            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "associatedEntity": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
            "resourceShareName": "MyLicenseShare",
            "associationType": "RESOURCE",
            "status": "ASSOCIATED",
            "creationTime": 1632342958.457,
            "lastUpdatedTime": 1632342958.907,
            "external": false
        }
    ]
}
```

For more information, see Viewing resource shares you created in AWS RAM in the *AWS RAM User Guide*.

Example 2: To list principal associations for a resource share

The following `get-resource-share-associations` example lists only the principal associations for only the specified resource share.

```
aws ram get-resource-share-associations \
    --resource-share-arns arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --association-type PRINCIPAL
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "resourceShareName": "MyNewResourceShare",
            "associatedEntity": "arn:aws:organizations::123456789012:ou/
o-63bEXAMPLE/ou-46xi-rEXAMPLE",
            "associationType": "PRINCIPAL",
            "status": "ASSOCIATED",
            "creationTime": 1634587042.49,
            "lastUpdatedTime": 1634587044.291,
            "external": false
        }
    ]
}
```

For more information, see Viewing resource shares you created in AWS RAM in the *AWS RAM User Guide*.

- For API details, see GetResourceShareAssociations in *AWS CLI Command Reference*.

`get-resource-share-invitations`

The following code example shows how to use `get-resource-share-invitations`.

AWS CLI

To list your resource share invitations

The following `get-resource-share-invitations` example lists your current resource share invitations.

```
aws ram get-resource-share-invitations
```

Output:

```
{
    "resourceShareInvitations": [
        {
            "resourceShareInvitationArn": "arn:aws:ram:us-
west2-1:123456789111:resource-share-invitation/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
            "resourceShareName": "project-resource-share",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789111:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "senderAccountId": "123456789111",
            "receiverAccountId": "123456789222",
            "invitationTimestamp": 1565312166.258,
            "status": "PENDING"
        }
    ]
}
```

For more information, see Accepting and rejecting resource share invitations in the *AWS RAM User Guide*.

- For API details, see GetResourceShareInvitations in *AWS CLI Command Reference*.

`get-resource-shares`

The following code example shows how to use `get-resource-shares`.

AWS CLI

Example 1: To list resource shares you own and share with others

The following `get-resource-shares` example lists the resource shares that created and are sharing with others.

```
aws ram get-resource-shares \
```

```
    --resource-owner SELF
```

Output:

```
{
    "resourceShares": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "name": "my-resource-share",
            "owningAccountId": "123456789012",
            "allowExternalPrincipals": false,
            "status": "ACTIVE",
            "tags": [
                {
                    "key": "project",
                    "value": "lima"
                }
            ],
            "creationTime": 1565295733.282,
            "lastUpdatedTime": 1565295733.282
        },
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "name": "my-resource-share",
            "owningAccountId": "123456789012",
            "allowExternalPrincipals": true,
            "status": "ACTIVE",
            "creationTime": 1565295733.282,
            "lastUpdatedTime": 1565295733.282
        }
    ]
}
```

For more information, see Viewing resource shares you created in AWS RAM in the *AWS RAM User Guide*.

Example 2: To list resource shares owned by others and shared with you

The following `get-resource-shares` example lists the resource shares that others created and shared with you. In this example, there are none.

```
aws ram get-resource-shares \
    --resource-owner OTHER-ACCOUNTS
```

Output:

```
{
    "resourceShares": []
}
```

For more information, see Viewing resource shares shared with you in the *AWS RAM User Guide*.

- For API details, see GetResourceShares in *AWS CLI Command Reference*.

`list-pending-invitation-resources`

The following code example shows how to use `list-pending-invitation-resources`.

AWS CLI

To list the resources that are available in a pending resource share

The following `list-pending-invitation-resources` example lists all of the resources that are in the resource share associated with the specified invitation.

