
    "VoiceChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2022-04-28T00:17:03.836Z",
        "Enabled": true,
        "Id": "voice",
        "IsArchived": false,
        "LastModifiedDate": "2022-04-28T00:17:03.836Z",
        "Platform": "VOICE",
        "Version": 1
    }
}
```

For more information, see Managing the Amazon Pinpoint voice channel in the *Amazon Pinpoint User Guide*.

- For API details, see GetVoiceChannel in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve a list of tags for a resource

The following `list-tags-for-resource` example retrieves all the tags (key names and values) that are associated with the specified resource.

```
aws pinpoint list-tags-for-resource \
    --resource-arn arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example
```

Output:

```
{
    "TagsModel": {
        "tags": {
            "Year": "2019",
            "Stack": "Production"
        }
    }
}
```

For more information, see Manage Amazon Pinpoint resource tags in the *Amazon Pinpoint Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`phone-number-validate`

The following code example shows how to use `phone-number-validate`.

AWS CLI

To retrieve information about a phone number

The following `phone-number-validate` example retrieves information about a phone number.

```
aws pinpoint phone-number-validate \
    --number-validate-request PhoneNumber="+12065550142"
```

Output:

```
{
    "NumberValidateResponse": {
        "Carrier": "ExampleCorp Mobile",
        "City": "Seattle",
        "CleansedPhoneNumberE164": "+12065550142",
        "CleansedPhoneNumberNational": "2065550142",
        "Country": "United States",
        "CountryCodeIso2": "US",
        "CountryCodeNumeric": "1",
        "OriginalPhoneNumber": "+12065550142",
        "PhoneType": "MOBILE",
        "PhoneTypeCode": 0,
        "Timezone": "America/Los_Angeles",
        "ZipCode": "98101"
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see PhoneNumberValidate in *AWS CLI Command Reference*.

`send-messages`

The following code example shows how to use `send-messages`.

AWS CLI

To send SMS message using the endpoint of an application

The following `send-messages` example sends a direct message for an application with an endpoint.

```
aws pinpoint send-messages \
```

```
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --message-request file://myfile.json
```

Contents of `myfile.json`:

```
{
    "MessageConfiguration": {
        "SMSMessage": {
            "Body": "hello, how are you?"
        }
    },
    "Endpoints": {
        "testendpoint": {}
    }
}
```

Output:

```
{
    "MessageResponse": {
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "EndpointResult": {
            "testendpoint": {
                "Address": "+12345678900",
                "DeliveryStatus": "SUCCESSFUL",
                "MessageId": "itnuqhai5alf1n6ahv3udc05n7hhddr6gb3lq6g0",
                "StatusCode": 200,
                "StatusMessage": "MessageId:
 itnuqhai5alf1n6ahv3udc05n7hhddr6gb3lq6g0"
            }
        },
        "RequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see SendMessages in *AWS CLI Command Reference*.

`send-users-messages`

The following code example shows how to use `send-users-messages`.

AWS CLI

To send SMS message for an user of an application

The following `send-users-messages` example sends a direct message for an user of an application.

```
aws pinpoint send-users-messages \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --send-users-message-request file://myfile.json
```

Contents of `myfile.json`:

```
{
    "MessageConfiguration": {
        "SMSMessage": {
            "Body": "hello, how are you?"
        }
    },
    "Users": {
        "testuser": {}
    }
}
```

Output:

```
{
    "SendUsersMessageResponse": {
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "RequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Result": {
            "testuser": {
                "testuserendpoint": {
                    "DeliveryStatus": "SUCCESSFUL",
                    "MessageId": "7qu4hk5bqhda3i7i2n4pjf98qcuh8b7p45ifsmo0",
                    "StatusCode": 200,
                    "StatusMessage": "MessageId:
 7qu4hk5bqhda3i7i2n4pjf98qcuh8b7p45ifsmo0",
                    "Address": "+12345678900"
                }
            }
        }
    }
```

```
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see SendUsersMessages in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a resource

The following `tag-resource` example adds two tags (key names and values) to a resource.

```
aws pinpoint tag-resource \
    --resource-arn arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
    --tags-model tags={Stack=Production,Year=2019}
```

This command produces no output.

For more information, see Manage Amazon Pinpoint resource tags in the *Amazon Pinpoint Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To remove a tag from a resource

The following `untag-resource` example removes the specified tag (key name and value) from a resource.

```
aws pinpoint untag-resource \
    --resource-arn arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
    --tag-keys Year
```

This command produces no output.

For more information, see Manage Amazon Pinpoint resource tags in the *Amazon Pinpoint Developer Guide*.

Example 2: To remove multiple tags from a resource

The following `untag-resource` example removes the specified tags (key names and values) from a resource.

```
aws pinpoint untag-resource \
    --resource-arn arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
    --tag-keys Year Stack
```

This command produces no output.

For more information, see Manage Amazon Pinpoint resource tags in the *Amazon Pinpoint Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-sms-channel`

The following code example shows how to use `update-sms-channel`.

AWS CLI

To enable SMS channel or to update the status and settings of the SMS channel for an application.

The following `update-sms-channel` example enables SMS channel for an SMS channel for an application.

```
aws pinpoint update-sms-channel \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --sms-channel-request Enabled=true
```

Output:

```
{
    "SMSChannelResponse": {
```

```
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "CreationDate": "2019-01-28T23:25:25.224Z",
        "Enabled": true,
        "Id": "sms",
        "IsArchived": false,
        "LastModifiedDate": "2023-05-18T23:22:50.977Z",
        "Platform": "SMS",
        "PromotionalMessagesPerSecond": 20,
        "TransactionalMessagesPerSecond": 20,
        "Version": 3
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see UpdateSmsChannel in *AWS CLI Command Reference*.

Amazon Polly examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Polly.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-lexicon`

The following code example shows how to use `delete-lexicon`.

AWS CLI

To delete a lexicon

The following `delete-lexicon` example deletes the specified lexicon.

```
aws polly delete-lexicon \
    --name w3c
```

This command produces no output.

For more information, see Managing lexicons in the *Amazon Polly Developer Guide*.

- For API details, see DeleteLexicon in *AWS CLI Command Reference*.

`get-lexicon`

The following code example shows how to use `get-lexicon`.

AWS CLI

To retrieve the content of a lexicon

The following `get-lexicon` example retrieves the content of the specified pronunciation lexicon.

```
aws polly get-lexicon \
    --name w3c
```

Output:

```
{
    "Lexicon": {
        "Content": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>\n<lexicon version=
\"1.0\" \n      xmlns=    \"http://www.w3.org/2005/01/pronunciation-lexicon
\"\n      xmlns:xsi=\"http://www.w3.org/2001/XMLSchema-instance\" \n
 xsi:schemaLocation=\"http://www.w3.org/2005/01/pronunciation-lexicon \n
 http://www.w3.org/TR/2007/CR-pronunciation-    lexicon-20071212/pls.xsd\"\n
   alphabet=\"ipa\" \n      xml:lang=\"en-US\">\n  <lexeme>\n    <grapheme>W3C</
grapheme>\n        <alias>World Wide Web Consortium</alias>\n  </lexeme>\n</lexicon>
\n",
        "Name": "w3c"
    },
    "LexiconAttributes": {
        "Alphabet": "ipa",
        "LanguageCode": "en-US",
        "LastModified": 1603908910.99,
        "LexiconArn": "arn:aws:polly:us-west-2:123456789012:lexicon/w3c",
```

```
        "LexemesCount": 1,
        "Size": 492
    }
}
```

For more information, see Managing lexicons in the *Amazon Polly Developer Guide*.

- For API details, see GetLexicon in *AWS CLI Command Reference*.

`get-speech-synthesis-task`

The following code example shows how to use `get-speech-synthesis-task`.

AWS CLI

To get information about a speech synthesis task

The following `get-speech-synthesis-task` example retrieves information about the specified speech synthesis task.

```
aws polly get-speech-synthesis-task \
    --task-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "SynthesisTask": {
        "TaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TaskStatus": "completed",
        "OutputUri": "https://s3.us-west-2.amazonaws.com/amzn-s3-demo-bucket/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111.mp3",
        "CreationTime": 1603911042.689,
        "RequestCharacters": 1311,
        "OutputFormat": "mp3",
        "TextType": "text",
        "VoiceId": "Joanna"
    }
}
```

For more information, see Creating long audio files in the *Amazon Polly Developer Guide*.

- For API details, see GetSpeechSynthesisTask in *AWS CLI Command Reference*.

`list-lexicons`

The following code example shows how to use `list-lexicons`.

AWS CLI

To list your lexicons

The following `list-lexicons` example lists your pronunciation lexicons.

```
aws polly list-lexicons
```

Output:

```
{
    "Lexicons": [
        {
            "Name": "w3c",
            "Attributes": {
                "Alphabet": "ipa",
                "LanguageCode": "en-US",
                "LastModified": 1603908910.99,
                "LexiconArn": "arn:aws:polly:us-west-2:123456789012:lexicon/w3c",
                "LexemesCount": 1,
                "Size": 492
            }
        }
    ]
}
```

For more information, see Managing lexicons in the *Amazon Polly Developer Guide*.

- For API details, see ListLexicons in *AWS CLI Command Reference*.

`list-speech-synthesis-tasks`

The following code example shows how to use `list-speech-synthesis-tasks`.

AWS CLI

To list your speech synthesis tasks

The following `list-speech-synthesis-tasks` example lists your speech synthesis tasks.

```
aws polly list-speech-synthesis-tasks
```

Output:

```
{
    "SynthesisTasks": [
        {
            "TaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TaskStatus": "completed",
            "OutputUri": "https://s3.us-west-2.amazonaws.com/amzn-s3-demo-bucket/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111.mp3",
            "CreationTime": 1603911042.689,
            "RequestCharacters": 1311,
            "OutputFormat": "mp3",
            "TextType": "text",
            "VoiceId": "Joanna"
        }
    ]
}
```

For more information, see Creating long audio files in the *Amazon Polly Developer Guide*.

- For API details, see ListSpeechSynthesisTasks in *AWS CLI Command Reference*.

`put-lexicon`

The following code example shows how to use `put-lexicon`.

AWS CLI

To store a lexicon

The following `put-lexicon` example stores the specified pronunciation lexicon. The `example.pls` file specifies a W3C PLS-compliant lexicon.

```
aws polly put-lexicon \
    --name w3c \
    --content file://example.pls
```

Contents of `example.pls`:

```
<?xml version="1.0" encoding="UTF-8"?>
```

```
<lexicon version="1.0"
    xmlns="http://www.w3.org/2005/01/pronunciation-lexicon"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://www.w3.org/2005/01/pronunciation-lexicon
        http://www.w3.org/TR/2007/CR-pronunciation-lexicon-20071212/pls.xsd"
    alphabet="ipa"
    xml:lang="en-US">
    <lexeme>
        <grapheme>W3C</grapheme>
        <alias>World Wide Web Consortium</alias>
    </lexeme>
</lexicon>
```

This command produces no output.

For more information, see Managing lexicons in the *Amazon Polly Developer Guide*.

- For API details, see PutLexicon in *AWS CLI Command Reference*.

`start-speech-synthesis-task`

The following code example shows how to use `start-speech-synthesis-task`.

AWS CLI

To synthesize text

The following `start-speech-synthesis-task` example synthesizes the text in `text_file.txt` and stores the resulting MP3 file in the specified bucket.

```
aws polly start-speech-synthesis-task \
    --output-format mp3 \
    --output-s3-bucket-name amzn-s3-demo-bucket \
    --text  file://text_file.txt \
    --voice-id Joanna
```

Contents of `text_file.txt`:

```
Amazon Polly is a service that turns text into lifelike speech. With
asynchronous synthesis tasks, you can convert long documents, such as
articles, book chapters, and training material, into a single audio file
that is stored in the Amazon S3 bucket that you specify. Synchronous
```

```
requests are limited in the amount of text that they can process, so
asynchronous tasks are the better choice when you have a large amount of
text to synthesize. When you start a task, Amazon Polly returns a task ID
right away and continues to process the text in the background. You can use
the task ID to check the status of the task at any time. When the task is
complete, the audio file is available in the output bucket, and you can
download it, play it in an application, or share it with your users. You can
also have Amazon Polly send a notification to an Amazon SNS topic when the
task finishes, so that you do not have to check the status yourself. Amazon
Polly supports many languages and voices, and you can choose the voice that
best fits your content. For example, you might use one voice for a news
article and a different voice for a story for children. You can also use
SSML tags to control how the text is spoken, such as adding pauses or
changing the speaking rate. This makes it simple to create audio content.
```

Output:

```
{
    "SynthesisTask": {
        "TaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TaskStatus": "scheduled",
        "OutputUri": "https://s3.us-west-2.amazonaws.com/amzn-s3-demo-bucket/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111.mp3",
        "CreationTime": 1603911042.689,
        "RequestCharacters": 1311,
        "OutputFormat": "mp3",
        "TextType": "text",
        "VoiceId": "Joanna"
    }
}
```

For more information, see Creating long audio files in the *Amazon Polly Developer Guide*.

- For API details, see StartSpeechSynthesisTask in *AWS CLI Command Reference*.

AWS Price List examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Price List.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

                    "tenancy",
                    "usagetype",
                    "normalizationSizeFactor",
                    "instanceCapacity2xlarge",
                    "instanceCapacity16xlarge",
                    "maxIopsBurstPerformance",
                    "instanceCapacity12xlarge",
                    "instanceCapacity32xlarge",
                    "instanceCapacityXlarge",
                    "licenseModel",
```

```
                "currentGeneration",
                "preInstalledSw",
                "location",
                "instanceCapacity24xlarge",
                "instanceCapacity9xlarge",
                "instanceCapacityMedium",
                "operation"
            ]
        }
    ],
    "FormatVersion": "aws_v1"
}
```

For more information, see Finding services and products using AWS Price List Query API in the *AWS Billing User Guide*.

- For API details, see DescribeServices in *AWS CLI Command Reference*.

`get-attribute-values`

The following code example shows how to use `get-attribute-values`.

AWS CLI

To retrieve a list of attribute values

The following `get-attribute-values` example retrieves a list of values available for the given attribute.

```
aws pricing get-attribute-values \
    --service-code AmazonEC2 \
    --attribute-name volumeType \
    --max-items 2
```

Output:

```
{
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ==",
    "AttributeValues": [
        {
            "Value": "Cold HDD"
        },
        {
```

```
            "Value": "General Purpose"
        }
    ]
}
```

For more information, see Finding services and products using AWS Price List Query API in the *AWS Billing User Guide*.

- For API details, see GetAttributeValues in *AWS CLI Command Reference*.

`get-products`

The following code example shows how to use `get-products`.

AWS CLI

To retrieve a list of products

The following `get-products` example retrieves a list of products that match the given criteria.

```
aws pricing get-products \
    --filters file://filters.json \
    --format-version aws_v1 \
    --max-results 1 \
    --service-code AmazonEC2
```

Contents of `filters.json`:

```
[
    {
        "Type": "TERM_MATCH",
        "Field": "ServiceCode",
        "Value": "AmazonEC2"
    },
    {
        "Type": "TERM_MATCH",
        "Field": "volumeType",
        "Value": "Provisioned IOPS"
    }
]
```

Output:

```
{
    "FormatVersion": "aws_v1",
    "NextToken": "WGDY7ko8fQXdlaUZVdasFQ==:RVSagyIFn770XQOzdUIcO9BY6ucBG9itXAZGZF/

```

For more information, see Finding services and products using AWS Price List Query API in the *AWS Billing User Guide*.

- For API details, see GetProducts in *AWS CLI Command Reference*.

AWS Private CA examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Private CA.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-certificate-authority-audit-report`

The following code example shows how to use `create-certificate-authority-audit-report`.

AWS CLI

To create a certificate authority audit report

The following `create-certificate-authority-audit-report` example creates an audit report for the private CA identified by the ARN.

```
aws acm-pca create-certificate-authority-audit-report \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:accountid:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --s3-bucket-name your-bucket-name \
    --audit-report-response-format JSON
```

Output:

```
{
    "AuditReportId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "S3Key": "audit-report/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111.json"
}
```

For more information, see Use audit reports with your private CA in the *AWS Private Certificate Authority User Guide*.

- For API details, see CreateCertificateAuthorityAuditReport in *AWS CLI Command Reference*.

`create-certificate-authority`

The following code example shows how to use `create-certificate-authority`.

AWS CLI

To create a private certificate authority

The following `create-certificate-authority` example creates a private certificate authority in your AWS account.

```
aws acm-pca create-certificate-authority \
    --certificate-authority-configuration file://C:\ca_config.txt \
    --revocation-configuration file://C:\revoke_config.txt \
    --certificate-authority-type "SUBORDINATE" \
    --idempotency-token 98256344
```

Contents of `C:\ca_config.txt`:

```
{
    "KeyAlgorithm": "RSA_2048",
    "SigningAlgorithm": "SHA256WITHRSA",
    "Subject": {
        "Country": "US",
        "Organization": "Example Corp",
        "OrganizationalUnit": "Sales",
        "State": "WA",
        "Locality": "Seattle",
        "CommonName": "www.example.com"
    }
}
```

Contents of `C:\revoke_config.txt`:

```
{
    "CrlConfiguration": {
        "Enabled": true,
        "ExpirationInDays": 7,
        "CustomCname": "crl.example.com",
        "S3BucketName": "amzn-s3-demo-bucket"
    }
}
```

Output:

```
{
    "CertificateAuthorityArn": "arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create a private CA in AWS Private CA in the *AWS Private Certificate Authority User Guide*.

- For API details, see CreateCertificateAuthority in *AWS CLI Command Reference*.

`delete-certificate-authority`

The following code example shows how to use `delete-certificate-authority`.

AWS CLI

To delete a private certificate authority

The following `delete-certificate-authority` example deletes the certificate authority identified by the ARN.

```
aws acm-pca delete-certificate-authority \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Delete your private CA in the *AWS Private Certificate Authority User Guide*.

- For API details, see DeleteCertificateAuthority in *AWS CLI Command Reference*.

`describe-certificate-authority-audit-report`

The following code example shows how to use `describe-certificate-authority-audit-report`.

AWS CLI

To describe an audit report for a certificate authority

The following `describe-certificate-authority-audit-report` example lists information about the specified audit report for the CA identified by the ARN.

```
aws acm-pca describe-certificate-authority-audit-report \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
```

```
    --audit-report-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "AuditReportStatus": "SUCCESS",
    "S3BucketName": "amzn-s3-demo-bucket",
    "S3Key": "audit-report/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222.json",
    "CreatedAt": "2023-08-21T20:30:15.123000+00:00"
}
```

For more information, see Use audit reports with your private CA in the *AWS Private Certificate Authority User Guide*.

- For API details, see DescribeCertificateAuthorityAuditReport in *AWS CLI Command Reference*.

`describe-certificate-authority`

The following code example shows how to use `describe-certificate-authority`.

AWS CLI

To describe a private certificate authority

The following `describe-certificate-authority` example lists information about the private CA identified by the ARN.

```
aws acm-pca describe-certificate-authority \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "CertificateAuthority": {
        "Arn": "arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "OwnerAccount": "123456789012",
        "CreatedAt": "2023-08-21T20:30:15.123000+00:00",
        "LastStateChangeAt": "2023-08-21T20:45:47.456000+00:00",
        "Type": "SUBORDINATE",
```

```
        "Serial": "4109",
        "Status": "ACTIVE",
        "NotBefore": "2023-08-21T19:45:47+00:00",
        "NotAfter": "2033-08-21T20:45:47+00:00",
        "CertificateAuthorityConfiguration": {
            "KeyAlgorithm": "RSA_2048",
            "SigningAlgorithm": "SHA256WITHRSA",
            "Subject": {
                "Country": "US",
                "Organization": "Example Corp",
                "OrganizationalUnit": "Sales",
                "State": "WA",
                "CommonName": "www.example.com",
                "Locality": "Seattle"
            }
        },
        "RevocationConfiguration": {
            "CrlConfiguration": {
                "Enabled": true,
                "ExpirationInDays": 7,
                "CustomCname": "crl.example.com",
                "S3BucketName": "amzn-s3-demo-bucket",
                "S3ObjectAcl": "BUCKET_OWNER_FULL_CONTROL"
            },
            "OcspConfiguration": {
                "Enabled": false
            }
        },
        "KeyStorageSecurityStandard": "FIPS_140_2_LEVEL_3_OR_HIGHER",
        "UsageMode": "GENERAL_PURPOSE"
    }
}
```

For more information, see View a private CA in the *AWS Private Certificate Authority User Guide*.

- For API details, see DescribeCertificateAuthority in *AWS CLI Command Reference*.

`get-certificate-authority-certificate`

The following code example shows how to use `get-certificate-authority-certificate`.

AWS CLI

To retrieve a certificate authority (CA) certificate

The following `get-certificate-authority-certificate` example retrieves the certificate and certificate chain for the private CA specified by the ARN.

```
aws acm-pca get-certificate-authority-certificate \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --output text
```

Output:

```
-----BEGIN CERTIFICATE-----

```

For more information, see Installing the CA certificate in the *AWS Private Certificate Authority User Guide*.

- For API details, see GetCertificateAuthorityCertificate in *AWS CLI Command Reference*.

`get-certificate-authority-csr`

The following code example shows how to use `get-certificate-authority-csr`.

AWS CLI

To retrieve the certificate signing request for a certificate authority

The following `get-certificate-authority-csr` example retrieves the CSR for the private CA specified by the ARN.

```
aws acm-pca get-certificate-authority-csr \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
```

```
    --output text
```

Output:

```

-----END CERTIFICATE REQUEST-----
```

For more information, see Installing the CA certificate in the *AWS Private Certificate Authority User Guide*.

- For API details, see GetCertificateAuthorityCsr in *AWS CLI Command Reference*.

`get-certificate`

The following code example shows how to use `get-certificate`.

AWS CLI

To retrieve an issued certificate

The following `get-certificate` example retrieves a certificate from the specified private CA.

```
aws acm-pca get-certificate \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --certificate-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/certificate/6707447683a9b7f4055627ffd55cebcc \
    --output text
```

Output:

```
-----BEGIN CERTIFICATE-----
MIIEDzCCAvegAwIBAgIRAJuJ8f6ZVYL7gG/rS3qvrZMwDQYJKoZIhvcNAQELBQAw
cTELMAkGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAOBgNVBAcMB1Nl
    ....certificate body truncated for brevity....

```

```
-----END CERTIFICATE---- -----BEGIN CERTIFICATE-----
MIIDrzCCApegAwIBAgIRAOskdzLvcj1eShkoyEE693AwDQYJKoZIhvcNAQELBQAw
cTELMAkGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAOBgNVBAcMB1Nl
    ...certificate body truncated for brevity....
kdRGB6P2hpxstDOUIwAoCbhoaWwfA4ybJznf+jOQhAziNlRdKQRR8nODWpKt7H9w
dJ5nxsTk/fniJz86Ddtp6n8s82wYdkN3cVffeK72A9aTCOU=
-----END CERTIFICATE-----
```

The first part of the output is the certificate itself. The second part is the certificate chain that chains to the root CA certificate. Note that when you use the `--output text` option, a TAB character is inserted between the two certificate pieces (that is the cause of the indented text). If you intend to take this output and parse the certificates with other tools, you might need to remove the TAB character so it is processed correctly.

For more information, see Retrieve a private certificate in the *AWS Private Certificate Authority User Guide*.

- For API details, see GetCertificate in *AWS CLI Command Reference*.

`import-certificate-authority-certificate`

The following code example shows how to use `import-certificate-authority-certificate`.

AWS CLI

To import your certificate authority certificate into ACM PCA

The following `import-certificate-authority-certificate` example imports the signed private CA certificate for the CA specified by the ARN into ACM PCA.

```
aws acm-pca import-certificate-authority-certificate \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --certificate fileb://C:\ca_cert.pem \
    --certificate-chain fileb://C:\ca_cert_chain.pem
```

This command produces no output.

For more information, see Installing the CA certificate in the *AWS Private Certificate Authority User Guide*.

- For API details, see ImportCertificateAuthorityCertificate in *AWS CLI Command Reference*.

`issue-certificate`

The following code example shows how to use `issue-certificate`.

AWS CLI

To issue a private certificate

The following `issue-certificate` example uses the private CA specified by the ARN to issue a private certificate.

```
aws acm-pca issue-certificate \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --csr fileb://C:\cert_1.csr \
    --signing-algorithm "SHA256WITHRSA" \
    --validity Value=365,Type="DAYS" \
    --idempotency-token 1234
```

Output:

```
{
    "CertificateArn": "arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/certificate/6707447683a9b7f4055627ffd55cebcc"
}
```

For more information, see Issue private end-entity certificates in the *AWS Private Certificate Authority User Guide*.

- For API details, see IssueCertificate in *AWS CLI Command Reference*.

`list-certificate-authorities`

The following code example shows how to use `list-certificate-authorities`.

AWS CLI

To list your private certificate authorities

The following `list-certificate-authorities` example lists information about all of the private CAs in your account.

```
aws acm-pca list-certificate-authorities \
    --max-results 10
```

Output:

```
{
    "CertificateAuthorities": [
        {
            "Arn": "arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "OwnerAccount": "123456789012",
            "CreatedAt": "2023-08-21T20:30:15.123000+00:00",
            "LastStateChangeAt": "2023-08-21T20:45:47.456000+00:00",
            "Type": "SUBORDINATE",
            "Serial": "4109",
            "Status": "ACTIVE",
            "NotBefore": "2023-08-21T19:45:47+00:00",

            "CertificateAuthorityConfiguration": {
                "KeyAlgorithm": "RSA_2048",
                "SigningAlgorithm": "SHA256WITHRSA",
                "Subject": {
                    "Country": "US",
                    "Organization": "Example Corp",
                    "OrganizationalUnit": "Sales",
                    "State": "WA",
                    "CommonName": "www.example.com",
                    "Locality": "Seattle"
                }
            },
            "RevocationConfiguration": {
                "CrlConfiguration": {
                    "Enabled": true,
                    "ExpirationInDays": 7,
                    "CustomCname": "crl.example.com",
                    "S3BucketName": "amzn-s3-demo-bucket",
                    "S3ObjectAcl": "BUCKET_OWNER_FULL_CONTROL"
                },
                "OcspConfiguration": {
                    "Enabled": false
```

```
                }
            },
            "KeyStorageSecurityStandard": "FIPS_140_2_LEVEL_3_OR_HIGHER",
            "UsageMode": "GENERAL_PURPOSE"
        }
    ]
}
```

For more information, see List private CAs in the *AWS Private Certificate Authority User Guide*.

- For API details, see ListCertificateAuthorities in *AWS CLI Command Reference*.

`list-tags`

The following code example shows how to use `list-tags`.

AWS CLI

To list the tags for your certificate authority

The following `list-tags` example lists the tags associated with the private CA specified by the ARN.

```
aws acm-pca list-tags \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/123455678-1234-1234-1234-123456789012 \
    --max-results 10
```

Output:

```
{
    "Tags": [
        {
            "Key": "Admin",
            "Value": "Alice"
        },
        {
            "Key": "Purpose",
            "Value": "Website"
        }
    ]
}
```

For more information, see Add tags for your private CA in the *AWS Private Certificate Authority User Guide*.

- For API details, see ListTags in *AWS CLI Command Reference*.

`revoke-certificate`

The following code example shows how to use `revoke-certificate`.

AWS CLI

To revoke a private certificate

The following `revoke-certificate` example revokes a private certificate from the CA identified by the ARN.

```
aws acm-pca revoke-certificate \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:1234567890:certificate-authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --certificate-serial 67:07:44:76:83:a9:b7:f4:05:56:27:ff:d5:5c:eb:cc \
    --revocation-reason "KEY_COMPROMISE"
```

This command produces no output.

For more information, see Revoke a private certificate in the *AWS Private Certificate Authority User Guide*.

- For API details, see RevokeCertificate in *AWS CLI Command Reference*.

`tag-certificate-authority`

The following code example shows how to use `tag-certificate-authority`.

AWS CLI

To attach tags to a private certificate authority

The following `tag-certificate-authority` example attaches one or more tags to your private CA.

```
aws acm-pca tag-certificate-authority \
```

```
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags Key=Admin,Value=Alice
```

This command produces no output.

For more information, see Add tags for your private CA in the *AWS Private Certificate Authority User Guide*.

- For API details, see TagCertificateAuthority in *AWS CLI Command Reference*.

`untag-certificate-authority`

The following code example shows how to use `untag-certificate-authority`.

AWS CLI

To remove one or more tags from your private certificate authority

The following `untag-certificate-authority` example removes tags from the private CA identified by the ARN.

```
aws acm-pca untag-certificate-authority \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags Key=Purpose,Value=Website
```

This command produces no output.

For more information, see Add tags for your private CA in the *AWS Private Certificate Authority User Guide*.

- For API details, see UntagCertificateAuthority in *AWS CLI Command Reference*.

`update-certificate-authority`

The following code example shows how to use `update-certificate-authority`.

AWS CLI

To update the configuration of your private certificate authority

The following `update-certificate-authority` example updates the status and configuration of the private CA identified by the ARN.

```
aws acm-pca update-certificate-authority \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/12345678-1234-1234-1234-1232456789012 \
    --revocation-configuration file://C:\revoke_config.txt \
    --status "DISABLED"
```

Contents of `C:\revoke_config.txt`:

```
{
    "CrlConfiguration": {
        "Enabled": true,
        "ExpirationInDays": 7,
        "CustomCname": "crl.example.com",
        "S3BucketName": "amzn-s3-demo-bucket"
    }
}
```

This command produces no output.

For more information, see Update a private CA in AWS Private Certificate Authority in the *AWS Private Certificate Authority User Guide*.

- For API details, see UpdateCertificateAuthority in *AWS CLI Command Reference*.

AWS Proton examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Proton.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`cancel-service-instance-deployment`

The following code example shows how to use `cancel-service-instance-deployment`.

AWS CLI

To cancel a service instance deployment

The following `cancel-service-instance-deployment` example cancels a service instance deployment.

```
aws proton cancel-service-instance-deployment \
    --service-instance-name "instance-one" \
    --service-name "simple-svc"
```

Output:

```
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-
instance/instance-one",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "CANCELLING",
        "environmentName": "simple-env",
        "lastDeploymentAttemptedAt": "2021-04-02T21:45:15.406000+00:00",
        "lastDeploymentSucceededAt": "2021-04-02T21:38:00.823000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_optional_input: abc\n  my_sample_pipeline_required_input:
 '123'\ninstances:\n- name: my-instance\n  environment: MySimpleEnv
\n  spec:\n    my_sample_service_instance_optional_input: def\n
 my_sample_service_instance_required_input: '456'\n- name: my-other-instance\n
 environment: MySimpleEnv\n  spec:\n    my_sample_service_instance_required_input:
 '789'\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "1",
        "templateName": "svc-simple"
    }
}
```

For more information, see Update a service instance in the *The AWS Proton Administrator Guide* or Update a service instance in the *The AWS Proton User Guide*.

- For API details, see CancelServiceInstanceDeployment in *AWS CLI Command Reference*.

`cancel-service-pipeline-deployment`

The following code example shows how to use `cancel-service-pipeline-deployment`.

AWS CLI

To cancel a service pipeline deployment

The following `cancel-service-pipeline-deployment` example cancels a service pipeline deployment.

```
aws proton cancel-service-pipeline-deployment \
    --service-name "simple-svc"
```

Output:

```
{
    "pipeline": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "CANCELLING",
        "lastDeploymentAttemptedAt": "2021-04-02T22:02:45.095000+00:00",
        "lastDeploymentSucceededAt": "2021-04-02T21:39:28.991000+00:00",
        "templateMajorVersion": "1",
        "templateMinorVersion": "1",
        "templateName": "svc-simple"
    }
}
```

For more information, see Update a service pipeline in the *The AWS Proton Administrator Guide* or Update a service pipeline in the *The AWS Proton User Guide*.

- For API details, see CancelServicePipelineDeployment in *AWS CLI Command Reference*.

`create-service`

The following code example shows how to use `create-service`.

AWS CLI

To create a service

The following `create-service` example creates a service with a service pipeline.

```
aws proton create-service \
    --name "MySimpleService" \
    --template-name "fargate-service" \
    --template-major-version "1" \
    --branch-name "mainline" \
    --repository-connection-arn "arn:aws:codestar-connections:region-id:account-id:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --repository-id "myorg/myapp" \
    --spec file://spec.yaml
```

Contents of `spec.yaml`:

```
proton: ServiceSpec

pipeline:
    my_sample_pipeline_required_input: "hello"
    my_sample_pipeline_optional_input: "bye"

instances:
    - name: "acme-network-dev"
        environment: "ENV_NAME"
        spec:
            my_sample_service_instance_required_input: "hi"
            my_sample_service_instance_optional_input: "ho"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
        "createdAt": "2020-11-18T19:50:27.460000+00:00",
        "lastModifiedAt": "2020-11-18T19:50:27.460000+00:00",
        "name": "MySimpleService",
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-id:123456789012connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "repositoryId": "myorg/myapp",
        "status": "CREATE_IN_PROGRESS",
```

```
        "templateName": "fargate-service"
    }
}
```

For more information, see Create a service in the *The AWS Proton Administrator Guide* and Create a service in the *The AWS Proton User Guide*.

- For API details, see CreateService in *AWS CLI Command Reference*.

`delete-service`

The following code example shows how to use `delete-service`.

AWS CLI

To delete a service

The following `delete-service` example deletes a service.

```
aws proton delete-service \
    --name "simple-svc"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
        "branchName": "mainline",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "description": "Edit by updating description",
        "lastModifiedAt": "2020-11-29T00:30:39.248000+00:00",
        "name": "simple-svc",
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "repositoryId": "myorg/myapp",
        "status": "DELETE_IN_PROGRESS",
        "templateName": "fargate-service"
    }
}
```

For more information, see Delete a service in the *The AWS Proton Administrator Guide*.

- For API details, see DeleteService in *AWS CLI Command Reference*.

`get-service-instance`

The following code example shows how to use `get-service-instance`.

AWS CLI

To get service instance details

The following `get-service-instance` example gets detail data for a service instance.

```
aws proton get-service-instance \
    --name "instance-one" \
    --service-name "simple-svc"
```

Output:

```
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-
instance/instance-one",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "deploymentStatus": "SUCCEEDED",
        "environmentName": "simple-env",
        "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
        "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_optional_input: hello world\n
 my_sample_pipeline_required_input: pipeline up\ninstances:\n- name: instance-one\n
 environment: my-simple-env\n  spec:\n    my_sample_service_instance_optional_input:
 Ola\n    my_sample_service_instance_required_input: Ciao\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```

For more information, see View service data in the *The AWS Proton Administrator Guide* or View service data in the *The AWS Proton User Guide*.

- For API details, see GetServiceInstance in *AWS CLI Command Reference*.

get-service

The following code example shows how to use `get-service`.

AWS CLI

To get service details

The following `get-service` example gets detail data for a service.

```
aws proton get-service \
    --name "simple-svc"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
        "branchName": "mainline",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "lastModifiedAt": "2020-11-28T22:44:51.207000+00:00",
        "name": "simple-svc",
        "pipeline": {
            "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/
pipeline/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "createdAt": "2020-11-28T22:40:50.512000+00:00",
            "deploymentStatus": "SUCCEEDED",
            "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
            "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
            "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_required_input: hello\n  my_sample_pipeline_optional_input:
 bye\ninstances:\n- name: instance-svc-simple\n  environment: my-simple-
env\n  spec:\n    my_sample_service_instance_required_input: hi\n
 my_sample_service_instance_optional_input: ho\n",
            "templateMajorVersion": "1",
            "templateMinorVersion": "1",
            "templateName": "svc-simple"
        },
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "repositoryId": "myorg/myapp",
        "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_required_input: hello\n  my_sample_pipeline_optional_input:
```

```
 bye\ninstances:\n- name: instance-svc-simple\n  environment: my-simple-
env\n  spec:\n    my_sample_service_instance_required_input: hi\n
 my_sample_service_instance_optional_input: ho\n",
        "status": "ACTIVE",
        "templateName": "svc-simple"
    }
}
```

For more information, see View service data in the *The AWS Proton Administrator Guide* or View service data in the *The AWS Proton User Guide*.

- For API details, see GetService in *AWS CLI Command Reference*.

`list-service-instances`

The following code example shows how to use `list-service-instances`.

AWS CLI

To list all service instances

The following `list-service-instances` example lists service instances.

```
aws proton list-service-instances
```

Output:

```
{
    "serviceInstances": [
        {
            "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/
service-instance/instance-one",
            "createdAt": "2020-11-28T22:40:50.512000+00:00",
            "deploymentStatus": "SUCCEEDED",
            "environmentName": "simple-env",
            "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
            "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
            "name": "instance-one",
            "serviceName": "simple-svc",
            "templateMajorVersion": "1",
            "templateMinorVersion": "0",
            "templateName": "fargate-service"
        }
```

```
    ]
}
```

For more information, see View service instance data in the *The AWS Proton Administrator Guide* or View service instance data in the *The AWS Proton User Guide*.

- For API details, see ListServiceInstances in *AWS CLI Command Reference*.

`update-service-instance`

The following code example shows how to use `update-service-instance`.

AWS CLI

To update a service instance to a new minor version

The following `update-service-instance` example updates a service instance to a new minor version of its service template that adds a new instance named "my-other-instance" with a new required input.

```
aws proton update-service-instance \
    --service-name "simple-svc" \
    --spec "file://service-spec.yaml" \
    --template-major-version "1" \
    --template-minor-version "1" \
    --deployment-type "MINOR_VERSION" \
    --name "instance-one"
```

Contents of `service-spec.yaml`:

```
proton: ServiceSpec
pipeline:
    my_sample_pipeline_optional_input: "abc"
    my_sample_pipeline_required_input: "123"
instances:
    - name: "instance-one"
        environment: "simple-env"
        spec:
            my_sample_service_instance_optional_input: "def"
            my_sample_service_instance_required_input: "456"
    - name: "my-other-instance"
        environment: "simple-env"
```

```
        spec:
            my_sample_service_instance_required_input: "789"
```

Output:

```
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-
instance/instance-one",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "IN_PROGRESS",
        "environmentName": "arn:aws:proton:region-id:123456789012:environment/
simple-env",
        "lastDeploymentAttemptedAt": "2021-04-02T21:38:00.823000+00:00",
        "lastDeploymentSucceededAt": "2021-04-02T21:29:59.962000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```

For more information, see Update a service instance in the *The AWS Proton Administrator Guide* or Update a service instance in the *The AWS Proton User Guide*.

- For API details, see UpdateServiceInstance in *AWS CLI Command Reference*.

`update-service-pipeline`

The following code example shows how to use `update-service-pipeline`.

AWS CLI

To update a service pipeline

The following `update-service-pipeline` example updates a service pipeline to a new minor version of its service template.

```
aws proton update-service-pipeline \
    --service-name "simple-svc" \
    --spec "file://service-spec.yaml" \
    --template-major-version "1" \
```

```
    --template-minor-version "1" \
    --deployment-type "MINOR_VERSION"
```

Contents of `service-spec.yaml`:

```
proton: ServiceSpec

pipeline:
  my_sample_pipeline_optional_input: "abc"
  my_sample_pipeline_required_input: "123"

instances:
  - name: "my-instance"
    environment: "MySimpleEnv"
    spec:
      my_sample_service_instance_optional_input: "def"
      my_sample_service_instance_required_input: "456"
  - name: "my-other-instance"
    environment: "MySimpleEnv"
    spec:
      my_sample_service_instance_required_input: "789"
```

Output:

```
{
    "pipeline": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "IN_PROGRESS",
        "lastDeploymentAttemptedAt": "2021-04-02T21:39:28.991000+00:00",
        "lastDeploymentSucceededAt": "2021-04-02T21:29:59.962000+00:00",
        "spec": "proton: ServiceSpec\n\npipeline:\n
 my_sample_pipeline_optional_input: \"abc\"\n  my_sample_pipeline_required_input:
 \"123\"\n\ninstances:\n  - name: \"my-instance\"\n    environment: \"MySimpleEnv
\"\n    spec:\n      my_sample_service_instance_optional_input: \"def
\"\n      my_sample_service_instance_required_input: \"456\"\n  - name:
 \"my-other-instance\"\n    environment: \"MySimpleEnv\"\n    spec:\n
 my_sample_service_instance_required_input: \"789\"\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
```

```
}
```

For more information, see Update a service pipeline in the *The AWS Proton Administrator Guide* or Update a service pipeline in the *The AWS Proton User Guide*.

- For API details, see UpdateServicePipeline in *AWS CLI Command Reference*.

`update-service`

The following code example shows how to use `update-service`.

AWS CLI

To update a service

The following `update-service` example edits a service description.

```
aws proton update-service \
    --name "MySimpleService" \
    --description "Edit by updating description"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
        "branchName": "mainline",
        "createdAt": "2021-03-12T22:39:42.318000+00:00",
        "description": "Edit by updating description",
        "lastModifiedAt": "2021-03-12T22:44:21.975000+00:00",
        "name": "MySimpleService",
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "repositoryId": "myorg/myapp",
        "status": "ACTIVE",
        "templateName": "fargate-service"
    }
}
```

For more information, see Edit a service in the *The AWS Proton Administrator Guide* or Edit a service in the *The AWS Proton User Guide*.

- For API details, see UpdateService in *AWS CLI Command Reference*.

Amazon RDS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-option-to-option-group`

The following code example shows how to use `add-option-to-option-group`.

AWS CLI

To add an option to an option group

The following `add-option-to-option-group` example adds an option to the specified option group.

```
aws rds add-option-to-option-group \
    --option-group-name myoptiongroup \
    --options OptionName=OEM,Port=5500,DBSecurityGroupMemberships=default \
    --apply-immediately
```

Output:

```
{
    "OptionGroup": {
        "OptionGroupName": "myoptiongroup",
        "OptionGroupDescription": "Test Option Group",
        "EngineName": "oracle-ee",
        "MajorEngineVersion": "12.1",
        "Options": [
            {
```

```
                "OptionName": "Timezone",
                "OptionDescription": "Change time zone",
                "Persistent": true,
                "Permanent": false,
                "OptionSettings": [
                    {
                        "Name": "TIME_ZONE",
                        "Value": "Australia/Sydney",
                        "DefaultValue": "UTC",
                        "Description": "Specifies the timezone the user wants to
 change the system time to",
                        "ApplyType": "DYNAMIC",
                        "DataType": "STRING",
                        "AllowedValues": "Africa/Cairo,Africa/Casablanca,Africa/

                "OptionSettings": [],
                "DBSecurityGroupMemberships": [
                    {
                        "DBSecurityGroupName": "default",
                        "Status": "authorized"
                    }
                ],
                "VpcSecurityGroupMemberships": []
            }
        ],
        "AllowsVpcAndNonVpcInstanceMemberships": false,
        "OptionGroupArn": "arn:aws:rds:us-west-2:123456789012:og:myoptiongroup"
    }
}
```

For more information, see Adding an Option to an Option Group in the *Amazon RDS User Guide*.

- For API details, see AddOptionToOptionGroup in *AWS CLI Command Reference*.

`add-role-to-db-cluster`

The following code example shows how to use `add-role-to-db-cluster`.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB cluster

The following `add-role-to-db-cluster` example associates a role with a DB cluster.

```
aws rds add-role-to-db-cluster \
    --db-cluster-identifier mydbcluster \
    --role-arn arn:aws:iam::123456789012:role/RDSLoadFromS3
```

This command produces no output.

For more information, see Associating an IAM role with an Amazon Aurora MySQL DB cluster in the *Amazon Aurora User Guide*.

- For API details, see AddRoleToDbCluster in *AWS CLI Command Reference*.

`add-role-to-db-instance`

The following code example shows how to use `add-role-to-db-instance`.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB instance

The following `add-role-to-db-instance` example adds the role to an Oracle DB instance named `test-instance`.

```
aws rds add-role-to-db-instance \
    --db-instance-identifier test-instance \
    --feature-name S3_INTEGRATION \
    --role-arn arn:aws:iam::123456789012:role/rds-s3-integration-role
```

This command produces no output.

For more information, see Prerequisites for Amazon RDS Oracle Integration with Amazon S3 in the *Amazon RDS User Guide*.

- For API details, see AddRoleToDbInstance in *AWS CLI Command Reference*.

`add-source-identifier-to-subscription`

The following code example shows how to use `add-source-identifier-to-subscription`.

AWS CLI

To add a source identifier to a subscription

The following `add-source-identifier-to-subscription` example adds another source identifier to an existing subscription.

```
aws rds add-source-identifier-to-subscription \
    --subscription-name my-instance-events \
    --source-identifier test-instance-repl
```

Output:

```
{
    "EventSubscription": {
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
```

```
        "CustSubscriptionId": "my-instance-events",
        "EventSubscriptionArn": "arn:aws:rds:us-west-2:123456789012:es:my-instance-
events",
        "Enabled": false,
        "Status": "modifying",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "CustomerAwsId": "123456789012",
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:interesting-events",
        "SourceType": "db-instance",
        "SourceIdsList": [
            "test-instance",
            "test-instance-repl"
        ]
    }
}
```

For more information, see Adding a source identifier to an Amazon RDS event notification subscription in the *Amazon RDS User Guide*.

- For API details, see AddSourceIdentifierToSubscription in *AWS CLI Command Reference*.

`add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add tags to a resource

The following `add-tags-to-resource` example add tags to an RDS database.

```
aws rds add-tags-to-resource \
    --resource-name arn:aws:rds:us-west-2:123456789012:db:database-mysql \
    --tags "[{\"Key\": \"Name\",\"Value\": \"MyDatabase\"},{\"Key\": \"Environment
\",\"Value\": \"test\"}]"
```

This command produces no output.

For more information, see Tagging Amazon RDS Resources in the *Amazon RDS User Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

`apply-pending-maintenance-action`

The following code example shows how to use `apply-pending-maintenance-action`.

AWS CLI

To apply pending maintenance actions

The following `apply-pending-maintenance-action` example applies the pending maintenance actions for a DB cluster.

```
aws rds apply-pending-maintenance-action \
    --resource-identifier arn:aws:rds:us-west-2:123456789012:cluster:my-db-cluster \
    --apply-action system-update \
    --opt-in-type immediate
```

Output:

```
{
    "ResourcePendingMaintenanceActions": {
        "ResourceIdentifier": "arn:aws:rds:us-west-2:123456789012:cluster:my-db-
cluster",
        "PendingMaintenanceActionDetails": [
            {
                "Action": "system-update",
                "OptInStatus": "immediate",
                "CurrentApplyDate": "2021-01-23T01:07:36.100Z",
                "Description": "Upgrade to Aurora PostgreSQL 3.3.2"
            }
        ]
    }
}
```

For more information, see Maintaining a DB instance in the *Amazon RDS User Guide* and Maintaining an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see ApplyPendingMaintenanceAction in *AWS CLI Command Reference*.

`authorize-db-security-group-ingress`

The following code example shows how to use `authorize-db-security-group-ingress`.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB instance

The following `authorize-db-security-group-ingress` example configures the default security group with an ingress rule for the CIDR IP range 192.0.2.0/24.

```
aws rds authorize-db-security-group-ingress \
    --db-security-group-name default \
    --cidrip 192.0.2.0/24
```

Output:

```
{
    "DBSecurityGroup": {
        "OwnerId": "123456789012",
        "DBSecurityGroupName": "default",
        "DBSecurityGroupDescription": "default",
        "EC2SecurityGroups": [],
        "IPRanges": [
            {
                "Status": "authorizing",
                "CIDRIP": "192.0.2.0/24"
            }
        ],
        "DBSecurityGroupArn": "arn:aws:rds:us-west-2:123456789012:secgrp:default"
    }
}
```

For more information, see Authorizing Network Access to a DB Security Group from an IP Range in the *Amazon RDS User Guide*.

- For API details, see AuthorizeDbSecurityGroupIngress in *AWS CLI Command Reference*.

`backtrack-db-cluster`

The following code example shows how to use `backtrack-db-cluster`.

AWS CLI

To backtrack an Aurora DB cluster

The following `backtrack-db-cluster` example backtracks the specified DB cluster sample-cluster to March 19, 2018, at 10 a.m.

```
aws rds backtrack-db-cluster \
    --db-cluster-identifier sample-cluster \
    --backtrack-to 2018-03-19T10:00:00+00:00
```

Output:

```
{
    "DBClusterIdentifier": "sample-cluster",
    "BacktrackIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "BacktrackTo": "2018-03-19T10:00:00+00:00",
    "BacktrackedFrom": "2018-03-19T11:30:00.123000+00:00",
    "BacktrackRequestCreationTime": "2018-03-19T11:30:00.123000+00:00",
    "Status": "PENDING"
}
```

For more information, see Backtracking an Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see BacktrackDbCluster in *AWS CLI Command Reference*.

`cancel-export-task`

The following code example shows how to use `cancel-export-task`.

AWS CLI

To cancel a snapshot export to Amazon S3

The following `cancel-export-task` example cancels an export task in progress that is exporting a snapshot to Amazon S3.

```
aws rds cancel-export-task \
    --export-task-identifier my-s3-export-1
```

Output:

```
{
    "ExportTaskIdentifier": "my-s3-export-1",
    "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:publisher-final-
snapshot",
```

```
    "SnapshotTime": "2019-03-24T20:01:09.815Z",
    "S3Bucket": "amzn-s3-demo-bucket",
    "S3Prefix": "",
    "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/export-snap-S3-role",
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "Status": "CANCELING",
    "PercentProgress": 0,
    "TotalExtractedDataInGB": 0
}
```

For more information, see Canceling a snapshot export task in the *Amazon RDS User Guide* or Canceling a snapshot export task in the *Amazon Aurora User Guide*.

- For API details, see CancelExportTask in *AWS CLI Command Reference*.

`copy-db-cluster-parameter-group`

The following code example shows how to use `copy-db-cluster-parameter-group`.

AWS CLI

To copy a DB cluster parameter group

The following `copy-db-cluster-parameter-group` example makes a copy of a DB cluster parameter group.

```
aws rds copy-db-cluster-parameter-group \
    --source-db-cluster-parameter-group-identifier mydbclusterpg \
    --target-db-cluster-parameter-group-identifier mydbclusterpgcopy \
    --target-db-cluster-parameter-group-description "Copy of mydbclusterpg parameter
 group"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "DBClusterParameterGroupName": "mydbclusterpgcopy",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-west-2:123456789012:cluster-
pg:mydbclusterpgcopy",
        "DBParameterGroupFamily": "aurora-mysql5.7",
        "Description": "Copy of mydbclusterpg parameter group"
    }
```

```
}
```

For more information, see Copying a DB Cluster Parameter Group in the *Amazon Aurora Users Guide*.

- For API details, see CopyDbClusterParameterGroup in *AWS CLI Command Reference*.

`copy-db-cluster-snapshot`

The following code example shows how to use `copy-db-cluster-snapshot`.

AWS CLI

To copy a DB cluster snapshot

The following `copy-db-cluster-snapshot` example creates a copy of a DB cluster snapshot, including its tags.

```
aws rds copy-db-cluster-snapshot \
    --source-db-cluster-snapshot-identifier arn:aws:rds:us-
west-2:123456789012:cluster-snapshot:rds:myaurora-2019-06-04-09-16 \
    --target-db-cluster-snapshot-identifier myclustersnapshotcopy \
    --copy-tags
```

Output:

```
{
    "DBClusterSnapshot": {
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2c"
        ],
        "DBClusterSnapshotIdentifier": "myclustersnapshotcopy",
        "DBClusterIdentifier": "myaurora",
        "SnapshotCreateTime": "2019-06-04T09:16:42.649Z",
        "Engine": "aurora-mysql",
        "AllocatedStorage": 0,
        "Status": "available",
        "Port": 0,
        "VpcId": "vpc-6594f31c",
        "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
        "MasterUsername": "myadmin",
```

```
        "EngineVersion": "5.7.mysql_aurora.2.04.2",
        "LicenseModel": "aurora-mysql",
        "SnapshotType": "manual",
        "PercentProgress": 100,
        "StorageEncrypted": true,
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBClusterSnapshotArn": "arn:aws:rds:us-west-2:123456789012:cluster-
snapshot:myclustersnapshotcopy",
        "IAMDatabaseAuthenticationEnabled": false
    }
}
```

For more information, see Copying a Snapshot in the *Amazon Aurora User Guide*.

- For API details, see CopyDbClusterSnapshot in *AWS CLI Command Reference*.

`copy-db-parameter-group`

The following code example shows how to use `copy-db-parameter-group`.

AWS CLI

To copy a DB cluster parameter group

The following `copy-db-parameter-group` example makes a copy of a DB parameter group.

```
aws rds copy-db-parameter-group \
    --source-db-parameter-group-identifier mydbpg \
    --target-db-parameter-group-identifier mydbpgcopy \
    --target-db-parameter-group-description "Copy of mydbpg parameter group"
```

Output:

```
{
    "DBParameterGroup": {
        "DBParameterGroupName": "mydbpgcopy",
        "DBParameterGroupArn": "arn:aws:rds:us-west-2:123456789012:pg:mydbpgcopy",
        "DBParameterGroupFamily": "mysql5.7",
        "Description": "Copy of mydbpg parameter group"
    }
}
```

For more information, see Copying a DB Parameter Group in the *Amazon RDS Users Guide*.

- For API details, see CopyDbParameterGroup in *AWS CLI Command Reference*.

`copy-db-snapshot`

The following code example shows how to use `copy-db-snapshot`.

AWS CLI

To copy a DB snapshot

The following `copy-db-snapshot` example creates a copy of a DB snapshot.

```
aws rds copy-db-snapshot \
    --source-db-snapshot-identifier rds:database-mysql-2019-06-06-08-38 \
    --target-db-snapshot-identifier mydbsnapshotcopy
```

Output:

```
{
    "DBSnapshot": {
        "VpcId": "vpc-6594f31c",
        "Status": "creating",
        "Encrypted": true,
        "SourceDBSnapshotIdentifier": "arn:aws:rds:us-
west-2:123456789012:snapshot:rds:database-mysql-2019-06-06-08-38",
        "MasterUsername": "admin",
        "Iops": 1000,
        "Port": 3306,
        "LicenseModel": "general-public-license",
        "DBSnapshotArn": "arn:aws:rds:us-
west-2:123456789012:snapshot:mydbsnapshotcopy",
        "EngineVersion": "5.6.40",
        "OptionGroupName": "default:mysql-5-6",
        "ProcessorFeatures": [],
        "Engine": "mysql",
        "StorageType": "io1",
        "DbiResourceId": "db-ZI7UJ5BLKMBYFGX7FDENCKADC4",
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "SnapshotType": "manual",
        "IAMDatabaseAuthenticationEnabled": false,
        "SourceRegion": "us-west-2",
        "DBInstanceIdentifier": "database-mysql",
        "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
```

```
        "AvailabilityZone": "us-west-2c",
        "PercentProgress": 0,
        "AllocatedStorage": 100,
        "DBSnapshotIdentifier": "mydbsnapshotcopy"
    }
}
```

For more information, see Copying a Snapshot in the *Amazon RDS User Guide*.

- For API details, see CopyDbSnapshot in *AWS CLI Command Reference*.

`copy-option-group`

The following code example shows how to use `copy-option-group`.

AWS CLI

To copy an option group

The following `copy-option-group` example makes a copy of an option group.

```
aws rds copy-option-group \
    --source-option-group-identifier myoptiongroup \
    --target-option-group-identifier new-option-group \
    --target-option-group-description "My option group copy"
```

Output:

```
{
    "OptionGroup": {
        "Options": [],
        "OptionGroupName": "new-option-group",
        "MajorEngineVersion": "11.2",
        "OptionGroupDescription": "My option group copy",
        "AllowsVpcAndNonVpcInstanceMemberships": true,
        "EngineName": "oracle-ee",
        "OptionGroupArn": "arn:aws:rds:us-west-2:123456789012:og:new-option-group"
    }
}
```

For more information, see Making a Copy of an Option Group in the *Amazon RDS User Guide*.

- For API details, see CopyOptionGroup in *AWS CLI Command Reference*.

create-blue-green-deployment

The following code example shows how to use `create-blue-green-deployment`.

AWS CLI

Example 1: To create a blue/green deployment for an RDS for MySQL DB instance

The following `create-blue-green-deployment` example creates a blue/green deployment for a MySQL DB instance.

```
aws rds create-blue-green-deployment \
    --blue-green-deployment-name bgd-cli-test-instance \
    --source arn:aws:rds:us-west-2:123456789012:db:my-db-instance \
    --target-engine-version 8.0 \
    --target-db-parameter-group-name mysql-80-group
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",
        "Source": "arn:aws:rds:us-west-2:123456789012:db:my-db-instance",
        "SwitchoverDetails": [
            {
                "SourceMember": "arn:aws:rds:us-west-2:123456789012:db:my-db-
instance"

For more information, see Creating a blue/green deployment in the *Amazon RDS User Guide*.

Example 2: To create a blue/green deployment for an Aurora MySQL DB cluster

The following `create-blue-green-deployment` example creates a blue/green deployment for an Aurora MySQL DB cluster.

```
aws rds create-blue-green-deployment \
    --blue-green-deployment-name my-blue-green-deployment \
    --source arn:aws:rds:us-west-2:123456789012:cluster:my-aurora-mysql-cluster \
    --target-engine-version 8.0 \
    --target-db-cluster-parameter-group-name ams-80-binlog-enabled \
    --target-db-parameter-group-name mysql-80-cluster-group
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
        "BlueGreenDeploymentName": "my-blue-green-deployment",
```

```
        "Source": "arn:aws:rds:us-west-2:123456789012:cluster:my-aurora-mysql-
cluster",
        "SwitchoverDetails": [

`create-db-cluster-endpoint`

The following code example shows how to use `create-db-cluster-endpoint`.

AWS CLI

To create a custom DB cluster endpoint

The following `create-db-cluster-endpoint` example creates a custom DB cluster endpoint and associate it with the specified Aurora DB cluster.

```
aws rds create-db-cluster-endpoint \
    --db-cluster-endpoint-identifier mycustomendpoint \
    --endpoint-type reader \
    --db-cluster-identifier mydbcluster \
    --static-members dbinstance1 dbinstance2
```

Output:

```
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
    "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-
west-2.rds.amazonaws.com",
    "Status": "creating",
```

```
    "EndpointType": "CUSTOM",
    "CustomEndpointType": "READER",
    "StaticMembers": [
        "dbinstance1",
        "dbinstance2"
    ],
    "ExcludedMembers": [],
    "DBClusterEndpointArn": "arn:aws:rds:us-west-2:123456789012:cluster-
endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see CreateDbClusterEndpoint in *AWS CLI Command Reference*.

`create-db-cluster-parameter-group`

The following code example shows how to use `create-db-cluster-parameter-group`.

AWS CLI

To create a DB cluster parameter group

The following `create-db-cluster-parameter-group` example creates a DB cluster parameter group.

```
aws rds create-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclusterparametergroup \
    --db-parameter-group-family aurora5.6 \
    --description "My new cluster parameter group"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "DBClusterParameterGroupName": "mydbclusterparametergroup",
        "DBParameterGroupFamily": "aurora5.6",
        "Description": "My new cluster parameter group",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-west-2:123456789012:cluster-
pg:mydbclusterparametergroup"
    }
```

```
}
```

For more information, see Creating a DB Cluster Parameter Group in the *Amazon Aurora User Guide*.

- For API details, see CreateDbClusterParameterGroup in *AWS CLI Command Reference*.

`create-db-cluster-snapshot`

The following code example shows how to use `create-db-cluster-snapshot`.

AWS CLI

To create a DB cluster snapshot

The following `create-db-cluster-snapshot` example creates a DB cluster snapshot.

```
aws rds create-db-cluster-snapshot \
    --db-cluster-identifier mydbcluster \
    --db-cluster-snapshot-identifier mydbclustersnapshot
```

Output:

```
{
    "DBClusterSnapshot": {
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2d"
        ],
        "DBClusterSnapshotIdentifier": "mydbclustersnapshot",
        "DBClusterIdentifier": "mydbcluster",
        "SnapshotCreateTime": "2019-06-18T21:21:00.469Z",

        "MasterUsername": "myadmin",
        "EngineVersion": "5.7.mysql_aurora.2.04.2",
        "LicenseModel": "aurora-mysql",
        "SnapshotType": "manual",
```

```
        "PercentProgress": 0,
        "StorageEncrypted": true,
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBClusterSnapshotArn": "arn:aws:rds:us-west-2:123456789012:cluster-
snapshot:mydbclustersnapshot",
        "IAMDatabaseAuthenticationEnabled": false
    }
}
```

For more information, see Creating a DB Cluster Snapshot in the *Amazon Aurora User Guide*.

- For API details, see CreateDbClusterSnapshot in *AWS CLI Command Reference*.

`create-db-cluster`

The following code example shows how to use `create-db-cluster`.

AWS CLI

Example 1: To create a MySQL 5.7--compatible DB cluster

The following `create-db-cluster` example creates a MySQL 5.7-compatible DB cluster using the default engine version. Replace the sample password `secret99` with a secure password. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-cluster \
    --db-cluster-identifier sample-cluster \
    --engine aurora-mysql \
    --engine-version 5.7 \
    --master-username admin \
    --master-user-password secret99 \
    --db-subnet-group-name default \
    --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```
{
    "DBCluster": {
        "DBSubnetGroup": "default",
```

```
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-0b9130572daf3dc16",
                "Status": "active"
            }
        ],
        "AllocatedStorage": 1,
        "AssociatedRoles": [],
        "PreferredBackupWindow": "09:12-09:42",
        "ClusterCreateTime": "2023-02-27T23:21:33.048Z",
        "DeletionProtection": false,
        "IAMDatabaseAuthenticationEnabled": false,
        "ReadReplicaIdentifiers": [],
        "EngineMode": "provisioned",
        "Engine": "aurora-mysql",
        "StorageEncrypted": false,
        "MultiAZ": false,
        "PreferredMaintenanceWindow": "mon:04:31-mon:05:01",
        "HttpEndpointEnabled": false,
        "BackupRetentionPeriod": 1,
        "DbClusterResourceId": "cluster-ANPAJ4AE5446DAEXAMPLE",
        "DBClusterIdentifier": "sample-cluster",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2d"
        ],
        "MasterUsername": "master",
        "EngineVersion": "5.7.mysql_aurora.2.11.1",
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster",
        "DBClusterMembers": [],
        "Port": 3306,
        "Status": "creating",
        "Endpoint": "sample-cluster.cluster-cnpexample.us-west-2.rds.amazonaws.com",
        "DBClusterParameterGroup": "default.aurora-mysql5.7",
        "HostedZoneId": "Z2R2ITUGPM61AM",
        "ReaderEndpoint": "sample-cluster.cluster-ro-cnpexample.us-
west-2.rds.amazonaws.com",
        "CopyTagsToSnapshot": false
    }
}
```

Example 2: To create a PostgreSQL--compatible DB cluster

The following `create-db-cluster` example creates a PostgreSQL-compatible DB cluster using the default engine version. Replace the example password `secret99` with a secure password. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-cluster \
    --db-cluster-identifier sample-pg-cluster \
    --engine aurora-postgresql \
    --master-username master \
    --master-user-password secret99 \
    --db-subnet-group-name default \
    --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```
{
    "DBCluster": {
        "Endpoint": "sample-pg-cluster.cluster-cnpexample.us-
west-2.rds.amazonaws.com",
        "HttpEndpointEnabled": false,
        "DBClusterMembers": [],
        "EngineMode": "provisioned",
        "CopyTagsToSnapshot": false,
        "HostedZoneId": "Z2R2ITUGPM61AM",
        "IAMDatabaseAuthenticationEnabled": false,
        "AllocatedStorage": 1,
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-0b9130572daf3dc16",
                "Status": "active"
            }
        ],
        "DeletionProtection": false,
        "StorageEncrypted": false,
        "BackupRetentionPeriod": 1,
        "PreferredBackupWindow": "09:56-10:26",
        "ClusterCreateTime": "2023-02-27T23:26:08.371Z",
        "DBClusterParameterGroup": "default.aurora-postgresql13",
        "EngineVersion": "13.7",
        "Engine": "aurora-postgresql",
```

```
        "Status": "creating",
        "DBClusterIdentifier": "sample-pg-cluster",
        "MultiAZ": false,
        "Port": 5432,
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-pg-
cluster",
        "AssociatedRoles": [],
        "DbClusterResourceId": "cluster-ANPAJ4AE5446DAEXAMPLE",
        "PreferredMaintenanceWindow": "wed:03:33-wed:04:03",
        "ReaderEndpoint": "sample-pg-cluster.cluster-ro-cnpexample.us-
west-2.rds.amazonaws.com",
        "MasterUsername": "master",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2c"
        ],
        "ReadReplicaIdentifiers": [],
        "DBSubnetGroup": "default"
    }
}
```

Example 3: To create an Aurora PostgreSQL DB cluster with Express Configuration

The following `create-db-cluster` example creates an Aurora PostgreSQL-compatible DB cluster with Express Configuration enabled. Unlike the standard create cluster, Express Configuration automatically adds a DB instance `sample-cluster-instance-1` for your DB cluster, so you don't need to separately call the `create-db-instance` AWS CLI command.

```
aws rds create-db-cluster \
    --db-cluster-identifier sample-cluster \
    --engine aurora-postgresql \
    --with-express-configuration
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
```

```
            "us-west-2b"
        ],
        "BackupRetentionPeriod": 7,
        "DBClusterIdentifier": "sample-cluster",
        "DBClusterParameterGroup": "default.aurora-postgresql17",
        "Status": "creating",
        "MultiAZ": false,
        "Engine": "aurora-postgresql",
        "EngineVersion": "17.7",
        "Port": 5432,
        "MasterUsername": "postgres",
        "PreferredBackupWindow": "06:15-06:45",
        "PreferredMaintenanceWindow": "sat:03:44-sat:04:14",
        "ReadReplicaIdentifiers": [],
        "DBClusterMembers": [
            {
                "DBInstanceIdentifier": "sample-cluster-instance-1",
                "IsClusterWriter": false,
                "DBClusterParameterGroupStatus": "in-sync",
                "PromotionTier": 1
            }
        ],
        "VpcSecurityGroups": [],
        "StorageEncrypted": false,
        "DbClusterResourceId": "cluster-EXAMPLE4RESOURCE",
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster",
        "AssociatedRoles": [],
        "IAMDatabaseAuthenticationEnabled": true,
        "ClusterCreateTime": "2026-01-10T22:14:02Z",
        "EngineMode": "provisioned",
        "AutoMinorVersionUpgrade": true,
        "DeletionProtection": false,
        "HttpEndpointEnabled": false,
        "CopyTagsToSnapshot": false,
        "CrossAccountClone": false,
        "DomainMemberships": [],
        "TagList": [],
        "ServerlessV2ScalingConfiguration": {
            "MinCapacity": 0.0,
            "MaxCapacity": 16.0,
            "SecondsUntilAutoPause": 300
        },
        "ServerlessV2PlatformVersion": "3",
        "DatabaseInsightsMode": "standard",
```

```
        "PerformanceInsightsEnabled": false,
        "LocalWriteForwardingStatus": "disabled",
        "EngineLifecycleSupport": "open-source-rds-extended-support"
    }
}
```

For more information, see Creating an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

Example 4: To create an Aurora PostgreSQL DB cluster for Aurora Limitless Database

The following `create-db-cluster` example creates an Aurora PostgreSQL primary DB cluster that's compatible with Aurora Serverless v2 and Aurora Limitless Database. After you create the DB cluster, create its writer DB instance with the `create-db-instance` command and then a DB shard group with the `create-db-shard-group` command.

```
aws rds create-db-cluster \
    --db-cluster-identifier my-sv2-cluster \
    --engine aurora-postgresql \
    --engine-version 15.2-limitless \
    --storage-type aurora-iopt1 \
    --serverless-v2-scaling-configuration MinCapacity=2,MaxCapacity=16 \
    --enable-limitless-database \
    --master-username myuser \
    --master-user-password mypassword \
    --enable-cloudwatch-logs-exports postgresql
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2b",
            "us-west-2c",
            "us-west-2a"
        ],
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "my-sv2-cluster",
        "DBClusterParameterGroup": "default.aurora-postgresql15",
        "DBSubnetGroup": "default",
        "Status": "creating",
```

```
        "Endpoint": "my-sv2-cluster.cluster-cekycexample.us-
west-2.rds.amazonaws.com",
        "ReaderEndpoint": "my-sv2-cluster.cluster-ro-cekycexample.us-
west-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-postgresql",
        "EngineVersion": "15.2-limitless",
        "Port": 5432,
        "MasterUsername": "myuser",
        "PreferredBackupWindow": "06:05-06:35",
        "PreferredMaintenanceWindow": "mon:08:25-mon:08:55",
        "ReadReplicaIdentifiers": [],
        "DBClusterMembers": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-########",
                "Status": "active"
            }
        ],
        "HostedZoneId": "Z2XHWR1EXAMPLE",
        "StorageEncrypted": false,

`create-db-instance-read-replica`

The following code example shows how to use `create-db-instance-read-replica`.

AWS CLI

To create a DB instance read replica

The following `create-db-instance-read-replica` example creates a read replica of an existing DB instance named `test-instance`. The read replica is named `test-instance-repl`.

```
aws rds create-db-instance-read-replica \
    --db-instance-identifier test-instance-repl \
    --source-db-instance-identifier test-instance
```

Output:

```
{
    "DBInstance": {
        "IAMDatabaseAuthenticationEnabled": false,
        "MonitoringInterval": 0,
        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:test-instance-repl",
        "ReadReplicaSourceDBInstanceIdentifier": "test-instance",
        "DBInstanceIdentifier": "test-instance-repl"
    }
}
```

For more information, see Creating a read replica in the *Amazon RDS User Guide*.

- For API details, see CreateDbInstanceReadReplica in *AWS CLI Command Reference*.

`create-db-instance`

The following code example shows how to use `create-db-instance`.

AWS CLI

Example 1: To create a DB instance

The following `create-db-instance` example uses the required options to launch a new DB instance.

```
aws rds create-db-instance \
    --db-instance-identifier test-mysql-instance \
    --db-instance-class db.t3.micro \
    --engine mysql \
    --master-username admin \
    --master-user-password secret99 \
    --allocated-storage 20
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-mysql-instance",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "mysql",
        "DBInstanceStatus": "creating",
        "MasterUsername": "admin",
        "AllocatedStorage": 20,

        "DeletionProtection": false,
        "AssociatedRoles": []
    }
}
```

For more information, see Creating an Amazon RDS DB Instance in the *Amazon RDS User Guide*.

Example 2: To create an Aurora Serverless v2 writer DB instance in a DB cluster

The following `create-db-instance` example creates an Aurora Serverless v2 primary (writer) DB instance in a DB cluster. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` command.

```
aws rds create-db-instance \
    --db-instance-identifier my-sv2-instance \
    --db-cluster-identifier my-sv2-cluster \
    --engine aurora-postgresql \
```

```
    --db-instance-class db.serverless
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "my-sv2-instance",
        "DBInstanceClass": "db.serverless",
        "Engine": "aurora-postgresql",
        "DBInstanceStatus": "creating",
        "MasterUsername": "myuser",
        "AllocatedStorage": 1,
        "PreferredBackupWindow": "06:05-06:35",
        "BackupRetentionPeriod": 1,
        "DBSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-########",
                "Status": "active"
            }
        ],
        "DBParameterGroups": [
            {
                "DBParameterGroupName": "default.aurora-postgresql15",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "DBSubnetGroup": {
            "DBSubnetGroupName": "default",
            "DBSubnetGroupDescription": "default",
            "VpcId": "vpc-########",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-########",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    },
                    "SubnetOutpost": {},
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-########",

```

For more information, see Using Aurora Serverless v2 in the *Amazon Aurora User Guide*.

- For API details, see CreateDBInstance in *AWS CLI Command Reference*.

`create-db-parameter-group`

The following code example shows how to use `create-db-parameter-group`.

AWS CLI

To create a DB parameter group

The following `create-db-parameter-group` example creates a DB parameter group.

```
aws rds create-db-parameter-group \
    --db-parameter-group-name mydbparametergroup \
    --db-parameter-group-family MySQL5.6 \
    --description "My new parameter group"
```

Output:

```
{
    "DBParameterGroup": {
        "DBParameterGroupName": "mydbparametergroup",
```

```
        "DBParameterGroupFamily": "mysql5.6",
        "Description": "My new parameter group",
        "DBParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:pg:mydbparametergroup"
    }
}
```

For more information, see Creating a DB Parameter Group in the *Amazon RDS User Guide*.

- For API details, see CreateDBParameterGroup in *AWS CLI Command Reference*.

`create-db-proxy-endpoint`

The following code example shows how to use `create-db-proxy-endpoint`.

AWS CLI

To create a DB proxy endpoint for an RDS database

The following `create-db-proxy-endpoint` example creates a DB proxy endpoint.

```
aws rds create-db-proxy-endpoint \
    --db-proxy-name proxyExample \
    --db-proxy-endpoint-name "proxyep1" \
    --vpc-subnet-ids subnetgroup1 subnetgroup2
```

Output:

```
{
    "DBProxyEndpoint": {
        "DBProxyEndpointName": "proxyep1",
        "DBProxyEndpointArn": "arn:aws:rds:us-west-2:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
        "DBProxyName": "proxyExample",
        "Status": "creating",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234",
            "sg-5678"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
```

```
        ],
        "Endpoint": "proxyep1.endpoint.proxy-ab0cd1efghij.us-
west-2.rds.amazonaws.com",
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
        "TargetRole": "READ_WRITE",
        "IsDefault": false
    }
}
```

For more information, see Creating a proxy endpoint in the *Amazon RDS User Guide* and Creating a proxy endpoint in the *Amazon Aurora User Guide*.

- For API details, see CreateDbProxyEndpoint in *AWS CLI Command Reference*.

`create-db-proxy`

The following code example shows how to use `create-db-proxy`.

AWS CLI

To create a DB proxy for an RDS database

The following `create-db-proxy` example creates a DB proxy.

```
aws rds create-db-proxy \
    --db-proxy-name proxyExample \
    --engine-family MYSQL \
    --auth
 Description="proxydescription1",AuthScheme="SECRETS",SecretArn="arn:aws:secretsmanager:us-
west-2:123456789012:secret:secretName-1234f",IAMAuth="DISABLED",ClientPasswordAuthType="MYSQ
 \
    --role-arn arn:aws:iam::123456789012:role/ProxyRole \
    --vpc-subnet-ids subnetgroup1 subnetgroup2
```

Output:

```
{
    "DBProxy": {
        "DBProxyName": "proxyExample",
        "DBProxyArn": "arn:aws:rds:us-west-2:123456789012:db-
proxy:prx-0123a01b12345c0ab",
        "EngineFamily": "MYSQL",
        "VpcId": "vpc-1234567",
```

```

    }
}
```

For more information, see Creating an RDS Proxy in the *Amazon RDS User Guide* and Creating an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see CreateDbProxy in *AWS CLI Command Reference*.

`create-db-security-group`

The following code example shows how to use `create-db-security-group`.

AWS CLI

To create an Amazon RDS DB security group

The following `create-db-security-group` example creates a new Amazon RDS DB security group.

```
aws rds create-db-security-group \
    --db-security-group-name mysecgroup \
    --db-security-group-description "My Test Security Group"
```

In the example, the new DB security group is named `mysecgroup` and has a description.

Output:

```
{
    "DBSecurityGroup": {
        "OwnerId": "123456789012",
        "DBSecurityGroupName": "mysecgroup",
        "DBSecurityGroupDescription": "My Test Security Group",
        "VpcId": "vpc-a1b2c3d4",
        "EC2SecurityGroups": [],
        "IPRanges": [],
        "DBSecurityGroupArn": "arn:aws:rds:us-west-2:123456789012:secgrp:mysecgroup"
    }
}
```

For more information, see Controlling access with security groups in the *Amazon RDS User Guide*.

- For API details, see CreateDbSecurityGroup in *AWS CLI Command Reference*.

`create-db-shard-group`

The following code example shows how to use `create-db-shard-group`.

AWS CLI

To create a DB shard group

The following `create-db-shard-group` example creates a DB shard group in an Aurora PostgreSQL primary DB cluster that's compatible with Aurora Serverless v2 and Aurora Limitless Database. Before you create the DB shard group, create the DB cluster with the `create-db-cluster` command and its writer DB instance with the `create-db-instance` command.

```
aws rds create-db-shard-group \
    --db-shard-group-identifier my-db-shard-group \
    --db-cluster-identifier my-sv2-cluster \
```

```
    --max-acu 768
```

Output:

```
{
    "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
    "DBShardGroupIdentifier": "my-db-shard-group",
    "DBClusterIdentifier": "my-sv2-cluster",
    "MaxACU": 768.0,
    "ComputeRedundancy": 0,
    "Status": "creating",
    "PubliclyAccessible": false,
    "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-west-2.rds.amazonaws.com"
}
```

For more information, see Using Aurora Serverless v2 in the *Amazon Aurora User Guide*.

- For API details, see CreateDbShardGroup in *AWS CLI Command Reference*.

`create-db-snapshot`

The following code example shows how to use `create-db-snapshot`.

AWS CLI

To create a DB snapshot

The following `create-db-snapshot` example creates a DB snapshot.

```
aws rds create-db-snapshot \
    --db-instance-identifier database-mysql \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBInstanceIdentifier": "database-mysql",
        "Engine": "mysql",
        "AllocatedStorage": 100,
```

```
        "Status": "creating",
        "Port": 3306,
        "AvailabilityZone": "us-west-2b",
        "VpcId": "vpc-6594f31c",
        "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
        "MasterUsername": "admin",
        "EngineVersion": "5.6.40",

For more information, see Creating a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see CreateDBSnapshot in *AWS CLI Command Reference*.

`create-db-subnet-group`

The following code example shows how to use `create-db-subnet-group`.

AWS CLI

To create a DB subnet group

The following `create-db-subnet-group` example creates a DB subnet group called `mysubnetgroup` using existing subnets.

```
aws rds create-db-subnet-group \
    --db-subnet-group-name mysubnetgroup \
    --db-subnet-group-description "test DB subnet group" \
    --subnet-ids
 '["subnet-0a1dc4e1a6f123456","subnet-070dd7ecb3aaaaaaa","subnet-00f5b198bc0abcdef"]'
```

Output:

```
{
    "DBSubnetGroup": {
        "DBSubnetGroupName": "mysubnetgroup",
        "DBSubnetGroupDescription": "test DB subnet group",
        "VpcId": "vpc-0f08e7610a1b2c3d4",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-070dd7ecb3aaaaaaa",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-00f5b198bc0abcdef",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-0a1dc4e1a6f123456",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            }
        ],
        "DBSubnetGroupArn": "arn:aws:rds:us-
west-2:0123456789012:subgrp:mysubnetgroup"
    }
}
```

For more information, see Creating a DB Instance in a VPC in the *Amazon RDS User Guide*.

- For API details, see CreateDbSubnetGroup in *AWS CLI Command Reference*.

`create-event-subscription`

The following code example shows how to use `create-event-subscription`.

AWS CLI

To create an event subscription

The following `create-event-subscription` example creates a subscription for backup and recovery events for DB instances in the current AWS account. Notifications are sent to an Amazon Simple Notification Service topic, specified by `--sns-topic-arn`.

```
aws rds create-event-subscription \
    --subscription-name my-instance-events \
    --source-type db-instance \
    --event-categories '["backup","recovery"]' \
    --sns-topic-arn arn:aws:sns:us-west-2:123456789012:interesting-events
```

Output:

```
{
    "EventSubscription": {
        "Status": "creating",
        "CustSubscriptionId": "my-instance-events",
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:interesting-events",
        "CustomerAwsId": "123456789012",
        "EventSubscriptionArn": "arn:aws:rds:us-west-2:123456789012:es:my-instance-
events",
        "SourceType": "db-instance",
        "Enabled": true
    }
}
```

For more information, see Subscribing to Amazon RDS event notification in the *Amazon RDS User Guide*.

- For API details, see CreateEventSubscription in *AWS CLI Command Reference*.

`create-global-cluster`

The following code example shows how to use `create-global-cluster`.

AWS CLI

To create a global DB cluster

The following `create-global-cluster` example creates a new Aurora MySQL-compatible global DB cluster.

```
aws rds create-global-cluster \
    --global-cluster-identifier myglobalcluster \
    --engine aurora-mysql
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": false,
        "GlobalClusterMembers": []
    }
}
```

For more information, see Creating an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see CreateGlobalCluster in *AWS CLI Command Reference*.

`create-option-group`

The following code example shows how to use `create-option-group`.

AWS CLI

To Create an Amazon RDS option group

The following `create-option-group` example creates a new Amazon RDS option group named `MyOptionGroup` with a description for `Oracle Enterprise Edition` version `11.2`.

```
aws rds create-option-group \
    --option-group-name MyOptionGroup \
    --engine-name oracle-ee \
    --major-engine-version 11.2 \
    --option-group-description "Oracle Database Manager Database Control"
```

Output:

```
{
    "OptionGroup": {
        "OptionGroupName": "myoptiongroup",
        "OptionGroupDescription": "Oracle Database Manager Database Control",
        "EngineName": "oracle-ee",
        "MajorEngineVersion": "11.2",
        "Options": [],
        "AllowsVpcAndNonVpcInstanceMemberships": true,
        "OptionGroupArn": "arn:aws:rds:us-west-2:123456789012:og:myoptiongroup"
    }
}
```

For more information, see Creating an option group in the *Amazon RDS User Guide*.

- For API details, see CreateOptionGroup in *AWS CLI Command Reference*.

`create-tenant-database`

The following code example shows how to use `create-tenant-database`.

AWS CLI

To create a tenant database

The following `create-tenant-database` example creates a tenant database in an RDS for Oracle CDB instance. The master user password is read from a file named `master_user_password.txt`, which in this example is located in the current working directory.

```
aws rds create-tenant-database \
    --db-instance-identifier test-rds-oracle \
    --tenant-db-name tenant2 \
    --master-username tenantadmin \
```

```
    --master-user-password file://master_user_password.txt
```

Contents of `master_user_password.txt`:

```
Example-Passw0rd
```

Output:

```
{
    "TenantDatabase": {
        "TenantDatabaseCreateTime": "2026-09-12T16:12:32.429000+00:00",
        "DBInstanceIdentifier": "test-rds-oracle",
        "TenantDBName": "TENANT2",
        "Status": "creating",
        "MasterUsername": "tenantadmin",
        "DbiResourceId": "db-ABCD1234EFGH5678IJKEXAMPLE",
        "TenantDatabaseResourceId": "tdb-
ABCD1234EFGH5678IJKL90MNOPQRST1234UVWX5678YZAEXAMPLE",
        "TenantDatabaseARN": "arn:aws:rds:us-west-2:123456789012:tenant-
database:tdb-abcd1234efgh5678ijkl90mnopqrst1234uvwx5678yzaexample",
        "CharacterSetName": "AL32UTF8",
        "NcharCharacterSetName": "AL16UTF16",
        "DeletionProtection": true,
        "PendingModifiedValues": {
            "MasterUserPassword": "****"
        },
        "TagList": []
    }
}
```

For more information, see Adding an RDS for Oracle tenant database to your CDB instance in the *Amazon RDS User Guide*.

- For API details, see CreateTenantDatabase in *AWS CLI Command Reference*.

`delete-blue-green-deployment`

The following code example shows how to use `delete-blue-green-deployment`.

AWS CLI

Example 1: To delete resources in green environment for an RDS for MySQL DB instance

The following `delete-blue-green-deployment` example deletes the resources in a green environment for an RDS for MySQL DB instance.

```
aws rds delete-blue-green-deployment \
    --blue-green-deployment-identifier bgd-v53303651eexfake \
    --delete-target
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",

```

For more information, see Deleting a blue/green deployment in the *Amazon Aurora User Guide*.

- For API details, see DeleteBlueGreenDeployment in *AWS CLI Command Reference*.

`delete-db-cluster-automated-backup`

The following code example shows how to use `delete-db-cluster-automated-backup`.

AWS CLI

To delete an automated backup of a DB cluster

The following `delete-db-cluster-automated-backup` example deletes the automated backup for the specified DB cluster resource ID. To find the resource ID, use the `describe-db-cluster-automated-backups` command.