```
aws ram list-pending-invitation-resources \
    --resource-share-invitation-arn arn:aws:ram:us-west-2:123456789012:resource-share-invitation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "resources": [
        {
            "arn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-04a555b0e6EXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "creationTime": 1634676051.269,
            "lastUpdatedTime": 1634676052.07,
            "status": "AVAILABLE",
            "type": "ec2:Subnet"
        },
```

```
        {
            "arn": "arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "creationTime": 1624912434.431,
            "lastUpdatedTime": 1624912434.431,
            "status": "AVAILABLE",
            "type": "license-manager:LicenseConfiguration"
        }
    ]
}
```

For more information, see Viewing resources shared with you in the *AWS RAM User Guide*.

- For API details, see ListPendingInvitationResources in *AWS CLI Command Reference*.

`list-permissions`

The following code example shows how to use `list-permissions`.

AWS CLI

To list the available RAM managed permissions

The following `list-permissions` example lists all of the RAM managed permissions available for only the AWS Glue database resource type.

```
aws ram list-permissions \
    --resource-type glue:Database
```

Output:

```
{
    "permissions": [
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMDefaultPermissionGlueDatabase",
            "version": "1",
            "defaultVersion": true,
            "name": "AWSRAMDefaultPermissionGlueDatabase",
            "resourceType": "glue:Database",
            "creationTime": 1592007820.935,
```

```
            "lastUpdatedTime": 1592007820.935,
            "isResourceTypeDefault": true
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
            "resourceType": "glue:Database",
            "creationTime": 1624912413.323,
            "lastUpdatedTime": 1624912413.323,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueDatabaseReadWrite",
            "resourceType": "glue:Database",
            "creationTime": 1624912417.4,
            "lastUpdatedTime": 1624912417.4,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
            "resourceType": "glue:Database",
            "creationTime": 1624912434.431,
            "lastUpdatedTime": 1624912434.431,
            "isResourceTypeDefault": false
        }
    ]
}
```

The following `list-permissions` example displays the available RAM managed permissions for all resource types.

```
aws ram list-permissions
```

Output:

```
{
    "permissions": [
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMBlankEndEntityCertificateAPICSRPassthroughIssuanceCertificateAuthority",
            "version": "1",
            "defaultVersion": true,
            "name":
 "AWSRAMBlankEndEntityCertificateAPICSRPassthroughIssuanceCertificateAuthority",
            "resourceType": "acm-pca:CertificateAuthority",
            "creationTime": 1623264861.085,
            "lastUpdatedTime": 1623264861.085,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/AWSRAMDefaultPermissionAppMesh",
            "version": "1",
            "defaultVersion": true,
            "name": "AWSRAMDefaultPermissionAppMesh",
            "resourceType": "appmesh:Mesh",
            "creationTime": 1589307188.584,
            "lastUpdatedTime": 1589307188.584,
            "isResourceTypeDefault": true
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMSubordinateCACertificatePathLen0IssuanceCertificateAuthority",
            "version": "1",
            "defaultVersion": true,
            "name":
 "AWSRAMSubordinateCACertificatePathLen0IssuanceCertificateAuthority",
            "resourceType": "acm-pca:CertificateAuthority",
            "creationTime": 1623264876.75,
            "lastUpdatedTime": 1623264876.75,
            "isResourceTypeDefault": false
        }
    ]
}
```

For more information, see Viewing managed permissions in the *AWS RAM User Guide*.

- For API details, see ListPermissions in *AWS CLI Command Reference*.

`list-principals`

The following code example shows how to use `list-principals`.

AWS CLI

To list principals with access to a resource

The following `list-principals` example displays a list of the principals that can access resources of the specified type through any resource shares.

```
aws ram list-principals \
    --resource-owner SELF \
    --resource-type ec2:Subnet
```

Output:

```
{
    "principals": [
        {
            "id": "arn:aws:organizations::123456789012:ou/o-gx7EXAMPLE/ou-29c5-
zEXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "creationTime": 1565298209.737,
            "lastUpdatedTime": 1565298211.019,
            "external": false
        }
    ]
}
```

For more information, see Viewing the principals you share resources with in AWS RAM in the *AWS RAM User Guide*.

- For API details, see ListPrincipals in *AWS CLI Command Reference*.

`list-resource-share-permissions`

The following code example shows how to use `list-resource-share-permissions`.

AWS CLI

To list all of the RAM managed permissions currently attached to a resource share

The following `list-resource-share-permissions` example lists all of the RAM managed permissions that are attached to the specified resource share.