```
aws rds delete-db-cluster-automated-backup \
    --db-cluster-resource-id cluster-ABCD1234EFGH5678IJKL90MNOP
```

Output:

```
{
    "DBClusterAutomatedBackup": {
        "Engine": "aurora-postgresql",
        "DBClusterAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:cluster-
auto-backup:cab-abcd1234efgh5678ijkl90mnopqrst5678uvwx1234yzab56cdef7890abcd1234",
        "DBClusterIdentifier": "test-aurora-cluster",
        "RestoreWindow": {},
        "MasterUsername": "postgres",
        "DbClusterResourceId": "cluster-ABCD1234EFGH5678IJKL90MNOP",
        "Region": "us-west-2",
        "Status": "deleted",
        "IAMDatabaseAuthenticationEnabled": false,
        "ClusterCreateTime": "2026-09-12T11:38:04+00:00",
        "StorageEncrypted": true,
        "StorageEncryptionType": "sse-kms",
        "AllocatedStorage": 1,
        "EngineVersion": "17.7",
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:test-aurora-
cluster",
        "BackupRetentionPeriod": 7,
        "PreferredBackupWindow": "04:30-05:00",
        "EngineMode": "provisioned",
        "AvailabilityZones": [
            "us-west-2b",
            "us-west-2d",
            "us-west-2c"
        ],
        "Port": 5432,
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "TagList": []
    }
}
```

For more information, see Deleting retained automated backups for Amazon Aurora in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbClusterAutomatedBackup in *AWS CLI Command Reference*.

`delete-db-cluster-endpoint`

The following code example shows how to use `delete-db-cluster-endpoint`.

AWS CLI

To delete a custom DB cluster endpoint

The following `delete-db-cluster-endpoint` example deletes the specified custom DB cluster endpoint.

```
aws rds delete-db-cluster-endpoint \
    --db-cluster-endpoint-identifier mycustomendpoint
```

Output:

```
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
    "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-
west-2.rds.amazonaws.com",
    "Status": "deleting",
    "EndpointType": "CUSTOM",
    "CustomEndpointType": "READER",
    "StaticMembers": [
        "dbinstance1",
        "dbinstance2",
        "dbinstance3"
    ],
    "ExcludedMembers": [],
    "DBClusterEndpointArn": "arn:aws:rds:us-west-2:123456789012:cluster-
endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbClusterEndpoint in *AWS CLI Command Reference*.

`delete-db-cluster-parameter-group`

The following code example shows how to use `delete-db-cluster-parameter-group`.

AWS CLI

To delete a DB cluster parameter group

The following `delete-db-cluster-parameter-group` example deletes the specified DB cluster parameter group.

```
aws rds delete-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclusterparametergroup
```

This command produces no output.

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbClusterParameterGroup in *AWS CLI Command Reference*.

`delete-db-cluster-snapshot`

The following code example shows how to use `delete-db-cluster-snapshot`.

AWS CLI

To delete a DB cluster snapshot

The following `delete-db-cluster-snapshot` example deletes the specified DB cluster snapshot.

```
aws rds delete-db-cluster-snapshot \
    --db-cluster-snapshot-identifier mydbclustersnapshot
```

Output:

```
{
```

```
    "DBClusterSnapshot": {
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2d"
        ],
        "DBClusterSnapshotIdentifier": "mydbclustersnapshot",
        "DBClusterIdentifier": "mydbcluster",
        "SnapshotCreateTime": "2019-06-18T21:21:00.469Z",
        "Engine": "aurora-mysql",
        "AllocatedStorage": 0,
        "Status": "available",
        "Port": 0,
        "VpcId": "vpc-6594f31c",
        "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
        "MasterUsername": "myadmin",
        "EngineVersion": "5.7.mysql_aurora.2.04.2",
        "LicenseModel": "aurora-mysql",
        "SnapshotType": "manual",
        "PercentProgress": 100,
        "StorageEncrypted": true,
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBClusterSnapshotArn": "arn:aws:rds:us-west-2:123456789012:cluster-
snapshot:mydbclustersnapshot",
        "IAMDatabaseAuthenticationEnabled": false
    }
}
```

For more information, see Deleting a Snapshot in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbClusterSnapshot in *AWS CLI Command Reference*.

`delete-db-cluster`

The following code example shows how to use `delete-db-cluster`.

AWS CLI

To delete a DB cluster

The following `delete-db-cluster` example deletes the DB cluster named `mycluster` and takes a final snapshot named `mycluster-final-snapshot`. You can't delete a DB cluster if it contains DB instances that aren't in the **deleting** state, so first use the `delete-db-instance`

command to delete the final DB instance in the DB cluster. You can't take a final snapshot when deleting a DB instance in a DB cluster.

```
aws rds delete-db-instance \
    --db-instance-identifier database-3
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "database-3",
        "DBInstanceClass": "db.r4.large",
        "Engine": "aurora-postgresql",
        "DBInstanceStatus": "deleting"
    }
}
```

Then delete the DB cluster. The status of the DB cluster is **available** while the snapshot is being taken. To follow the progress of the deletion, use the `describe-db-clusters` command.

```
aws rds delete-db-cluster \
    --db-cluster-identifier mycluster \
    --no-skip-final-snapshot \
    --final-db-snapshot-identifier mycluster-final-snapshot
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 20,
        "AvailabilityZones": [
            "us-west-2b",
            "us-west-2c",
            "us-west-2a"
        ],
        "BackupRetentionPeriod": 7,
        "DBClusterIdentifier": "mycluster",
        "DBClusterParameterGroup": "default.aurora-postgresql10",
        "DBSubnetGroup": "default-vpc-aa11bb22",
        "Status": "available"
    }
```

```
}
```

For more information, see Deleting a DB Instance in an Aurora DB Cluster in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbCluster in *AWS CLI Command Reference*.

`delete-db-instance-automated-backup`

The following code example shows how to use `delete-db-instance-automated-backup`.

AWS CLI

To delete a replicated automated backup from a Region

The following `delete-db-instance-automated-backup` example deletes the automated backup with the specified Amazon Resource Name (ARN).

```
aws rds delete-db-instance-automated-backup \
    --db-instance-automated-backups-arn "arn:aws:rds:us-west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
```

Output:

```
{
    "DBInstanceAutomatedBackup": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
        "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
        "Region": "us-east-1",
        "DBInstanceIdentifier": "new-orcl-db",
        "RestoreWindow": {},
        "AllocatedStorage": 20,
        "Status": "deleting",
        "Port": 1521,
        "AvailabilityZone": "us-east-1b",
        "VpcId": "vpc-########",
        "InstanceCreateTime": "2020-12-04T15:28:31Z",
        "MasterUsername": "admin",
        "Engine": "oracle-se2",
        "EngineVersion": "12.1.0.2.v21",
        "LicenseModel": "bring-your-own-license",
```

```
        "OptionGroupName": "default:oracle-se2-12-1",
        "Encrypted": false,
        "StorageType": "gp2",
        "IAMDatabaseAuthenticationEnabled": false,
        "BackupRetentionPeriod": 7,
        "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
    }
}
```

For more information, see Deleting replicated backups in the *Amazon RDS User Guide*.

- For API details, see DeleteDbInstanceAutomatedBackup in *AWS CLI Command Reference*.

`delete-db-instance`

The following code example shows how to use `delete-db-instance`.

AWS CLI

To delete a DB instance

The following `delete-db-instance` example deletes the specified DB instance after creating a final DB snapshot named `test-instance-final-snap`.

```
aws rds delete-db-instance \
    --db-instance-identifier test-instance \
    --final-db-snapshot-identifier test-instance-final-snap
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-instance",
        "DBInstanceStatus": "deleting"
    }
}
```

For more information, see Deleting a DB instance in the *Amazon RDS User Guide*.

- For API details, see DeleteDBInstance in *AWS CLI Command Reference*.

delete-db-parameter-group

The following code example shows how to use `delete-db-parameter-group`.

AWS CLI

To delete a DB parameter group

The following `delete-db-parameter-group` example deletes a DB parameter group.

```
aws rds delete-db-parameter-group \
    --db-parameter-group-name mydbparametergroup
```

This command produces no output.

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DeleteDBParameterGroup in *AWS CLI Command Reference*.

delete-db-proxy-endpoint

The following code example shows how to use `delete-db-proxy-endpoint`.

AWS CLI

To delete a DB proxy endpoint for an RDS database

The following `delete-db-proxy-endpoint` example deletes a DB proxy endpoint for the target database.

```
aws rds delete-db-proxy-endpoint \
    --db-proxy-endpoint-name proxyEP1
```

Output:

```
{
    "DBProxyEndpoint":
    {
        "DBProxyEndpointName": "proxyEP1",
        "DBProxyEndpointArn": "arn:aws:rds:us-west-2:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
        "DBProxyName": "proxyExample",
```

```
        "Status": "deleting",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234",
            "sg-5678"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Endpoint": "proxyEP1.endpoint.proxy-ab0cd1efghij.us-
west-2.rds.amazonaws.com",
        "CreatedDate": "2023-04-13T01:49:38.568000+00:00",
        "TargetRole": "READ_ONLY",
        "IsDefault": false
    }
}
```

For more information, see Deleting a proxy endpoint in the *Amazon RDS User Guide* and Deleting a proxy endpoint in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbProxyEndpoint in *AWS CLI Command Reference*.

`delete-db-proxy`

The following code example shows how to use `delete-db-proxy`.

AWS CLI

To delete a DB proxy for an RDS database

The following `delete-db-proxy` example deletes a DB proxy.

```
aws rds delete-db-proxy \
    --db-proxy-name proxyExample
```

Output:

```
{
    "DBProxy": {
        "DBProxyName": "proxyExample",
        "DBProxyArn": "arn:aws:rds:us-west-2:123456789012:db-
proxy:prx-0123a01b12345c0ab",
```

```
        "Status": "deleting",
        "EngineFamily": "PostgreSQL",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234",
            "sg-5678"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Auth": [
            {
                "Description": "proxydescription",
                "AuthScheme": "SECRETS",
                "SecretArn": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:proxysecret1-Abcd1e",
                "IAMAuth": "DISABLED"
            }
        ],
        "RoleArn": "arn:aws:iam::12345678912:role/ProxyPostgreSQLRole",
        "Endpoint": "proxyExample.proxy-ab0cd1efghij.us-west-2.rds.amazonaws.com",
        "RequireTLS": false,
        "IdleClientTimeout": 1800,
        "DebugLogging": false,
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
        "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
    }
}
```

For more information, see Deleting an RDS Proxy in the *Amazon RDS User Guide* and Deleting an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbProxy in *AWS CLI Command Reference*.

`delete-db-security-group`

The following code example shows how to use `delete-db-security-group`.

AWS CLI

To delete a DB security group

The following `delete-db-security-group` example deletes a DB security group named `mysecuritygroup`.

```
aws rds delete-db-security-group \
    --db-security-group-name mysecuritygroup
```

This command produces no output.

For more information, see Working with DB security groups (EC2-Classic platform) in the *Amazon RDS User Guide*.

- For API details, see DeleteDbSecurityGroup in *AWS CLI Command Reference*.

`delete-db-shard-group`

The following code example shows how to use `delete-db-shard-group`.

AWS CLI

Example 1: To delete a DB shard group unsuccessfully

The following `delete-db-shard-group` example shows the error that occurs when you try to delete a DB shard group before deleting all of your databases and schemas.

```
aws rds delete-db-shard-group \
    --db-shard-group-identifier limitless-test-shard-grp
```

This command produces no output. Instead, the command fails and returns the following error message.

```
An error occurred (InvalidDBShardGroupState) when calling the DeleteDBShardGroup
 operation: Unable to delete the DB shard group limitless-test-db-shard-group.
Delete all of your Limitless Database databases and schemas, then try again.
```

Example 2: To delete a DB shard group successfully

The following `delete-db-shard-group` example deletes a DB shard group after you've deleted all of your databases and schemas, including the `public` schema.

```
aws rds delete-db-shard-group \
    --db-shard-group-identifier limitless-test-shard-grp
```

Output:

```
{
    "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
    "DBShardGroupIdentifier": "limitless-test-shard-grp",
    "DBClusterIdentifier": "limitless-test-cluster",
    "MaxACU": 768.0,
    "ComputeRedundancy": 0,
    "Status": "deleting",
    "PubliclyAccessible": true,
    "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-
west-2.rds.amazonaws.com"
}
```

For more information, see Deleting Aurora DB clusters and DB instances in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbShardGroup in *AWS CLI Command Reference*.

`delete-db-snapshot`

The following code example shows how to use `delete-db-snapshot`.

AWS CLI

To delete a DB snapshot

The following `delete-db-snapshot` example deletes the specified DB snapshot.

```
aws rds delete-db-snapshot \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBInstanceIdentifier": "database-mysql",
        "SnapshotCreateTime": "2019-06-18T22:08:40.702Z",
        "Engine": "mysql",
        "AllocatedStorage": 100,
        "Status": "deleted",
```

```
        "Port": 3306,
        "AvailabilityZone": "us-west-2b",
        "VpcId": "vpc-6594f31c",
        "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
        "MasterUsername": "admin",
        "EngineVersion": "5.6.40",
        "LicenseModel": "general-public-license",
        "SnapshotType": "manual",
        "Iops": 1000,
        "OptionGroupName": "default:mysql-5-6",
        "PercentProgress": 100,
        "StorageType": "io1",
        "Encrypted": true,
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBSnapshotArn": "arn:aws:rds:us-west-2:123456789012:snapshot:mydbsnapshot",
        "IAMDatabaseAuthenticationEnabled": false,
        "ProcessorFeatures": [],
        "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
    }
}
```

For more information, see Deleting a Snapshot in the *Amazon RDS User Guide*.

- For API details, see DeleteDbSnapshot in *AWS CLI Command Reference*.

`delete-db-subnet-group`

The following code example shows how to use `delete-db-subnet-group`.

AWS CLI

To delete a DB subnet group

The following `delete-db-subnet-group` example deletes the DB subnet group called `mysubnetgroup`.

```
aws rds delete-db-subnet-group \
    --db-subnet-group-name mysubnetgroup
```

This command produces no output.

For more information, see Working with a DB Instance in a VPC in the *Amazon RDS User Guide*.

- For API details, see DeleteDbSubnetGroup in *AWS CLI Command Reference*.

`delete-event-subscription`

The following code example shows how to use `delete-event-subscription`.

AWS CLI

To delete an event subscription

The following `delete-event-subscription` example deletes the specified event subscription.

```
aws rds delete-event-subscription \
    --subscription-name my-instance-events
```

Output:

```
{
    "EventSubscription": {
        "EventSubscriptionArn": "arn:aws:rds:us-west-2:123456789012:es:my-instance-
events",
        "CustomerAwsId": "123456789012",
        "Enabled": false,
        "SourceIdsList": [
            "test-instance"
        ],
        "SourceType": "db-instance",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "SubscriptionCreationTime": "2018-07-31 23:22:01.893",
        "CustSubscriptionId": "my-instance-events",
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:interesting-events",
        "Status": "deleting"
    }
}
```

For more information, see Deleting an Amazon RDS event notification subscription in the *Amazon RDS User Guide*.

- For API details, see DeleteEventSubscription in *AWS CLI Command Reference*.

`delete-global-cluster`

The following code example shows how to use `delete-global-cluster`.

AWS CLI

To delete a global DB cluster

The following `delete-global-cluster` example deletes an Aurora MySQL-compatible global DB cluster. The output shows the cluster that you're deleting, but subsequent `describe-global-clusters` commands don't list that DB cluster.

```
aws rds delete-global-cluster \
    --global-cluster-identifier myglobalcluster
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": false,
        "GlobalClusterMembers": []
    }
}
```

For more information, see Deleting an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see DeleteGlobalCluster in *AWS CLI Command Reference*.

`delete-option-group`

The following code example shows how to use `delete-option-group`.

AWS CLI

To delete an option group

The following `delete-option-group` example deletes the specified option group.

```
aws rds delete-option-group \
    --option-group-name myoptiongroup
```

This command produces no output.

For more information, see Deleting an Option Group in the *Amazon RDS User Guide*.

- For API details, see DeleteOptionGroup in *AWS CLI Command Reference*.

`delete-tenant-database`

The following code example shows how to use `delete-tenant-database`.

AWS CLI

To delete a tenant database

The following `delete-tenant-database` example deletes a tenant database from an RDS for Oracle CDB instance and takes a final snapshot of it.

```
aws rds delete-tenant-database \
    --db-instance-identifier test-rds-oracle \
    --tenant-db-name tenant2 \
    --final-db-snapshot-identifier final-snap-test
```

Output:

```
{
    "TenantDatabase": {
        "TenantDatabaseCreateTime": "2026-09-12T16:12:32.429000+00:00",
        "DBInstanceIdentifier": "test-rds-oracle",
        "TenantDBName": "TENANT2",
        "Status": "deleting",
        "MasterUsername": "tenantadmin",
        "DbiResourceId": "db-ABCD1234EFGH5678IJKEXAMPLE",
        "TenantDatabaseResourceId": "tdb-
ABCD1234EFGH5678IJKL90MNOPQRST1234UVWX5678YZAEXAMPLE",
        "TenantDatabaseARN": "arn:aws:rds:us-west-2:123456789012:tenant-
database:tdb-abcd1234efgh5678ijkl90mnopqrst1234uvwx5678yzaexample",
        "CharacterSetName": "AL32UTF8",
        "NcharCharacterSetName": "AL16UTF16",
```

```
        "DeletionProtection": false,
        "PendingModifiedValues": {},
        "TagList": []
    }
}
```

For more information, see Deleting an RDS for Oracle tenant database from your CDB in the *Amazon RDS User Guide*.

- For API details, see DeleteTenantDatabase in *AWS CLI Command Reference*.

`deregister-db-proxy-targets`

The following code example shows how to use `deregister-db-proxy-targets`.

AWS CLI

To deregister a DB proxy target from database target group

The following `deregister-db-proxy-targets` example removes the association between the proxy `proxyExample` and its target.

```
aws rds deregister-db-proxy-targets \
    --db-proxy-name proxyExample \
    --db-instance-identifiers database-1
```

This command produces no output.

For more information, see Deleting an RDS Proxy in the *Amazon RDS User Guide* and Deleting an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see DeregisterDbProxyTargets in *AWS CLI Command Reference*.

`describe-account-attributes`

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe account attributes

The following `describe-account-attributes` example retrieves the attributes for the current AWS account.

```
aws rds describe-account-attributes
```

Output:

```
{
    "AccountQuotas": [
        {
            "Max": 40,
            "Used": 4,
            "AccountQuotaName": "DBInstances"
        },
        {
            "Max": 40,
            "Used": 0,
            "AccountQuotaName": "ReservedDBInstances"
        },
        {
            "Max": 100000,
            "Used": 40,
            "AccountQuotaName": "AllocatedStorage"
        },
        {
            "Max": 25,
            "Used": 0,
            "AccountQuotaName": "DBSecurityGroups"
        },
        {
            "Max": 20,
            "Used": 0,
            "AccountQuotaName": "AuthorizationsPerDBSecurityGroup"
        },
        {
            "Max": 50,
            "Used": 1,
            "AccountQuotaName": "DBParameterGroups"
        },
        {
            "Max": 100,
            "Used": 3,
            "AccountQuotaName": "ManualSnapshots"
        },
        {
            "Max": 20,
```

```
            "Used": 0,
            "AccountQuotaName": "EventSubscriptions"
        },
        {
            "Max": 50,
            "Used": 1,
            "AccountQuotaName": "DBSubnetGroups"
        },
        {
            "Max": 20,

```

For more information, see Quotas and constraints for Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see DescribeAccountAttributes in *AWS CLI Command Reference*.

`describe-blue-green-deployments`

The following code example shows how to use `describe-blue-green-deployments`.

AWS CLI

Example 1: To describe a blue/green deployment of an RDS DB instance after creation completes

The following `describe-blue-green-deployments` example retrieves the details of a blue/green deployment after creation completes.

```
aws rds describe-blue-green-deployments \
    --blue-green-deployment-identifier bgd-v53303651eexfake
```

Output:

```
{
    "BlueGreenDeployments": [
        {
            "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
            "BlueGreenDeploymentName": "bgd-cli-test-instance",
            "Source": "arn:aws:rds:us-west-2:123456789012:db:my-db-instance",
            "Target": "arn:aws:rds:us-west-2:123456789012:db:my-db-instance-green-

`describe-certificates`

The following code example shows how to use `describe-certificates`.

AWS CLI

To describe certificates

The following `describe-certificates` example retrieves the details of the certificate associated with the user's default region.

```
aws rds describe-certificates
```

Output:

```
{
    "Certificates": [
        {
            "CertificateIdentifier": "rds-ca-ecc384-g1",
```

```
            "CertificateType": "CA",
            "Thumbprint": "2ee3dcc06e50192559b13929e73484354f23387d",
            "ValidFrom": "2021-05-24T22:06:59+00:00",
            "ValidTill": "2121-05-24T23:06:59+00:00",
            "CertificateArn": "arn:aws:rds:us-west-2::cert:rds-ca-ecc384-g1",
            "CustomerOverride": false
        },
        {

- For API details, see DescribeCertificates in *AWS CLI Command Reference*.

`describe-db-cluster-automated-backups`

The following code example shows how to use `describe-db-cluster-automated-backups`.

AWS CLI

To describe the automated backups of a DB cluster

The following `describe-db-cluster-automated-backups` example retrieves the automated backup for the specified DB cluster, including the window of time that you can restore to.

```
aws rds describe-db-cluster-automated-backups \
    --db-cluster-identifier test-aurora-cluster
```

Output:

```
{
    "DBClusterAutomatedBackups": [
        {
            "Engine": "aurora-postgresql",
            "DBClusterAutomatedBackupsArn": "arn:aws:rds:us-

        }
    ]
}
```

For more information, see Viewing retained automated backups for Amazon Aurora in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterAutomatedBackups in *AWS CLI Command Reference*.

`describe-db-cluster-backtracks`

The following code example shows how to use `describe-db-cluster-backtracks`.

AWS CLI

To describe backtracks for a DB cluster

The following `describe-db-cluster-backtracks` example retrieves details about the specified DB cluster.

```
aws rds describe-db-cluster-backtracks \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBClusterBacktracks": [
        {
            "DBClusterIdentifier": "mydbcluster",
            "BacktrackIdentifier": "2f5f5294-0dd2-44c9-9f50-EXAMPLE",
            "BacktrackTo": "2021-02-12T04:59:22Z",
            "BacktrackedFrom": "2021-02-12T14:37:31.640Z",
```

```
            "BacktrackRequestCreationTime": "2021-02-12T14:36:18.819Z",
            "Status": "COMPLETED"
        },
        {
            "DBClusterIdentifier": "mydbcluster",
            "BacktrackIdentifier": "3c7a6421-af2a-4ea3-ae95-EXAMPLE",
            "BacktrackTo": "2021-02-11T22:53:46Z",
            "BacktrackedFrom": "2021-02-12T00:09:27.006Z",
            "BacktrackRequestCreationTime": "2021-02-12T00:07:53.487Z",
            "Status": "COMPLETED"
        }
    ]
}
```

For more information, see Backtracking an Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterBacktracks in *AWS CLI Command Reference*.

`describe-db-cluster-endpoints`

The following code example shows how to use `describe-db-cluster-endpoints`.

AWS CLI

Example 1: To describe DB cluster endpoints

The following `describe-db-cluster-endpoints` example retrieves details for your DB cluster endpoints. The most common kinds of Aurora clusters have two endpoints. One endpoint has type `WRITER`. You can use this endpoint for all SQL statements. The other endpoint has type `READER`. You can use this endpoint only for SELECT and other read-only SQL statements.

```
aws rds describe-db-cluster-endpoints
```

Output:

```
{
    "DBClusterEndpoints": [
        {
            "DBClusterIdentifier": "my-database-1",
            "Endpoint": "my-database-1.cluster-cnpexample.us-
west-2.rds.amazonaws.com",
```

```
            "Status": "creating",
            "EndpointType": "WRITER"
        },
        {
            "DBClusterIdentifier": "my-database-1",
            "Endpoint": "my-database-1.cluster-ro-cnpexample.us-
west-2.rds.amazonaws.com",
            "Status": "creating",
            "EndpointType": "READER"
        },
        {
            "DBClusterIdentifier": "mydbcluster",
            "Endpoint": "mydbcluster.cluster-cnpexamle.us-west-2.rds.amazonaws.com",
            "Status": "available",
            "EndpointType": "WRITER"
        },
        {
            "DBClusterIdentifier": "mydbcluster",
            "Endpoint": "mydbcluster.cluster-ro-cnpexample.us-
west-2.rds.amazonaws.com",
            "Status": "available",
            "EndpointType": "READER"
        }
    ]
}
```

Example 2: To describe DB cluster endpoints of a single DB cluster

The following `describe-db-cluster-endpoints` example retrieves details for the DB cluster endpoints of a single specified DB cluster. Aurora Serverless clusters have only a single endpoint with a type of `WRITER`.

```
aws rds describe-db-cluster-endpoints \
    --db-cluster-identifier serverless-cluster
```

Output:

```
{
    "DBClusterEndpoints": [
        {
            "Status": "available",
            "Endpoint": "serverless-cluster.cluster-cnpexample.us-
west-2.rds.amazonaws.com",
```

```
            "DBClusterIdentifier": "serverless-cluster",
            "EndpointType": "WRITER"
        }
    ]
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterEndpoints in *AWS CLI Command Reference*.

`describe-db-cluster-parameter-groups`

The following code example shows how to use `describe-db-cluster-parameter-groups`.

AWS CLI

To describe DB cluster parameter groups

The following `describe-db-cluster-parameter-groups` example retrieves details for your DB cluster parameter groups.

```
aws rds describe-db-cluster-parameter-groups
```

Output:

```
{
    "DBClusterParameterGroups": [
        {
            "DBClusterParameterGroupName": "default.aurora-mysql5.7",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "Default cluster parameter group for aurora-mysql5.7",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:cluster-pg:default.aurora-mysql5.7"
        },
        {
            "DBClusterParameterGroupName": "default.aurora-postgresql9.6",
            "DBParameterGroupFamily": "aurora-postgresql9.6",
            "Description": "Default cluster parameter group for aurora-
postgresql9.6",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:cluster-pg:default.aurora-postgresql9.6"
```

```
        },
        {
            "DBClusterParameterGroupName": "default.aurora5.6",
            "DBParameterGroupFamily": "aurora5.6",
            "Description": "Default cluster parameter group for aurora5.6",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:cluster-pg:default.aurora5.6"
        },
        {
            "DBClusterParameterGroupName": "mydbclusterpg",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "My DB cluster parameter group",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:cluster-pg:mydbclusterpg"
        },
        {
            "DBClusterParameterGroupName": "mydbclusterpgcopy",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "Copy of mydbclusterpg parameter group",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:cluster-pg:mydbclusterpgcopy"
        }
    ]
}
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterParameterGroups in *AWS CLI Command Reference*.

`describe-db-cluster-parameters`

The following code example shows how to use `describe-db-cluster-parameters`.

AWS CLI

Example 1: To describe the parameters in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves details about the parameters in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \
```

```
    --db-cluster-parameter-group-name mydbclusterpg
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "allow-suspicious-udfs",
            "Description": "Controls whether user-defined functions that have only
 an xxx symbol for the main function can be loaded",
            "Source": "engine-default",
            "ApplyType": "static",
            "DataType": "boolean",
            "AllowedValues": "0,1",
            "IsModifiable": false,
            "ApplyMethod": "pending-reboot",
            "SupportedEngineModes": [
                "provisioned"
            ]
        },
        {
            "ParameterName": "aurora_lab_mode",
            "ParameterValue": "0",
            "Description": "Enables new features in the Aurora engine.",
            "Source": "engine-default",
            "ApplyType": "static",
            "DataType": "boolean",
            "AllowedValues": "0,1",
            "IsModifiable": true,
            "ApplyMethod": "pending-reboot",
            "SupportedEngineModes": [
                "provisioned"
            ]
        }
    ]
}
```

Example 2: To list only the parameter names in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves only the names of the parameters in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \
```

```
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].{ParameterName:ParameterName}'
```

Output:

```
[
    {
        "ParameterName": "allow-suspicious-udfs"
    },
    {
        "ParameterName": "aurora_binlog_read_buffer_size"
    },
    {
        "ParameterName": "aurora_binlog_replication_max_yield_seconds"
    },
    {
        "ParameterName": "aurora_binlog_use_large_read_buffer"
    },
    {
        "ParameterName": "aurora_lab_mode"
    }
]
```

Example 3: To describe only the modifiable parameters in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].{ParameterName:ParameterName,IsModifiable:IsModifiable} |
 [?IsModifiable == `true`]'
```

Output:

```
[
    {
        "ParameterName": "aurora_binlog_read_buffer_size",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_binlog_replication_max_yield_seconds",
```

```
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_binlog_use_large_read_buffer",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_lab_mode",
        "IsModifiable": true
    }
]
```

Example 4: To describe only the modifiable Boolean parameters in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group and that have a Boolean data type.

```
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].
{ParameterName:ParameterName,DataType:DataType,IsModifiable:IsModifiable} | [?
DataType == `"boolean"`] | [?IsModifiable == `true`]'
```

Output:

```
[
    {
        "DataType": "boolean",
        "ParameterName": "aurora_binlog_use_large_read_buffer",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "aurora_lab_mode",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "autocommit",
        "IsModifiable": true
```

```
    },
    {
        "DataType": "boolean",
        "ParameterName": "automatic_sp_privileges",
        "IsModifiable": true
    }
]
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterParameters in *AWS CLI Command Reference*.

`describe-db-cluster-snapshot-attributes`

The following code example shows how to use `describe-db-cluster-snapshot-attributes`.

AWS CLI

To describe the attribute names and values for a DB cluster snapshot

The following `describe-db-cluster-snapshot-attributes` example retrieves details of the attribute names and values for the specified DB cluster snapshot.

```
aws rds describe-db-cluster-snapshot-attributes \
    --db-cluster-snapshot-identifier myclustersnapshot
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotIdentifier": "myclustersnapshot",
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789012"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a DB Cluster Snapshot in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterSnapshotAttributes in *AWS CLI Command Reference*.

`describe-db-cluster-snapshots`

The following code example shows how to use `describe-db-cluster-snapshots`.

AWS CLI

To describe a DB cluster snapshot for a DB cluster

The following `describe-db-cluster-snapshots` example retrieves the details for the DB cluster snapshots for the specified DB cluster.

```
aws rds describe-db-cluster-snapshots \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBClusterSnapshots": [
        {
            "AvailabilityZones": [
                "us-west-2a",
                "us-west-2b",

            "DeletionProtection": false,
            "HttpEndpointEnabled": false
        }
    ]
}
```

Example 2: To list certain attributes of all DB clusters

The following `describe-db-clusters` example retrieves only the `DBClusterIdentifier`, `Endpoint`, and `ReaderEndpoint` attributes of all your DB clusters in the current AWS Region.

```
aws rds describe-db-clusters \
    --query 'DBClusters[].
{DBClusterIdentifier:DBClusterIdentifier,Endpoint:Endpoint,ReaderEndpoint:ReaderEndpoint}'
```

Output:

```
[
    {
        "Endpoint": "cluster-57-2020-05-01-2270.cluster-cnpexample.us-
west-2.rds.amazonaws.com",
        "ReaderEndpoint": "cluster-57-2020-05-01-2270.cluster-ro-cnpexample.us-
west-2.rds.amazonaws.com",
        "DBClusterIdentifier": "cluster-57-2020-05-01-2270"
    },
    {
        "Endpoint": "cluster-57-2020-05-01-4615.cluster-cnpexample.us-
west-2.rds.amazonaws.com",
        "ReaderEndpoint": "cluster-57-2020-05-01-4615.cluster-ro-cnpexample.us-
west-2.rds.amazonaws.com",
        "DBClusterIdentifier": "cluster-57-2020-05-01-4615"
    },
    {
```

```
        "Endpoint": "pg2-cluster.cluster-cnpexample.us-west-2.rds.amazonaws.com",
        "ReaderEndpoint": "pg2-cluster.cluster-ro-cnpexample.us-
west-2.rds.amazonaws.com",
        "DBClusterIdentifier": "pg2-cluster"
    }
]
```

Example 3: To list DB clusters with a specific attribute

The following `describe-db-clusters` example retrieves only the `DBClusterIdentifier` and `Engine` attributes of your DB clusters that use the `aurora-postgresql` DB engine.

```
aws rds describe-db-clusters \
    --query 'DBClusters[].{DBClusterIdentifier:DBClusterIdentifier,Engine:Engine} |
 [?Engine == `"aurora-postgresql"`]'
```

Output:

```
[
    {
        "Engine": "aurora-postgresql",
        "DBClusterIdentifier": "pg2-cluster"
    }
]
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusters in *AWS CLI Command Reference*.

`describe-db-engine-versions`

The following code example shows how to use `describe-db-engine-versions`.

AWS CLI

To describe the DB engine versions for the MySQL DB engine

The following `describe-db-engine-versions` example displays details about each of the DB engine versions for the specified DB engine.

```
aws rds describe-db-engine-versions \
```

```
    --engine mysql
```

Output:

```
{
    "DBEngineVersions": [
        {
            "Engine": "mysql",
            "EngineVersion": "5.5.46",
            "DBParameterGroupFamily": "mysql5.5",
            "DBEngineDescription": "MySQL Community Edition",
            "DBEngineVersionDescription": "MySQL 5.5.46",
            "ValidUpgradeTarget": [
                {
                    "Engine": "mysql",
                    "EngineVersion": "5.5.53",
                    "Description": "MySQL 5.5.53",
                    "AutoUpgrade": false,
                    "IsMajorVersionUpgrade": false
                },
                {
                    "Engine": "mysql",
                    "EngineVersion": "5.5.54",
                    "Description": "MySQL 5.5.54",
                    "AutoUpgrade": false,
                    "IsMajorVersionUpgrade": false
                },
                {
                    "Engine": "mysql",
                    "EngineVersion": "5.5.57",
                    "Description": "MySQL 5.5.57",
                    "AutoUpgrade": false,
                    "IsMajorVersionUpgrade": false
                }
            ]
        }
    ]
}
```

For more information, see What Is Amazon Relational Database Service (Amazon RDS)? in the *Amazon RDS User Guide*.

- For API details, see DescribeDBEngineVersions in *AWS CLI Command Reference*.

`describe-db-instance-automated-backups`

The following code example shows how to use `describe-db-instance-automated-backups`.

AWS CLI

To describe the automated backups for a DB instance

The following `describe-db-instance-automated-backups` example displays details about the automated backups for the specified DB instance. The details include replicated automated backups in other AWS Regions.

```
aws rds describe-db-instance-automated-backups \
    --db-instance-identifier new-orcl-db
```

Output:

```
{
    "DBInstanceAutomatedBackups": [
        {
            "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
            "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",

            "DBInstanceIdentifier": "new-orcl-db",
            "RestoreWindow": {
                "EarliestTime": "2020-12-07T21:05:20.939Z",
                "LatestTime": "2020-12-07T21:05:20.939Z"
            },
            "AllocatedStorage": 20,
            "Status": "replicating",
            "Port": 1521,
            "InstanceCreateTime": "2020-12-04T15:28:31Z",
            "MasterUsername": "admin",
            "Engine": "oracle-se2",
            "EngineVersion": "12.1.0.2.v21",
            "LicenseModel": "bring-your-own-license",
            "OptionGroupName": "default:oracle-se2-12-1",
            "Encrypted": false,
            "StorageType": "gp2",
            "IAMDatabaseAuthenticationEnabled": false,
            "BackupRetentionPeriod": 14,
            "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-
west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
```

```
        }
    ]
}
```

For more information, see Finding information about replicated backups in the *Amazon RDS User Guide*.

- For API details, see DescribeDbInstanceAutomatedBackups in *AWS CLI Command Reference*.

`describe-db-instances`

The following code example shows how to use `describe-db-instances`.

AWS CLI

To describe a DB instance

The following `describe-db-instances` example retrieves details about the specified DB instance.

```
aws rds describe-db-instances \
    --db-instance-identifier mydbinstancecf
```

Output:

```
{
    "DBInstances": [
        {
            "DBInstanceIdentifier": "mydbinstancecf",
            "DBInstanceClass": "db.t3.small",
            "Engine": "mysql",
            "DBInstanceStatus": "available",
            "MasterUsername": "masterawsuser",
            "Endpoint": {
                "Address": "mydbinstancecf.abcexample.us-west-2.rds.amazonaws.com",
                "Port": 3306,
                "HostedZoneId": "Z2R2ITUGPM61AM"
            }
        }
    ]
}
```

For more information, see Amazon RDS DB instances in the *Amazon RDS User Guide*.

- For API details, see DescribeDBInstances in *AWS CLI Command Reference*.

`describe-db-log-files`

The following code example shows how to use `describe-db-log-files`.

AWS CLI

To describe the log files for a DB instance

The following `describe-db-log-files` example retrieves details about the log files for the specified DB instance.

```
aws rds describe-db-log-files \
    --db-instance-identifier test-instance
```

Output:

```
{
    "DescribeDBLogFiles": [
        {
            "Size": 0,
            "LastWritten": 1533060000000,
            "LogFileName": "error/mysql-error-running.log"
        },
        {
            "Size": 2683,
            "LastWritten": 1532994300000,
            "LogFileName": "error/mysql-error-running.log.0"
        },
        {
            "Size": 107,
            "LastWritten": 1533057300000,
            "LogFileName": "error/mysql-error-running.log.18"
        },
        {
            "Size": 13105,
            "LastWritten": 1532991000000,
            "LogFileName": "error/mysql-error-running.log.23"
        },

- For API details, see DescribeDbLogFiles in *AWS CLI Command Reference*.

`describe-db-major-engine-versions`

The following code example shows how to use `describe-db-major-engine-versions`.

AWS CLI

To describe the lifecycle support dates for a major engine version

The following `describe-db-major-engine-versions` example retrieves the standard and extended support dates for major engine version 17 of RDS for PostgreSQL.

```
aws rds describe-db-major-engine-versions \
    --engine postgres \
    --major-engine-version 17
```

Output:

```
{
    "DBMajorEngineVersions": [
        {
            "Engine": "postgres",
            "MajorEngineVersion": "17",
            "SupportedEngineLifecycles": [
                {
                    "LifecycleSupportName": "open-source-rds-standard-support",
                    "LifecycleSupportStartDate": "2024-11-14T00:00:00+00:00",
```

```
                    "LifecycleSupportEndDate": "2030-02-28T23:59:59.999000+00:00"
                },
                {
                    "LifecycleSupportName": "open-source-rds-extended-support",
                    "LifecycleSupportStartDate": "2030-03-01T00:00:00+00:00",
                    "LifecycleSupportEndDate": "2033-02-28T23:59:59.999000+00:00"
                }
            ]
        }
    ]
}
```

For more information, see Viewing support dates for engine versions in Amazon RDS Extended Support in the *Amazon RDS User Guide*.

- For API details, see DescribeDbMajorEngineVersions in *AWS CLI Command Reference*.

`describe-db-parameter-groups`

The following code example shows how to use `describe-db-parameter-groups`.

AWS CLI

To describe your DB parameter group

The following `describe-db-parameter-groups` example retrieves details about your DB parameter groups.

```
aws rds describe-db-parameter-groups
```

Output:

```
{
    "DBParameterGroups": [
        {
            "DBParameterGroupName": "default.aurora-mysql5.7",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "Default parameter group for aurora-mysql5.7",
            "DBParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:pg:default.aurora-mysql5.7"
        },
        {
```

```
            "DBParameterGroupName": "default.aurora-postgresql9.6",
            "DBParameterGroupFamily": "aurora-postgresql9.6",
            "Description": "Default parameter group for aurora-postgresql9.6",
            "DBParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:pg:default.aurora-postgresql9.6"
        },
        {
            "DBParameterGroupName": "default.aurora5.6",
            "DBParameterGroupFamily": "aurora5.6",
            "Description": "Default parameter group for aurora5.6",
            "DBParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:pg:default.aurora5.6"
        },
        {
            "DBParameterGroupName": "default.mariadb10.1",
            "DBParameterGroupFamily": "mariadb10.1",
            "Description": "Default parameter group for mariadb10.1",
            "DBParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:pg:default.mariadb10.1"
        }
    ]
}
```

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeDBParameterGroups in *AWS CLI Command Reference*.

`describe-db-parameters`

The following code example shows how to use `describe-db-parameters`.

AWS CLI

To describe the parameters in a DB parameter group

The following `describe-db-parameters` example retrieves the details of the specified DB parameter group.

```
aws rds describe-db-parameters \
    --db-parameter-group-name mydbpg
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "allow-suspicious-udfs",
            "Description": "Controls whether user-defined functions that have only
 an xxx symbol for the main function can be loaded",
            "Source": "engine-default",
            "ApplyType": "static",
            "DataType": "boolean",
            "AllowedValues": "0,1",
            "IsModifiable": false,
            "ApplyMethod": "pending-reboot"
        },
        {
            "ParameterName": "auto_generate_certs",
            "Description": "Controls whether the server autogenerates SSL key and
 certificate files in the data directory, if they do not already exist.",
            "Source": "engine-default",
            "ApplyType": "static",
            "DataType": "boolean",
            "AllowedValues": "0,1",
            "IsModifiable": false,
            "ApplyMethod": "pending-reboot"
        }
    ]
}
```

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeDBParameters in *AWS CLI Command Reference*.

`describe-db-proxies`

The following code example shows how to use `describe-db-proxies`.

AWS CLI

To describe a DB proxy for an RDS database

The following `describe-db-proxies` example returns information about DB proxies.

```
aws rds describe-db-proxies
```

Output:

```
{
    "DBProxies": [
        {
            "DBProxyName": "proxyExample1",
            "DBProxyArn": "arn:aws:rds:us-west-2:123456789012:db-

```
            "TargetRole": "READ_WRITE",
            "IsDefault": false
        }
    ]
}
```

For more information, see Viewing a proxy endpoint in the *Amazon RDS User Guide* and Creating a proxy endpoint in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbProxyEndpoints in *AWS CLI Command Reference*.

`describe-db-proxy-target-groups`

The following code example shows how to use `describe-db-proxy-target-groups`.

AWS CLI

To describe a DB proxy endpoints

The following `describe-db-proxy-target-groups` example returns information about DB proxy target groups.

```
aws rds describe-db-proxy-target-groups \
    --db-proxy-name proxyExample
```

Output:

```
{
    "TargetGroups": [
        {
            "DBProxyName": "proxyExample",
            "TargetGroupName": "default",
            "TargetGroupArn": "arn:aws:rds:us-west-2:123456789012:target-group:prx-
tg-0123a01b12345c0ab",
            "IsDefault": true,
            "Status": "available",
            "ConnectionPoolConfig": {
                "MaxConnectionsPercent": 100,
                "MaxIdleConnectionsPercent": 50,
                "ConnectionBorrowTimeout": 120,
                "SessionPinningFilters": []
            },
            "CreatedDate": "2023-05-02T18:41:19.495000+00:00",
```

```
            "UpdatedDate": "2023-05-02T18:41:21.762000+00:00"
        }
    ]
}
```

For more information, see Viewing an RDS Proxy in the *Amazon RDS User Guide* and Viewing an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbProxyTargetGroups in *AWS CLI Command Reference*.

`describe-db-proxy-targets`

The following code example shows how to use `describe-db-proxy-targets`.

AWS CLI

To describe DB proxy targets

The following `describe-db-proxy-targets` example returns information about DB proxy targets.

```
aws rds describe-db-proxy-targets \
    --db-proxy-name proxyExample
```

Output:

```
{
    "Targets": [
        {
            "Endpoint": "database1.ab0cd1efghij.us-west-2.rds.amazonaws.com",
            "TrackedClusterId": "database1",
            "RdsResourceId": "database1-instance-1",
            "Port": 3306,
            "Type": "RDS_INSTANCE",
            "Role": "READ_WRITE",
            "TargetHealth": {
                "State": "UNAVAILABLE",
                "Reason": "PENDING_PROXY_CAPACITY",
                "Description": "DBProxy Target is waiting for proxy to scale to
 desired capacity"
            }
        }
    ]
```

```
}
```

For more information, see Viewing an RDS proxy in the *Amazon RDS User Guide* and Viewing an RDS proxy in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbProxyTargets in *AWS CLI Command Reference*.

`describe-db-recommendations`

The following code example shows how to use `describe-db-recommendations`.

AWS CLI

Example 1: To list all DB recommendations

The following `describe-db-recommendations` example lists all DB recommendations in your AWS account.

```
aws rds describe-db-recommendations
```

Output:

```
{
    "DBRecommendations": [
        {
            "RecommendationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

 updates for Amazon RDS",
                    "Url": "https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/
blue-green-deployments.html"
                }
            ]
        }
    ]
}
```

For more information, see Viewing and responding to Amazon RDS recommendations in the *Amazon RDS User Guide* and Viewing and responding to Amazon RDS recommendations in the *Amazon Aurora User Guide*.

Example 2: To list high severity DB recommendations

The following `describe-db-recommendations` example lists high severity DB recommendations in your AWS account.

```
aws rds describe-db-recommendations \
    --filters Name=severity,Values=high
```

Output:

```
{
    "DBRecommendations": [
        {
            "RecommendationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TypeId": "config_recommendation::rds_extended_support",
            "Severity": "high",
            "ResourceArn": "arn:aws:rds:us-west-2:123456789012:db:database-1",
            "Status": "active",

`describe-db-security-groups`

The following code example shows how to use `describe-db-security-groups`.

AWS CLI

To list DB security groups

The following `describe-db-security-groups` example lists DB security groups.

```
aws rds describe-db-security-groups
```

Output:

```
{
    "DBSecurityGroups": [
        {
            "OwnerId": "123456789012",
            "DBSecurityGroupName": "default",
            "DBSecurityGroupDescription": "default",
            "EC2SecurityGroups": [],
            "IPRanges": [],
            "DBSecurityGroupArn": "arn:aws:rds:us-
west-2:123456789012:secgrp:default"
        },
        {
            "OwnerId": "123456789012",
            "DBSecurityGroupName": "mysecgroup",
            "DBSecurityGroupDescription": "My Test Security Group",
            "VpcId": "vpc-1234567f",
            "EC2SecurityGroups": [],
            "IPRanges": [],
            "DBSecurityGroupArn": "arn:aws:rds:us-
west-2:123456789012:secgrp:mysecgroup"
        }
    ]
}
```

For more information, see Listing Available DB Security Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeDbSecurityGroups in *AWS CLI Command Reference*.

describe-db-shard-groups

The following code example shows how to use `describe-db-shard-groups`.

AWS CLI

Example 1: To describe DB shard groups

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups.

```
aws rds describe-db-shard-groups
```

Output:

```
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
            "DBShardGroupIdentifier": "limitless-test-shard-grp",
            "DBClusterIdentifier": "limitless-test-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": true,
            "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-
west-2.rds.amazonaws.com"
        },
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
west-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbShardGroups in *AWS CLI Command Reference*.

`describe-db-snapshot-attributes`

The following code example shows how to use `describe-db-snapshot-attributes`.

AWS CLI

To describe the attribute names and values for a DB snapshot

The following `describe-db-snapshot-attributes` example describes the attribute names and values for a DB snapshot.

```
aws rds describe-db-snapshot-attributes \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789111",
                    "123456789222"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see DescribeDbSnapshotAttributes in *AWS CLI Command Reference*.

`describe-db-snapshot-tenant-databases`

The following code example shows how to use `describe-db-snapshot-tenant-databases`.

AWS CLI

To describe the tenant databases in a DB snapshot

The following `describe-db-snapshot-tenant-databases` example retrieves the details of the tenant databases contained in a snapshot of an RDS for Oracle CDB instance.

```
aws rds describe-db-snapshot-tenant-databases \
    --db-snapshot-identifier final-snap-test
```

Output:

```
{
    "DBSnapshotTenantDatabases": [
        {
            "DBSnapshotIdentifier": "final-snap-test",
            "DBInstanceIdentifier": "test-rds-oracle",

```

For more information, see Restoring to a DB instance in the *Amazon RDS User Guide*.

- For API details, see DescribeDbSnapshotTenantDatabases in *AWS CLI Command Reference*.

`describe-db-snapshots`

The following code example shows how to use `describe-db-snapshots`.

AWS CLI

Example 1: To describe a DB snapshot for a DB instance

The following `describe-db-snapshots` example retrieves the details of a DB snapshot for a DB instance.

```
aws rds describe-db-snapshots \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshots": [
        {
            "DBSnapshotIdentifier": "mydbsnapshot",
            "DBInstanceIdentifier": "mysqldb",
            "SnapshotCreateTime": "2018-02-08T22:28:08.598Z",
            "Engine": "mysql",
            "AllocatedStorage": 20,
            "Status": "available",
            "Port": 3306,
            "AvailabilityZone": "us-west-2d",
            "VpcId": "vpc-6594f31c",
            "InstanceCreateTime": "2018-02-08T22:24:55.973Z",
            "MasterUsername": "mysqladmin",
            "EngineVersion": "5.6.37",
```

```
            "LicenseModel": "general-public-license",
            "SnapshotType": "manual",
            "OptionGroupName": "default:mysql-5-6",
            "PercentProgress": 100,
            "StorageType": "gp2",
            "Encrypted": false,
            "DBSnapshotArn": "arn:aws:rds:us-
west-2:123456789012:snapshot:mydbsnapshot",
            "IAMDatabaseAuthenticationEnabled": false,
            "ProcessorFeatures": [],
            "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
        }
    ]
}
```

For more information, see Creating a DB Snapshot in the *Amazon RDS User Guide*.

Example 2: To find the number of manual snapshots taken

The following `describe-db-snapshots` example uses the `length` operator in the `--query` option to return the number of manual snapshots that have been taken in the current AWS Region.

```
aws rds describe-db-snapshots \
    --snapshot-type manual \
    --query "length(*[].{DBSnapshots:SnapshotType})"
```

Output:

```
35
```

For more information, see Creating a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see DescribeDBSnapshots in *AWS CLI Command Reference*.

`describe-db-subnet-groups`

The following code example shows how to use `describe-db-subnet-groups`.

AWS CLI

To describe a DB subnet group

The following `describe-db-subnet-groups` example retrieves the details of the specified DB subnet group.

```
aws rds describe-db-subnet-groups
```

Output:

```
{
    "DBSubnetGroups": [
        {
            "DBSubnetGroupName": "mydbsubnetgroup",
            "DBSubnetGroupDescription": "My DB Subnet Group",
            "VpcId": "vpc-971c12ee",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-d8c8e7f4",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-718fdc7d",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2d"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-cbc8e7e7",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-0ccde220",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    },
                    "SubnetStatus": "Active"
                }
```

```
            ],
            "DBSubnetGroupArn": "arn:aws:rds:us-
west-2:123456789012:subgrp:mydbsubnetgroup"
        }
    ]
}
```

For more information, see Amazon Virtual Private Cloud VPCs and Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see DescribeDbSubnetGroups in *AWS CLI Command Reference*.

`describe-engine-default-cluster-parameters`

The following code example shows how to use `describe-engine-default-cluster-parameters`.

AWS CLI

To describe the default engine and system parameter information for the Aurora database engine

The following `describe-engine-default-cluster-parameters` example retrieves the details of the default engine and system parameter information for Aurora DB clusters with MySQL 5.7 compatibility.

```
aws rds describe-engine-default-cluster-parameters \
    --db-parameter-group-family aurora-mysql5.7
```

Output:

```
{
    "EngineDefaults": {
        "Parameters": [
            {
                "ParameterName": "aurora_load_from_s3_role",
                "Description": "IAM role ARN used to load data from AWS S3",
                "Source": "engine-default",
                "ApplyType": "dynamic",
                "DataType": "string",
                "IsModifiable": true,
                "SupportedEngineModes": [
```

```
                    "provisioned"
                ]
            }
        ]
    }
}
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DescribeEngineDefaultClusterParameters in *AWS CLI Command Reference*.

`describe-engine-default-parameters`

The following code example shows how to use `describe-engine-default-parameters`.

AWS CLI

To describe the default engine and system parameter information for the database engine

The following `describe-engine-default-parameters` example retrieves details for the default engine and system parameter information for MySQL 5.7 DB instances.

```
aws rds describe-engine-default-parameters \
    --db-parameter-group-family mysql5.7
```

Output:

```
{
    "EngineDefaults": {
        "Parameters": [
            {
                "ParameterName": "allow-suspicious-udfs",
                "Description": "Controls whether user-defined functions that have
 only an xxx symbol for the main function can be loaded",
                "Source": "engine-default",
                "ApplyType": "static",
                "DataType": "boolean",
                "AllowedValues": "0,1",
                "IsModifiable": false
            }
        ]
```

```
    }
}
```

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeEngineDefaultParameters in *AWS CLI Command Reference*.

`describe-event-categories`

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe event categories

The following `describe-event-categories` example retrieves details about the event categories for all available event sources.

```
aws rds describe-event-categories
```

Output:

```
{
    "EventCategoriesMapList": [
        {
            "SourceType": "db-instance",
            "EventCategories": [
                "deletion",
                "read replica",
                "failover",
                "restoration",
                "maintenance",
                "low storage",
                "configuration change",
                "backup",
                "creation",
                "availability",
                "recovery",
                "failure",
                "backtrack",
                "notification"
            ]
```

```
        },
        {
            "SourceType": "db-security-group",
            "EventCategories": [
                "configuration change",
                "failure"
            ]
        },
        {
            "SourceType": "db-parameter-group",
            "EventCategories": [
                "configuration change"
            ]
        },
        {
            "SourceType": "db-snapshot",
            "EventCategories": [
                "deletion",
                "creation",
                "restoration",
                "notification"
            ]
        },
        {
            "SourceType": "db-cluster",
            "EventCategories": [
                "failover",
                "failure",
                "notification"
            ]
        },
        {
            "SourceType": "db-cluster-snapshot",
            "EventCategories": [
                "backup"
            ]
        }
    ]
}
```

For more information, see Amazon RDS event categories and event messages in the *Amazon RDS User Guide*.

- For API details, see DescribeEventCategories in *AWS CLI Command Reference*.

`describe-event-subscriptions`

The following code example shows how to use `describe-event-subscriptions`.

AWS CLI

To describe event subscriptions

The following `describe-event-subscriptions` example describes all of the Amazon RDS event subscriptions for the current AWS account.

```
aws rds describe-event-subscriptions
```

Output:

```
{
    "EventSubscriptionsList": [
        {
            "EventCategoriesList": [
                "backup",
                "recovery"
            ],
            "Enabled": true,
            "EventSubscriptionArn": "arn:aws:rds:us-west-2:123456789012:es:my-
instance-events",
            "Status": "creating",
            "SourceType": "db-instance",
            "CustomerAwsId": "123456789012",
            "SubscriptionCreationTime": "2018-07-31 23:22:01.893",
            "CustSubscriptionId": "my-instance-events",
            "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:interesting-events"
        }
    ]
}
```

For more information, see Listing Amazon RDS event notification subscriptions in the *Amazon RDS User Guide*.

- For API details, see DescribeEventSubscriptions in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To describe events

The following `describe-events` example retrieves details for the events that have occurred for the specified DB instance.

```
aws rds describe-events \
    --source-identifier test-instance \
    --source-type db-instance
```

Output:

```
{
    "Events": [
        {
            "SourceType": "db-instance",
            "SourceIdentifier": "test-instance",
            "EventCategories": [
                "backup"
            ],
            "Message": "Backing up DB instance",
            "Date": "2018-07-31T23:09:23.983Z",
            "SourceArn": "arn:aws:rds:us-west-2:123456789012:db:test-instance"
        },
        {
            "SourceType": "db-instance",
            "SourceIdentifier": "test-instance",
            "EventCategories": [
                "backup"
            ],
            "Message": "Finished DB Instance backup",
            "Date": "2018-07-31T23:15:13.049Z",
            "SourceArn": "arn:aws:rds:us-west-2:123456789012:db:test-instance"
        }
    ]
}
```

For more information, see Viewing Amazon RDS events in the *Amazon RDS User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

describe-export-tasks

The following code example shows how to use `describe-export-tasks`.

AWS CLI

To describe snapshot export tasks

The following `describe-export-tasks` example returns information about snapshot exports to Amazon S3.

```
aws rds describe-export-tasks
```

Output:

```
{
    "ExportTasks": [
        {
            "ExportTaskIdentifier": "test-snapshot-export",
            "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:test-
snapshot",
            "SnapshotTime": "2020-03-02T18:26:28.163Z",
            "TaskStartTime": "2020-03-02T18:57:56.896Z",

            "S3Bucket": "amzn-s3-demo-bucket",
            "S3Prefix": "",
            "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "Status": "COMPLETE",
            "PercentProgress": 100,
            "TotalExtractedDataInGB": 0
        },
        {
            "ExportTaskIdentifier": "my-s3-export",
            "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-
test",
            "SnapshotTime": "2020-03-27T20:48:42.023Z",
            "S3Bucket": "amzn-s3-demo-bucket",
            "S3Prefix": "",
            "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
```

```
            "Status": "STARTING",
            "PercentProgress": 0,
            "TotalExtractedDataInGB": 0
        }
    ]
}
```

For more information, see Monitoring Snapshot Exports in the *Amazon RDS User Guide*.

- For API details, see DescribeExportTasks in *AWS CLI Command Reference*.

`describe-global-clusters`

The following code example shows how to use `describe-global-clusters`.

AWS CLI

To describe global DB clusters

The following `describe-global-clusters` example lists Aurora global DB clusters in the current AWS Region.

```
aws rds describe-global-clusters
```

Output:

```
{
    "GlobalClusters": [
        {
            "GlobalClusterIdentifier": "myglobalcluster",
            "GlobalClusterResourceId": "cluster-f5982077e3b5aabb",
            "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
            "Status": "available",
            "Engine": "aurora-mysql",
            "EngineVersion": "5.7.mysql_aurora.2.07.2",
            "StorageEncrypted": false,
            "DeletionProtection": false,
            "GlobalClusterMembers": []
        }
    ]
}
```

For more information, see Managing an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see DescribeGlobalClusters in *AWS CLI Command Reference*.

`describe-option-group-options`

The following code example shows how to use `describe-option-group-options`.

AWS CLI

To describe all available options

The following `describe-option-group-options` example lists two options for an Oracle Database 19c instance.

```
aws rds describe-option-group-options \
    --engine-name oracle-ee \
    --major-engine-version 19 \
    --max-items 2
```

Output:

```
{
    "OptionGroupOptions": [
        {
            "Name": "APEX",
            "Description": "Oracle Application Express Runtime Environment",
            "EngineName": "oracle-ee",
            "MajorEngineVersion": "19",
            "MinimumRequiredMinorEngineVersion": "0.0.0.ru-2019-07.rur-2019-07.r1",
            "PortRequired": false,
            "OptionsDependedOn": [],
            "OptionsConflictsWith": [],
            "Persistent": false,
            "Permanent": false,

            "Persistent": false,
            "Permanent": false,
            "RequiresAutoMinorEngineVersionUpgrade": false,
            "VpcOnly": false,
            "OptionGroupOptionSettings": []
        }
    ],
    "NextToken": "eyJNYXJrZXIiOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

For more information, see Listing the Options and Option Settings for an Option Group in the *Amazon RDS User Guide*.

- For API details, see DescribeOptionGroupOptions in *AWS CLI Command Reference*.

`describe-option-groups`

The following code example shows how to use `describe-option-groups`.

AWS CLI

To describe the available option groups

The following `describe-option-groups` example lists the options groups for an Oracle Database 19c instance.

```
aws rds describe-option-groups \
    --engine-name oracle-ee \
    --major-engine-version 19
```

Output:

```
{
    "OptionGroupsList": [
        {
            "OptionGroupName": "default:oracle-ee-19",
            "OptionGroupDescription": "Default option group for oracle-ee 19",
            "EngineName": "oracle-ee",
            "MajorEngineVersion": "19",
            "Options": [],
            "AllowsVpcAndNonVpcInstanceMemberships": true,
            "OptionGroupArn": "arn:aws:rds:us-west-2:123456789012:og:default:oracle-
ee-19"
        }
    ]
}
```

For more information, see Listing the Options and Option Settings for an Option Group in the *Amazon RDS User Guide*.

- For API details, see DescribeOptionGroups in *AWS CLI Command Reference*.

`describe-orderable-db-instance-options`

The following code example shows how to use `describe-orderable-db-instance-options`.

AWS CLI

To describe orderable DB instance options

The following `describe-orderable-db-instance-options` example retrieves details about the orderable options for a DB instances running the MySQL DB engine.

```
aws rds describe-orderable-db-instance-options \
```

```
    --engine mysql
```

Output:

```
{
    "OrderableDBInstanceOptions": [
        {
            "MinStorageSize": 5,
            "ReadReplicaCapable": true,
            "MaxStorageSize": 6144,
            "AvailabilityZones": [
                {
                    "Name": "us-west-2a"
                },
                {
                    "Name": "us-west-2b"
                },
                {
                    "Name": "us-west-2c"
                },
                {
                    "Name": "us-west-2d"
                }
            ],
            "SupportsIops": false,
            "AvailableProcessorFeatures": [],
            "MultiAZCapable": true,
            "DBInstanceClass": "db.m1.large",
            "Vpc": true,
            "StorageType": "gp2",
            "LicenseModel": "general-public-license",
            "EngineVersion": "5.5.46",
            "SupportsStorageEncryption": false,
            "SupportsEnhancedMonitoring": true,
            "Engine": "mysql",
            "SupportsIAMDatabaseAuthentication": false,
            "SupportsPerformanceInsights": false
        }
    ]
}
```

For more information, see DB instance classes in the *Amazon RDS User Guide*.

- For API details, see DescribeOrderableDBInstanceOptions in *AWS CLI Command Reference*.

`describe-pending-maintenance-actions`

The following code example shows how to use `describe-pending-maintenance-actions`.

AWS CLI

To list resources with at least one pending maintenance action

The following `describe-pending-maintenance-actions` example lists the pending maintenance action for a DB instance.

```
aws rds describe-pending-maintenance-actions
```

Output:

```
{
    "PendingMaintenanceActions": [
        {
            "ResourceIdentifier": "arn:aws:rds:us-
west-2:123456789012:cluster:global-db1-cl1",
            "PendingMaintenanceActionDetails": [
                {
                    "Action": "system-update",
                    "Description": "Upgrade to Aurora PostgreSQL 2.4.2"
                }
            ]
        }
    ]
}
```

For more information, see Maintaining a DB Instance in the *Amazon RDS User Guide*.

- For API details, see DescribePendingMaintenanceActions in *AWS CLI Command Reference*.

`describe-reserved-db-instances-offerings`

The following code example shows how to use `describe-reserved-db-instances-offerings`.

AWS CLI

To describe reserved DB instance offerings

The following `describe-reserved-db-instances-offerings` example retrieves details about reserved DB instance options for `oracle`.

```
aws rds describe-reserved-db-instances-offerings \
    --product-description oracle
```

Output:

```
{
    "ReservedDBInstancesOfferings": [
        {
            "CurrencyCode": "USD",
            "UsagePrice": 0.0,
            "ProductDescription": "oracle-se2(li)",
            "ReservedDBInstancesOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "MultiAZ": true,
            "DBInstanceClass": "db.m4.xlarge",
            "OfferingType": "Partial Upfront",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.594,
                    "RecurringChargeFrequency": "Hourly"
                }
            ],
            "FixedPrice": 4089.0,
            "Duration": 31536000
        }
    ]
}
```

For more information, see Reserved DB instances for Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see DescribeReservedDbInstancesOfferings in *AWS CLI Command Reference*.

`describe-reserved-db-instances`

The following code example shows how to use `describe-reserved-db-instances`.

AWS CLI

To describe reserved DB instances

The following `describe-reserved-db-instances` example retrieves details about any reserved DB instances in the current AWS account.

```
aws rds describe-reserved-db-instances
```

Output:

```
{
    "ReservedDBInstances": [
        {
            "ReservedDBInstanceId": "myreservedinstance",
            "ReservedDBInstancesOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DBInstanceClass": "db.t3.micro",
            "StartTime": "2020-06-01T13:44:21.436Z",
            "Duration": 31536000,
            "FixedPrice": 0.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
            "DBInstanceCount": 1,
            "ProductDescription": "sqlserver-ex(li)",
            "OfferingType": "No Upfront",
            "MultiAZ": false,
            "State": "payment-pending",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.014,
                    "RecurringChargeFrequency": "Hourly"
                }
            ],
            "ReservedDBInstanceArn": "arn:aws:rds:us-
west-2:123456789012:ri:myreservedinstance",
            "LeaseId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see Reserved DB Instances for Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see DescribeReservedDbInstances in *AWS CLI Command Reference*.

`describe-serverless-v2-platform-versions`

The following code example shows how to use `describe-serverless-v2-platform-versions`.

AWS CLI

To describe an Aurora Serverless v2 platform version

The following `describe-serverless-v2-platform-versions` example retrieves the details of platform version 3 for Aurora PostgreSQL.

```
aws rds describe-serverless-v2-platform-versions \
    --engine aurora-postgresql \
    --serverless-v2-platform-version 3
```

Output:

```
{
    "ServerlessV2PlatformVersions": [
        {
            "ServerlessV2PlatformVersion": "3",
            "ServerlessV2PlatformVersionDescription": "Version 3 offering scaling up
 to 256 ACUs, and performance improvement up to 30% compared to version 2",
            "Engine": "aurora-postgresql",
            "ServerlessV2FeaturesSupport": {
                "MinCapacity": 0.0,
                "MaxCapacity": 256.0
            },
            "Status": "enabled",
            "IsDefault": false
        }
    ]
}
```

For more information, see Checking the default platform version in the *Amazon Aurora User Guide*.

- For API details, see DescribeServerlessV2PlatformVersions in *AWS CLI Command Reference*.

`describe-source-regions`

The following code example shows how to use `describe-source-regions`.

AWS CLI

To describe source Regions

The following `describe-source-regions` example retrieves details about all source AWS Regions. It also shows that automated backups can be replicated only from US West (Oregon) to the destination AWS Region, US East (N. Virginia).

```
aws rds describe-source-regions \
    --region us-east-1
```

Output:

```
{
    "SourceRegions": [
        {
            "RegionName": "af-south-1",
            "Endpoint": "https://rds.af-south-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": false
        },
        {
            "RegionName": "ap-east-1",
            "Endpoint": "https://rds.ap-east-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": false
        },
        {
            "RegionName": "ap-northeast-1",
            "Endpoint": "https://rds.ap-northeast-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": true
        },
        {
            "RegionName": "ap-northeast-2",

            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": true
        }
    ]
}
```

For more information, see Finding information about replicated backups in the *Amazon RDS User Guide*.

- For API details, see DescribeSourceRegions in *AWS CLI Command Reference*.

`describe-tenant-databases`

The following code example shows how to use `describe-tenant-databases`.

AWS CLI

To describe the tenant databases in a DB instance

The following `describe-tenant-databases` example retrieves the details of the tenant databases in an RDS for Oracle CDB instance.

```
aws rds describe-tenant-databases \
    --db-instance-identifier test-rds-oracle
```

Output:

```
{
    "TenantDatabases": [
        {
            "TenantDatabaseCreateTime": "2026-09-12T16:02:18.011000+00:00",
            "DBInstanceIdentifier": "test-rds-oracle",
```

```
            "TenantDBName": "ORCL",
            "Status": "available",
            "MasterUsername": "admin",
            "DbiResourceId": "db-ABCD1234EFGH5678IJKEXAMPLE",
            "TenantDatabaseResourceId": "tdb-
QRST5678UVWX1234YZAB90CDEFGHIJ5678KLMN1234OPQEXAMPLE",
            "TenantDatabaseARN": "arn:aws:rds:us-west-2:123456789012:tenant-
database:tdb-qrst5678uvwx1234yzab90cdefghij5678klmn1234opqexample",
            "CharacterSetName": "AL32UTF8",
            "NcharCharacterSetName": "AL16UTF16",
            "DeletionProtection": false,
            "PendingModifiedValues": {},
            "TagList": []
        }
    ]
}
```

For more information, see Viewing tenant database details in the *Amazon RDS User Guide*.

- For API details, see DescribeTenantDatabases in *AWS CLI Command Reference*.

`describe-valid-db-instance-modifications`

The following code example shows how to use `describe-valid-db-instance-modifications`.

AWS CLI

To describe valid modifications for a DB instance

The following `describe-valid-db-instance-modifications` example retrieves details about the valid modifications for the specified DB instance.

```
aws rds describe-valid-db-instance-modifications \
    --db-instance-identifier test-instance
```

Output:

```
{
    "ValidDBInstanceModificationsMessage": {
        "ValidProcessorFeatures": [],
        "Storage": [
            {
```

```
                "StorageSize": [
                    {
                        "Step": 1,

                    }
                ],
                "StorageType": "magnetic"
            }
        ]
    }
}
```

For more information, see Modifying an Amazon RDS DB instance in the *Amazon RDS User Guide*.

- For API details, see DescribeValidDbInstanceModifications in *AWS CLI Command Reference*.

`disable-http-endpoint`

The following code example shows how to use `disable-http-endpoint`.

AWS CLI

To disable the RDS Data API for a DB cluster

The following `disable-http-endpoint` example disables the RDS Data API for the specified Aurora DB cluster.

```
aws rds disable-http-endpoint \
    --resource-arn arn:aws:rds:us-west-2:123456789012:cluster:test-aurora-pg-cluster
```

Output:

```
{
    "ResourceArn": "arn:aws:rds:us-west-2:123456789012:cluster:test-aurora-pg-
cluster",
    "HttpEndpointEnabled": false
}
```

For more information, see Enabling or disabling RDS Data API on an existing database in the *Amazon Aurora User Guide*.

- For API details, see DisableHttpEndpoint in *AWS CLI Command Reference*.

`download-db-log-file-portion`

The following code example shows how to use `download-db-log-file-portion`.

AWS CLI

Example 1: To download the latest part of a DB log file

The following `download-db-log-file-portion` example downloads only the latest part of your log file, saving it to a local file named `tail.txt`.

```
aws rds download-db-log-file-portion \
    --db-instance-identifier test-instance \
    --log-file-name log.txt \
    --output text > tail.txt
```

This command produces no output.

The saved file might contain blank lines. They appear at the end of each part of the log file while being downloaded.

For more information, see Downloading a database log file in the *Amazon RDS User Guide*.

Example 2: To download an entire DB log file

The following `download-db-log-file-portion` example downloads the entire log file, using the `--starting-token 0` parameter, and saves the output to a local file named `full.txt`.

```
aws rds download-db-log-file-portion \
    --db-instance-identifier test-instance \
    --log-file-name log.txt \
    --starting-token 0 \
    --output text > full.txt
```

This command produces no output.

The saved file might contain blank lines. They appear at the end of each part of the log file while being downloaded.

For more information, see Downloading a database log file in the *Amazon RDS User Guide*.

- For API details, see DownloadDbLogFilePortion in *AWS CLI Command Reference*.

`enable-http-endpoint`

The following code example shows how to use `enable-http-endpoint`.

AWS CLI

To enable the RDS Data API for a DB cluster

The following `enable-http-endpoint` example enables the RDS Data API for the specified Aurora DB cluster.

```
aws rds enable-http-endpoint \
    --resource-arn arn:aws:rds:us-west-2:123456789012:cluster:test-aurora-pg-cluster
```

Output:

```
{
    "ResourceArn": "arn:aws:rds:us-west-2:123456789012:cluster:test-aurora-pg-
cluster",
    "HttpEndpointEnabled": true
}
```

For more information, see Enabling the Amazon RDS Data API in the *Amazon Aurora User Guide*.

- For API details, see EnableHttpEndpoint in *AWS CLI Command Reference*.

`failover-db-cluster`

The following code example shows how to use `failover-db-cluster`.

AWS CLI

To force a failover for a DB cluster

The following `failover-db-cluster` example promotes the specified Aurora Replica to be the primary DB instance, or writer, of the DB cluster.

```
aws rds failover-db-cluster \
    --db-cluster-identifier test-aurora-cluster-failover \
    --target-db-instance-identifier test-aurora-cluster-failover-instance-1-reader
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2d",
            "us-west-2c",
            "us-west-2a"
        ],
        "BackupRetentionPeriod": 7,
        "DBClusterIdentifier": "test-aurora-cluster-failover",
        "DBClusterParameterGroup": "default.aurora-postgresql17",
        "DBSubnetGroup": "default",
        "Status": "available",
        "Endpoint": "test-aurora-cluster-failover.cluster-cnpexample.us-
west-2.rds.amazonaws.com",
```

```
        "ReaderEndpoint": "test-aurora-cluster-failover.cluster-ro-cnpexample.us-
west-2.rds.amazonaws.com",
        "MultiAZ": true,
        "Engine": "aurora-postgresql",
        "EngineVersion": "17.7",
        "Port": 5432,
        "MasterUsername": "postgres"
    }
}
```

For more information, see Failing over an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see FailoverDbCluster in *AWS CLI Command Reference*.

`failover-global-cluster`

The following code example shows how to use `failover-global-cluster`.

AWS CLI

To fail over a global database

The following `failover-global-cluster` example promotes the specified secondary cluster to be the primary cluster of the global database. Run this command in the Region that hosts the secondary cluster that you're promoting.

```
aws rds failover-global-cluster \
    --region us-east-2 \
    --global-cluster-identifier global-database \
    --target-db-cluster-identifier arn:aws:rds:us-
east-2:123456789012:cluster:secondary-cluster \
    --allow-data-loss
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "global-database",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-cluster:global-
database",
```

```
        "Status": "failing-over",
        "Engine": "aurora-postgresql",
        "EngineVersion": "17.7",
        "EngineLifecycleSupport": "open-source-rds-extended-support-disabled",
        "StorageEncrypted": true,
        "StorageEncryptionType": "sse-kms",
        "DeletionProtection": false,
        "GlobalClusterMembers": [
            {
                "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:primary-
cluster",
                "Readers": [
                    "arn:aws:rds:us-east-2:123456789012:cluster:secondary-cluster"
                ],
                "IsWriter": true,
                "SynchronizationStatus": "connected"
            },
            {
                "DBClusterArn": "arn:aws:rds:us-
east-2:123456789012:cluster:secondary-cluster",
                "Readers": [],
                "IsWriter": false,
                "GlobalWriteForwardingStatus": "disabled",
                "SynchronizationStatus": "connected"
            }
        ],
        "Endpoint": "global-database.global-cnpexample.global.rds.amazonaws.com",
        "FailoverState": {
            "Status": "pending",
            "FromDbClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:primary-
cluster",
            "ToDbClusterArn": "arn:aws:rds:us-east-2:123456789012:cluster:secondary-
cluster",
            "IsDataLossAllowed": true
        },
        "TagList": []
    }
}
```

For more information, see Using switchover or failover in Amazon Aurora Global Database in the *Amazon Aurora User Guide*.

- For API details, see FailoverGlobalCluster in *AWS CLI Command Reference*.

`generate-db-auth-token`

The following code example shows how to use `generate-db-auth-token`.

AWS CLI

To generate an IAM authentication token

The following `generate-db-auth-token` example generates IAM authentication token to connect to a database.

```
aws rds generate-db-auth-token \
    --hostname mydb.123456789012.us-west-2.rds.amazonaws.com \
    --port 3306 \
    --region us-west-2 \
    --username db_user
```

Output:

```
mydb.123456789012.us-west-2.rds.amazonaws.com:3306/?
Action=connect&DBUser=db_user&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-
Credential=AKIAIEXAMPLE%2Fus-east-1%2Frds-db%2Faws4_request&X-Amz-
Date=20210123T011543Z&X-Amz-Expires=900&X-Amz-SignedHeaders=host&X-Amz-
Signature=88987EXAMPLE1EXAMPLE2EXAMPLE3EXAMPLE4EXAMPLE5EXAMPLE6
```

For more information, see Connecting to your DB instance using IAM authentication in the *Amazon RDS User Guide* and Connecting to your DB cluster using IAM authentication in the *Amazon Aurora User Guide*.

- For API details, see GenerateDbAuthToken in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags on an Amazon RDS resource

The following `list-tags-for-resource` example lists all tags on a DB instance.

```
aws rds list-tags-for-resource \
    --resource-name arn:aws:rds:us-west-2:123456789012:db:orcl1
```

Output:

```
{
    "TagList": [
        {
            "Key": "Environment",
            "Value": "test"
        },
        {
            "Key": "Name",
            "Value": "MyDatabase"
        }
    ]
}
```

For more information, see Tagging Amazon RDS Resources in the *Amazon RDS User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`modify-certificates`

The following code example shows how to use `modify-certificates`.

AWS CLI

To temporarily override the system-default SSL/TLS certificate for new DB instances

The following `modify-certificates` example temporarily overrides the system-default SSL/TLS certificate for new DB instances.

```
aws rds modify-certificates \
    --certificate-identifier rds-ca-2019
```

Output:

```
{
    "Certificate": {
        "CertificateIdentifier": "rds-ca-2019",
```

```
        "CertificateType": "CA",
        "Thumbprint": "EXAMPLE123456789012",
        "ValidFrom": "2019-09-19T18:16:53Z",
        "ValidTill": "2024-08-22T17:08:50Z",
        "CertificateArn": "arn:aws:rds:us-west-2::cert:rds-ca-2019",
        "CustomerOverride": true,
        "CustomerOverrideValidTill": "2024-08-22T17:08:50Z"
    }
}
```

For more information, see Rotating your SSL/TLS certificate in the *Amazon RDS User Guide* and Rotating your SSL/TLS certificate in the *Amazon Aurora User Guide*.

- For API details, see ModifyCertificates in *AWS CLI Command Reference*.

`modify-current-db-cluster-capacity`

The following code example shows how to use `modify-current-db-cluster-capacity`.

AWS CLI

To scale the capacity of an Aurora Serverless DB cluster

The following `modify-current-db-cluster-capacity` example scales the capacity of an Aurora Serverless DB cluster to 8.

```
aws rds modify-current-db-cluster-capacity \
    --db-cluster-identifier mydbcluster \
    --capacity 8
```

Output:

```
{
    "DBClusterIdentifier": "mydbcluster",
    "PendingCapacity": 8,
    "CurrentCapacity": 1,
    "SecondsBeforeTimeout": 300,
    "TimeoutAction": "ForceApplyCapacityChange"
}
```

- For API details, see ModifyCurrentDbClusterCapacity in *AWS CLI Command Reference*.

`modify-db-cluster-endpoint`

The following code example shows how to use `modify-db-cluster-endpoint`.

AWS CLI

To modify a custom DB cluster endpoint

The following `modify-db-cluster-endpoint` example modifies the specified custom DB cluster endpoint.

```
aws rds modify-db-cluster-endpoint \
    --db-cluster-endpoint-identifier mycustomendpoint \
    --static-members dbinstance1 dbinstance2 dbinstance3
```

Output:

```
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
    "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-
west-2.rds.amazonaws.com",
    "Status": "modifying",
    "EndpointType": "CUSTOM",
    "CustomEndpointType": "READER",
    "StaticMembers": [
        "dbinstance1",
        "dbinstance2",
        "dbinstance3"
    ],
    "ExcludedMembers": [],
    "DBClusterEndpointArn": "arn:aws:rds:us-west-2:123456789012:cluster-
endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbClusterEndpoint in *AWS CLI Command Reference*.

`modify-db-cluster-parameter-group`

The following code example shows how to use `modify-db-cluster-parameter-group`.

AWS CLI

To modify parameters in a DB cluster parameter group

The following `modify-db-cluster-parameter-group` example modifies the values of parameters in a DB cluster parameter group.

```
aws rds modify-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclusterpg \
    --
parameters "ParameterName=server_audit_logging,ParameterValue=1,ApplyMethod=immediate" "Para
```

Output:

```
{
    "DBClusterParameterGroupName": "mydbclusterpg"
}
```

For more information, see Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbClusterParameterGroup in *AWS CLI Command Reference*.

`modify-db-cluster-snapshot-attribute`

The following code example shows how to use `modify-db-cluster-snapshot-attribute`.

AWS CLI

To modify a DB cluster snapshot attribute

The following `modify-db-cluster-snapshot-attribute` example makes changes to the specified DB cluster snapshot attribute.

```
aws rds modify-db-cluster-snapshot-attribute \
    --db-cluster-snapshot-identifier myclustersnapshot \
    --attribute-name restore \
```

```
    --values-to-add 123456789012
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotIdentifier": "myclustersnapshot",
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789012"
                ]
            }
        ]
    }
}
```

For more information, see Restoring from a DB Cluster Snapshot in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbClusterSnapshotAttribute in *AWS CLI Command Reference*.

`modify-db-cluster`

The following code example shows how to use `modify-db-cluster`.

AWS CLI

Example 1: To modify a DB cluster

The following `modify-db-cluster` example changes the master user password for the DB cluster named `cluster-2` and sets the backup retention period to 14 days. The `--apply-immediately` parameter causes the changes to be made immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-cluster \
    --db-cluster-identifier cluster-2 \
    --backup-retention-period 14 \
    --master-user-password newpassword99 \
    --apply-immediately
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2b",
            "us-west-2c",
            "us-west-2a"
        ],
        "BackupRetentionPeriod": 14,
        "DatabaseName": "",
        "DBClusterIdentifier": "cluster-2",
        "DBClusterParameterGroup": "default.aurora5.6",
        "DBSubnetGroup": "default-vpc-2305ca49",

        "DomainMemberships": []
    }
}
```

For more information, see Modifying an Amazon Aurora DB Cluster in the *Amazon Aurora User Guide*.

Example 2: To associate VPC security group with a DB cluster

The following `modify-db-cluster` example associates a specific VPC security group and removes DB security groups from a DB cluster.

```
aws rds modify-db-cluster \
    --db-cluster-identifier dbName \
    --vpc-security-group-ids sg-ID
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2b",
            "us-west-2a"
        ],
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "dbName",
        "DBClusterParameterGroup": "default.aurora-mysql8.0",
        "DBSubnetGroup": "default",
```

```
        "Status": "available",
        "EarliestRestorableTime": "2024-02-15T01:12:13.966000+00:00",

            }
        ],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-ID",
                "Status": "active"
            }
        ]
    }
}
```

For more information, see Controlling access with security groups in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbCluster in *AWS CLI Command Reference*.

`modify-db-instance`

The following code example shows how to use `modify-db-instance`.

AWS CLI

Example 1: To modify a DB instance

The following `modify-db-instance` example associates an option group and a parameter group with a compatible Microsoft SQL Server DB instance. The `--apply-immediately` parameter causes the option and parameter groups to be associated immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-instance \
    --db-instance-identifier database-2 \
    --option-group-name test-se-2017 \
    --db-parameter-group-name test-sqlserver-se-2017 \
    --apply-immediately
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "database-2",
        "DBInstanceClass": "db.r4.large",
        "Engine": "sqlserver-se",
        "DBInstanceStatus": "available",
        "DBParameterGroups": [
            {
                "DBParameterGroupName": "test-sqlserver-se-2017",
                "ParameterApplyStatus": "applying"
            }
        ],
        "AvailabilityZone": "us-west-2d",
        "MultiAZ": true,
        "EngineVersion": "14.00.3281.6.v1",
        "AutoMinorVersionUpgrade": false,
        "ReadReplicaDBInstanceIdentifiers": [],
        "LicenseModel": "license-included",
        "OptionGroupMemberships": [
            {
                "OptionGroupName": "test-se-2017",
                "Status": "pending-apply"
            }
        ],
        "CharacterSetName": "SQL_Latin1_General_CP1_CI_AS",
        "SecondaryAvailabilityZone": "us-west-2c",
        "PubliclyAccessible": true,
        "StorageType": "gp2",
        "DeletionProtection": false,
```

```
        "AssociatedRoles": [],
        "MaxAllocatedStorage": 1000
    }
}
```

For more information, see Modifying an Amazon RDS DB Instance in the *Amazon RDS User Guide*.

Example 2: To associate VPC security group with a DB instance

The following `modify-db-instance` example associates a specific VPC security group and removes DB security groups from a DB instance.

```
aws rds modify-db-instance \
    --db-instance-identifier dbName \
    --vpc-security-group-ids sg-ID
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "dbName",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "mysql",
        "DBInstanceStatus": "available",
        "MasterUsername": "admin",
        "Endpoint": {
            "Address": "dbName.abcdefghijk.us-west-2.rds.amazonaws.com",
            "Port": 3306,
            "HostedZoneId": "ABCDEFGHIJK1234"
        },
        "AllocatedStorage": 20,
        "InstanceCreateTime": "2024-02-15T00:37:58.793000+00:00",
        "PreferredBackupWindow": "11:57-12:27",
        "BackupRetentionPeriod": 7,
        "DBSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-ID",
                "Status": "active"
            }
        ],
```

```
        "MultiAZ": false,
        "EngineVersion": "8.0.35",
        "AutoMinorVersionUpgrade": true,
        "ReadReplicaDBInstanceIdentifiers": [],
        "LicenseModel": "general-public-license"
    }
}
```

For more information, see Controlling access with security groups in the *Amazon RDS User Guide*.

- For API details, see ModifyDBInstance in *AWS CLI Command Reference*.

`modify-db-parameter-group`

The following code example shows how to use `modify-db-parameter-group`.

AWS CLI

To modify a DB parameter group

The following `modify-db-parameter-group` example changes the value of the `clr enabled` parameter in a DB parameter group. The `--apply-immediately` parameter causes the DB parameter group to be modified immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-parameter-group \
    --db-parameter-group-name test-sqlserver-se-2017 \
    --parameters "ParameterName='clr
 enabled',ParameterValue=1,ApplyMethod=immediate"
```

Output:

```
{
    "DBParameterGroupName": "test-sqlserver-se-2017"
}
```

For more information, see Modifying Parameters in a DB Parameter Group in the *Amazon RDS User Guide*.