```
aws ram list-resource-share-permissions \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "permissions": [
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMDefaultPermissionLicenseConfiguration",
            "version": "1",
            "resourceType": "license-manager:LicenseConfiguration",
            "status": "ASSOCIATED",
            "lastUpdatedTime": 1632342984.234
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite",
            "version": "2",
            "resourceType": "glue:Database",
            "status": "ASSOCIATED",
            "lastUpdatedTime": 1632512462.297
        }
    ]
}
```

For more information, see Managing permissions in AWS RAM in the *AWS RAM User Guide*.

- For API details, see ListResourceSharePermissions in *AWS CLI Command Reference*.

`list-resource-types`

The following code example shows how to use `list-resource-types`.

AWS CLI

To list the resource types that are supported by AWS RAM

The following `list-resource-types` example lists all of the resource types currently supported by AWS RAM.

```
aws ram list-resource-types
```

Output:

```
{
    "resourceTypes": [
        {
            "resourceType": "route53resolver:FirewallRuleGroup",
            "serviceName": "route53resolver"
        },
        {
            "resourceType": "ec2:LocalGatewayRouteTable",
            "serviceName": "ec2"
        },
        {
            "resourceType": "ec2:Subnet",
            "serviceName": "ec2"
        },
        {
            "resourceType": "ec2:TransitGatewayMulticastDomain",
            "serviceName": "ec2"
        }
    ]
}
```

For more information, see Shareable AWS resources in the *AWS RAM User Guide*.

- For API details, see ListResourceTypes in *AWS CLI Command Reference*.

`list-resources`

The following code example shows how to use `list-resources`.

AWS CLI

To list the resources associated with a resource share

The following `list-resources` example lists all resources in the specified resource share that are of the specified resource type.

```
aws ram list-resources \
    --resource-type ec2:Subnet \
    --resource-owner SELF \
    --resource-share-arns arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "resources": [
        {
            "arn": "aarn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1f4e15235",
            "type": "ec2:Subnet",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "creationTime": 1565301545.023,
            "lastUpdatedTime": 1565301545.947
        }
    ]
}
```

For more information, see Viewing your shared resources in AWS RAM in the *AWS RAM User Guide*.

- For API details, see ListResources in *AWS CLI Command Reference*.

`promote-resource-share-created-from-policy`

The following code example shows how to use `promote-resource-share-created-from-policy`.

AWS CLI

To promote a resource-policy based resource share to full functionality in AWS RAM

The following `promote-resource-share-created-from-policy` example takes a resource share that you created implicitly by attaching a resource-based policy, and converts it to be fully functional with the AWS RAM console and its CLI and API operations.

```
aws ram promote-resource-share-created-from-policy \
```

```
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "returnValue": true
}
```

For more information, see What about cross-account access with resource-based policies? in the *AWS RAM User Guide*.

- For API details, see PromoteResourceShareCreatedFromPolicy in *AWS CLI Command Reference*.

`reject-resource-share-invitation`

The following code example shows how to use `reject-resource-share-invitation`.

AWS CLI

To reject a resource share invitation

The following `reject-resource-share-invitation` example rejects the specified resource share invitation.

```
aws ram reject-resource-share-invitation \
    --resource-share-invitation-arn arn:aws:ram:us-west-2:123456789111:resource-
share-invitation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "resourceShareInvitation": {
        "resourceShareInvitationArn": "arn:aws:ram:us-west-2:123456789111:resource-
share-invitation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "resourceShareName": "project-resource-share",
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789111:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "senderAccountId": "123456789111",
        "receiverAccountId": "123456789222",
```

```
        "invitationTimestamp": 1565319592.463,
        "status": "REJECTED"
    }
}
```

For more information, see Accepting and rejecting resource share invitations in the *AWS RAM User Guide*.

- For API details, see RejectResourceShareInvitation in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a resource share

The following `tag-resource` example adds a tag key `project` and associated value `lima` to the specified resource share.