- For API details, see ModifyDBParameterGroup in *AWS CLI Command Reference*.

`modify-db-proxy-endpoint`

The following code example shows how to use `modify-db-proxy-endpoint`.

AWS CLI

To modify a DB proxy endpoint for an RDS database

The following `modify-db-proxy-endpoint` example modifies a DB proxy endpoint `proxyEndpoint` to set the read-timeout to 65 seconds.

```
aws rds modify-db-proxy-endpoint \
    --db-proxy-endpoint-name proxyEndpoint \
    --cli-read-timeout 65
```

Output:

```
{
    "DBProxyEndpoint":
    {
        "DBProxyEndpointName": "proxyEndpoint",
        "DBProxyEndpointArn": "arn:aws:rds:us-west-2:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
        "DBProxyName": "proxyExample",
        "Status": "available",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Endpoint": "proxyEndpoint.endpoint.proxyExample-ab0cd1efghij.us-
west-2.rds.amazonaws.com",
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
        "TargetRole": "READ_WRITE",
        "IsDefault": false
    }
}
```

For more information, see Modifying a proxy endpoint in the *Amazon RDS User Guide* and Modifying a proxy endpoint in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbProxyEndpoint in *AWS CLI Command Reference*.

`modify-db-proxy-target-group`

The following code example shows how to use `modify-db-proxy-target-group`.

AWS CLI

To modify a DB proxy endpoints

The following `modify-db-proxy-target-group` example modifies a DB proxy target group to set the maximum connections to 80 percent and maximum idle connections to 10 percent.

```
aws rds modify-db-proxy-target-group \
    --target-group-name default \
    --db-proxy-name proxyExample \
    --connection-pool-config MaxConnectionsPercent=80,MaxIdleConnectionsPercent=10
```

Output:

```
{
    "DBProxyTargetGroup":
    {
        "DBProxyName": "proxyExample",
        "TargetGroupName": "default",
        "TargetGroupArn": "arn:aws:rds:us-west-2:123456789012:target-group:prx-
tg-0123a01b12345c0ab",
        "IsDefault": true,
        "Status": "available",
        "ConnectionPoolConfig": {
            "MaxConnectionsPercent": 80,
            "MaxIdleConnectionsPercent": 10,
            "ConnectionBorrowTimeout": 120,
            "SessionPinningFilters": []
        },
        "CreatedDate": "2023-05-02T18:41:19.495000+00:00",
        "UpdatedDate": "2023-05-02T18:41:21.762000+00:00"
    }
}
```

For more information, see Modifying an RDS Proxy in the *Amazon RDS User Guide* and Modifying an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbProxyTargetGroup in *AWS CLI Command Reference*.

`modify-db-proxy`

The following code example shows how to use `modify-db-proxy`.

AWS CLI

To modify a DB proxy for an RDS database

The following `modify-db-proxy` example modifies a DB proxy named `proxyExample` to require SSL for its connections.

```
aws rds modify-db-proxy \
    --db-proxy-name proxyExample \
    --require-tls
```

Output:

```
{
    "DBProxy": {
        "DBProxyName": "proxyExample",
        "DBProxyArn": "arn:aws:rds:us-west-2:123456789012:db-
proxy:prx-0123a01b12345c0ab",
        "Status": "modifying",
        "EngineFamily": "PostgreSQL",
        "VpcId": "sg-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Auth": [
            {
                "Description": "proxydescription1",
                "AuthScheme": "SECRETS",
                "SecretArn": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:proxysecret1-Abcd1e",
                "IAMAuth": "DISABLED"
            }
```

```
        ],
        "RoleArn": "arn:aws:iam::12345678912:role/ProxyPostgreSQLRole",
        "Endpoint": "proxyExample.proxy-ab0cd1efghij.us-west-2.rds.amazonaws.com",
        "RequireTLS": true,
        "IdleClientTimeout": 1800,
        "DebugLogging": false,
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
        "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
    }
}
```

For more information, see Modify an RDS Proxy in the *Amazon RDS User Guide* and Creating an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbProxy in *AWS CLI Command Reference*.

`modify-db-shard-group`

The following code example shows how to use `modify-db-shard-group`.

AWS CLI

To modify a DB shard group

The following `modify-db-shard-group` example changes the maximum capacity of a DB shard group to 1000 Aurora capacity units (ACUs). To see the new maximum capacity after the change is applied, use the `describe-db-shard-groups` command.

```
aws rds modify-db-shard-group \
    --db-shard-group-identifier my-db-shard-group \
    --max-acu 1000
```

Output:

```
{
    "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
    "DBShardGroupIdentifier": "my-db-shard-group",
    "DBClusterIdentifier": "my-sv2-cluster",
    "MaxACU": 768.0,
    "ComputeRedundancy": 0,
    "Status": "available",
    "PubliclyAccessible": false,
```

```
    "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-west-2.rds.amazonaws.com"
}
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbShardGroup in *AWS CLI Command Reference*.

`modify-db-snapshot-attribute`

The following code example shows how to use `modify-db-snapshot-attribute`.

AWS CLI

Example 1: To enable two AWS accounts to restore a DB snapshot

The following `modify-db-snapshot-attribute` example grants permission to two AWS accounts, with the identifiers 123456789111 and 123456789222, to restore the DB snapshot named `mydbsnapshot`.

```
aws rds modify-db-snapshot-attribute \
    --db-snapshot-identifier mydbsnapshot \
    --attribute-name restore \
    --values-to-add {"123456789111","123456789222"}
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789111",
                    "123456789222"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a Snapshot in the *Amazon RDS User Guide*.

Example 2: To prevent an AWS account from restoring a DB snapshot

The following `modify-db-snapshot-attribute` example removes permission from a particular AWS account to restore the DB snapshot named `mydbsnapshot`. When specifying a single account, the account identifier can't be surrounded by quotations marks or braces.

```
aws rds modify-db-snapshot-attribute \
    --db-snapshot-identifier mydbsnapshot \
    --attribute-name restore \
    --values-to-remove 123456789222
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789111"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a Snapshot in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSnapshotAttribute in *AWS CLI Command Reference*.

`modify-db-snapshot`

The following code example shows how to use `modify-db-snapshot`.

AWS CLI

To modify a DB snapshot

The following `modify-db-snapshot` example upgrades a PostgeSQL 10.6 snapshot named `db5-snapshot-upg-test` to PostgreSQL 11.7. The new DB engine version is shown after the snapshot has finished upgrading and its status is **available**.

```
aws rds modify-db-snapshot \
    --db-snapshot-identifier db5-snapshot-upg-test \
    --engine-version 11.7
```

Output:

```
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "db5-snapshot-upg-test",
        "DBInstanceIdentifier": "database-5",
        "SnapshotCreateTime": "2020-03-27T20:49:17.092Z",
        "Engine": "postgres",
        "AllocatedStorage": 20,
        "Status": "upgrading",
        "Port": 5432,
        "AvailabilityZone": "us-west-2a",
        "VpcId": "vpc-2ff27557",
        "InstanceCreateTime": "2020-03-27T19:59:04.735Z",
        "MasterUsername": "postgres",
        "EngineVersion": "10.6",
        "LicenseModel": "postgresql-license",
        "SnapshotType": "manual",
        "OptionGroupName": "default:postgres-11",
        "PercentProgress": 100,
        "StorageType": "gp2",
        "Encrypted": false,
        "DBSnapshotArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-
upg-test",
        "IAMDatabaseAuthenticationEnabled": false,
        "ProcessorFeatures": [],
        "DbiResourceId": "db-GJMF75LM42IL6BTFRE4UZJ5YM4"
    }
}
```

For more information, see Upgrading a PostgreSQL DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSnapshot in *AWS CLI Command Reference*.

`modify-db-subnet-group`

The following code example shows how to use `modify-db-subnet-group`.

AWS CLI

To modify a DB subnet group

The following `modify-db-subnet-group` example adds a subnet with the ID `subnet-08e41f9e230222222` to the DB subnet group named `mysubnetgroup`. To keep the existing subnets in the subnet group, include their IDs as values in the `--subnet-ids` option. Make sure to have subnets with at least two different Availability Zones in the DB subnet group.

```
aws rds modify-db-subnet-group \
    --db-subnet-group-name mysubnetgroup \
    --subnet-ids
 '["subnet-0a1dc4e1a6f123456","subnet-070dd7ecb3aaaaaaa","subnet-00f5b198bc0abcdef","subnet-
```

Output:

```
{
    "DBSubnetGroup": {
        "DBSubnetGroupName": "mysubnetgroup",
        "DBSubnetGroupDescription": "test DB subnet group",
        "VpcId": "vpc-0f08e7610a1b2c3d4",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-08e41f9e230222222",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-070dd7ecb3aaaaaaa",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-00f5b198bc0abcdef",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                },
                "SubnetStatus": "Active"
```

```
            },
            {
                "SubnetIdentifier": "subnet-0a1dc4e1a6f123456",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            }
        ],
        "DBSubnetGroupArn": "arn:aws:rds:us-
west-2:123456789012:subgrp:mysubnetgroup"
    }
}
```

For more information, see Step 3: Create a DB Subnet Group in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSubnetGroup in *AWS CLI Command Reference*.

`modify-event-subscription`

The following code example shows how to use `modify-event-subscription`.

AWS CLI

To modify an event subscription

The following `modify-event-subscription` example disables the specified event subscription, so that it no longer publishes notifications to the specified Amazon Simple Notification Service topic.

```
aws rds modify-event-subscription \
    --subscription-name my-instance-events \
    --no-enabled
```

Output:

```
{
    "EventSubscription": {
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
```

```
        "CustomerAwsId": "123456789012",
        "SourceType": "db-instance",
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "EventSubscriptionArn": "arn:aws:rds:us-west-2:123456789012:es:my-instance-
events",
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:interesting-events",
        "CustSubscriptionId": "my-instance-events",
        "Status": "modifying",
        "Enabled": false
    }
}
```

For more information, see Modifying an Amazon RDS event notification subscription in the *Amazon RDS User Guide*.

- For API details, see ModifyEventSubscription in *AWS CLI Command Reference*.

`modify-global-cluster`

The following code example shows how to use `modify-global-cluster`.

AWS CLI

To modify a global DB cluster

The following `modify-global-cluster` example enables deletion protection for an Aurora MySQL-compatible global DB cluster.

```
aws rds modify-global-cluster \
    --global-cluster-identifier myglobalcluster \
    --deletion-protection
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
```

```
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": true,
        "GlobalClusterMembers": []
    }
}
```

For more information, see Managing an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see ModifyGlobalCluster in *AWS CLI Command Reference*.

`modify-tenant-database`

The following code example shows how to use `modify-tenant-database`.

AWS CLI

To rename a tenant database

The following `modify-tenant-database` example renames a tenant database in an RDS for Oracle CDB instance.

```
aws rds modify-tenant-database \
    --db-instance-identifier test-rds-oracle \
    --tenant-db-name orcl \
    --new-tenant-db-name tenant2
```

Output:

```
{
    "TenantDatabase": {
        "TenantDatabaseCreateTime": "2026-09-12T16:02:18.011000+00:00",
        "DBInstanceIdentifier": "test-rds-oracle",
        "TenantDBName": "ORCL",
        "Status": "available",
        "MasterUsername": "admin",
        "DbiResourceId": "db-ABCD1234EFGH5678IJKEXAMPLE",
        "TenantDatabaseResourceId": "tdb-
QRST5678UVWX1234YZAB90CDEFGHIJ5678KLMN1234OPQEXAMPLE",
        "TenantDatabaseARN": "arn:aws:rds:us-west-2:123456789012:tenant-
database:tdb-qrst5678uvwx1234yzab90cdefghij5678klmn1234opqexample",
```

```
        "CharacterSetName": "AL32UTF8",
        "NcharCharacterSetName": "AL16UTF16",
        "DeletionProtection": false,
        "PendingModifiedValues": {
            "TenantDBName": "TENANT2"
        },
        "TagList": []
    }
}
```

For more information, see Modifying an RDS for Oracle tenant database in the *Amazon RDS User Guide*.

- For API details, see ModifyTenantDatabase in *AWS CLI Command Reference*.

`promote-read-replica-db-cluster`

The following code example shows how to use `promote-read-replica-db-cluster`.

AWS CLI

To promote a DB cluster read replica

The following `promote-read-replica-db-cluster` example promotes the specified read replica to become a standalone DB cluster.

```
aws rds promote-read-replica-db-cluster \
    --db-cluster-identifier mydbcluster-1
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2c"
        ],
        "BackupRetentionPeriod": 1,
        "DatabaseName": "",
        "DBClusterIdentifier": "mydbcluster-1"
```

```
    }
}
```

For more information, see Promoting a read replica to be a DB cluster in the *Amazon Aurora User Guide*.

- For API details, see PromoteReadReplicaDbCluster in *AWS CLI Command Reference*.

`promote-read-replica`

The following code example shows how to use `promote-read-replica`.

AWS CLI

To promote a read replica

The following `promote-read-replica` example promotes the specified read replica to become a standalone DB instance.

```
aws rds promote-read-replica \
    --db-instance-identifier test-instance-repl
```

Output:

```
{
    "DBInstance": {
        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:test-instance-repl",
        "StorageType": "standard",
        "ReadReplicaSourceDBInstanceIdentifier": "test-instance",
        "DBInstanceStatus": "modifying"
    }
}
```

For more information, see Promoting a read replica to be a standalone DB instance in the *Amazon RDS User Guide*.

- For API details, see PromoteReadReplica in *AWS CLI Command Reference*.

`purchase-reserved-db-instances-offering`

The following code example shows how to use `purchase-reserved-db-instances-offering`.

AWS CLI

To purchase a reserved DB instance

The following `purchase-reserved-db-instances-offering` example buys a reserved MySQL DB instance with the db.t2.micro instance class and a duration of one year. The offering ID is required for purchasing a reserved DB instance, so first use the `describe-reserved-db-instances-offerings` command to find it.

```
aws rds describe-reserved-db-instances-offerings \
    --product-description mysql \
    --db-instance-class db.t2.micro \
    --duration 1
```

Output:

```
{
    "ReservedDBInstancesOfferings": [
        {
            "ReservedDBInstancesOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DBInstanceClass": "db.t2.micro",
            "Duration": 31536000,
            "FixedPrice": 51.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
            "ProductDescription": "mysql",
            "OfferingType": "Partial Upfront",
            "MultiAZ": false,
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.006,
                    "RecurringChargeFrequency": "Hourly"
                }
            ]
        }
    ]
}
```

Then buy the reserved DB instance offering.

```
aws rds purchase-reserved-db-instances-offering \
    --reserved-db-instances-offering-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ReservedDBInstance": {
        "ReservedDBInstanceId": "ri-2020-06-29-16-54-57-670",
        "ReservedDBInstancesOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DBInstanceClass": "db.t2.micro",
        "StartTime": "2020-06-29T16:54:57.670Z",
        "Duration": 31536000,
        "FixedPrice": 51.0,
        "UsagePrice": 0.0,
        "CurrencyCode": "USD",
        "DBInstanceCount": 1,
        "ProductDescription": "mysql",
        "OfferingType": "Partial Upfront",
        "MultiAZ": false,
        "State": "payment-pending",
        "RecurringCharges": [
            {
                "RecurringChargeAmount": 0.006,
                "RecurringChargeFrequency": "Hourly"
            }
        ],
        "ReservedDBInstanceArn": "arn:aws:rds:us-
west-2:123456789012:ri:ri-2020-06-29-16-54-57-670"
    }
}
```

For more information, see Reserved DB Instances for Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see PurchaseReservedDbInstancesOffering in *AWS CLI Command Reference*.

`reboot-db-cluster`

The following code example shows how to use `reboot-db-cluster`.

AWS CLI

To reboot a Multi-AZ DB cluster

The following `reboot-db-cluster` example reboots all the DB instances in the specified Multi-AZ DB cluster. Use this operation only for a non-Aurora Multi-AZ DB cluster.

```
aws rds reboot-db-cluster \
    --db-cluster-identifier test-pg-multiaz-cluster
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 20,
        "AvailabilityZones": [
            "us-west-2b",
            "us-west-2c",
            "us-west-2d"
        ],
        "BackupRetentionPeriod": 7,
        "DBClusterIdentifier": "test-pg-multiaz-cluster",
        "DBClusterParameterGroup": "default.postgres17",
        "DBSubnetGroup": "default",
        "Status": "available",
        "Endpoint": "test-pg-multiaz-cluster.cluster-cnpexample.us-
west-2.rds.amazonaws.com",
        "ReaderEndpoint": "test-pg-multiaz-cluster.cluster-ro-cnpexample.us-
west-2.rds.amazonaws.com",
        "MultiAZ": true,
        "Engine": "postgres",
        "EngineVersion": "17.5"
    }
}
```

For more information, see Rebooting a Multi-AZ DB cluster and reader DB instances for Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see RebootDbCluster in *AWS CLI Command Reference*.

`reboot-db-instance`

The following code example shows how to use `reboot-db-instance`.

AWS CLI

To reboot a DB instance

The following `reboot-db-instance` example starts a reboot of the specified DB instance.

```
aws rds reboot-db-instance \
    --db-instance-identifier test-mysql-instance
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-mysql-instance",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "mysql",
        "DBInstanceStatus": "rebooting",
        "MasterUsername": "admin",
        "Endpoint": {
            "Address": "test-mysql-instance.############.us-
west-2.rds.amazonaws.com",
            "Port": 3306,
            "HostedZoneId": "Z1PVIF0EXAMPLE"
        }
    }
}
```

For more information, see Rebooting a DB Instance in the *Amazon RDS User Guide*.

- For API details, see RebootDBInstance in *AWS CLI Command Reference*.

`reboot-db-shard-group`

The following code example shows how to use `reboot-db-shard-group`.

AWS CLI

To reboot a DB shard group

The following `reboot-db-shard-group` example reboots a DB shard group. To follow the progress of the reboot, use the `describe-db-shard-groups` command.

```
aws rds reboot-db-shard-group \
    --db-shard-group-identifier my-db-shard-group
```

Output:

```
{
```

```
    "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
    "DBShardGroupIdentifier": "my-db-shard-group",
    "DBClusterIdentifier": "my-sv2-cluster",
    "MaxACU": 1000.0,
    "ComputeRedundancy": 0,
    "Status": "available",
    "PubliclyAccessible": false,
    "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-west-2.rds.amazonaws.com"
}
```

For more information, see Rebooting an Amazon Aurora DB cluster or Amazon Aurora DB instance in the *Amazon Aurora User Guide*.

- For API details, see RebootDbShardGroup in *AWS CLI Command Reference*.

`register-db-proxy-targets`

The following code example shows how to use `register-db-proxy-targets`.

AWS CLI

To register a DB proxy with a database

The following `register-db-proxy-targets` example creates the association between a database and a proxy.

```
aws rds register-db-proxy-targets \
    --db-proxy-name proxyExample \
    --db-cluster-identifiers database-5
```

Output:

```
{
    "DBProxyTargets": [
        {
            "RdsResourceId": "database-5",
            "Port": 3306,
            "Type": "TRACKED_CLUSTER",
            "TargetHealth": {
                "State": "REGISTERING"
            }
        },
```

```
        {
            "Endpoint": "database-5instance-1.ab0cd1efghij.us-
west-2.rds.amazonaws.com",
            "RdsResourceId": "database-5",
            "Port": 3306,
            "Type": "RDS_INSTANCE",
            "TargetHealth": {
                "State": "REGISTERING"
            }
        }
    ]
}
```

For more information, see Creating an RDS proxy in the *Amazon RDS User Guide* and Creating an RDS proxy in the *Amazon Aurora User Guide*.

- For API details, see RegisterDbProxyTargets in *AWS CLI Command Reference*.

`remove-from-global-cluster`

The following code example shows how to use `remove-from-global-cluster`.

AWS CLI

To detach an Aurora secondary cluster from an Aurora global database cluster

The following `remove-from-global-cluster` example detaches an Aurora secondary cluster from an Aurora global database cluster. The cluster changes from being read-only to a standalone cluster with read-write capability.

```
aws rds remove-from-global-cluster \
    --region us-west-2 \
    --global-cluster-identifier myglobalcluster \
    --db-cluster-identifier arn:aws:rds:us-west-2:123456789012:cluster:DB-1
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-abc123def456gh",
```

```
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-postgresql",
        "EngineVersion": "10.11",
        "StorageEncrypted": true,
        "DeletionProtection": false,
        "GlobalClusterMembers": [
            {
                "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:js-
global-cluster",
                "Readers": [
                    "arn:aws:rds:us-west-2:123456789012:cluster:DB-1"
                ],
                "IsWriter": true
            },
            {
                "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:DB-1",
                "Readers": [],
                "IsWriter": false,
                "GlobalWriteForwardingStatus": "disabled"
            }
        ]
    }
}
```

For more information, see Removing a cluster from an Amazon Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see RemoveFromGlobalCluster in *AWS CLI Command Reference*.

`remove-option-from-option-group`

The following code example shows how to use `remove-option-from-option-group`.

AWS CLI

To delete an option from an option group

The following `remove-option-from-option-group` example removes the `OEM` option from `myoptiongroup`.

```
aws rds remove-option-from-option-group \
```

```
    --option-group-name myoptiongroup \
    --options OEM \
    --apply-immediately
```

Output:

```
{
    "OptionGroup": {
        "OptionGroupName": "myoptiongroup",
        "OptionGroupDescription": "Test",
        "EngineName": "oracle-ee",
        "MajorEngineVersion": "19",
        "Options": [],
        "AllowsVpcAndNonVpcInstanceMemberships": true,
        "OptionGroupArn": "arn:aws:rds:us-west-2:123456789012:og:myoptiongroup"
    }
}
```

For more information, see Removing an Option from an Option Group in the *Amazon Aurora User Guide*.

- For API details, see RemoveOptionFromOptionGroup in *AWS CLI Command Reference*.

`remove-role-from-db-cluster`

The following code example shows how to use `remove-role-from-db-cluster`.

AWS CLI

To disassociate an AWS Identity and Access Management (IAM) role from a DB cluster

The following `remove-role-from-db-cluster` example removes a role from a DB cluster.

```
aws rds remove-role-from-db-cluster \
    --db-cluster-identifier mydbcluster \
    --role-arn arn:aws:iam::123456789012:role/RDSLoadFromS3
```

This command produces no output.

For more information, see Associating an IAM role with an Amazon Aurora MySQL DB cluster in the *Amazon Aurora User Guide*.

- For API details, see RemoveRoleFromDbCluster in *AWS CLI Command Reference*.

`remove-role-from-db-instance`

The following code example shows how to use `remove-role-from-db-instance`.

AWS CLI

To disassociate an AWS Identity and Access Management (IAM) role from a DB instance

The following `remove-role-from-db-instance` example removes the role named `rds-s3-integration-role` from an Oracle DB instance named `test-instance`.

```
aws rds remove-role-from-db-instance \
    --db-instance-identifier test-instance \
    --feature-name S3_INTEGRATION \
    --role-arn arn:aws:iam::123456789012:role/rds-s3-integration-role
```

This command produces no output.

For more information, see Disabling RDS SQL Server Integration with S3 in the *Amazon RDS User Guide*.

- For API details, see RemoveRoleFromDbInstance in *AWS CLI Command Reference*.

`remove-source-identifier-from-subscription`

The following code example shows how to use `remove-source-identifier-from-subscription`.

AWS CLI

To remove a source identifier from a subscription

The following `remove-source-identifier-from-subscription` example removes the specified source identifier from an existing subscription.

```
aws rds remove-source-identifier-from-subscription \
    --subscription-name my-instance-events \
    --source-identifier test-instance-repl
```

Output:

```
{
    "EventSubscription": {
```

```
        "EventSubscriptionArn": "arn:aws:rds:us-west-2:123456789012:es:my-instance-
events",
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:interesting-events",
        "Status": "modifying",
        "CustSubscriptionId": "my-instance-events",
        "CustomerAwsId": "123456789012",
        "SourceIdsList": [
            "test-instance"
        ],
        "SourceType": "db-instance",
        "Enabled": false
    }
}
```

For more information, see Modifying an Amazon RDS event notification subscription in the *Amazon RDS User Guide*.

- For API details, see RemoveSourceIdentifierFromSubscription in *AWS CLI Command Reference*.

`remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI

To remove tags from a resource

The following `remove-tags-from-resource` example removes tags from a resource.

```
aws rds remove-tags-from-resource \
    --resource-name arn:aws:rds:us-west-2:123456789012:db:mydbinstance \
    --tag-keys Name Environment
```

This command produces no output.

For more information, see Tagging Amazon RDS resources in the *Amazon RDS User Guide* and Tagging Amazon RDS resources in the *Amazon Aurora User Guide*.

- For API details, see RemoveTagsFromResource in *AWS CLI Command Reference*.

`reset-db-cluster-parameter-group`

The following code example shows how to use `reset-db-cluster-parameter-group`.

AWS CLI

Example 1: To reset all parameters to their default values

The following `reset-db-cluster-parameter-group` example resets all parameter values in a customer-created DB cluster parameter group to their default values.

```
aws rds reset-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclpg \
    --reset-all-parameters
```

Output:

```
{
    "DBClusterParameterGroupName": "mydbclpg"
}
```

For more information, see Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

Example 2: To reset specific parameters to their default values

The following `reset-db-cluster-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB cluster parameter group.

```
aws rds reset-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclpgy \
    --
parameters "ParameterName=max_connections,ApplyMethod=immediate" "ParameterName=max_allowed_
```

Output:

```
{
    "DBClusterParameterGroupName": "mydbclpg"
}
```

For more information, see Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

- For API details, see ResetDbClusterParameterGroup in *AWS CLI Command Reference*.

`reset-db-parameter-group`

The following code example shows how to use `reset-db-parameter-group`.

AWS CLI

Example 1: To reset all parameters to their default values

The following `reset-db-parameter-group` example resets all parameter values in a customer-created DB parameter group to their default values.

```
aws rds reset-db-parameter-group \
    --db-parameter-group-name mypg \
    --reset-all-parameters
```

Output:

```
{
    "DBParameterGroupName": "mypg"
}
```

For more information, see Working with DB parameter groups in the *Amazon RDS User Guide* and Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

Example 2: To reset specific parameters to their default values

The following `reset-db-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB parameter group.

```
aws rds reset-db-parameter-group \
    --db-parameter-group-name mypg \
    --
parameters "ParameterName=max_connections,ApplyMethod=immediate" "ParameterName=max_allowed_
```

Output:

```
{
    "DBParameterGroupName": "mypg"
}
```

For more information, see Working with DB parameter groups in the *Amazon RDS User Guide* and Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

- For API details, see ResetDbParameterGroup in *AWS CLI Command Reference*.

`restore-db-cluster-from-s3`

The following code example shows how to use `restore-db-cluster-from-s3`.

AWS CLI

To restore an Amazon Aurora DB cluster from Amazon S3

The following `restore-db-cluster-from-s3` example restores an Amazon Aurora MySQL version 5.7-compatible DB cluster from a MySQL 5.7 DB backup file in Amazon S3.

```
aws rds restore-db-cluster-from-s3 \
    --db-cluster-identifier cluster-s3-restore \
    --engine aurora-mysql \
    --master-username admin \
    --master-user-password mypassword \
    --s3-bucket-name amzn-s3-demo-bucket \
    --s3-prefix test-backup \
    --s3-ingestion-role-arn arn:aws:iam::123456789012:role/service-role/TestBackup \
    --source-engine mysql \
    --source-engine-version 5.7.28
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
            "us-west-2b"
        ],
```

```
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "cluster-s3-restore",
        "DBClusterParameterGroup": "default.aurora-mysql5.7",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "cluster-s3-restore.cluster-co3xyzabc123.us-
west-2.rds.amazonaws.com",

        "CopyTagsToSnapshot": false,
        "CrossAccountClone": false,
        "DomainMemberships": []
    }
}
```

For more information, see Migrating Data from MySQL by Using an Amazon S3 Bucket in the *Amazon Aurora User Guide*.

- For API details, see RestoreDbClusterFromS3 in *AWS CLI Command Reference*.

`restore-db-cluster-from-snapshot`

The following code example shows how to use `restore-db-cluster-from-snapshot`.

AWS CLI

To restore a DB cluster from a snapshot

The following `restore-db-cluster-from-snapshot` example restores an Aurora PostgreSQL DB cluster compatible with PostgreSQL version 10.7 from a DB cluster snapshot named `test-instance-snapshot`.

```
aws rds restore-db-cluster-from-snapshot \
    --db-cluster-identifier newdbcluster \
    --snapshot-identifier test-instance-snapshot \
    --engine aurora-postgresql \
    --engine-version 10.7
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",

    }
}
```

For more information, see Restoring from a DB Cluster Snapshot in the *Amazon Aurora User Guide*.

- For API details, see RestoreDbClusterFromSnapshot in *AWS CLI Command Reference*.

`restore-db-cluster-to-point-in-time`

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

AWS CLI

To restore a DB cluster to a specified time

The following `restore-db-cluster-to-point-in-time` example restores the DB cluster named `database-4` to the latest possible time. Using `copy-on-write` as the restore type restores the new DB cluster as a clone of the source DB cluster.

```
aws rds restore-db-cluster-to-point-in-time \
    --source-db-cluster-identifier database-4 \
    --db-cluster-identifier sample-cluster-clone \
    --restore-type copy-on-write \
    --use-latest-restorable-time
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
            "us-west-2b"
        ],
        "BackupRetentionPeriod": 7,
        "DatabaseName": "",
        "DBClusterIdentifier": "sample-cluster-clone",
        "DBClusterParameterGroup": "default.aurora-postgresql10",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "sample-cluster-clone.cluster-############.us-
west-2.rds.amazonaws.com",
        "ReaderEndpoint": "sample-cluster-clone.cluster-ro-############.us-
west-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-postgresql",
        "EngineVersion": "10.7",
        "Port": 5432,
        "MasterUsername": "postgres",
        "PreferredBackupWindow": "09:33-10:03",
        "PreferredMaintenanceWindow": "sun:12:22-sun:12:52",

        "CrossAccountClone": false
    }
}
```

For more information, see Restoring a DB Cluster to a Specified Time in the *Amazon Aurora User Guide*.

- For API details, see RestoreDbClusterToPointInTime in *AWS CLI Command Reference*.

`restore-db-instance-from-db-snapshot`

The following code example shows how to use `restore-db-instance-from-db-snapshot`.

AWS CLI

To restore a DB instance from a DB snapshot

The following `restore-db-instance-from-db-snapshot` example creates a new DB instance named `db7-new-instance` with the `db.t3.small` DB instance class from the specified DB snapshot. The source DB instance from which the snapshot was taken uses a deprecated DB instance class, so you can't upgrade it.

```
aws rds restore-db-instance-from-db-snapshot \
    --db-instance-identifier db7-new-instance \
    --db-snapshot-identifier db7-test-snapshot \
```

```
    --db-instance-class db.t3.small
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "db7-new-instance",
        "DBInstanceClass": "db.t3.small",
        "Engine": "mysql",
        "DBInstanceStatus": "creating",
        "PreferredMaintenanceWindow": "mon:07:37-mon:08:07",
        "PendingModifiedValues": {},
        "MultiAZ": false,
        "EngineVersion": "5.7.22",
        "AutoMinorVersionUpgrade": true,
        "ReadReplicaDBInstanceIdentifiers": [],
        "LicenseModel": "general-public-license",
        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:db7-new-instance",
        "IAMDatabaseAuthenticationEnabled": false,
        "PerformanceInsightsEnabled": false,
        "DeletionProtection": false,
        "AssociatedRoles": []
    }
}
```

For more information, see Restoring from a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see RestoreDbInstanceFromDbSnapshot in *AWS CLI Command Reference*.

`restore-db-instance-from-s3`

The following code example shows how to use `restore-db-instance-from-s3`.

AWS CLI

To restore a DB instance from a backup in Amazon S3

The following `restore-db-instance-from-s3` example creates a new DB instance named `restored-test-instance` from an existing backup in the `my-backups` S3 bucket.

```
aws rds restore-db-instance-from-s3 \
    --db-instance-identifier restored-test-instance \
```

```
    --allocated-storage 250 \
    --db-instance-class db.m4.large \
    --engine mysql \
    --master-username master \
    --master-user-password secret99 \
    --s3-bucket-name my-backups \
    --s3-ingestion-role-arn arn:aws:iam::123456789012:role/my-role \
    --source-engine mysql \
    --source-engine-version 5.6.27
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "restored-test-instance",
        "DBInstanceClass": "db.m4.large",
        "Engine": "mysql",
        "DBInstanceStatus": "creating",
        "MasterUsername": "master",

        "PerformanceInsightsEnabled": false,
        "DeletionProtection": false,
        "AssociatedRoles": [],
        "TagList": []
    }
}
```

For more information, see Restoring a backup into an Amazon RDS for MySQL DB instance in the *Amazon RDS User Guide*.

For more information, see Restoring a backup into an Amazon RDS for MySQL DB instance in the *Amazon RDS User Guide*.

- For API details, see RestoreDbInstanceFromS3 in *AWS CLI Command Reference*.

`restore-db-instance-to-point-in-time`

The following code example shows how to use `restore-db-instance-to-point-in-time`.

AWS CLI

Example 1: To restore a DB instance to a point in time

The following `restore-db-instance-to-point-in-time` example restores `test-instance` to a new DB instance named `restored-test-instance`, as of the specified time.

```
aws rds restore-db-instance-to-point-in-time \
    --source-db-instance-identifier test-instance \
    --target-db-instance-identifier restored-test-instance \
    --restore-time 2018-07-30T23:45:00.000Z
```

Output:

```
{
    "DBInstance": {
        "AllocatedStorage": 20,
        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:restored-test-
instance",
        "DBInstanceStatus": "creating",
        "DBInstanceIdentifier": "restored-test-instance"
    }
}
```

For more information, see Restoring a DB instance to a specified time in the *Amazon RDS User Guide*.

Example 2: To restore a DB instance to a specified time from a replicated backup

The following `restore-db-instance-to-point-in-time` example restores an Oracle DB instance to the specified time from a replicated automated backup.

```
aws rds restore-db-instance-to-point-in-time \
    --source-db-instance-automated-backups-arn "arn:aws:rds:us-
west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example" \
    --target-db-instance-identifier myorclinstance-from-replicated-backup \
    --restore-time 2020-12-08T18:45:00.000Z
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "myorclinstance-from-replicated-backup",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "oracle-se2",
        "DBInstanceStatus": "creating",
        "MasterUsername": "admin",
        "DBName": "ORCL",
        "AllocatedStorage": 20,
```

```
        "PreferredBackupWindow": "07:45-08:15",
        "BackupRetentionPeriod": 14,
        "DbiResourceId": "db-KGLXG75BGVIWKQT7NQ4EXAMPLE",
        "CACertificateIdentifier": "rds-ca-2019",
        "DomainMemberships": [],
        "CopyTagsToSnapshot": false,
        "MonitoringInterval": 0,
        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:myorclinstance-from-
replicated-backup",
        "IAMDatabaseAuthenticationEnabled": false,
        "PerformanceInsightsEnabled": false,
        "DeletionProtection": false,
        "AssociatedRoles": [],
        "TagList": []
    }
}
```

For more information, see Restoring to a specified time from a replicated backup in the *Amazon RDS User Guide*.

- For API details, see RestoreDbInstanceToPointInTime in *AWS CLI Command Reference*.

`start-activity-stream`

The following code example shows how to use `start-activity-stream`.

AWS CLI

To start a database activity stream

The following `start-activity-stream` example starts an asynchronous activity stream to monitor an Aurora cluster named my-pg-cluster.

```
aws rds start-activity-stream \
    --mode async \
    --kms-key-id arn:aws:kms:us-west-2:1234567890123:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 \
    --resource-arn arn:aws:rds:us-west-2:1234567890123:cluster:my-pg-cluster \
    --apply-immediately
```

Output:

```
{
```

```
    "KmsKeyId": "arn:aws:kms:us-west-2:1234567890123:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "KinesisStreamName": "aws-rds-das-cluster-0ABCDEFGHI1JKLM2NOPQ3R4S",
    "Status": "starting",
    "Mode": "async",
    "ApplyImmediately": true
}
```

For more information, see Starting a database activity stream in the *Amazon Aurora User Guide*.

- For API details, see StartActivityStream in *AWS CLI Command Reference*.

`start-db-cluster`

The following code example shows how to use `start-db-cluster`.

AWS CLI

To start a DB cluster

The following `start-db-cluster` example starts a DB cluster and its DB instances.

```
aws rds start-db-cluster \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2d",
            "us-west-2b"
        ],
        "BackupRetentionPeriod": 1,
        "DatabaseName": "mydb",
        "DBClusterIdentifier": "mydbcluster"
    }
}
```

For more information, see Stopping and starting an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see StartDbCluster in *AWS CLI Command Reference*.

`start-db-instance-automated-backups-replication`

The following code example shows how to use `start-db-instance-automated-backups-replication`.

AWS CLI

To enable cross-Region automated backups

The following `start-db-instance-automated-backups-replication` example replicates automated backups from a DB instance in the US East (N. Virginia) Region to US West (Oregon). The backup retention period is 14 days.

```
aws rds start-db-instance-automated-backups-replication \
    --region us-west-2 \
    --source-db-instance-arn "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db" \
    --backup-retention-period 14
```

Output:

```
{
    "DBInstanceAutomatedBackup": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
        "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
        "Region": "us-east-1",
        "DBInstanceIdentifier": "new-orcl-db",
        "RestoreWindow": {},
        "AllocatedStorage": 20,
        "Status": "pending",
        "Port": 1521,
        "InstanceCreateTime": "2020-12-04T15:28:31Z",
        "MasterUsername": "admin",
        "Engine": "oracle-se2",
        "EngineVersion": "12.1.0.2.v21",
        "LicenseModel": "bring-your-own-license",
        "OptionGroupName": "default:oracle-se2-12-1",
        "Encrypted": false,
        "StorageType": "gp2",
        "IAMDatabaseAuthenticationEnabled": false,
        "BackupRetentionPeriod": 14,
```

```
        "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
    }
}
```

For more information, see Enabling cross-Region automated backups in the *Amazon RDS User Guide*.

- For API details, see StartDbInstanceAutomatedBackupsReplication in *AWS CLI Command Reference*.

`start-db-instance`

The following code example shows how to use `start-db-instance`.

AWS CLI

To start a DB instance

The following `start-db-instance` example starts the specified DB instance.

```
aws rds start-db-instance \
    --db-instance-identifier test-instance
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-instance",
        "DBInstanceStatus": "starting"
    }
}
```

For more information, see Starting an Amazon RDS DB instance that was previously stopped in the *Amazon RDS User Guide*.

- For API details, see StartDbInstance in *AWS CLI Command Reference*.

`start-export-task`

The following code example shows how to use `start-export-task`.

AWS CLI

To export a snapshot to Amazon S3

The following `start-export-task` example exports a DB snapshot named `db5-snapshot-test` to the Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws rds start-export-task \
    --export-task-identifier my-s3-export \
    --source-arn arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-test \
    --s3-bucket-name amzn-s3-demo-bucket \
    --iam-role-arn arn:aws:iam::123456789012:role/service-role/ExportRole \
    --kms-key-id arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ExportTaskIdentifier": "my-s3-export",
    "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-test",
    "SnapshotTime": "2020-03-27T20:48:42.023Z",
    "S3Bucket": "amzn-s3-demo-bucket",
    "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Status": "STARTING",
    "PercentProgress": 0,
    "TotalExtractedDataInGB": 0
}
```

For more information, see Exporting a Snapshot to an Amazon S3 Bucket in the *Amazon RDS User Guide*.

- For API details, see StartExportTask in *AWS CLI Command Reference*.

`stop-activity-stream`

The following code example shows how to use `stop-activity-stream`.

AWS CLI

To stop a database activity stream

The following `stop-activity-stream` example stops an activity stream in an Aurora cluster named my-pg-cluster.

```
aws rds stop-activity-stream \
    --resource-arn arn:aws:rds:us-west-2:1234567890123:cluster:my-pg-cluster \
    --apply-immediately
```

Output:

```
{
    "KmsKeyId": "arn:aws:kms:us-west-2:1234567890123:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "KinesisStreamName": "aws-rds-das-cluster-0ABCDEFGHI1JKLM2NOPQ3R4S",
    "Status": "stopping"
}
```

For more information, see Stopping an activity stream in the *Amazon Aurora User Guide*.

- For API details, see StopActivityStream in *AWS CLI Command Reference*.

`stop-db-cluster`

The following code example shows how to use `stop-db-cluster`.

AWS CLI

To stop a DB cluster

The following `stop-db-cluster` example stops a DB cluster and its DB instances.

```
aws rds stop-db-cluster \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2d",
            "us-west-2b"
```

```
        ],
        "BackupRetentionPeriod": 1,
        "DatabaseName": "mydb",
        "DBClusterIdentifier": "mydbcluster",
        "Status": "stopping"
    }
}
```

For more information, see Stopping and starting an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see StopDbCluster in *AWS CLI Command Reference*.

`stop-db-instance-automated-backups-replication`

The following code example shows how to use `stop-db-instance-automated-backups-replication`.