```
aws ram tag-resource \
    --tags key=project,value=lima \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Update a resource share in AWS RAM in the *AWS RAM User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource share

The following `untag-resource` example removes the `project` tag key and associated value from the specified resource share.

```
aws ram untag-resource \
    --tag-keys project \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Update a resource share in AWS RAM in the *AWS RAM User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-resource-share`

The following code example shows how to use `update-resource-share`.

AWS CLI

To update a resource share

The following `update-resource-share` example changes the specified resource share to allow external principals that are not in an AWS Organization.

```
aws ram update-resource-share \
    --allow-external-principals \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "resourceShare": {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/

        "lastUpdatedTime": 1565303080.023
    }
}
```

For more information, see Update a resource share in AWS RAM in the *AWS RAM User Guide*.

- For API details, see UpdateResourceShare in *AWS CLI Command Reference*.

Resource Explorer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Explorer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-default-view`

The following code example shows how to use `associate-default-view`.

AWS CLI

To set a Resource Explorer view as the default for its AWS Region

The following `associate-default-view` example sets a view, as specified by its ARN, to be the default view for the AWS Region in which you call the operation.

```
aws resource-explorer-2 associate-default-view \
    --view-arn arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-Main-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-Main-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

```
}
```

For more information, see Setting a default view in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see AssociateDefaultView in *AWS CLI Command Reference*.

`batch-get-view`

The following code example shows how to use `batch-get-view`.

AWS CLI

To retrieve details about multiple Resource Explorer views

The following `batch-get-view` example displays the details about two views specified by their ARNs. Use spaces to separate the multiple ARNs in the --view-arn parameter.

```
aws resource-explorer-2 batch-get-view \
    --view-arns arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-EC2-Only-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-Main-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Views": [
        {
            "Filters": {
                "FilterString": "service:ec2"
            },
            "IncludedProperties": [
                {
                    "Name": "tags"
                }
            ],
            "LastUpdatedAt": "2022-07-13T21:33:45.249000+00:00",
            "Owner": "123456789012",
            "Scope": "arn:aws:iam::123456789012:root",
            "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-EC2-Only-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        },
```

```
        {
            "Filters": {
                "FilterString": ""
            },
            "IncludedProperties": [
                {
                    "Name": "tags"
                }
            ],
            "LastUpdatedAt": "2022-07-13T20:34:11.314000+00:00",
            "Owner": "123456789012",
            "Scope": "arn:aws:iam::123456789012:root",
            "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-
Main-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ],
    "Errors": []
}
```

For more information about views, see Working with views in the *AWS Resource Explorer Users Guide*.

- For API details, see BatchGetView in *AWS CLI Command Reference*.

`create-index`

The following code example shows how to use `create-index`.

AWS CLI

To turn on Resource Explorer in an AWS Region by creating an index

The following `create-index` example creates a local index in the AWS Region in which the operation is called. The AWS CLI automatically generates a random `client-token` parameter value and includes it in the call to AWS if you don't specify a value.

```
aws resource-explorer-2 create-index
```

Output:

```
{
```

```
    "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE22222c",
    "CreatedAt": "2022-11-01T20:00:59.149Z",
    "State": "CREATING"
}
```

After you create a local index, you can convert it into the aggregator index for the account by running the update-index-type command.

For more information, see Creating user-owned indexes for enhanced Resource Explorer functionality in the *AWS Resource Explorer Users Guide*.

- For API details, see CreateIndex in *AWS CLI Command Reference*.

`create-view`

The following code example shows how to use `create-view`.

AWS CLI

Example 1: To create an unfiltered view for the index in an AWS Region

The following `create-view` example creates a view in the specified AWS Region that returns all results in the Region without any filtering. The view includes the optional Tags field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```
aws resource-explorer-2 create-view \
    --view-name My-Main-View \
    --included-properties Name=tags \
    --region us-west-2
```

Output:

```
{
    "View": {
        "Filters": {
            "FilterString": ""
        },
        "IncludedProperties": [
            {
```

```
                "Name": "tags"
            }
        ],
        "LastUpdatedAt": "2022-07-13T20:34:11.314000+00:00",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-Main-
View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

Example 2: To create a view that returns only resources associated with Amazon EC2

The following `create-view` example creates a view in AWS Region `us-west-2` that returns only those resources in the Region that are associated with the Amazon EC2 service. The view includes the optional `Tags` field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```
aws resource-explorer-2 create-view \
    --view-name My-EC2-Only-View \
    --included-properties Name=tags \
    --filters FilterString="service:ec2" \
    --region us-west-2
```

Output:

```
{
    "View": {
        "Filters": {
            "FilterString": "service:ec2"
        },
        "IncludedProperties": [
            {
                "Name":"tags"
            }
        ],
        "LastUpdatedAt": "2022-07-13T21:35:09.059Z",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-EC2-
Only-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

```
    }
}
```

For more information, see Creating Resource Explorer views to use for search in the *AWS Resource Explorer Users Guide*.

- For API details, see CreateView in *AWS CLI Command Reference*.

`delete-index`

The following code example shows how to use `delete-index`.

AWS CLI

To turn off Resource Explorer in an AWS Region by deleting its index

The following `delete-index` example deletes the specified Resource Explorer index in the AWS Region in which you make the request.

```
aws resource-explorer-2 delete-index \
    --arn arn:aws:resource-explorer-2:us-west-2:123456789012:index/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --region us-west-2
```

Output:

```
{
    "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "State": "DELETING"
}
```

For more information about deleting an index, see Turning off Resource Explorer in the *AWS Resource Explorer Users Guide*.

- For API details, see DeleteIndex in *AWS CLI Command Reference*.

`delete-view`

The following code example shows how to use `delete-view`.

AWS CLI

To delete a Resource Explorer view

The following `delete-view` example deletes a view specified by its ARN.

```
aws resource-explorer-2 delete-view \
    --view-arn arn:aws:resource-explorer-2:us-west-2:123456789012:view/EC2-Only-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/EC2-Only-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Deleting views in Resource Explorer in the *AWS Resource Explorer Users Guide*.

- For API details, see DeleteView in *AWS CLI Command Reference*.

`disassociate-default-view`

The following code example shows how to use `disassociate-default-view`.

AWS CLI

To remove the default Resource Explorer view for an AWS Region

The following `disassociate-default-view` example removes the default Resource Explorer view for the AWS Region in which you call the operation. After performing this operation, all search operations in the Region must explicitly specify a view or the operation fails.

```
aws resource-explorer-2 disassociate-default-view
```

This command produces no output.

For more information, see Setting a default view in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see DisassociateDefaultView in *AWS CLI Command Reference*.

`get-default-view`

The following code example shows how to use `get-default-view`.

AWS CLI

To retrieve the Resource Explorer view that is the default view for its AWS Region

The following `get-default-view` example retrieves the ARN of the view that is the default for the AWS Region in which you call the operation.

```
aws resource-explorer-2 get-default-view
```

Output:

```
{
    "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/default-
view/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting a default view in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see GetDefaultView in *AWS CLI Command Reference*.

`get-index`

The following code example shows how to use `get-index`.