AWS CLI

To stop replicating automated backups

The following `stop-db-instance-automated-backups-replication` example ends replication of automated backups to the US West (Oregon) Region. Replicated backups are retained according to the set backup retention period.

```
aws rds stop-db-instance-automated-backups-replication \
    --region us-west-2 \
    --source-db-instance-arn "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db"
```

Output:

```
{
    "DBInstanceAutomatedBackup": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
        "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
        "Region": "us-east-1",
        "DBInstanceIdentifier": "new-orcl-db",
        "RestoreWindow": {
            "EarliestTime": "2020-12-04T23:13:21.030Z",
            "LatestTime": "2020-12-07T19:59:57Z"
        },
```

```
        "AllocatedStorage": 20,
        "Status": "replicating",
        "Port": 1521,
        "InstanceCreateTime": "2020-12-04T15:28:31Z",
        "MasterUsername": "admin",
        "Engine": "oracle-se2",
        "EngineVersion": "12.1.0.2.v21",
        "LicenseModel": "bring-your-own-license",
        "OptionGroupName": "default:oracle-se2-12-1",
        "Encrypted": false,
        "StorageType": "gp2",
        "IAMDatabaseAuthenticationEnabled": false,
        "BackupRetentionPeriod": 7,
        "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
    }
}
```

For more information, see Stopping automated backup replication in the *Amazon RDS User Guide*.

- For API details, see StopDbInstanceAutomatedBackupsReplication in *AWS CLI Command Reference*.

`stop-db-instance`

The following code example shows how to use `stop-db-instance`.

AWS CLI

To stop a DB instance

The following `stop-db-instance` example stops the specified DB instance.

```
aws rds stop-db-instance \
    --db-instance-identifier test-instance
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-instance",
        "DBInstanceStatus": "stopping"
```

```
    }
}
```

For more information, see Stopping an Amazon RDS DB instance temporarily in the *Amazon RDS User Guide*.

- For API details, see StopDbInstance in *AWS CLI Command Reference*.

`switchover-blue-green-deployment`

The following code example shows how to use `switchover-blue-green-deployment`.

AWS CLI

Example 1: To switch a blue/green deployment for an RDS DB instance

The following `switchover-blue-green-deployment` example promotes the specified green environment as the new production environment.

```
aws rds switchover-blue-green-deployment \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
    --switchover-timeout 300
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",

        "CreateTime": "2022-02-25T22:33:22.225000+00:00"
    }
}
```

For more information, see Switching a blue/green deployment in the *Amazon RDS User Guide*.

Example 2: To promote a blue/green deployment for an Aurora MySQL DB cluster

The following `switchover-blue-green-deployment` example promotes the specified green environment as the new production environment.

```
aws rds switchover-blue-green-deployment \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
    --switchover-timeout 300
```

Output:

```
{
    "BlueGreenDeployment": {

For more information, see Switching a blue/green deployment in the *Amazon Aurora User Guide*.

- For API details, see SwitchoverBlueGreenDeployment in *AWS CLI Command Reference*.

`switchover-global-cluster`

The following code example shows how to use `switchover-global-cluster`.

AWS CLI

To switch over a global database

The following `switchover-global-cluster` example promotes the specified secondary cluster to be the primary cluster of the global database. Run this command in the Region that hosts the current primary cluster.

```
aws rds switchover-global-cluster \
    --region us-east-1 \
    --global-cluster-identifier global-database \
    --target-db-cluster-identifier arn:aws:rds:us-
east-2:123456789012:cluster:secondary-cluster
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "global-database",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-cluster:global-
database",
        "Status": "switching-over",
        "Engine": "aurora-postgresql",
        "EngineVersion": "17.7",
        "EngineLifecycleSupport": "open-source-rds-extended-support-disabled",
        "StorageEncrypted": true,
        "StorageEncryptionType": "sse-kms",
        "DeletionProtection": false,
        "GlobalClusterMembers": [
            {
                "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:primary-
cluster",
                "Readers": [
```

```
                    "arn:aws:rds:us-east-2:123456789012:cluster:secondary-cluster"
                ],
                "IsWriter": true,
                "SynchronizationStatus": "connected"
            },
            {
                "DBClusterArn": "arn:aws:rds:us-

cluster",
            "ToDbClusterArn": "arn:aws:rds:us-east-2:123456789012:cluster:secondary-
cluster",
            "IsDataLossAllowed": false
        },
        "TagList": []
    }
}
```

For more information, see Using switchover or failover in Amazon Aurora Global Database in the *Amazon Aurora User Guide*.

- For API details, see SwitchoverGlobalCluster in *AWS CLI Command Reference*.

`switchover-read-replica`

The following code example shows how to use `switchover-read-replica`.

AWS CLI

To switch over a read replica

The following `switchover-read-replica` example promotes the specified Oracle read replica to be the new primary database. Specify the identifier of the read replica that you're promoting.

```
aws rds switchover-read-replica \
    --db-instance-identifier rds-oracle-reader
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "rds-oracle-reader",
        "DBInstanceStatus": "available",
        "Engine": "oracle-ee",
        "ReadReplicaSourceDBInstanceIdentifier": "rds-oracle-testdb",
        "ReplicaMode": "open-read-only",
        "StatusInfos": [
            {
                "StatusType": "read replication",
                "Normal": true,
                "Status": "replicating"
            }
        ],
        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:rds-oracle-reader"
    }
}
```

For more information, see Initiating the Oracle Data Guard switchover in the *Amazon RDS User Guide*.

- For API details, see SwitchoverReadReplica in *AWS CLI Command Reference*.

Amazon RDS Data Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Data Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-execute-statement`

The following code example shows how to use `batch-execute-statement`.

AWS CLI

To execute a batch SQL statement

The following `batch-execute-statement` example executes a batch SQL statement over an array of data with a parameter set.

```
aws rds-data batch-execute-statement \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --sql "insert into mytable values (:id, :val)" \
    --parameter-sets "[[{\"name\": \"id\", \"value\": {\"longValue\": 1}},{\"name\":
 \"val\", \"value\": {\"stringValue\": \"ValueOne\"}}],
        [{\"name\": \"id\", \"value\": {\"longValue\": 2}},{\"name\": \"val\",
 \"value\": {\"stringValue\": \"ValueTwo\"}}],
        [{\"name\": \"id\", \"value\": {\"longValue\": 3}},{\"name\": \"val\",
 \"value\": {\"stringValue\": \"ValueThree\"}}]]"
```

This command produces no output.

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see BatchExecuteStatement in *AWS CLI Command Reference*.

`begin-transaction`

The following code example shows how to use `begin-transaction`.

AWS CLI

To start a SQL transaction

The following `begin-transaction` example starts a SQL transaction.

```
aws rds-data begin-transaction \
```

```
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret"
```

Output:

```
{
    "transactionId": "ABC1234567890xyz"
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see BeginTransaction in *AWS CLI Command Reference*.

`commit-transaction`

The following code example shows how to use `commit-transaction`.

AWS CLI

To commit a SQL transaction

The following `commit-transaction` example ends the specified SQL transaction and commits the changes that you made as part of it.

```
aws rds-data commit-transaction \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "transactionStatus": "Transaction Committed"
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see CommitTransaction in *AWS CLI Command Reference*.

execute-statement

The following code example shows how to use `execute-statement`.

AWS CLI

Example 1: To execute a SQL statement that is part of a transaction

The following `execute-statement` example runs a SQL statement that is part of a transaction.

```
aws rds-data execute-statement \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --sql "update mytable set quantity=5 where id=201" \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "numberOfRecordsUpdated": 1
}
```

Example 2: To execute a SQL statement with parameters

The following `execute-statement` example runs a SQL statement with parameters.

```
aws rds-data execute-statement \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --sql "insert into mytable values (:id, :val)" \
    --parameters "[{\"name\": \"id\", \"value\": {\"longValue\": 1}},{\"name\":
 \"val\", \"value\": {\"stringValue\": \"value1\"}}]"
```

Output:

```
{
    "numberOfRecordsUpdated": 1
```

```
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see ExecuteStatement in *AWS CLI Command Reference*.

`rollback-transaction`

The following code example shows how to use `rollback-transaction`.

AWS CLI

To roll back a SQL transaction

The following `rollback-transaction` example rolls back the specified SQL transaction.

```
aws rds-data rollback-transaction \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "transactionStatus": "Rollback Complete"
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see RollbackTransaction in *AWS CLI Command Reference*.

Amazon RDS Performance Insights examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Performance Insights.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`create-performance-analysis-report`

The following code example shows how to use `create-performance-analysis-report`.

AWS CLI

To create a performance analysis report

The following `create-performance-analysis-report` example creates a performance analysis report with the start time `1682969503` and end time `1682979503` for the database `db-abcdefg123456789`.

```
aws pi create-performance-analysis-report \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --start-time 1682969503 \
    --end-time 1682979503
```

Output:

```
{
    "AnalysisReportId": "report-0234d3ed98e28fb17"
}
```

For more information about creating performance analysis reports, see AWS CLI examples for Performance Insights in the *Amazon RDS User Guide* and AWS CLI examples for Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see CreatePerformanceAnalysisReport in *AWS CLI Command Reference*.

`delete-performance-analysis-report`

The following code example shows how to use `delete-performance-analysis-report`.

AWS CLI

To delete a performance analysis report

The following `delete-performance-analysis-report` example deletes the performance analysis report with the report ID `report-0d99cc91c4422ee61`.

```
aws pi delete-performance-analysis-report \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --analysis-report-id report-0d99cc91c4422ee61
```

This command produces no output.

For more information about deleting performance analysis reports, see AWS CLI examples for Performance Insights in the *Amazon RDS User Guide* and AWS CLI examples for Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see DeletePerformanceAnalysisReport in *AWS CLI Command Reference*.

`describe-dimension-keys`

The following code example shows how to use `describe-dimension-keys`.

AWS CLI

Example 1: To describe dimension keys

The following `describe-dimension-keys` example requests the names of all wait events. The data is summarized by event name, and the aggregate values of those events over the specified time period.

```
aws pi describe-dimension-keys \
    --service-type RDS \
    --identifier db-LKCGOBK26374TPTDFXOIWVCPPM \
    --start-time 1527026400 \
    --end-time 1527080400 \
    --metric db.load.avg \
    --group-by '{"Group":"db.wait_event"}'
```

Output:

```
{
    "AlignedEndTime": 1.5270804E9,
    "AlignedStartTime": 1.5270264E9,
    "Keys": [
        {
            "Dimensions": {"db.wait_event.name": "wait/synch/mutex/innodb/
aurora_lock_thread_slot_futex"},
            "Total": 0.05906906851195666
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/aurora_redo_log_flush"},
            "Total": 0.015824722186149193
        },
        {
            "Dimensions": {"db.wait_event.name": "CPU"},
            "Total": 0.008014396230265477
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/
aurora_respond_to_client"},
            "Total": 0.0036361612526204477
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/table/sql/handler"},
            "Total": 0.0019108398419382965
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/synch/cond/mysys/
my_thread_var::suspend"},
            "Total": 8.533847837782684E-4
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/file/csv/data"},
            "Total": 6.864181956477376E-4
        },
        {
            "Dimensions": {"db.wait_event.name": "Unknown"},
            "Total": 3.895887056379051E-4
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/synch/mutex/sql/
FILE_AS_TABLE::LOCK_shim_lists"},
            "Total": 3.710368625122906E-5
```

```
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/lock/table/sql/handler"},
            "Total": 0
        }
    ]
}
```

Example 2: To find the SQL ID for statements contributing the most to DB load

The following `describe-dimension-keys` example requests the SQL statement and SQL ID for the 10 statements that contributed the most to DB load.

```
aws pi describe-dimension-keys \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --start-time 2023-05-01T00:00:00Z \
    --end-time 2023-05-01T01:00:00Z \
    --metric db.load.avg \
    --group-by '{"Group": "db.sql", "Dimensions": ["db.sql.id",
 "db.sql.statement"],"Limit": 10}'
```

Output:

```
{
    "AlignedEndTime": 1.5270804E9,
    "AlignedStartTime": 1.5270264E9,
    "Keys": [
        {
            "Dimensions": {"db.sql.id": "AKIAIOSFODNN7EXAMPLE", "db.sql.statement":
 "SELECT * FROM customers WHERE customer_id = 123"},
            "Total": 25.5,"Partitions": [12.3, 13.2]
        }
    ]
}
```

For more information about dimensions in Performance Insights, see Database load in the *Amazon RDS User Guide* and Database load in the *Amazon Aurora User Guide*.

- For API details, see DescribeDimensionKeys in *AWS CLI Command Reference*.

`get-dimension-key-details`

The following code example shows how to use `get-dimension-key-details`.

AWS CLI

To get details for a specified dimension group for a DB instance

The following `get-dimension-key-details` example retrieves the full text of a SQL statement for DB instance `db-10BCD2EFGHIJ3KL4M5NO6PQRS5`. The `--group` is `db.sql`, and the `--group-identifier` is `db.sql.id`. In this example, `example-sql-id` represents a SQL ID retrieved by using the `get-resource-metrics` or `describe-dimension-keys` operations. In this example, the dimensions details are available. Thus, Performance Insights retrieves the full text of the SQL statement, without truncating it.

```
aws pi get-dimension-key-details \
    --service-type RDS \
    --identifier db-10BCD2EFGHIJ3KL4M5NO6PQRS5 \
    --group db.sql \
    --group-identifier example-sql-id \
    --requested-dimensions statement
```

Output:

```
{
    "Dimensions":[
        {
            "Value": "SELECT e.last_name, d.department_name FROM employees e,
 departments d WHERE e.department_id=d.department_id",
            "Dimension": "db.sql.statement",
            "Status": "AVAILABLE"
        }
    ]
}
```

For more information about dimensions in Performance Insights, see Database load in the *Amazon RDS User Guide* and Database load in the *Amazon Aurora User Guide*.

- For API details, see GetDimensionKeyDetails in *AWS CLI Command Reference*.

`get-performance-analysis-report`

The following code example shows how to use `get-performance-analysis-report`.

AWS CLI

To get a performance analysis report

The following `get-performance-analysis-report` example gets the performance analysis report for the database `db-abcdefg123456789` with the report ID `report-0d99cc91c4422ee61`. The response provides the report status, ID, time details, and insights.

```
aws pi get-performance-analysis-report \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --analysis-report-id report-0d99cc91c4422ee61
```

Output:

```
{
    "AnalysisReport": {
        "Status": "Succeeded",
        "ServiceType": "RDS",
        "Identifier": "db-abcdefg123456789",
        "StartTime": 1680583486.584,
        "AnalysisReportId": "report-0d99cc91c4422ee61",
        "EndTime": 1680587086.584,
        "CreateTime": 1680587087.139,
        "Insights": [
            {
                "InsightId": "insight-12345678901234567",
                "InsightType": "HighDBLoad",
                "Context": "CAUSAL",
                "StartTime": 1680583486.584,
                "EndTime": 1680587086.584,
                "Severity": "HIGH",
                "Description": "A high severity Insight found between 04:44 to
 05:44, where there was an unusually high DB load 600x above baseline. Likely
 performance impact."
            }
        ]
```

```
    }
}
```

For more information about performance analysis reports, see Analyzing database performance for a period of time in the *Amazon RDS User Guide* and Analyzing database performance for a period of time in the *Amazon Aurora User Guide*.

- For API details, see GetPerformanceAnalysisReport in *AWS CLI Command Reference*.

`get-resource-metadata`

The following code example shows how to use `get-resource-metadata`.

AWS CLI

To get resource metadata for a database

The following `get-resource-metadata` example gets the resource metadata for the database `db-abcdefg123456789`. The response shows that SQL digest statistics are enabled.

```
aws pi get-resource-metadata \
    --service-type RDS \
    --identifier db-abcdefg123456789
```

Output:

```
{
    "Identifier": "db-abcdefg123456789",
    "Features":{
        "SQL_DIGEST_STATISTICS":{
            "Status": "ENABLED"
        }
    }
}
```

For more information about SQL statistics for Performance Insights, see SQL statistics for Performance Insights in the *Amazon RDS User Guide* and SQL statistics for Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see GetResourceMetadata in *AWS CLI Command Reference*.

get-resource-metrics

The following code example shows how to use `get-resource-metrics`.

AWS CLI

To get resource metrics

The following `get-resource-metrics` example requests data points for the *db.wait_event* dimension group, and for the *db.wait_event.name* dimension within that group. In the response, the relevant data points are grouped by the requested dimension (*db.wait_event.name*).

```
aws pi get-resource-metrics \
    --service-type RDS \
    --identifier db-LKCGOBK26374TPTDFXOIWVCPPM \
    --start-time 1527026400 \
    --end-time 1527080400 \
    --period-in-seconds 300 \
    --metric-queries db.load.avg \
    --metric-queries file://metric-queries.json
```

The arguments for `--metric-queries` are stored in a JSON file, `metric-queries.json`.

Contents of `metric-queries.json`:

```
[
    {
        "Metric": "db.load.avg",
        "GroupBy": {
            "Group": "db.wait_event"
        }
    }
]
```

Output:

```
{
    "AlignedEndTime": 1.5270804E9,
    "AlignedStartTime": 1.5270264E9,
    "Identifier": "db-LKCGOBK26374TPTDFXOIWVCPPM",
    "MetricList": [
        {
            "Key": {
```

```
                "Metric": "db.load.avg"
            },
            "DataPoints": [
                {
                    "Timestamp": 1527026700.0,
                    "Value": 1.3533333333333333
                },
                {
                    "Timestamp": 1527027000.0,
                    "Value": 0.88
                }
            ]
        },
        {
            "Key": {
                "Metric": "db.load.avg",
                "Dimensions": {
                    "db.wait_event.name": "wait/synch/mutex/innodb/
aurora_lock_thread_slot_futex"
                }
            },
            "DataPoints": [
                {
                    "Timestamp": 1527026700.0,
                    "Value": 0.8566666666666667
                },
                {
                    "Timestamp": 1527027000.0,
                    "Value": 0.8633333333333333
                }
            ]
        }
    ]
}
```

For more information, see Retrieving metrics with the Performance Insights API for Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see GetResourceMetrics in *AWS CLI Command Reference*.

`list-available-resource-dimensions`

The following code example shows how to use `list-available-resource-dimensions`.

AWS CLI

To list the dimensions that can be queried for a metric type on a DB instance

The following `list-available-resource-dimensions` example lists the `db.load` metrics you can query for the database `db-abcdefg123456789`.

```
aws pi list-available-resource-dimensions \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --metrics db.load
```

Output:

```
{
    "MetricDimensions": [
        {
            "Metric": "db.load",
            "Groups": [
                {
                    "Group": "db.user",
                    "Dimensions": [
                        {
                            "Identifier": "db.user.id"
                        },
                        {
                            "Identifier": "db.user.name"
                        }
                    ]
                },
                {
                    "Group": "db.sql_tokenized",
                    "Dimensions": [
                        {
                            "Identifier": "db.sql_tokenized.id"
                        },
                        {
                            "Identifier": "db.sql_tokenized.db_id"
                        },
                        {
                            "Identifier": "db.sql_tokenized.statement"
                        }
                    ]
```

```
                }
            ]
        }
    ]
}
```

For more information about dimensions in Performance Insights, see Database load in the *Amazon RDS User Guide* and Database load in the *Amazon Aurora User Guide*.

- For API details, see ListAvailableResourceDimensions in *AWS CLI Command Reference*.

`list-available-resource-metrics`

The following code example shows how to use `list-available-resource-metrics`.

AWS CLI

To list the metrics that can be queried for a metric type on a DB instance

The following `list-available-resource-metrics` example lists the `db.load` metrics you can query for the database `db-abcdefg123456789`.

```
aws pi list-available-resource-metrics \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --metric-types "os" "db"
```

Output:

```
{
    "Metrics": [
        {
            "Description": "The number of virtual CPUs for the DB instance",
            "Metric": "os.general.numVCPUs",
            "Unit": "vCPUs"
        },
        {
            "Description": "Time spent reading data file blocks by backends in this
 instance",
            "Metric": "db.IO.read_latency",
            "Unit": "Milliseconds per block"
        }
```

```
    ]
}
```

For more information about metrics in Performance Insights, see Database load in the *Amazon RDS User Guide* and Database load in the *Amazon Aurora User Guide*.

- For API details, see ListAvailableResourceMetrics in *AWS CLI Command Reference*.

`list-performance-analysis-reports`

The following code example shows how to use `list-performance-analysis-reports`.

AWS CLI

To list performance analysis reports for a database

The following `list-performance-analysis-reports` example lists performance analysis reports for the database db-abcdefg123456789. The response lists all the reports with the report ID, status, and time period details.

```
aws pi list-performance-analysis-reports \
    --service-type RDS \
    --identifier db-abcdefg123456789
```

Output:

```
{
    "AnalysisReports": [
        {
            "Status": "Succeeded",
            "EndTime": 1680587086.584,
            "CreateTime": 1680587087.139,
            "StartTime": 1680583486.584,
            "AnalysisReportId": "report-0d99cc91c4422ee61"
        },
        {
            "Status": "Succeeded",
            "EndTime": 1681491137.914,
            "CreateTime": 1681491145.973,
            "StartTime": 1681487537.914,
            "AnalysisReportId": "report-002633115cc002233"
        },
```

```
        {
            "Status": "Succeeded",
            "EndTime": 1681493499.849,
            "CreateTime": 1681493507.762,
            "StartTime": 1681489899.849,
            "AnalysisReportId": "report-043b1e006b47246f9"
        },
        {
            "Status": "InProgress",
            "EndTime": 1682979503.0,
            "CreateTime": 1682979618.994,
            "StartTime": 1682969503.0,
            "AnalysisReportId": "report-01ad15f9b88bcbd56"
        }
    ]
}
```

For more information about performance analysis reports, see Analyzing database performance for a period of time in the *Amazon RDS User Guide* and Analyzing database performance for a period of time in the *Amazon Aurora User Guide*.

- For API details, see ListPerformanceAnalysisReports in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a performance analysis report

The following `list-tags-for-resource` example lists tags for a performance analysis report with the report ID `report-0d99cc91c4422ee61`.

```
aws pi list-tags-for-resource \
    --service-type RDS \
    --resource-arn arn:aws:pi:us-west-2:123456789012:perf-reports/RDS/db-
abcdefg123456789/report-0d99cc91c4422ee61
```

Output:

```
{
```

```
    "Tags": [
        {
            "Value": "test-tag",
            "Key": "name"
        }
    ]
}
```

For more information about tagging performance analysis reports, see AWS CLI examples for Performance Insights in the *Amazon RDS User Guide* and AWS CLI examples for Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a performance analysis report

The following `tag-resource` example adds the tag key `name` with the tag value `test-tag` to a performance analysis report with the report ID `report-0d99cc91c4422ee61`.

```
aws pi tag-resource \
    --service-type RDS \
    --resource-arn arn:aws:pi:us-west-2:123456789012:perf-reports/RDS/db-abcdefg123456789/report-0d99cc91c4422ee61 \
    --tags Key=name,Value=test-tag
```

This command produces no output.

For more information about tagging performance analysis reports, see AWS CLI examples for Performance Insights in the *Amazon RDS User Guide* and AWS CLI examples for Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To delete a tag for a performance analysis report

The following `untag-resource` example deletes the tag `name` for a performance analysis report with the report ID `report-0d99cc91c4422ee61`.

```
aws pi untag-resource \
    --service-type RDS \
    --resource-arn arn:aws:pi:us-west-2:123456789012:perf-reports/RDS/db-abcdefg123456789/report-0d99cc91c4422ee61 \
    --tag-keys name
```

This command produces no output.

For more information about tagging performance analysis reports, see AWS CLI examples for Performance Insights in the *Amazon RDS User Guide* and AWS CLI examples for Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Amazon Redshift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Redshift.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-reserved-node-exchange`

The following code example shows how to use `accept-reserved-node-exchange`.

AWS CLI

To accept reserved node exchange

The following `accept-reserved-node-exchange` example accepts exchange of a DC1 reserved node for a DC2 reserved node.

```
aws redshift accept-reserved-node-exchange \
    --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE \
    --target-reserved-node-offering-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:

```
{
    "ExchangedReservedNode": {
        "ReservedNodeId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
        "ReservedNodeOfferingId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
        "NodeType": "dc2.large",
        "StartTime": "2019-12-06T21:17:26Z",
        "Duration": 31536000,
        "FixedPrice": 0.0,
        "UsagePrice": 0.0,
        "CurrencyCode": "USD",
        "NodeCount": 1,
        "State": "exchanging",
        "OfferingType": "All Upfront",
        "RecurringCharges": [
            {
                "RecurringChargeAmount": 0.0,
                "RecurringChargeFrequency": "Hourly"
            }
        ],
        "ReservedNodeOfferingType": "Regular"
    }
}
```

For more information, see Upgrading Reserved Nodes With the AWS CLI in the *Amazon Redshift Cluster Management Guide*.

- For API details, see AcceptReservedNodeExchange in *AWS CLI Command Reference*.

`authorize-cluster-security-group-ingress`

The following code example shows how to use `authorize-cluster-security-group-ingress`.

AWS CLI

Example 1: To authorize access to an EC2 security group

The following `authorize-cluster-security-group-ingress` example authorizes access to a named Amazon EC2 security group.

```
aws redshift authorize-cluster-security-group-ingress \
    --cluster-security-group-name mysecuritygroup \
    --ec2-security-group-name myec2securitygroup \
    --ec2-security-group-owner-id 123456789012
```

Output:

```
{
    "ClusterSecurityGroup": {
        "ClusterSecurityGroupName": "mysecuritygroup",
        "Description": "This is my cluster security group",
        "EC2SecurityGroups": [
            {
                "Status": "authorizing",
                "EC2SecurityGroupName": "myec2securitygroup",
                "EC2SecurityGroupOwnerId": "123456789012",
                "Tags": []
            }
        ],
        "IPRanges": [],
        "Tags": []
    }
}
```

For more information, see Infrastructure security in Amazon Redshift in the *Amazon Redshift Management Guide*.

Example 2: To authorize access to a CIDR range

The following `authorize-cluster-security-group-ingress` example authorizes access to a CIDR range.

```
aws redshift authorize-cluster-security-group-ingress \
    --cluster-security-group-name mysecuritygroup \
    --cidrip 192.168.100.100/32
```

Output:

```
{
    "ClusterSecurityGroup": {
        "ClusterSecurityGroupName": "mysecuritygroup",
        "Description": "This is my cluster security group",
        "EC2SecurityGroups": [],
        "IPRanges": [
            {
                "Status": "authorizing",
                "CIDRIP": "192.168.100.100/32",
                "Tags": []
            }
        ],
        "Tags": []
    }
}
```

For more information, see Infrastructure security in Amazon Redshift in the *Amazon Redshift Management Guide*.

- For API details, see AuthorizeClusterSecurityGroupIngress in *AWS CLI Command Reference*.

`authorize-snapshot-access`

The following code example shows how to use `authorize-snapshot-access`.

AWS CLI

To authorize an AWS account to restore a snapshot

The following `authorize-snapshot-access` example authorizes the AWS account 123456789111 to restore the snapshot `my-snapshot-id`. By default, the output is in JSON format.

```
aws redshift authorize-snapshot-access \
    --snapshot-identifier my-snapshot-id \
```

```
    --account-with-restore-access 123456789111
```

Output:

```
{
    "Snapshot": {
        "Status": "available",
        "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
        "EstimatedSecondsToCompletion": 0,
        "AvailabilityZone": "us-west-2a",
        "ClusterVersion": "1.0",
        "MasterUsername": "adminuser",
        "Encrypted": false,
        "OwnerAccount": "123456789012",
        "BackupProgressInMegaBytes": 11.0,
        "ElapsedTimeInSeconds": 0,
        "DBName": "dev",
        "CurrentBackupRateInMegaBytesPerSecond": 0.1534,
        "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
        "ActualIncrementalBackupSizeInMegaBytes": 11.0,
        "SnapshotType": "manual",
        "NodeType": "dw.hs1.xlarge",
        "ClusterIdentifier": "mycluster",
        "TotalBackupSizeInMegaBytes": 20.0,
        "Port": 5439,
        "NumberOfNodes": 2,
        "SnapshotIdentifier": "my-snapshot-id"
    }
}
```

For more information, see Sharing a snapshot in the *Amazon Redshift Management Guide*.

- For API details, see AuthorizeSnapshotAccess in *AWS CLI Command Reference*.

`batch-delete-cluster-snapshots`

The following code example shows how to use `batch-delete-cluster-snapshots`.

AWS CLI

To delete a set of cluster snapshots

The following `batch-delete-cluster-snapshots` example deletes a set of manual cluster snapshots.

```
aws redshift batch-delete-cluster-snapshots \
    --
identifiers SnapshotIdentifier=mycluster-2019-11-06-14-12 SnapshotIdentifier=mycluster-2019-
```

Output:

```
{
    "Resources": [
        "mycluster-2019-11-06-14-12",
        "mycluster-2019-11-06-14-20"
    ]
}
```

For more information, see Amazon Redshift Snapshots in the *Amazon Redshift Cluster Management Guide*.

- For API details, see BatchDeleteClusterSnapshots in *AWS CLI Command Reference*.

`batch-modify-cluster-snapshots`

The following code example shows how to use `batch-modify-cluster-snapshots`.

AWS CLI

To modify a set of cluster snapshots

The following `batch-modify-cluster-snapshots` example modifies the settings for a set of cluster snapshots.

```
aws redshift batch-modify-cluster-snapshots \
    --snapshot-identifier-list mycluster-2019-11-06-16-31 mycluster-2019-11-06-16-32
 \
    --manual-snapshot-retention-period 30
```

Output:

```
{
    "Resources": [
```

```
        "mycluster-2019-11-06-16-31",
        "mycluster-2019-11-06-16-32"
    ],
    "Errors": []
}
```

For more information, see Amazon Redshift Snapshots in the *Amazon Redshift Cluster Management Guide*.

- For API details, see BatchModifyClusterSnapshots in *AWS CLI Command Reference*.

`cancel-resize`

The following code example shows how to use `cancel-resize`.

AWS CLI

To cancel resize of a cluster

The following `cancel-resize` example cancels a classic resize operation for a cluster.

```
aws redshift cancel-resize \
    --cluster-identifier mycluster
```

Output:

```
{
    "TargetNodeType": "dc2.large",
    "TargetNumberOfNodes": 2,
    "TargetClusterType": "multi-node",
    "Status": "CANCELLING",
    "ResizeType": "ClassicResize",
    "TargetEncryptionType": "NONE"
}
```

For more information, see Resizing a cluster in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CancelResize in *AWS CLI Command Reference*.

`copy-cluster-snapshot`

The following code example shows how to use `copy-cluster-snapshot`.

AWS CLI

To copy a cluster snapshot

The following `copy-cluster-snapshot` example creates a copy of the automated snapshot `cm:examplecluster-2013-01-22-19-27-58` named `my-saved-snapshot-copy`. By default, the output is in JSON format.

```
aws redshift copy-cluster-snapshot \
    --source-snapshot-identifier cm:examplecluster-2013-01-22-19-27-58 \
    --target-snapshot-identifier my-saved-snapshot-copy
```

Output:

```
{
    "Snapshot": {
        "Status": "available",
        "SnapshotCreateTime": "2013-01-22T19:27:58.931Z",
        "AvailabilityZone": "us-west-2c",
        "ClusterVersion": "1.0",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "ClusterCreateTime": "2013-01-22T19:23:59.368Z",
        "SnapshotType": "manual",
        "NodeType": "dw.hs1.xlarge",
        "ClusterIdentifier": "examplecluster",
        "Port": 5439,
        "NumberOfNodes": 2,
        "SnapshotIdentifier": "my-saved-snapshot-copy"
    }
}
```

For more information, see Copying an automated snapshot in the *Amazon Redshift Management Guide*.

- For API details, see CopyClusterSnapshot in *AWS CLI Command Reference*.

`create-cluster-parameter-group`

The following code example shows how to use `create-cluster-parameter-group`.

AWS CLI

To create a cluster parameter group

The following `create-cluster-parameter-group` example creates a new cluster parameter group.

```
aws redshift create-cluster-parameter-group \
    --parameter-group-name myclusterparametergroup \
    --parameter-group-family redshift-1.0 \
    --description "My first cluster parameter group"
```

Output:

```
{
    "ClusterParameterGroup": {
        "ParameterGroupFamily": "redshift-1.0",
        "Description": "My first cluster parameter group",
        "ParameterGroupName": "myclusterparametergroup"
    }
}
```

For more information, see Amazon Redshift parameter groups in the *Amazon Redshift Management Guide*.

- For API details, see CreateClusterParameterGroup in *AWS CLI Command Reference*.

`create-cluster-security-group`

The following code example shows how to use `create-cluster-security-group`.

AWS CLI

To create a cluster security group

The following `create-cluster-security-group` example creates a new cluster security group. By default, the output is in JSON format.

```
aws redshift create-cluster-security-group \
    --cluster-security-group-name mysecuritygroup \
    --description "This is my cluster security group"
```

Output:

```
{
    "ClusterSecurityGroup": {
        "ClusterSecurityGroupName": "mysecuritygroup",
        "Description": "This is my cluster security group",
        "EC2SecurityGroups": [],
        "IPRanges": [],
        "Tags": []
    }
}
```

You can also obtain the same information in text format using the `--output text` option.

```
aws redshift create-cluster-security-group \
    --cluster-security-group-name mysecuritygroup \
    --description "This is my cluster security group" \
    --output text
```

Output:

```
This is my cluster security group   123456789012    mysecuritygroup
```

For more information, see Infrastructure security in Amazon Redshift in the *Amazon Redshift Management Guide*.

- For API details, see CreateClusterSecurityGroup in *AWS CLI Command Reference*.

`create-cluster-snapshot`

The following code example shows how to use `create-cluster-snapshot`.

AWS CLI

To create a cluster snapshot

The following `create-cluster-snapshot` example creates a new cluster snapshot. By default, the output is in JSON format.

```
aws redshift create-cluster-snapshot \
```

```
    --cluster-identifier mycluster \
    --snapshot-identifier my-snapshot-id
```

Output:

```
{
    "Snapshot": {
        "Status": "creating",
        "SnapshotCreateTime": "2013-01-22T22:20:33.548Z",
        "AvailabilityZone": "us-west-2a",
        "ClusterVersion": "1.0",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
        "SnapshotType": "manual",
        "NodeType": "dw.hs1.xlarge",
        "ClusterIdentifier": "mycluster",
        "Port": 5439,
        "NumberOfNodes": 2,
        "SnapshotIdentifier": "my-snapshot-id"
    }
}
```

For more information, see Creating a manual snapshot in the *Amazon Redshift Management Guide*.

- For API details, see CreateClusterSnapshot in *AWS CLI Command Reference*.

`create-cluster-subnet-group`

The following code example shows how to use `create-cluster-subnet-group`.

AWS CLI

To create a cluster subnet group

The following `create-cluster-subnet-group` example creates a new cluster subnet group.

```
aws redshift create-cluster-subnet-group \
    --cluster-subnet-group-name mysubnetgroup \
    --description "My subnet group" \
    --subnet-ids subnet-763fdd1c
```

Output:

```
{
    "ClusterSubnetGroup": {
        "Subnets": [
            {
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-763fdd1c",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                }
            } ],
        "VpcId": "vpc-7e3fdd14",
        "SubnetGroupStatus": "Complete",
        "Description": "My subnet group",
        "ClusterSubnetGroupName": "mysubnetgroup"
    }
}
```

For more information, see Subnets for Redshift resources in the *Amazon Redshift Management Guide*.

- For API details, see CreateClusterSubnetGroup in *AWS CLI Command Reference*.

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

To create a cluster with minimal parameters

The following `create-cluster` example creates a cluster with the minimal set of parameters. By default, the output is in JSON format.

```
aws redshift create-cluster \
    --node-type dw.hs1.xlarge \
    --number-of-nodes 2 \
    --master-username adminuser \
    --master-user-password TopSecret1 \
    --cluster-identifier mycluster
```

Output:

```
{
    "Cluster": {
        "NodeType": "dw.hs1.xlarge",
        "ClusterVersion": "1.0",
        "PubliclyAccessible": true,
        "MasterUsername": "adminuser",
        "ClusterParameterGroups": [
            {
                "ParameterApplyStatus": "in-sync",
                "ParameterGroupName": "default.redshift-1.0"
        } ],
        "ClusterSecurityGroups": [
            {
                "Status": "active",
                "ClusterSecurityGroupName": "default"
        } ],
        "AllowVersionUpgrade": true,
        "VpcSecurityGroups": [],
        "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
        "AutomatedSnapshotRetentionPeriod": 1,
        "ClusterStatus": "creating",
        "ClusterIdentifier": "mycluster",
        "DBName": "dev",
        "NumberOfNodes": 2,
        "PendingModifiedValues": {
            "MasterUserPassword": "****"
        }
    }
}
```

For more information, see Creating a cluster in the *Amazon Redshift Management Guide*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

`create-event-subscription`

The following code example shows how to use `create-event-subscription`.

AWS CLI

To create a notification subscription for an event

The following `create-event-subscription` example creates an event notification subscription.

```
aws redshift create-event-subscription \
    --subscription-name mysubscription \
    --sns-topic-arn arn:aws:sns:us-west-2:123456789012:MySNStopic \
    --source-type cluster \
    --source-ids mycluster
```

Output:

```
{
        "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "mysubscription",
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNStopic",
        "Status": "active",
        "SubscriptionCreationTime": "2019-12-09T20:05:19.365Z",
        "SourceType": "cluster",
        "SourceIdsList": [
            "mycluster"
        ],
        "EventCategoriesList": [],
        "Severity": "INFO",
        "Enabled": true,
        "Tags": []
    }
}
```

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateEventSubscription in *AWS CLI Command Reference*.

`create-hsm-client-certificate`

The following code example shows how to use `create-hsm-client-certificate`.

AWS CLI

To create an HSM client certificate

The following `create-hsm-client-certificate` example generates an HSM client certificate that a cluster can use to connect to an HSM.

```
aws redshift create-hsm-client-certificate \
    --hsm-client-certificate-identifier myhsmclientcert
```

Output:

```
{
    "HsmClientCertificate": {
        "HsmClientCertificateIdentifier": "myhsmclientcert",
        "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----
\nMIICiEXAMPLECQD6m7oRw0uXOjANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMC

        "Tags": []
    }
}
```

For more information, see Amazon Redshift API Permissions Reference in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateHsmClientCertificate in *AWS CLI Command Reference*.

`create-hsm-configuration`

The following code example shows how to use `create-hsm-configuration`.

AWS CLI

To create an HSM configuration

The following `create-hsm-configuration` example creates the specified HSM configuration that contains information required by a cluster to store and use database encryption keys in a hardware security module (HSM).

```
aws redshift create-hsm-configuration \
    --hsm-configuration-identifier myhsmconnection \
    --description "My HSM connection" \
    --hsm-ip-address 192.0.2.09 \
    --hsm-partition-name myhsmpartition \
    --hsm-partition-password A1b2c3d4 \
    --hsm-server-public-certificate myhsmclientcert
```

Output:

```
{
    "HsmConfiguration": {
        "HsmConfigurationIdentifier": "myhsmconnection",
        "Description": "My HSM connection",
        "HsmIpAddress": "192.0.2.09",
        "HsmPartitionName": "myhsmpartition",
        "Tags": []
    }
}
```

For more information, see Amazon Redshift database encryption in the *Amazon Redshift Management Guide*.

- For API details, see CreateHsmConfiguration in *AWS CLI Command Reference*.

`create-snapshot-copy-grant`

The following code example shows how to use `create-snapshot-copy-grant`.

AWS CLI

To create a snapshot copy grant

The following `create-snapshot-copy-grant` example creates a snapshot copy grant and encrypts copied snapshots in a destination AWS Region.

```
aws redshift create-snapshot-copy-grant \
```

```
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```
{
    "SnapshotCopyGrant": {
        "SnapshotCopyGrantName": "mysnapshotcopygrantname",
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
bPxRfih3yCo8nvbEXAMPLEKEY",
        "Tags": []
    }
}
```

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateSnapshotCopyGrant in *AWS CLI Command Reference*.

`create-snapshot-schedule`

The following code example shows how to use `create-snapshot-schedule`.

AWS CLI

To create snapshot schedule

The following `create-snapshot-schedule` example creates a snapshot schedule with the specified description and a rate of every 12 hours.

```
aws redshift create-snapshot-schedule \
    --schedule-definitions "rate(12 hours)" \
    --schedule-identifier mysnapshotschedule \
    --schedule-description "My schedule description"
```

Output:

```
{
    "ScheduleDefinitions": [
        "rate(12 hours)"
    ],
    "ScheduleIdentifier": "mysnapshotschedule",
    "ScheduleDescription": "My schedule description",
```

```
    "Tags": []
}
```

For more information, see Automated Snapshot Schedules in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateSnapshotSchedule in *AWS CLI Command Reference*.

`create-tags`

The following code example shows how to use `create-tags`.

AWS CLI

To create tags for a cluster

The following `create-tags` example adds the specified tag key/value pair to the specified cluster.

```
aws redshift create-tags \
    --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
    --tags "Key"="mytags","Value"="tag1"
```

This command produces no output.

For more information, see Tagging Resources in Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateTags in *AWS CLI Command Reference*.

`delete-cluster-parameter-group`

The following code example shows how to use `delete-cluster-parameter-group`.

AWS CLI

To delete a cluster parameter group

The following `delete-cluster-parameter-group` example deletes a cluster parameter group.

```
aws redshift delete-cluster-parameter-group \
```

```
    --parameter-group-name myclusterparametergroup
```

This command produces no output.

For more information, see Amazon Redshift parameter groups in the *Amazon Redshift Management Guide*.

- For API details, see DeleteClusterParameterGroup in *AWS CLI Command Reference*.

`delete-cluster-security-group`

The following code example shows how to use `delete-cluster-security-group`.

AWS CLI

To delete a cluster security group

The following `delete-cluster-security-group` example deletes a cluster security group.

```
aws redshift delete-cluster-security-group \
    --cluster-security-group-name mysecuritygroup
```

This command produces no output.

For more information, see Infrastructure security in Amazon Redshift in the *Amazon Redshift Management Guide*.

- For API details, see DeleteClusterSecurityGroup in *AWS CLI Command Reference*.

`delete-cluster-snapshot`

The following code example shows how to use `delete-cluster-snapshot`.