AWS CLI

Example 1: To retrieve the details for a Resource Explorer aggregator index

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains the aggregator index for the account, the output lists the Regions that replicate data into this Region's index.

```
aws resource-explorer-2 get-index \
    --region us-east-1
```

Output:

```
{
    "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
    "LastUpdatedAt": "2022-07-13T18:41:58.799000+00:00",
    "ReplicatingFrom": [
        "ap-south-1",
        "us-west-2"
    ],
    "State": "ACTIVE",
    "Tags": {},
    "Type": "AGGREGATOR"
}
```

Example 2: To retrieve the details for a Resource Explorer local index

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains a local index, the output lists the Region to which it replicates data from this Region's index.

```
aws resource-explorer-2 get-index \
    --region us-west-2
```

Output:

```
{
    "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
    "LastUpdatedAt": "2022-07-13T18:41:58.799000+00:00",
    "ReplicatingTo": [
        "us-west-2"
    ],
    "State": "ACTIVE",
    "Tags": {},
    "Type": "LOCAL"
}
```

For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the *AWS Resource Explorer Users Guide*.

- For API details, see GetIndex in *AWS CLI Command Reference*.

`get-view`

The following code example shows how to use `get-view`.

AWS CLI

To retrieve details about a Resource Explorer view

The following `get-view` example displays the details about a view specified by its ARN.

```
aws resource-explorer-2 get-view \
    --view-arn arn:aws:resource-explorer-2:us-west-2:123456789012:view/EC2-Only-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Tags" : {},
    "View" : {
        "Filters" : {
            "FilterString" : "service:ec2"
        },
        "IncludedProperties" : [
            {
                "Name" : "tags"
            }
        ],
        "LastUpdatedAt" : "2022-07-13T21:33:45.249Z",
        "Owner" : "123456789012",
        "Scope" : "arn:aws:iam::123456789012:root",
        "ViewArn" : "arn:aws:resource-explorer-2:us-west-2:123456789012:view/EC2-Only-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information about views, see Working with views in the *AWS Resource Explorer Users Guide*.

- For API details, see GetView in *AWS CLI Command Reference*.

`list-indexes`

The following code example shows how to use `list-indexes`.

AWS CLI

To list the AWS Regions where Resource Explorer has indexes

The following `list-indexes` example lists the indexes for all Regions where Resource Explorer has an index. The response specifies the type of each index, its AWS Region, and its ARN.

```
aws resource-explorer-2 list-indexes
```

Output:

```
{
    "Indexes": [
        {
            "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Region": "us-west-2",
            "Type": "AGGREGATOR"
        },
        {
            "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Region": "us-east-1",
            "Type": "LOCAL"
        },
        {
            "Arn": "arn:aws:resource-explorer-2:us-east-2:123456789012:index/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Region": "us-east-2",
            "Type": "LOCAL"
        },
        {
            "Arn": "arn:aws:resource-explorer-2:us-west-1:123456789012:index/
a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Region": "us-west-1",
            "Type": "LOCAL"
        }
    ]
}
```

For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the *AWS Resource Explorer Users Guide*.

- For API details, see ListIndexes in *AWS CLI Command Reference*.

`list-supported-resource-types`

The following code example shows how to use `list-supported-resource-types`.

AWS CLI

To list the AWS Regions where Resource Explorer has indexes

The following `list-supported-resource-types` example lists all of the resource types currently supported by &AREXlong;. The example response includes a `NextToken` value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 list-supported-resource-types \
    --max-items 10
```

Output:

```
{
    "ResourceTypes": [
        {
            "ResourceType": "cloudfront:cache-policy",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:distribution",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:function",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:origin-access-identity",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:origin-request-policy",
            "Service": "cloudfront"
```

```
        },
        {
            "ResourceType": "cloudfront:realtime-log-config",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:response-headers-policy",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudwatch:alarm",
            "Service": "cloudwatch"
        },
        {
            "ResourceType": "cloudwatch:dashboard",
            "Service": "cloudwatch"
        },
        {
            "ResourceType": "cloudwatch:insight-rule",
            "Service": "cloudwatch"
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxMH0="
}
```

To get the next part of the output, call the operation again, and pass the previous call's `NextToken` response value as the value for `--starting-token`. Repeat until `NextToken` is absent from the response.

```
aws resource-explorer-2 list-supported-resource-types \
    --max-items 10  \
    --starting-
token eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxMH0=
```