AWS CLI

To delete a cluster snapshot

The following `delete-cluster-snapshot` example deletes a cluster snapshot.

```
aws redshift delete-cluster-snapshot \
    --snapshot-identifier my-snapshot-id
```

Output:

```
{
    "Snapshot": {
        "SnapshotIdentifier": "my-snapshot-id",
        "ClusterIdentifier": "mycluster",
        "SnapshotCreateTime": "2013-01-22T22:20:33.548Z",
        "Status": "deleted",
        "Port": 5439,
        "AvailabilityZone": "us-west-2a",
        "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
        "MasterUsername": "adminuser",
        "ClusterVersion": "1.0",
        "SnapshotType": "manual",
        "NodeType": "dc2.large",
        "NumberOfNodes": 2,
        "DBName": "dev",
        "Encrypted": false,
        "EncryptedWithHSM": false,
        "OwnerAccount": "123456789012",
        "TotalBackupSizeInMegaBytes": 20.0,
        "ActualIncrementalBackupSizeInMegaBytes": 20.0,
        "BackupProgressInMegaBytes": 20.0,
        "CurrentBackupRateInMegaBytesPerSecond": 0.0,
        "EstimatedSecondsToCompletion": -1,
        "ElapsedTimeInSeconds": 0,
        "Tags": [],
        "EnhancedVpcRouting": false,
        "MaintenanceTrackName": "current",
        "ManualSnapshotRetentionPeriod": -1
    }
}
```

For more information, see Deleting a manual snapshot in the *Amazon Redshift Management Guide*.

- For API details, see DeleteClusterSnapshot in *AWS CLI Command Reference*.

`delete-cluster-subnet-group`

The following code example shows how to use `delete-cluster-subnet-group`.

AWS CLI

To delete a cluster subnet group

The following `delete-cluster-subnet-group` example deletes a cluster subnet group.

```
aws redshift delete-cluster-subnet-group \
    --cluster-subnet-group-name mysubnetgroup
```

This command produces no output.

For more information, see Subnets for Redshift resources in the *Amazon Redshift Management Guide*.

- For API details, see DeleteClusterSubnetGroup in *AWS CLI Command Reference*.

`delete-cluster`

The following code example shows how to use `delete-cluster`.

AWS CLI

Example 1: To delete a cluster with no final cluster snapshot

The following `delete-cluster` example deletes a cluster, forcing data deletion so no final cluster snapshot is created.

```
aws redshift delete-cluster \
    --cluster-identifier mycluster \
    --skip-final-cluster-snapshot
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "deleting",
        "ClusterAvailabilityStatus": "Modifying",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.c1a2b3c4d5e6.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-23T21:42:51.430Z",
        "AutomatedSnapshotRetentionPeriod": 1,
```

```
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-0a1b2c3d4e5f6a7b8",
                "Status": "active"
            }
        ],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "ClusterSubnetGroupName": "default",
        "VpcId": "vpc-0a1b2c3d4e5f6a7b8",
        "AvailabilityZone": "us-west-2a",
        "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
        "PendingModifiedValues": {},
        "ClusterVersion": "1.0",
        "AllowVersionUpgrade": true,
        "NumberOfNodes": 2,
        "PubliclyAccessible": false,
        "Encrypted": false,
        "Tags": [],
        "EnhancedVpcRouting": false,

        "MaintenanceTrackName": "current",
        "DeferredMaintenanceWindows": [],
        "NextMaintenanceWindowStartTime": "2019-12-28T03:30:00Z"
    }
}
```

For more information, see Shutting down and deleting a cluster in the *Amazon Redshift Management Guide*.

Example 2: To delete a cluster, allowing a final cluster snapshot

The following `delete-cluster` example deletes a cluster, but specifies a final cluster snapshot.

```
aws redshift delete-cluster \
    --cluster-identifier mycluster \
```

```
    --final-cluster-snapshot-identifier myfinalsnapshot
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "deleting",
        "ClusterAvailabilityStatus": "Modifying",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.c1a2b3c4d5e6.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-23T21:42:51.430Z",
        "AutomatedSnapshotRetentionPeriod": 1,
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-0a1b2c3d4e5f6a7b8",
                "Status": "active"
            }
        ],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "ClusterSubnetGroupName": "default",
        "VpcId": "vpc-0a1b2c3d4e5f6a7b8",
        "AvailabilityZone": "us-west-2a",
        "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
        "PendingModifiedValues": {},
        "ClusterVersion": "1.0",
        "AllowVersionUpgrade": true,
        "NumberOfNodes": 2,
        "PubliclyAccessible": false,
        "Encrypted": false,
        "Tags": [],
```

```
        "EnhancedVpcRouting": false,
        "IamRoles": [],
        "MaintenanceTrackName": "current",
        "DeferredMaintenanceWindows": [],
        "NextMaintenanceWindowStartTime": "2019-12-28T03:30:00Z"
    }
}
```

For more information, see Shutting down and deleting a cluster in the *Amazon Redshift Management Guide*.

- For API details, see DeleteCluster in *AWS CLI Command Reference*.

`delete-event-subscription`

The following code example shows how to use `delete-event-subscription`.

AWS CLI

To delete event subscription

The following `delete-event-subscription` example deletes the specified event notification subscription.

```
aws redshift delete-event-subscription \
    --subscription-name mysubscription
```

This command produces no output.

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteEventSubscription in *AWS CLI Command Reference*.

`delete-hsm-client-certificate`

The following code example shows how to use `delete-hsm-client-certificate`.

AWS CLI

To delete HSM client certificate

The following `delete-hsm-client-certificate` example deletes an HSM client certificate.

```
aws redshift delete-hsm-client-certificate \
    --hsm-client-certificate-identifier myhsmclientcert
```

This command produces no output.

For more information, see Amazon Redshift API Permissions Reference in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteHsmClientCertificate in *AWS CLI Command Reference*.

`delete-hsm-configuration`

The following code example shows how to use `delete-hsm-configuration`.

AWS CLI

To delete an HSM configuration

The following `delete-hsm-configuration` example deletes the specified HSM configuration from the current AWS account.

```
aws redshift delete-hsm-configuration \
    --hsm-configuration-identifier myhsmconnection
```

This command produces no output.

For more information, see Amazon Redshift database encryption in the *Amazon Redshift Management Guide*.

- For API details, see DeleteHsmConfiguration in *AWS CLI Command Reference*.

`delete-scheduled-action`

The following code example shows how to use `delete-scheduled-action`.

AWS CLI

To delete scheduled action

The following `delete-scheduled-action` example deletes the specified scheduled action.

```
aws redshift delete-scheduled-action \
```

```
    --scheduled-action-name myscheduledaction
```

This command produces no output.

For more information, see Scheduling a resize in the *Amazon Redshift Management Guide*.

- For API details, see DeleteScheduledAction in *AWS CLI Command Reference*.

`delete-snapshot-copy-grant`

The following code example shows how to use `delete-snapshot-copy-grant`.

AWS CLI

To delete snapshot copy grant

The following `delete-snapshot-copy-grant` example deletes the specified snapshot copy grant.

```
aws redshift delete-snapshot-copy-grant \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

This command produces no output.

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteSnapshotCopyGrant in *AWS CLI Command Reference*.

`delete-snapshot-schedule`

The following code example shows how to use `delete-snapshot-schedule`.

AWS CLI

To delete snapshot schedule

The following `delete-snapshot-schedule` example deletes the specified snapshot schedule. You must disassociate clusters before deleting the schedule.

```
aws redshift delete-snapshot-schedule \
    --schedule-identifier mysnapshotschedule
```

This command produces no output.

For more information, see Automated Snapshot Schedules in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteSnapshotSchedule in *AWS CLI Command Reference*.

`delete-tags`

The following code example shows how to use `delete-tags`.

AWS CLI

To delete tags from a cluster

The following `delete-tags` example deletes the tags with the specified key names from the specified cluster.

```
aws redshift delete-tags \
    --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
    --tag-keys "clustertagkey" "clustertagvalue"
```

This command produces no output.

For more information, see Tagging Resources in Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteTags in *AWS CLI Command Reference*.

`describe-account-attributes`

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe attributes of an AWS account

The following `describe-account-attributes` example displays the attributes attached to the calling AWS account.

```
aws redshift describe-account-attributes
```

Output:

```
{
    "AccountAttributes": [
        {
            "AttributeName": "max-defer-maintenance-duration",
            "AttributeValues": [
                {
                    "AttributeValue": "45"
                }
            ]
        }
    ]
}
```

For more information, see Considerations for using Amazon Redshift provisioned clusters in the *Amazon Redshift Management Guide*.

- For API details, see DescribeAccountAttributes in *AWS CLI Command Reference*.

`describe-cluster-db-revisions`

The following code example shows how to use `describe-cluster-db-revisions`.

AWS CLI

To describe DB revisions for a cluster

The following `describe-cluster-db-revisions` example displays the details of an array of `ClusterDbRevision` objects for the specified cluster.

```
aws redshift describe-cluster-db-revisions \
    --cluster-identifier mycluster
```

Output:

```
{
    "ClusterDbRevisions": [
        {
            "ClusterIdentifier": "mycluster",
            "CurrentDatabaseRevision": "11420",
            "DatabaseRevisionReleaseDate": "2019-11-22T16:43:49.597Z",
```

```
            "RevisionTargets": []
        }
    ]
}
```

For more information, see Cluster versions for Amazon Redshift in the *Amazon Redshift Management Guide*.

- For API details, see DescribeClusterDbRevisions in *AWS CLI Command Reference*.

`describe-cluster-parameter-groups`

The following code example shows how to use `describe-cluster-parameter-groups`.

AWS CLI

To get a description of all cluster parameter groups

The following `describe-cluster-parameter-groups` example returns a description of all cluster parameter groups for the account, with column headers. By default, the output is in JSON format.

```
aws redshift describe-cluster-parameter-groups
```

Output:

```
{
    "ParameterGroups": [
        {
            "ParameterGroupFamily": "redshift-1.0",
            "Description": "My first cluster parameter group",
            "ParameterGroupName": "myclusterparametergroup"
        }
    ]
}
```

You can also obtain the same information in text format using the `--output text` option.

```
aws redshift describe-cluster-parameter-groups \
    --output text
```

Output:

```
redshift-1.0        My first cluster parameter group        myclusterparametergroup
```

For more information, see Amazon Redshift parameter groups in the *Amazon Redshift Management Guide*.

- For API details, see DescribeClusterParameterGroups in *AWS CLI Command Reference*.

`describe-cluster-parameters`

The following code example shows how to use `describe-cluster-parameters`.

AWS CLI

To retrieve the parameters for a specified cluster parameter group

The following `describe-cluster-parameters` example retrieves the parameters for the named parameter group. By default, the output is in JSON format.

```
aws redshift describe-cluster-parameters \
    --parameter-group-name myclusterparametergroup
```

Output:

```
{
    "Parameters": [
        {
            "Description": "Sets the display format for date and time values.",
            "DataType": "string",
            "IsModifiable": true,
            "Source": "engine-default",
            "ParameterValue": "ISO, MDY",
            "ParameterName": "datestyle"
        },
        {
            "Description": "Sets the number of digits displayed for floating-point
 values",
            "DataType": "integer",
            "IsModifiable": true,
            "AllowedValues": "-15-2",
            "Source": "engine-default",
```

```
            "ParameterValue": "0",
            "ParameterName": "extra_float_digits"
        }
    ]
}
```

You can also obtain the same information in text format using the `--output text` option.

```
aws redshift describe-cluster-parameters \
    --parameter-group-name myclusterparametergroup \
    --output text
```

Output:

```
RESPONSEMETADATA    a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
Sets the display format for date and time values.   string  True    engine-default
 ISO, MDY        datestyle
Sets the number of digits displayed for floating-point values       integer True
 -15-2   engine-default  0       extra_float_digits
This parameter applies a user-defined label to a group of queries that are run
 during the same session..    string  True    engine-default  default query_group
require ssl for all databaseconnections     boolean True    true,false      engine-
default  false   require_ssl
Sets the schema search order for names that are not schema-qualified.       string
 True    engine-default  $user, public   search_path
Aborts any statement that takes over the specified number of milliseconds.  integer
 True    engine-default  0       statement_timeout
wlm json configuration      string  True    engine-default
 \[{"query_concurrency":5}]      wlm_json_configuration
```

For more information, see Amazon Redshift parameter groups in the *Amazon Redshift Management Guide*.

- For API details, see DescribeClusterParameters in *AWS CLI Command Reference*.

`describe-cluster-security-groups`

The following code example shows how to use `describe-cluster-security-groups`.

AWS CLI

To get a description of all cluster security groups

The following `describe-cluster-security-groups` example returns a description of all cluster security groups for the account. By default, the output is in JSON format.

```
aws redshift describe-cluster-security-groups
```

Output:

```
{
    "ClusterSecurityGroups": [
        {
            "Description": "default",
            "ClusterSecurityGroupName": "default",
            "EC2SecurityGroups": [],
            "IPRanges": [
                {
                    "Status": "authorized",
                    "CIDRIP": "0.0.0.0/0"
                }
            ]
        },
        {
            "Description": "This is my cluster security group",
            "ClusterSecurityGroupName": "mysecuritygroup",
            "EC2SecurityGroups": [],
            "IPRanges": []
        }
    ]
}
```

For more information, see Infrastructure security in Amazon Redshift in the *Amazon Redshift Management Guide*.

- For API details, see DescribeClusterSecurityGroups in *AWS CLI Command Reference*.

`describe-cluster-snapshots`

The following code example shows how to use `describe-cluster-snapshots`.

AWS CLI

To get a description of all cluster snapshots

The following `describe-cluster-snapshots` example returns a description of all cluster snapshots for the account. By default, the output is in JSON format.

```
aws redshift describe-cluster-snapshots
```

Output:

```
{
    "Snapshots": [
        {
            "Status": "available",
            "SnapshotCreateTime": "2013-07-17T22:02:22.852Z",
            "EstimatedSecondsToCompletion": -1,
            "AvailabilityZone": "us-west-2a",
            "ClusterVersion": "1.0",
            "MasterUsername": "adminuser",

            "Encrypted": false,
            "SnapshotType": "manual",
            "Port": 5439,
            "SnapshotIdentifier": "my-snapshot-id"
    } ]
}
```

For more information, see Amazon Redshift snapshots and backups in the *Amazon Redshift Management Guide*.

- For API details, see DescribeClusterSnapshots in *AWS CLI Command Reference*.

`describe-cluster-subnet-groups`

The following code example shows how to use `describe-cluster-subnet-groups`.

AWS CLI

To get a description of all cluster subnet groups

The following `describe-cluster-subnet-groups` example returns a description of all cluster subnet groups. By default, the output is in JSON format.

```
aws redshift describe-cluster-subnet-groups
```

Output:

```
{
    "ClusterSubnetGroups": [
        {
            "Subnets": [
                {
```

```
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-763fdd1c",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    }
                }
            ],
            "VpcId": "vpc-7e3fdd14",
            "SubnetGroupStatus": "Complete",
            "Description": "My subnet group",
            "ClusterSubnetGroupName": "mysubnetgroup"
        }
    ]
}
```

For more information, see Subnets for Redshift resources in the *Amazon Redshift Management Guide*.

- For API details, see DescribeClusterSubnetGroups in *AWS CLI Command Reference*.

`describe-cluster-tracks`

The following code example shows how to use `describe-cluster-tracks`.

AWS CLI

To describe cluster tracks

The following `describe-cluster-tracks` example displays details of the available maintenance tracks.

```
aws redshift describe-cluster-tracks \
    --maintenance-track-name current
```

Output:

```
{
    "MaintenanceTracks": [
        {
            "MaintenanceTrackName": "current",
            "DatabaseVersion": "1.0.11420",
            "UpdateTargets": [
                {
```

```
                    "MaintenanceTrackName": "preview_features",
                    "DatabaseVersion": "1.0.11746",
                    "SupportedOperations": [
                        {
                            "OperationName": "restore-from-cluster-snapshot"
                        }
                    ]
                },
                {
                    "MaintenanceTrackName": "trailing",
                    "DatabaseVersion": "1.0.11116",
                    "SupportedOperations": [
                        {
                            "OperationName": "restore-from-cluster-snapshot"
                        },
                        {
                            "OperationName": "modify-cluster"
                        }
                    ]
                }
            ]
        }
    ]
}
```

For more information, see Choosing Cluster Maintenance Tracks in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeClusterTracks in *AWS CLI Command Reference*.

`describe-cluster-versions`

The following code example shows how to use `describe-cluster-versions`.

AWS CLI

To get a description of all cluster versions

The following `describe-cluster-versions` example returns a description of all cluster versions. By default, the output is in JSON format.

```
aws redshift describe-cluster-versions
```

Output:

```
{
    "ClusterVersions": [
        {
            "ClusterVersion": "1.0",
            "Description": "Initial release",
            "ClusterParameterGroupFamily": "redshift-1.0"
        } ]
}
```

For more information, see Cluster versions for Amazon Redshift in the *Amazon Redshift Management Guide*.

- For API details, see DescribeClusterVersions in *AWS CLI Command Reference*.

`describe-clusters`

The following code example shows how to use `describe-clusters`.

AWS CLI

To get a description of all clusters

The following `describe-clusters` example returns a description of all clusters for the account. By default, the output is in JSON format.

```
aws redshift describe-clusters
```

Output:

```
{
    "Clusters": [
        {
            "NodeType": "dw.hs1.xlarge",
            "Endpoint": {
                "Port": 5439,
                "Address": "mycluster.coqoarplqhsn.us-west-2.redshift.amazonaws.com"
            },
            "ClusterVersion": "1.0",
            "PubliclyAccessible": true,
```

```
            "MasterUsername": "adminuser",
            "ClusterParameterGroups": [
                {
                    "ParameterApplyStatus": "in-sync",
                    "ParameterGroupName": "default.redshift-1.0"
            } ],
            "ClusterSecurityGroups": [
                {
                    "Status": "active",
                    "ClusterSecurityGroupName": "default"
            } ],
            "AllowVersionUpgrade": true,
            "VpcSecurityGroups": [],
            "AvailabilityZone": "us-west-2a",
            "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
            "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
            "AutomatedSnapshotRetentionPeriod": 1,
            "ClusterStatus": "available",
            "ClusterIdentifier": "mycluster",
            "DBName": "dev",
            "NumberOfNodes": 2,
            "PendingModifiedValues": {}
    } ]
}
```

You can also obtain the same information in text format using the `--output text` option.

```
aws redshift describe-clusters \
    --output text
```

Output:

```
dw.hs1.xlarge       1.0     true    adminuser       True    us-west-2a
 2013-01-22T21:59:29.559Z        sat:03:30-sat:04:00     1       available
 mycluster       dev     2
ENDPOINT    5439    mycluster.coqoarplqhsn.us-west-2.redshift.amazonaws.com
in-sync     default.redshift-1.0
active      default
PENDINGMODIFIEDVALUES
```

For more information, see Amazon Redshift provisioned clusters in the *Amazon Redshift Management Guide*.

- For API details, see DescribeClusters in *AWS CLI Command Reference*.

`describe-default-cluster-parameters`

The following code example shows how to use `describe-default-cluster-parameters`.

AWS CLI

To get a description of default cluster parameters

The following `describe-default-cluster-parameters` example returns a description of the default cluster parameters for the `redshift-1.0` family. By default, the output is in JSON format.

```
aws redshift describe-default-cluster-parameters \
    --parameter-group-family redshift-1.0
```

Output:

```
{
    "DefaultClusterParameters": {
        "ParameterGroupFamily": "redshift-1.0",
        "Parameters": [
            {
                "Description": "Sets the display format for date and time values.",
                "DataType": "string",
                "IsModifiable": true,
                "Source": "engine-default",
                "ParameterValue": "ISO, MDY",
                "ParameterName": "datestyle"
            },
            {
                "Description": "Sets the number of digits displayed for floating-
point values",
                "DataType": "integer",
                "IsModifiable": true,
                "AllowedValues": "-15-2",
                "Source": "engine-default",
                "ParameterValue": "0",
                "ParameterName": "extra_float_digits"
            }
        ]
```

```
    }
}
```

To see a list of valid parameter group families, use the `describe-cluster-parameter-groups` command.

For more information, see Amazon Redshift parameter groups in the *Amazon Redshift Management Guide*.

- For API details, see DescribeDefaultClusterParameters in *AWS CLI Command Reference*.

`describe-event-categories`

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe event categories for a cluster

The following `describe-event-categories` example displays details for the event categories for a cluster.

```
aws redshift describe-event-categories \
    --source-type cluster
```

Output:

```
{
    "EventCategoriesMapList": [
        {
            "SourceType": "cluster",
            "Events": [
                {
                    "EventId": "REDSHIFT-EVENT-2000",
                    "EventCategories": [
                        "management"
                    ],
                    "EventDescription": "Cluster <cluster name> created at <time in
 UTC>.",
                    "Severity": "INFO"
                },
                {
```

```
                    "EventId": "REDSHIFT-EVENT-2001",
                    "EventCategories": [
                        "management"
                    ],
                    "EventDescription": "Cluster <cluster name> deleted at <time in
 UTC>.",
                    "Severity": "INFO"
                },
                {
                    "EventId": "REDSHIFT-EVENT-3625",
                    "EventCategories": [
                        "monitoring"
                    ],
                    "EventDescription": "The cluster <cluster name> can't be resumed
 with its previous elastic network interface <ENI id>. We will allocate a new
 elastic network interface and associate it with the cluster node.",
                    "Severity": "INFO"
                }
            ]
        }
    ]
}
```

For more information, see Amazon Redshift provisioned cluster event notifications in the *Amazon Redshift Management Guide*.

- For API details, see DescribeEventCategories in *AWS CLI Command Reference*.

`describe-event-subscriptions`

The following code example shows how to use `describe-event-subscriptions`.

AWS CLI

To describe event subscriptions

The following `describe-event-subscriptions` example displays event notification subscriptions for the specified subscription.

```
aws redshift describe-event-subscriptions \
    --subscription-name mysubscription
```

Output:

```
{
    "EventSubscriptionsList": [
        {
            "CustomerAwsId": "123456789012",
            "CustSubscriptionId": "mysubscription",
            "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNStopic",
            "Status": "active",
            "SubscriptionCreationTime": "2019-12-09T21:50:21.332Z",
            "SourceIdsList": [],
            "EventCategoriesList": [
                "management"
            ],
            "Severity": "ERROR",
            "Enabled": true,
            "Tags": []
        }
    ]
}
```

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeEventSubscriptions in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To describe all events

The following `describe-events` example returns all events. By default, the output is in JSON format.

```
aws redshift describe-events
```

Output:

```
{
    "Events": [
        {
```

```
            "Date": "2013-01-22T19:17:03.640Z",
            "SourceIdentifier": "myclusterparametergroup",
            "Message": "Cluster parameter group myclusterparametergroup has been
 created.",
            "SourceType": "cluster-parameter-group"
        }
    ]
}
```

You can also obtain the same information in text format using the `--output text` option.

```
aws redshift describe-events \
    --output text
```

Output:

```
2013-01-22T19:17:03.640Z    myclusterparametergroup Cluster parameter group
 myclusterparametergroup has been created.       cluster-parameter-group
```

For more information, see Amazon Redshift events in the *Amazon Redshift Management Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-hsm-client-certificates`

The following code example shows how to use `describe-hsm-client-certificates`.

AWS CLI

To describe HSM client certificates

The following `describe-hsm-client-certificates` example displays details for the specified HSM client certificate.

```
aws redshift describe-hsm-client-certificates \
    --hsm-client-certificate-identifier myhsmclientcert
```

Output:

```
{
```

```
    "HsmClientCertificates": [
        {
        "HsmClientCertificateIdentifier": "myhsmclientcert",
        "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----

        "Tags": []
        }
    ]
}
```

For more information, see Amazon Redshift API Permissions Reference in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeHsmClientCertificates in *AWS CLI Command Reference*.

`describe-hsm-configurations`

The following code example shows how to use `describe-hsm-configurations`.

AWS CLI

To describe HSM configurations

The following `describe-hsm-configurations` example displays details for the available HSM configurations for the calling AWS account.

```
aws redshift describe-hsm-configurations \
    --hsm-configuration-identifier myhsmconnection
```

Output:

```
{
    "HsmConfigurations": [
        {
            "HsmConfigurationIdentifier": "myhsmconnection",
            "Description": "My HSM connection",
            "HsmIpAddress": "192.0.2.09",
            "HsmPartitionName": "myhsmpartition",
            "Tags": []
        }
    ]
}
```

For more information, see Encryption using hardware security modules in the *Amazon Redshift Management Guide*.

- For API details, see DescribeHsmConfigurations in *AWS CLI Command Reference*.

`describe-logging-status`

The following code example shows how to use `describe-logging-status`.

AWS CLI

To describe logging status for a cluster

The following `describe-logging-status` example displays whether information, such as queries and connection attempts, is being logged for a cluster.

```
aws redshift describe-logging-status \
    --cluster-identifier mycluster
```

Output:

```
{
    "LoggingEnabled": false
}
```

For more information, see Database Audit Logging in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeLoggingStatus in *AWS CLI Command Reference*.

describe-node-configuration-options

The following code example shows how to use `describe-node-configuration-options`.

AWS CLI

To describe node configuration options

The following `describe-node-configuration-options` example displays the properties of possible node configurations such as node type, number of nodes, and disk usage for the specified cluster snapshot.

```
aws redshift describe-node-configuration-options \
    --action-type restore-cluster \
    --snapshot-identifier rs:mycluster-2019-12-09-16-42-43
```

Output:

```
{
    "NodeConfigurationOptionList": [
        {
            "NodeType": "dc2.large",
            "NumberOfNodes": 2,
            "EstimatedDiskUtilizationPercent": 19.61
        },
        {
            "NodeType": "dc2.large",
            "NumberOfNodes": 4,
            "EstimatedDiskUtilizationPercent": 9.96
        },
        {
            "NodeType": "ds2.xlarge",
            "NumberOfNodes": 2,
            "EstimatedDiskUtilizationPercent": 1.53
        },
        {
            "NodeType": "ds2.xlarge",
            "NumberOfNodes": 4,
            "EstimatedDiskUtilizationPercent": 0.78
        }
    ]
}
```

For more information, see Purchasing Amazon Redshift Reserved Nodes in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeNodeConfigurationOptions in *AWS CLI Command Reference*.

`describe-orderable-cluster-options`

The following code example shows how to use `describe-orderable-cluster-options`.

AWS CLI

To describe all orderable cluster options

The following `describe-orderable-cluster-options` example returns descriptions of all orderable cluster options. By default, the output is in JSON format.

```
aws redshift describe-orderable-cluster-options
```

Output:

```
{
    "OrderableClusterOptions": [
        {
            "NodeType": "dw.hs1.8xlarge",
            "AvailabilityZones": [
                { "Name": "us-west-2a" },
                { "Name": "us-west-2b" },
                { "Name": "us-west-2c" } ],
            "ClusterVersion": "1.0",
            "ClusterType": "multi-node"
        },
        {
            "NodeType": "dw.hs1.xlarge",
            "AvailabilityZones": [
                { "Name": "us-west-2a" },
                { "Name": "us-west-2b" },
                { "Name": "us-west-2c" } ],
            "ClusterVersion": "1.0",
            "ClusterType": "multi-node"
        },
        {
            "NodeType": "dw.hs1.xlarge",
```

```
            "AvailabilityZones": [
                { "Name": "us-west-2a" },
                { "Name": "us-west-2b" },
                { "Name": "us-west-2c" } ],
            "ClusterVersion": "1.0",
            "ClusterType": "single-node"
        } ]
}
```

You can also obtain the same information in text format using the `--output text` option.

```
aws redshift describe-orderable-cluster-options \
    --output text
```

Output:

```
dw.hs1.8xlarge      1.0     multi-node
us-west-2a
us-west-2b
us-west-2c
dw.hs1.xlarge       1.0     multi-node
us-west-2a
us-west-2b
us-west-2c
dw.hs1.xlarge       1.0     single-node
us-west-2a
us-west-2b
us-west-2c
```

For more information, see Amazon Redshift provisioned clusters in the *Amazon Redshift Management Guide*.

- For API details, see DescribeOrderableClusterOptions in *AWS CLI Command Reference*.

`describe-reserved-node-offerings`

The following code example shows how to use `describe-reserved-node-offerings`.

AWS CLI

To describe reserved node offerings

The following `describe-reserved-node-offerings` example shows all of the reserved node offerings that are available for purchase.

```
aws redshift describe-reserved-node-offerings
```

Output:

```
{
    "ReservedNodeOfferings": [
        {
            "OfferingType": "Heavy Utilization",
            "FixedPrice": 3000.0,
            "NodeType": "dw.hs1.xlarge",
            "UsagePrice": 0.0,
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.114,
                    "RecurringChargeFrequency": "Hourly"
            } ],
            "Duration": 31536000,
            "ReservedNodeOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "OfferingType": "Heavy Utilization",
            "FixedPrice": 24000.0,
            "NodeType": "dw.hs1.8xlarge",
            "UsagePrice": 0.0,
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.912,

            } ],
            "Duration": 31536000,
            "ReservedNodeOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

If you want to purchase a reserved node offering, you can call `purchase-reserved-node-offering` using a valid *ReservedNodeOfferingId*.

For more information, see Reserved nodes in the *Amazon Redshift Management Guide*.

- For API details, see DescribeReservedNodeOfferings in *AWS CLI Command Reference*.

`describe-reserved-nodes`

The following code example shows how to use `describe-reserved-nodes`.

AWS CLI

To describe reserved nodes

The following `describe-reserved-nodes` example shows a reserved node offering that has been purchased.

```
aws redshift describe-reserved-nodes
```

Output:

```
{
    "ReservedNodes": [
        {
            "OfferingType": "Heavy Utilization",
            "FixedPrice": 3000.0,
            "NodeType": "dw.hs1.xlarge",
            "ReservedNodeId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "UsagePrice": 0.0,
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.21,
                    "RecurringChargeFrequency": "Hourly"
                } ],
            "NodeCount": 1,
            "State": "payment-pending",
            "StartTime": "2013-02-13T17:08:39.051Z",
            "Duration": 31536000,
            "ReservedNodeOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
        }
    ]
}
```

For more information, see Reserved nodes in the *Amazon Redshift Management Guide*.

- For API details, see DescribeReservedNodes in *AWS CLI Command Reference*.

`describe-resize`

The following code example shows how to use `describe-resize`.

AWS CLI

To describe a resize

The following `describe-resize` example describes the latest resize of a cluster. The request was for 3 nodes of type `dw.hs1.8xlarge`.

```
aws redshift describe-resize \
    --cluster-identifier mycluster
```

Output:

```
{
    "Status": "NONE",
    "TargetClusterType": "multi-node",
    "TargetNodeType": "dw.hs1.8xlarge",
    "TargetNumberOfNodes": 3
}
```

For more information, see Resizing a cluster in the *Amazon Redshift Management Guide*.

- For API details, see DescribeResize in *AWS CLI Command Reference*.

`describe-scheduled-actions`

The following code example shows how to use `describe-scheduled-actions`.

AWS CLI

To describe scheduled actions

The following `describe-scheduled-actions` example displays details for any currently scheduled actions.

```
aws redshift describe-scheduled-actions
```

Output:

```
{
    "ScheduledActions": [
        {
            "ScheduledActionName": "resizecluster",
            "TargetAction": {
                "ResizeCluster": {
                    "ClusterIdentifier": "mycluster",
                    "NumberOfNodes": 4,
                    "Classic": false
                }
            },
            "Schedule": "at(2019-12-10T00:07:00)",
            "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
            "State": "ACTIVE",
            "NextInvocations": [
                "2019-12-10T00:07:00Z"
            ]
        }
    ]
}
```

For more information, see Scheduling a resize in the *Amazon Redshift Management Guide*.

- For API details, see DescribeScheduledActions in *AWS CLI Command Reference*.

`describe-snapshot-copy-grants`

The following code example shows how to use `describe-snapshot-copy-grants`.

AWS CLI

To describe snapshot copy grants

The following `describe-snapshot-copy-grants` example displays details for the specified cluster snapshot copy grant.

```
aws redshift describe-snapshot-copy-grants \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```
{
```

```
    "SnapshotCopyGrants": [
        {
            "SnapshotCopyGrantName": "mysnapshotcopygrantname",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
bPxRfih3yCo8nvbEXAMPLEKEY",
            "Tags": []
        }
    ]
}
```

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeSnapshotCopyGrants in *AWS CLI Command Reference*.

`describe-snapshot-schedules`

The following code example shows how to use `describe-snapshot-schedules`.

AWS CLI

To describe snapshot schedules

The following `describe-snapshot-schedules` example displays details for the specified cluster snapshot schedule.

```
aws redshift describe-snapshot-schedules \
    --cluster-identifier mycluster \
    --schedule-identifier mysnapshotschedule
```

Output:

```
{
    "SnapshotSchedules": [
        {
            "ScheduleDefinitions": [
                "rate(12 hours)"
            ],
            "ScheduleIdentifier": "mysnapshotschedule",
            "ScheduleDescription": "My schedule description",
            "Tags": [],
            "AssociatedClusterCount": 1,
            "AssociatedClusters": [
```

```
                {
                    "ClusterIdentifier": "mycluster",
                    "ScheduleAssociationState": "ACTIVE"
                }
            ]
        }
    ]
}
```

For more information, see Automated Snapshot Schedules in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeSnapshotSchedules in *AWS CLI Command Reference*.

`describe-storage`

The following code example shows how to use `describe-storage`.

AWS CLI

To describe storage

The following `describe-storage` example displays details about the backup storage and provisional storage sizes for the account.

```
aws redshift describe-storage
```

Output:

```
{
    "TotalBackupSizeInMegaBytes": 193149.0,
    "TotalProvisionedStorageInMegaBytes": 655360.0
}
```

For more information, see Managing Snapshot Storage in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeStorage in *AWS CLI Command Reference*.

`describe-table-restore-status`

The following code example shows how to use `describe-table-restore-status`.

AWS CLI

To describe status of table restore requests from a cluster snapshot

The following `describe-table-restore-status` example displays details for table restore requests made for the specified cluster.

```
aws redshift describe-table-restore-status \
    --cluster-identifier mycluster
```

Output:

```
{
    "TableRestoreStatusDetails": [
        {
            "TableRestoreRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Status": "IN_PROGRESS",
            "RequestTime": "2019-12-27T18:22:12.257Z",
            "ClusterIdentifier": "mycluster",
            "SnapshotIdentifier": "mysnapshotid",
            "SourceDatabaseName": "dev",
            "SourceSchemaName": "public",
            "SourceTableName": "mytable",
            "TargetDatabaseName": "dev",
            "TargetSchemaName": "public",
            "NewTableName": "mytable-clone"
        }
    ]
}
```

For more information, see Restoring a Table from a Snapshot in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeTableRestoreStatus in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe tags

The following `describe-tags` example displays the resources the specified cluster associated with the specified tag names and values.

```
aws redshift describe-tags \
    --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
    --tag-keys clustertagkey \
    --tag-values clustertagvalue
```

Output:

```
{
    "TaggedResources": [
        {
            "Tag": {
                "Key": "clustertagkey",
                "Value": "clustertagvalue"
            },
            "ResourceName": "arn:aws:redshift:us-
west-2:123456789012:cluster:mycluster",
            "ResourceType": "cluster"
        }
    ]
}
```

For more information, see Tagging Resources in Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`disable-snapshot-copy`

The following code example shows how to use `disable-snapshot-copy`.

AWS CLI

To disable snapshot copy for a cluster

The following `disable-snapshot-copy` example disables the automatic copy of a snapshot for the specified cluster.

```
aws redshift disable-snapshot-copy \
    --cluster-identifier mycluster
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",

    }
}
```

For more information, see Copying Snapshots to Another AWS Region in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DisableSnapshotCopy in *AWS CLI Command Reference*.

`enable-snapshot-copy`

The following code example shows how to use `enable-snapshot-copy`.

AWS CLI

To enable snapshot copy for a cluster

The following `enable-snapshot-copy` example enables the automatic copy of a snapshot for the specified cluster.

```
aws redshift enable-snapshot-copy \
    --cluster-identifier mycluster \
    --destination-region us-west-1
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",

        "NextMaintenanceWindowStartTime": "2019-12-14T16:00:00Z"
    }
}
```

For more information, see Copying Snapshots to Another AWS Region in the *Amazon Redshift Cluster Management Guide*.

- For API details, see EnableSnapshotCopy in *AWS CLI Command Reference*.

`get-cluster-credentials`

The following code example shows how to use `get-cluster-credentials`.

AWS CLI

To get cluster credentials for an AWS account

The following `get-cluster-credentials` example retrieves temporary credentials that enable access to an Amazon Redshift database.

```
aws redshift get-cluster-credentials \
    --db-user adminuser \
```

```
    --db-name dev \
    --cluster-identifier mycluster
```

Output:

```
{
    "DbUser": "IAM:adminuser",
    "DbPassword": "AMAFUyyuros/QjxPTtgzcsuQsqzIasdzJEN04aCtWDzXx1O9d6UmpkBtvEeqFly/
EXAMPLE==",
    "Expiration": "2019-12-10T17:25:05.770Z"
}
```

For more information, see Generating IAM Database Credentials Using the Amazon Redshift CLI or API in the *Amazon Redshift Cluster Management Guide*.

- For API details, see GetClusterCredentials in *AWS CLI Command Reference*.

`get-reserved-node-exchange-offerings`

The following code example shows how to use `get-reserved-node-exchange-offerings`.

AWS CLI

To get reserved node exchange offerings

The following `get-reserved-node-exchange-offerings` example retrieves an array of DC2 `ReservedNodeOfferings` that match the specified DC1 reserved node.

```
aws redshift get-reserved-node-exchange-offerings \
    --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:

```
{
    "ReservedNodeOfferings": [
        {
            "ReservedNodeOfferingId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
            "NodeType": "dc2.large",
            "Duration": 31536000,
            "FixedPrice": 0.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
```

```
            "OfferingType": "All Upfront",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.0,
                    "RecurringChargeFrequency": "Hourly"
                }
            ],
            "ReservedNodeOfferingType": "Regular"
        }
    ]
}
```

For more information, see Upgrading Reserved Nodes With the AWS CLI in the *Amazon Redshift Cluster Management Guide*.

- For API details, see GetReservedNodeExchangeOfferings in *AWS CLI Command Reference*.

`modify-cluster-iam-roles`

The following code example shows how to use `modify-cluster-iam-roles`.

AWS CLI

To modify the IAM role for a cluster

The following `modify-cluster-iam-roles` example removes the specified AWS IAM role from the specified cluster.

```
aws redshift modify-cluster-iam-roles \
    --cluster-identifier mycluster \
    --remove-iam-roles arn:aws:iam::123456789012:role/myRedshiftRole
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
```

```
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
        "AutomatedSnapshotRetentionPeriod": 3,

- For API details, see ModifyClusterIamRoles in *AWS CLI Command Reference*.

`modify-cluster-maintenance`

The following code example shows how to use `modify-cluster-maintenance`.

AWS CLI

To modify cluster maintenance

The following `modify-cluster-maintenance` example defers the maintenance of the specified cluster by 30 days.

```
aws redshift modify-cluster-maintenance \
    --cluster-identifier mycluster \
    --defer-maintenance \
    --defer-maintenance-duration 30
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",

    }
}
```

For more information, see Cluster Maintenance in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyClusterMaintenance in *AWS CLI Command Reference*.

`modify-cluster-parameter-group`

The following code example shows how to use `modify-cluster-parameter-group`.

AWS CLI

To modify a parameter in a parameter group

The following `modify-cluster-parameter-group` example modifies the *wlm_json_configuration* parameter for workload management. It accepts the parameters from a file that contains the JSON contents shown below.

```
aws redshift modify-cluster-parameter-group \
    --parameter-group-name myclusterparametergroup \
    --parameters file://modify_pg.json
```

Contents of `modify_pg.json`:

```
[
    {
        "ParameterName": "wlm_json_configuration",
        "ParameterValue": "[{\"user_group\":\"example_user_group1\",\"query_group\":
 \"example_query_group1\", \"query_concurrency\":7},{\"query_concurrency\":5}]"
    }
]
```

Output:

```
{
    "ParameterGroupStatus": "Your parameter group has been updated but changes won't
 get applied until you reboot the associated Clusters.",
```

```
    "ParameterGroupName": "myclusterparametergroup"
}
```

For more information, see Modifying a parameter group in the *Amazon Redshift Management Guide*.

- For API details, see ModifyClusterParameterGroup in *AWS CLI Command Reference*.

`modify-cluster-snapshot-schedule`

The following code example shows how to use `modify-cluster-snapshot-schedule`.

AWS CLI

To modify cluster snapshot schedule

The following `modify-cluster-snapshot-schedule` example removes the specified snapshot schedule from the specified cluster.

```
aws redshift modify-cluster-snapshot-schedule \
    --cluster-identifier mycluster \
    --schedule-identifier mysnapshotschedule \
    --disassociate-schedule
```

This command produces no output.

For more information, see Automated Snapshot Schedules in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyClusterSnapshotSchedule in *AWS CLI Command Reference*.

`modify-cluster-snapshot`

The following code example shows how to use `modify-cluster-snapshot`.

AWS CLI

To modify cluster snapshot

The following `modify-cluster-snapshot` example sets the manual retention period setting for the specified cluster snapshot to value of 10 days.

```
aws redshift modify-cluster-snapshot \
    --snapshot-identifier mycluster-2019-11-06-16-32 \
    --manual-snapshot-retention-period 10
```

Output:

```
{
    "Snapshot": {
        "SnapshotIdentifier": "mycluster-2019-11-06-16-32",
        "ClusterIdentifier": "mycluster",
        "SnapshotCreateTime": "2019-12-07T00:34:05.633Z",
        "Status": "available",
        "Port": 5439,
        "AvailabilityZone": "us-west-2f",
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
        "MasterUsername": "adminuser",

    }
```

```
}
```

For more information, see Amazon Redshift Snapshots in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyClusterSnapshot in *AWS CLI Command Reference*.

`modify-cluster-subnet-group`

The following code example shows how to use `modify-cluster-subnet-group`.

AWS CLI

To modify the subnets in a cluster subnet group

The following `modify-cluster-subnet-group` example modifies the list of subnets in a cluster subnet group. By default, the output is in JSON format.

```
aws redshift modify-cluster-subnet-group \
    --cluster-subnet-group-name mysubnetgroup \
    --subnet-ids subnet-763fdd1 subnet-ac830e9
```

Output:

```
{
    "ClusterSubnetGroup":
    {
        "Subnets": [
            {
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-763fdd1c",
                "SubnetAvailabilityZone":
                    { "Name": "us-west-2a" }
            },
            {
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-ac830e9",
                "SubnetAvailabilityZone":
                    { "Name": "us-west-2b" }
            } ],
        "VpcId": "vpc-7e3fdd14",
        "SubnetGroupStatus": "Complete",
```

```
        "Description": "My subnet group",
        "ClusterSubnetGroupName": "mysubnetgroup"
    }
}
```

For more information, see Modifying a cluster subnet group in the *Amazon Redshift Management Guide*.

- For API details, see ModifyClusterSubnetGroup in *AWS CLI Command Reference*.

`modify-cluster`

The following code example shows how to use `modify-cluster`.

AWS CLI

Example 1: To associate a security group with a cluster

The following `modify-cluster` example associates a cluster security group with the specified cluster.

```
aws redshift modify-cluster \
    --cluster-identifier mycluster \
    --cluster-security-groups mysecuritygroup
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-02T22:45:07.890Z",
        "AutomatedSnapshotRetentionPeriod": 1,
```

```
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [
            {
                "ClusterSecurityGroupName": "default",
                "Status": "removing"
            },
            {
                "ClusterSecurityGroupName": "mysecuritygroup",
                "Status": "adding"
            }
        ],
        "VpcSecurityGroups": [],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "AvailabilityZone": "us-west-2a",
        "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
        "PendingModifiedValues": {},
        "ClusterVersion": "1.0",
        "AllowVersionUpgrade": true,
        "NumberOfNodes": 2,
        "PubliclyAccessible": true,
        "Encrypted": false,
        "Tags": [],
        "EnhancedVpcRouting": false,
        "IamRoles": [],
        "MaintenanceTrackName": "current"
    }
}
```

For more information, see Modifying a cluster in the *Amazon Redshift Management Guide*.

Example 2: To modify the maintenance window for a cluster

The following `modify-cluster` example changes the weekly preferred maintenance window for a cluster to be the minimum four hour window starting Sundays at 11:15 PM, and ending Mondays at 3:15 AM.

```
aws redshift modify-cluster \
    --cluster-identifier mycluster \
```

```
    --preferred-maintenance-window Sun:23:15-Mon:03:15
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-02T22:45:07.890Z",
        "AutomatedSnapshotRetentionPeriod": 1,
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [
            {
                "ClusterSecurityGroupName": "default",
                "Status": "active"
            }
        ],
        "VpcSecurityGroups": [],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "AvailabilityZone": "us-west-2a",
        "PreferredMaintenanceWindow": "sun:23:15-mon:03:15",
        "PendingModifiedValues": {},
        "ClusterVersion": "1.0",
        "AllowVersionUpgrade": true,
        "NumberOfNodes": 2,
        "PubliclyAccessible": true,
        "Encrypted": false,
        "Tags": [],
        "EnhancedVpcRouting": false,
        "IamRoles": [],
```

```
        "MaintenanceTrackName": "current"
    }
}
```

For more information, see Maintenance windows in the *Amazon Redshift Management Guide*.

Example 3: To change the master password for the cluster

The following `modify-cluster` example changes the master password for a cluster.

```
aws redshift modify-cluster \
    --cluster-identifier mycluster \
    --master-user-password A1b2c3d4
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-02T22:45:07.890Z",
        "AutomatedSnapshotRetentionPeriod": 1,
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [
            {
                "ClusterSecurityGroupName": "default",
                "Status": "active"
            }
        ],
        "VpcSecurityGroups": [],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
                "ParameterApplyStatus": "in-sync"
            }
```

```
        ],
        "AvailabilityZone": "us-west-2a",
        "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
        "PendingModifiedValues": {
            "MasterUserPassword": "****"
        },
        "ClusterVersion": "1.0",
        "AllowVersionUpgrade": true,
        "NumberOfNodes": 2,
        "PubliclyAccessible": true,
        "Encrypted": false,
        "Tags": [],
        "EnhancedVpcRouting": false,
        "IamRoles": [],
        "MaintenanceTrackName": "current"
    }
}
```

For more information, see Modifying a cluster in the *Amazon Redshift Management Guide*.

- For API details, see ModifyCluster in *AWS CLI Command Reference*.

`modify-event-subscription`

The following code example shows how to use `modify-event-subscription`.

AWS CLI

To modify event subscription

The following `modify-event-subscription` example disables the specified event notification subscription.

```
aws redshift modify-event-subscription \
    --subscription-name mysubscription \
    --no-enabled
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "mysubscription",
```

```
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNStopic",
        "Status": "active",
        "SubscriptionCreationTime": "2019-12-09T21:50:21.332Z",
        "SourceIdsList": [],
        "EventCategoriesList": [
            "management"
        ],
        "Severity": "ERROR",
        "Enabled": false,
        "Tags": []
    }
}
```

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyEventSubscription in *AWS CLI Command Reference*.

`modify-scheduled-action`

The following code example shows how to use `modify-scheduled-action`.

AWS CLI

To modify scheduled action

The following `modify-scheduled-action` example adds a description to the specified existing scheduled action.

```
aws redshift modify-scheduled-action \
    --scheduled-action-name myscheduledaction \
    --scheduled-action-description "My scheduled action"
```

Output:

```
{
    "ScheduledActionName": "myscheduledaction",
    "TargetAction": {
        "ResizeCluster": {
            "ClusterIdentifier": "mycluster",
            "NumberOfNodes": 2,
            "Classic": false
        }
```

```
    },
    "Schedule": "at(2019-12-25T00:00:00)",
    "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
    "ScheduledActionDescription": "My scheduled action",
    "State": "ACTIVE",
    "NextInvocations": [
        "2019-12-25T00:00:00Z"
    ]
}
```

For more information, see Scheduling a resize in the *Amazon Redshift Management Guide*.

- For API details, see ModifyScheduledAction in *AWS CLI Command Reference*.

`modify-snapshot-copy-retention-period`

The following code example shows how to use `modify-snapshot-copy-retention-period`.

AWS CLI

To modify snapshot copy retention period

The following `modify-snapshot-copy-retention-period` example modifies the number of days to retain snapshots for the specified cluster in the destination AWS Region after they are copied from the source AWS Region.

```
aws redshift modify-snapshot-copy-retention-period \
    --cluster-identifier mycluster \
    --retention-period 15
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
```

```
        },

```

For more information, see Snapshot Schedule Format in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifySnapshotCopyRetentionPeriod in *AWS CLI Command Reference*.

`modify-snapshot-schedule`

The following code example shows how to use `modify-snapshot-schedule`.

AWS CLI

To modify snapshot schedule

The following `modify-snapshot-schedule` example modifies the rate of the specified snapshot schedule to every 10 hours.

```
aws redshift modify-snapshot-schedule \
    --schedule-identifier mysnapshotschedule \
    --schedule-definitions "rate(10 hours)"
```

Output:

```
{
    "ScheduleDefinitions": [
        "rate(10 hours)"
    ],
    "ScheduleIdentifier": "mysnapshotschedule",
    "ScheduleDescription": "My schedule description",
    "Tags": []
}
```

For more information, see Snapshot Schedule Format in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifySnapshotSchedule in *AWS CLI Command Reference*.

`purchase-reserved-node-offering`

The following code example shows how to use `purchase-reserved-node-offering`.

AWS CLI

To purchase a reserved node

The following `purchase-reserved-node-offering` example purchases a reserved node offering. The `reserved-node-offering-id` is obtained by calling `describe-reserved-node-offerings`.

```
aws redshift purchase-reserved-node-offering \
    --reserved-node-offering-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ReservedNode": {
        "OfferingType": "Heavy Utilization",
        "FixedPrice": 3000.0,
        "NodeType": "dw.hs1.xlarge",
        "ReservedNodeId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "UsagePrice": 0.0,
        "RecurringCharges": [
            {
                "RecurringChargeAmount": 0.114,
                "RecurringChargeFrequency": "Hourly"
            }
        ],
        "NodeCount": 1,
        "State": "payment-pending",
        "StartTime": "2013-02-13T17:08:39.051Z",
        "Duration": 31536000,
        "ReservedNodeOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Purchasing a reserved node in the *Amazon Redshift Management Guide*.

- For API details, see PurchaseReservedNodeOffering in *AWS CLI Command Reference*.

`reboot-cluster`

The following code example shows how to use `reboot-cluster`.

AWS CLI

To reboot a cluster

The following `reboot-cluster` example reboots a cluster. By default, the output is in JSON format.

```
aws redshift reboot-cluster \
    --cluster-identifier mycluster
```

Output:

```
{
    "Cluster": {
        "NodeType": "dw.hs1.xlarge",
        "Endpoint": {
            "Port": 5439,
            "Address": "mycluster.coqoarplqhsn.us-west-2.redshift.amazonaws.com"
        },
        "ClusterVersion": "1.0",
        "PubliclyAccessible": true,
        "MasterUsername": "adminuser",
        "ClusterParameterGroups": [
            {
                "ParameterApplyStatus": "in-sync",
                "ParameterGroupName": "default.redshift-1.0"
            }
        ],
        "ClusterSecurityGroups": [
            {
                "Status": "active",
                "ClusterSecurityGroupName": "default"
            }
```

```
        ],
        "AllowVersionUpgrade": true,
        "VpcSecurityGroups": [],
        "AvailabilityZone": "us-west-2a",
        "ClusterCreateTime": "2013-01-22T21:59:29.559Z",

        "AutomatedSnapshotRetentionPeriod": 1,
        "ClusterStatus": "rebooting",
        "ClusterIdentifier": "mycluster",
        "DBName": "dev",
        "NumberOfNodes": 2,
        "PendingModifiedValues": {}
    }
}
```

For more information, see Rebooting a cluster in the *Amazon Redshift Management Guide*.

- For API details, see RebootCluster in *AWS CLI Command Reference*.

`reset-cluster-parameter-group`

The following code example shows how to use `reset-cluster-parameter-group`.

AWS CLI

To reset parameters in a parameter group

The following `reset-cluster-parameter-group` example resets all of the parameters in a parameter group.

```
aws redshift reset-cluster-parameter-group \
    --parameter-group-name myclusterparametergroup \
    --reset-all-parameters
```

Output:

```
{
    "ParameterGroupName": "myclusterparametergroup",
    "ParameterGroupStatus": "Your parameter group has been updated but changes won't
 get applied until you reboot the associated Clusters."
}
```

For more information, see Amazon Redshift parameter groups in the *Amazon Redshift Management Guide*.

- For API details, see ResetClusterParameterGroup in *AWS CLI Command Reference*.

`resize-cluster`

The following code example shows how to use `resize-cluster`.

AWS CLI

To resize cluster

The following `resize-cluster` example resizes the specified cluster.

```
aws redshift resize-cluster \
    --cluster-identifier mycluster \
    --cluster-type multi-node \
    --node-type dc2.large \
    --number-of-nodes 6 \
    --classic
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "resizing",

                "DeferMaintenanceEndTime": "2020-01-09T18:18:39.354Z"
            }
        ],
        "NextMaintenanceWindowStartTime": "2020-01-11T16:00:00Z",
        "ResizeInfo": {
            "ResizeType": "ClassicResize",
            "AllowCancelResize": true
        }
```

```
    }
}
```

For more information, see Resizing a Cluster in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ResizeCluster in *AWS CLI Command Reference*.

`restore-from-cluster-snapshot`

The following code example shows how to use `restore-from-cluster-snapshot`.

AWS CLI

To restore a cluster from a snapshot

The following `restore-from-cluster-snapshot` example restores a cluster from a snapshot.

```
aws redshift restore-from-cluster-snapshot \
    --cluster-identifier mycluster-clone \
    --snapshot-identifier my-snapshot-id
```

Output:

```
{
    "Cluster": {
        "NodeType": "dw.hs1.xlarge",
        "ClusterVersion": "1.0",
        "PubliclyAccessible": true,
        "MasterUsername": "adminuser",
        "ClusterParameterGroups": [
            {
                "ParameterApplyStatus": "in-sync",
                "ParameterGroupName": "default.redshift-1.0"
            }
        ],
        "ClusterSecurityGroups": [
            {
                "Status": "active",
                "ClusterSecurityGroupName": "default"
            }
        ],
```

```
        "AllowVersionUpgrade": true,
        "VpcSecurityGroups": [],
        "PreferredMaintenanceWindow": "sun:23:15-mon:03:15",
        "AutomatedSnapshotRetentionPeriod": 1,
        "ClusterStatus": "creating",
        "ClusterIdentifier": "mycluster-clone",
        "DBName": "dev",
        "NumberOfNodes": 2,
        "PendingModifiedValues": {}
    }
}
```

For more information, see Restoring a cluster from a snapshot in the *Amazon Redshift Management Guide*.

- For API details, see RestoreFromClusterSnapshot in *AWS CLI Command Reference*.

`restore-table-from-cluster-snapshot`

The following code example shows how to use `restore-table-from-cluster-snapshot`.

AWS CLI

To restore table from a cluster snapshot

The following `restore-table-from-cluster-snapshot` example creates a new table from the specified table in the specified cluster snapshot.

```
aws redshift restore-table-from-cluster-snapshot \
    --cluster-identifier mycluster \
    --snapshot-identifier mycluster-2019-11-19-16-17 \
    --source-database-name dev \
    --source-schema-name public \
    --source-table-name mytable \
    --target-database-name dev \
    --target-schema-name public \
    --new-table-name mytable-clone
```

Output:

```
{
```

```
    "TableRestoreStatus": {
        "TableRestoreRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Status": "PENDING",
        "RequestTime": "2019-12-20T00:20:16.402Z",
        "ClusterIdentifier": "mycluster",
        "SnapshotIdentifier": "mycluster-2019-11-19-16-17",
        "SourceDatabaseName": "dev",
        "SourceSchemaName": "public",
        "SourceTableName": "mytable",
        "TargetDatabaseName": "dev",
        "TargetSchemaName": "public",
        "NewTableName": "mytable-clone"
    }
}
```

For more information, see Restoring a Table from a Snapshot in the *Amazon Redshift Cluster Management Guide*.

- For API details, see RestoreTableFromClusterSnapshot in *AWS CLI Command Reference*.

`revoke-cluster-security-group-ingress`

The following code example shows how to use `revoke-cluster-security-group-ingress`.

AWS CLI

Example 1: To revoke access from an EC2 security group

The following `revoke-cluster-security-group-ingress` example revokes access to a named Amazon EC2 security group.

```
aws redshift revoke-cluster-security-group-ingress \
    --cluster-security-group-name mysecuritygroup \
    --ec2-security-group-name myec2securitygroup \
    --ec2-security-group-owner-id 123456789012
```

Output:

```
{
    "ClusterSecurityGroup": {
        "ClusterSecurityGroupName": "mysecuritygroup",
        "Description": "This is my cluster security group",
```

```
        "EC2SecurityGroups": [],
        "IPRanges": [],
        "Tags": []
    }
}
```

For more information, see Configuring security group communication settings for an Amazon Redshift cluster or an Amazon Redshift Serverless workgroup in the *Amazon Redshift Cluster Management Guide*.

Example 2: To revoke access to a CIDR range

The following `revoke-cluster-security-group-ingress` example revokes access to a CIDR range.

```
aws redshift revoke-cluster-security-group-ingress \
    --cluster-security-group-name mysecuritygroup \
    --cidrip 192.168.100.100/32
```

Output:

```
{
    "ClusterSecurityGroup": {
        "ClusterSecurityGroupName": "mysecuritygroup",
        "Description": "This is my cluster security group",
        "EC2SecurityGroups": [],
        "IPRanges": [],
        "Tags": []
    }
}
```

For more information, see Configuring security group communication settings for an Amazon Redshift cluster or an Amazon Redshift Serverless workgroup in the *Amazon Redshift Cluster Management Guide*.

- For API details, see RevokeClusterSecurityGroupIngress in *AWS CLI Command Reference*.

`revoke-snapshot-access`

The following code example shows how to use `revoke-snapshot-access`.

AWS CLI

To revoke the authorization of an AWS account to restore a snapshot

The following `revoke-snapshot-access` example revokes the authorization of the AWS account 123456789111 to restore the snapshot `my-snapshot-id`. By default, the output is in JSON format.

```
aws redshift revoke-snapshot-access \
    --snapshot-identifier my-snapshot-id \
    --account-with-restore-access 123456789111
```

Output:

```
{
    "Snapshot": {
        "Status": "available",
        "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
        "EstimatedSecondsToCompletion": 0,
        "AvailabilityZone": "us-west-2a",
        "ClusterVersion": "1.0",
        "MasterUsername": "adminuser",
        "Encrypted": false,
        "OwnerAccount": "123456789012",
        "BackupProgressInMegaBytes": 11.0,
        "ElapsedTimeInSeconds": 0,
        "DBName": "dev",
        "CurrentBackupRateInMegaBytesPerSecond": 0.1534,
        "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
        "ActualIncrementalBackupSizeInMegaBytes": 11.0,
        "SnapshotType": "manual",
        "NodeType": "dw.hs1.xlarge",
        "ClusterIdentifier": "mycluster",
        "TotalBackupSizeInMegaBytes": 20.0,
        "Port": 5439,
        "NumberOfNodes": 2,
        "SnapshotIdentifier": "my-snapshot-id"
    }
}
```

For more information, see Amazon Redshift snapshots and backups in the *Amazon Redshift Cluster Management Guide*.

- For API details, see RevokeSnapshotAccess in *AWS CLI Command Reference*.

`rotate-encryption-key`

The following code example shows how to use `rotate-encryption-key`.

AWS CLI

To rotate encryption key for a cluster

The following `rotate-encryption-key` example rotates the encryption key for the specified cluster.

```
aws redshift rotate-encryption-key \
    --cluster-identifier mycluster
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "rotating-keys",

    }
}
```

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see RotateEncryptionKey in *AWS CLI Command Reference*.

Amazon Rekognition examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Rekognition.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`compare-faces`

The following code example shows how to use `compare-faces`.

For more information, see Comparing faces in images.

AWS CLI

To compare faces in two images

The following `compare-faces` example compares faces in two images stored in an Amazon S3 bucket.

```
aws rekognition compare-faces \
    --source-image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"source.jpg"}}' \
    --target-image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"target.jpg"}}'
```

Output:

```
{
    "UnmatchedFaces": [],
    "FaceMatches": [
        {
            "Face": {
                "BoundingBox": {
                    "Width": 0.12368916720151901,

For more information, see Comparing Faces in Images in the *Amazon Rekognition Developer Guide*.

- For API details, see CompareFaces in *AWS CLI Command Reference*.

`create-collection`

The following code example shows how to use `create-collection`.

For more information, see Creating a collection.

AWS CLI

To create a collection

The following `create-collection` example creates a collection with the specified name.

```
aws rekognition create-collection \
    --collection-id "MyCollection"
```

Output:

```
{
    "CollectionArn": "aws:rekognition:us-west-2:123456789012:collection/
MyCollection",
    "FaceModelVersion": "4.0",
    "StatusCode": 200
}
```

For more information, see Creating a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see CreateCollection in *AWS CLI Command Reference*.

`create-stream-processor`

The following code example shows how to use `create-stream-processor`.

AWS CLI

To create a new stream processor

The following `create-stream-processor` example creates a new stream processor with the specified configuration.

```
aws rekognition create-stream-processor \
    --name my-stream-processor \
    --input '{"KinesisVideoStream":{"Arn":"arn:aws:kinesisvideo:us-
west-2:123456789012:stream/macwebcam/1530559711205"}}' \
    --stream-processor-output '{"KinesisDataStream":{"Arn":"arn:aws:kinesis:us-
west-2:123456789012:stream/AmazonRekognitionRekStream"}}' \
    --role-arn arn:aws:iam::123456789012:role/AmazonRekognitionDetect \
    --settings '{"FaceSearch":
{"CollectionId":"MyCollection","FaceMatchThreshold":85.5}}'
```

Output:

```
{
    "StreamProcessorArn": "arn:aws:rekognition:us-
west-2:123456789012:streamprocessor/my-stream-processor"
}
```

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see CreateStreamProcessor in *AWS CLI Command Reference*.

`delete-collection`

The following code example shows how to use `delete-collection`.

For more information, see Deleting a collection.

AWS CLI

To delete a collection

The following `delete-collection` example deletes the specified collection.

```
aws rekognition delete-collection \
```

```
    --collection-id MyCollection
```

Output:

```
{
    "StatusCode": 200
}
```

For more information, see Deleting a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see DeleteCollection in *AWS CLI Command Reference*.

`delete-faces`

The following code example shows how to use `delete-faces`.

For more information, see Deleting faces from a collection.

AWS CLI

To delete faces from a collection

The following `delete-faces` example deletes the specified face from a collection.

```
aws rekognition delete-faces \
    --collection-id MyCollection \
    --face-ids '["a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]'
```

Output:

```
{
    "DeletedFaces": [
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    ]
}
```

For more information, see Deleting Faces from a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see DeleteFaces in *AWS CLI Command Reference*.

`delete-stream-processor`

The following code example shows how to use `delete-stream-processor`.

AWS CLI

To delete a stream processor

The following `delete-stream-processor` example deletes the specified stream processor.

```
aws rekognition delete-stream-processor \
    --name my-stream-processor
```

This command produces no output.

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see DeleteStreamProcessor in *AWS CLI Command Reference*.

`describe-collection`

The following code example shows how to use `describe-collection`.

For more information, see Describing a collection.

AWS CLI

To describe a collection

The following `describe-collection` example displays the details about the specified collection.

```
aws rekognition describe-collection \
    --collection-id MyCollection
```

Output:

```
{
    "FaceCount": 200,
    "CreationTimestamp": 1569444828.274,
    "CollectionARN": "arn:aws:rekognition:us-west-2:123456789012:collection/
MyCollection",
```

```
    "FaceModelVersion": "4.0"
}
```

For more information, see Describing a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see DescribeCollection in *AWS CLI Command Reference*.

`describe-stream-processor`

The following code example shows how to use `describe-stream-processor`.

AWS CLI

To get information about a stream processor

The following `describe-stream-processor` example displays details about the specified stream processor.

```
aws rekognition describe-stream-processor \
    --name my-stream-processor
```

Output:

```
{
    "Status": "STOPPED",
    "Name": "my-stream-processor",
    "LastUpdateTimestamp": 1532449292.712,
    "Settings": {
        "FaceSearch": {
            "FaceMatchThreshold": 80.0,
            "CollectionId": "my-collection"
        }
    },
    "RoleArn": "arn:aws:iam::123456789012:role/AmazonRekognitionDetectStream",

        }
    },
    "CreationTimestamp": 1532449292.712
}
```

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see DescribeStreamProcessor in *AWS CLI Command Reference*.

`detect-faces`

The following code example shows how to use `detect-faces`.

For more information, see Detecting faces in an image.

AWS CLI

To detect faces in an image

The following `detect-faces` example detects faces in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-faces \
    --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"MyFriend.jpg"}}' \
    --attributes "ALL"
```

Output:

```
{
    "FaceDetails": [
        {
            "Confidence": 100.0,
            "Eyeglasses": {

For more information, see Detecting Faces in an Image in the *Amazon Rekognition Developer Guide*.

- For API details, see DetectFaces in *AWS CLI Command Reference*.

`detect-labels`

The following code example shows how to use `detect-labels`.

For more information, see Detecting labels in an image.

AWS CLI

To detect a label in an image

The following `detect-labels` example detects scenes and objects in an image stored in an Amazon S3 bucket.

```
aws rekognition detect-labels \
    --image '{"S3Object":{"Bucket":"amzn-s3-demo-bucket","Name":"image"}}'
```

Output:

```
{
    "Labels": [
        {
            "Instances": [],
            "Confidence": 99.15271759033203,

```

For more information, see Detecting Labels in an Image in the *Amazon Rekognition Developer Guide*.

- For API details, see DetectLabels in *AWS CLI Command Reference*.

`detect-moderation-labels`

The following code example shows how to use `detect-moderation-labels`.

For more information, see Detecting inappropriate images.

AWS CLI

To detect unsafe content in an image

The following `detect-moderation-labels` example detects unsafe content in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-moderation-labels \
    --image "S3Object={Bucket=MyImageS3Bucket,Name=gun.jpg}"
```

Output:

```
{
    "ModerationModelVersion": "3.0",
    "ModerationLabels": [
        {
            "Confidence": 97.29618072509766,
            "ParentName": "Violence",
            "Name": "Weapon Violence"
        },
        {
            "Confidence": 97.29618072509766,
            "ParentName": "",
            "Name": "Violence"
        }
    ]
}
```

For more information, see Detecting Unsafe Images in the *Amazon Rekognition Developer Guide*.

- For API details, see DetectModerationLabels in *AWS CLI Command Reference*.

`detect-text`

The following code example shows how to use `detect-text`.

For more information, see Detecting text in an image.

AWS CLI

To detect text in an image

The following `detect-text` example detects text in the specified image.

```
aws rekognition detect-text \
    --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePicture.jpg"}}'
```

Output:

```
{
    "TextDetections": [
        {

For more information, see Detecting text in an image in the *Amazon Rekognition Developer Guide*.

- For API details, see DetectText in *AWS CLI Command Reference*.

`get-celebrity-info`

The following code example shows how to use `get-celebrity-info`.

AWS CLI

To get information about a celebrity

The following `get-celebrity-info` example displays information about the specified celebrity. The `id` parameter comes from a previous call to `recognize-celebrities`.

```
aws rekognition get-celebrity-info \
    --id nnnnnnn
```

Output:

```
{
    "Name": "Celeb A",
    "Urls": [
        "www.imdb.com/name/aaaaaaaaa"
    ]
}
```

For more information, see Getting Information About a Celebrity in the *Amazon Rekognition Developer Guide*.

- For API details, see GetCelebrityInfo in *AWS CLI Command Reference*.

`get-celebrity-recognition`

The following code example shows how to use `get-celebrity-recognition`.

AWS CLI

To get the results of a celebrity recognition operation

The following `get-celebrity-recognition` example displays the results of a celebrity recognition operation that you started previously by calling `start-celebrity-recognition`.

```
aws rekognition get-celebrity-recognition  \
    --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```

`get-label-detection`

The following code example shows how to use `get-label-detection`.

AWS CLI

To get the results of an objects and scenes detection operation

The following `get-label-detection` example displays the results of an objects and scenes detection operation that you started previously by calling `start-label-detection`.

```
aws rekognition get-label-detection  \
    --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```
{
    "Labels": [
        {
            "Timestamp": 0,
            "Label": {
                "Instances": [],
                "Confidence": 50.19071578979492,
                "Parents": [
                    {
                        "Name": "Person"
                    },
                    {
                        "Name": "Crowd"
                    }
                ],
                "Name": "Audience"
            }
        },

index-faces

The following code example shows how to use `index-faces`.

For more information, see Adding faces to a collection.

AWS CLI

To add faces to a collection

The following `index-faces` example adds the faces found in an image to the specified collection.

```
aws rekognition index-faces \
    --image '{"S3Object":{"Bucket":"MyVideoS3Bucket","Name":"MyPicture.jpg"}}' \
    --collection-id MyCollection \
    --max-faces 1 \
    --quality-filter "AUTO" \
    --detection-attributes "ALL" \
    --external-image-id "MyPicture.jpg"
```

Output:

```
{
    "FaceRecords": [
        {
            "FaceDetail": {
                "Confidence": 99.993408203125,

- For API details, see IndexFaces in *AWS CLI Command Reference*.

`list-collections`

The following code example shows how to use `list-collections`.

For more information, see Listing collections.

AWS CLI

To list the available collections

The following `list-collections` example lists the available collections in the AWS account.

```
aws rekognition list-collections
```

Output:

```
{
    "FaceModelVersions": [
```

```
            "2.0",
            "3.0",
            "3.0",
            "3.0",
            "4.0",
            "1.0",
            "3.0",
            "4.0",
            "4.0",
            "4.0"
        ],
        "CollectionIds": [
            "MyCollection1",
            "MyCollection2",
            "MyCollection3",

            "MyCollection5",
            "MyCollection6",
            "MyCollection7",
            "MyCollection8",
            "MyCollection9",
            "MyCollection10"
        ]
}
```

For more information, see Listing Collections in the *Amazon Rekognition Developer Guide*.

- For API details, see ListCollections in *AWS CLI Command Reference*.

`list-faces`

The following code example shows how to use `list-faces`.

For more information, see Listing faces in a collection.

AWS CLI

To list the faces in a collection

The following `list-faces` example lists the faces in the specified collection.

```
aws rekognition list-faces \
    --collection-id MyCollection
```

Output:

```
{
    "FaceModelVersion": "3.0",
    "Faces": [
        {
            "BoundingBox": {
                "Width": 0.5216310024261475,

        }
    ]
}
```

For more information, see Listing Faces in a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see ListFaces in *AWS CLI Command Reference*.

`list-stream-processors`

The following code example shows how to use `list-stream-processors`.

AWS CLI

To list the stream processors in your account

The following `list-stream-processors` example lists the stream processors in your account and the state of each.

```
aws rekognition list-stream-processors
```

Output:

```
{
    "StreamProcessors": [
        {
            "Status": "STOPPED",
            "Name": "my-stream-processor"
        }
    ]
}
```

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see ListStreamProcessors in *AWS CLI Command Reference*.

`recognize-celebrities`

The following code example shows how to use `recognize-celebrities`.

For more information, see Recognizing celebrities in an image.

AWS CLI

To recognize celebrities in an image

The following `recognize-celebrities` example recognizes celebrities in the specified image stored in an Amazon S3 bucket.

```
aws rekognition recognize-celebrities \
    --image "S3Object={Bucket=MyImageS3Bucket,Name=moviestars.jpg}"
```

Output:

```

- For API details, see RecognizeCelebrities in *AWS CLI Command Reference*.

`search-faces-by-image`

The following code example shows how to use `search-faces-by-image`.

For more information, see Searching for a face (image).

AWS CLI

To search for faces in a collection that match the largest face in an image.

The following `search-faces-by-image` example searches for faces in a collection that match the largest face in the specified image.

```
aws rekognition search-faces-by-image \
```

```
    --image '{"S3Object":{"Bucket":"amzn-s3-demo-
bucket","Name":"ExamplePerson.jpg"}}' \
    --collection-id MyFaceImageCollection
```

Output:

```
{
    "SearchedFaceBoundingBox": {
        "Width": 0.18562500178813934,

}
```

For more information, see Searching for a Face Using Its Face ID in the *Amazon Rekognition Developer Guide*.

- For API details, see SearchFaces in *AWS CLI Command Reference*.

`start-celebrity-recognition`

The following code example shows how to use `start-celebrity-recognition`.

AWS CLI

To start the recognition of celebrities in a stored video

The following `start-celebrity-recognition` example starts a job to look for celebrities in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-celebrity-recognition \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Recognizing Celebrities in a Stored Video in the *Amazon Rekognition Developer Guide*.

- For API details, see StartCelebrityRecognition in *AWS CLI Command Reference*.

`start-content-moderation`

The following code example shows how to use `start-content-moderation`.

AWS CLI

To start the recognition of unsafe content in a stored video

The following `start-content-moderation` example starts a job to detect unsafe content in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-content-moderation \
```

```
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Unsafe Stored Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see StartContentModeration in *AWS CLI Command Reference*.

`start-face-detection`

The following code example shows how to use `start-face-detection`.

AWS CLI

To detect faces in a video

The following `start-face-detection` example starts a job to detect faces in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-face-detection \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Faces in a Stored Video in the *Amazon Rekognition Developer Guide*.

- For API details, see StartFaceDetection in *AWS CLI Command Reference*.

`start-face-search`

The following code example shows how to use `start-face-search`.

AWS CLI

To search for faces in a collection that match faces detected in a video

The following `start-face-search` example starts a job to search for faces in a collection that match faces detected in the specified video file in an Amazon S3 bucket.

```
aws rekognition start-face-search \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}" \
    --collection-id collection
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Searching Stored Videos for Faces in the *Amazon Rekognition Developer Guide*.

- For API details, see StartFaceSearch in *AWS CLI Command Reference*.

`start-label-detection`

The following code example shows how to use `start-label-detection`.

AWS CLI

To detect objects and scenes in a video

The following `start-label-detection` example starts a job to detect objects and scenes in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-label-detection \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
```

```
}
```

For more information, see Detecting Labels in a Video in the *Amazon Rekognition Developer Guide*.

- For API details, see StartLabelDetection in *AWS CLI Command Reference*.

`start-person-tracking`

The following code example shows how to use `start-person-tracking`.

AWS CLI

To start the pathing of people in a stored video

The following `start-person-tracking` example starts a job to track the paths that people take in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-person-tracking \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see People Pathing in the *Amazon Rekognition Developer Guide*.

- For API details, see StartPersonTracking in *AWS CLI Command Reference*.

`start-stream-processor`

The following code example shows how to use `start-stream-processor`.

AWS CLI

To start a stream processor

The following `start-stream-processor` example starts the specified video stream processor.

```
aws rekognition start-stream-processor \
    --name my-stream-processor
```

This command produces no output.

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see StartStreamProcessor in *AWS CLI Command Reference*.

`stop-stream-processor`

The following code example shows how to use `stop-stream-processor`.

AWS CLI

To stop a running stream processor

The following `stop-stream-processor` example stops the specified running stream processor.

```
aws rekognition stop-stream-processor \
    --name my-stream-processor
```

This command produces no output.

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see StopStreamProcessor in *AWS CLI Command Reference*.

AWS RAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS RAM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-resource-share-invitation`

The following code example shows how to use `accept-resource-share-invitation`.

AWS CLI

To accept a resource share invitation

The following `accept-resource-share-invitation` example accepts the specified resource share invitation. Principals in the invited account can immediately start using the resources in the share.

```
aws ram accept-resource-share-invitation \
    --resource-share-invitation-arn arn:aws:ram:us-west-2:123456789111:resource-share-invitation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "resourceShareInvitation": {
        "resourceShareInvitationArn": "arn:aws:ram:us-west-2:123456789111:resource-share-invitation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceShareName": "MyLicenseShare",
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789111:resource-share/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "senderAccountId": "123456789111",
        "receiverAccountId": "123456789222",
        "invitationTimestamp": "2021-09-22T15:07:35.620000-07:00",
        "status": "ACCEPTED"
    }
}
```

For more information, see Accepting and rejecting resource share invitations in the *AWS RAM User Guide*.

- For API details, see AcceptResourceShareInvitation in *AWS CLI Command Reference*.

`associate-resource-share-permission`

The following code example shows how to use `associate-resource-share-permission`.

AWS CLI

To associate a RAM managed permission with a resource share

The following `associate-resource-share-permission` example replaces the existing managed permission for the relevant resource type with the specified managed permission. Access to all resources of the relevant resource type is governed by the new permission.

```
aws ram associate-resource-share-permission \
    --permission-arn arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite \
    --replace \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "returnValue": true
}
```

For more information, see Managing permissions in AWS RAM in the *AWS RAM User Guide*.

- For API details, see AssociateResourceSharePermission in *AWS CLI Command Reference*.

`associate-resource-share`

The following code example shows how to use `associate-resource-share`.

AWS CLI

Example 1: To associate a resource with a resource share

The following `associate-resource-share` example adds a license configuration to the specified resource share.

```
aws ram associate-resource-share \
```

```
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --resource-arns arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "associatedEntity": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
            "associationType": "RESOURCE",
            "status": "ASSOCIATING",
            "external": false
        }
    ]
}
```

For more information, see Update a resource share in AWS RAM in the *AWS RAM User Guide*.

Example 2: To associate a principal with a resource share

The following `associate-resource-share` example grants access for the specified resource share to all accounts in the specified organizational unit.

```
aws ram associate-resource-share \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-
rEXAMPLE
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "status": "ASSOCIATING",
            "associationType": "PRINCIPAL",
```

```
            "associatedEntity": "arn:aws:organizations::123456789012:ou/
o-63bEXAMPLE/ou-46xi-rEXAMPLE",
            "external": false,
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Update a resource share in AWS RAM in the *AWS RAM User Guide*.

- For API details, see AssociateResourceShare in *AWS CLI Command Reference*.

`create-resource-share`

The following code example shows how to use `create-resource-share`.

AWS CLI

Example 1: To create a resource share

The following `create-resource-share` example creates an empty resource share with the specified name. You must separately add resources, principals, and permissions to the share.

```
aws ram create-resource-share \
    --name MyNewResourceShare
```

Output:

```
{
    "resourceShare": {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "name": "MyNewResourceShare",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": true,
        "status": "ACTIVE",
        "creationTime": 1634586271.302,
        "lastUpdatedTime": 1634586271.302
    }
}
```

For more information, see Creating a resource share in AWS RAM in the *AWS RAM User Guide*.

Example 2: To create a resource share with AWS accounts as principals

The following `create-resource-share` example creates a resource share and grants access to the specified AWS account (123456789111). If the specified principals are not part of the same AWS Organization, then invitations are sent and must be accepted before access is granted.

```
aws ram create-resource-share \
    --name MyNewResourceShare \
    --principals 123456789111
```

Output:

```
{
    "resourceShare": {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "name": "MyNewResourceShare",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": true,
        "status": "ACTIVE",
        "creationTime": 1634586751.437,
        "lastUpdatedTime": 1634586751.437
    }
}
```

For more information, see Creating a resource share in AWS RAM in the *AWS RAM User Guide*.

Example 3: To create a resource share restricted to your AWS Organization

The following `create-resource-share` example creates a resource share that is restricted to accounts in the AWS Organization that your account is a member of, and adds the specified OU as a principal. All accounts in that OU can use the resources in the resource share.

```
aws ram create-resource-share \
    --name MyNewResourceShare \
    --no-allow-external-principals \
    --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-
rEXAMPLE
```

Output:

```
{
    "resourceShare": {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "name": "MyNewResourceShare",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": false,
        "status": "ACTIVE",
        "creationTime": 1634587042.49,
        "lastUpdatedTime": 1634587042.49
    }
}
```

For more information, see Creating a resource share in AWS RAM in the *AWS RAM User Guide*.

- For API details, see CreateResourceShare in *AWS CLI Command Reference*.

`delete-resource-share`

The following code example shows how to use `delete-resource-share`.

AWS CLI

To delete a resource share

The following `delete-resource-share` example deletes the specified resource share.

```
aws ram delete-resource-share \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "returnValue": true
}
```

For more information, see Deleting a resource share in AWS RAM in the *AWS RAM User Guide*.

- For API details, see DeleteResourceShare in *AWS CLI Command Reference*.

`disassociate-resource-share-permission`

The following code example shows how to use `disassociate-resource-share-permission`.

AWS CLI

To remove a RAM managed permission for a resource type from a resource share

The following `disassociate-resource-share-permission` example removes the RAM managed permission for Glue databases from the specified resource share.

```
aws ram disassociate-resource-share-permission \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --permission-arn arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite
```

Output:

```
{
    "returnValue": true
}
```

For more information, see Managing permissions in AWS RAM in the *AWS RAM User Guide*.

- For API details, see DisassociateResourceSharePermission in *AWS CLI Command Reference*.

`disassociate-resource-share`

The following code example shows how to use `disassociate-resource-share`.

AWS CLI

To remove a resource from a resource share

The following `disassociate-resource-share` example removes the specified resource, in this case a VPC subnet, from the specified resource share. Any principals with access to the resource share can no longer perform operations on that resource.

```
aws ram disassociate-resource-share \
```

```
    --resource-arns arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "associatedEntity": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE",
            "associationType": "RESOURCE",
            "status": "DISASSOCIATING",
            "external": false
        }
    ]
}
```

For more information, see Update a resource share in AWS RAM in the *AWS RAM User Guide*.

- For API details, see DisassociateResourceShare in *AWS CLI Command Reference*.

`enable-sharing-with-aws-organization`

The following code example shows how to use `enable-sharing-with-aws-organization`.

AWS CLI

To enable resource sharing across AWS Organizations

The following `enable-sharing-with-aws-organization` example enables resource sharing across your organization and organizational units.

```
aws ram enable-sharing-with-aws-organization
```

Output:

```
{
```

```
    "returnValue": true
}
```

For more information, see Sharing your AWS resources in the *AWS RAM User Guide*.

- For API details, see EnableSharingWithAwsOrganization in *AWS CLI Command Reference*.

`get-permission`

The following code example shows how to use `get-permission`.

AWS CLI

To retrieve the details for a RAM managed permission

The following `get-permission` example displays the details for the default version of the specified RAM managed permission.

```
aws ram get-permission \
    --permission-arn arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase
```

Output:

```
{
    "permission": {
        "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase",
        "version": "2",
        "defaultVersion": true,
        "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
        "resourceType": "glue:Database",
        "permission": "{\"Effect\":\"Allow\",\"Action\":[\"glue:GetTable
\", \"glue:UpdateTable\", \"glue:DeleteTable\", \"glue:BatchDeleteTable\",
 \"glue:BatchDeleteTableVersion\", \"glue:GetTableVersion\", \"glue:GetTableVersions
\", \"glue:GetPartition\", \"glue:GetPartitions\", \"glue:BatchGetPartition\",
 \"glue:BatchCreatePartition\", \"glue:CreatePartition\", \"glue:UpdatePartition
\", \"glue:BatchDeletePartition\", \"glue:DeletePartition\", \"glue:GetTables\",
 \"glue:SearchTables\"]}",
        "creationTime": 1624912434.431,
        "lastUpdatedTime": 1624912434.431,
        "isResourceTypeDefault": false
```

```
    }
}
```

For more information, see Viewing managed permissions in the *AWS RAM User Guide*.

- For API details, see GetPermission in *AWS CLI Command Reference*.

`get-resource-policies`

The following code example shows how to use `get-resource-policies`.

AWS CLI

To get the policies for a resource

The following `get-resource-policies` example displays the resource-based permission policies for the specified resource associated with a resource share.

```
aws ram get-resource-policies \
    --resource-arns arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE
```

Output:

```
{
    "policies": [
        "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"RamStatement1\",
\"Effect\":\"Allow\",\"Principal\":{\"AWS\":[]},\"Action\":[\"ec2:RunInstances
\",\"ec2:CreateNetworkInterface\",\"ec2:DescribeSubnets\"],\"Resource\":
\"arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0250c25a1fEXAMPLE\"}]}"
    ]
}
```

For more information, see Viewing resource shares you created in AWS RAM in the *AWS RAM User Guide*.

- For API details, see GetResourcePolicies in *AWS CLI Command Reference*.

`get-resource-share-associations`

The following code example shows how to use `get-resource-share-associations`.

AWS CLI

Example 1: To list all resource associations for all resource types

The following `get-resource-share-associations` example lists the resource associations for all resource types across all of your resource shares.

```
aws ram get-resource-share-associations \
    --association-type RESOURCE
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "associatedEntity": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE",
            "resourceShareName": "MySubnetShare",
            "associationType": "RESOURCE",
            "status": "ASSOCIATED",
            "creationTime": 1565303590.973,
            "lastUpdatedTime": 1565303591.695,
            "external": false
        },
        {