Output:

```
{
    "ResourceTypes": [
        {
            "ResourceType": "cloudwatch:metric-stream",
            "Service": "cloudwatch"
        },
```

```
        {
            "ResourceType": "dynamodb:table",
            "Service": "dynamodb"
        },
        {
            "ResourceType": "ec2:capacity-reservation",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:capacity-reservation-fleet",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:client-vpn-endpoint",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:customer-gateway",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:dedicated-host",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:dhcp-options",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:egress-only-internet-gateway",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:elastic-gpu",
            "Service": "ec2"
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyMH0="
}
```

For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the *AWS Resource Explorer Users Guide*.

- For API details, see ListSupportedResourceTypes in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags attached to a Resource Explorer view or index

The following `list-tags-for-resource` example lists the tag key and value pairs attached to view with the specified ARN. You must call the operation from the AWS Region that contains the resource.

```
aws resource-explorer-2 list-tags-for-resource \
    --resource-arn arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Tags": {
        "application": "MainCorpApp",
        "department": "1234"
    }
}
```

For more information about tagging views, see Adding tags to views in the *AWS Resource Explorer Users Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-views`

The following code example shows how to use `list-views`.

AWS CLI

To list the Resource Explorer views available in an AWS Region

The following `list-views` example lists all of the views available in the Region in which you invoke the operation.

```
aws resource-explorer-2 list-views
```

Output:

```
{
    "Views": [
        "arn:aws:resource-explorer-2:us-west-2:123456789012:view/EC2-Only-View/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "arn:aws:resource-explorer-2:us-west-2:123456789012:view/Default-All-
Resources-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "arn:aws:resource-explorer-2:us-west-2:123456789012:view/Production-Only-
View/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
    ]
}
```

For more information about views, see Working with views in the *AWS Resource Explorer Users Guide*.

- For API details, see ListViews in *AWS CLI Command Reference*.

`search`

The following code example shows how to use `search`.

AWS CLI

Example 1: To search using the default view

The following `search` example displays all resources in the specified Region that are associated with the IAM service. The search uses the default view for the Region. The example response includes a `NextToken` value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 search \
    --query-string "service:iam"
```

Output:

```
{
    "Count": {
        "Complete": true,
        "TotalResources": 55
    },
```

```
    "NextToken":
 "AG9VOEF1KLEXAMPLEOhJHVwo5chEXAMPLER5XiEpNrgsEXAMPLE...b0CmOFOryHEXAMPLE",
    "Resources": [{
        "Arn": "arn:aws:iam::123456789012:policy/service-role/Some-Policy-For-A-
Service-Role",
        "LastReportedAt": "2022-07-21T12:34:42Z",
        "OwningAccountId": "123456789012",
        "Properties": [],
        "Region": "global",
        "ResourceType": "iam:policy",
        "Service": "iam"
    }, {
        "Arn": "arn:aws:iam::123456789012:policy/service-role/Another-Policy-For-A-
Service-Role",
        "LastReportedAt": "2022-07-21T12:34:42Z",
        "OwningAccountId": "123456789012",
        "Properties": [],
        "Region": "global",
        "ResourceType": "iam:policy",
        "Service": "iam"
    }],
    "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/my-default-
view/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Example 2: To search using a specified view

The following `search` example search displays all resources ("*") in the specified AWS Region that are visible through the specified view. The results include only resources associated with Amazon EC2 because of the filters attached to the view.

```
aws resource-explorer-2 search \
    --query-string "*" \
    --view-arn arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-EC2-view/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "Count": {
        "Complete": true,
        "TotalResources": 67
    },
```

```
    "Resources": [{
        "Arn": "arn:aws:ec2:us-west-2:123456789012:network-acl/acl-1a2b3c4d",
        "LastReportedAt": "2022-07-21T18:52:02Z",
        "OwningAccountId": "123456789012",
        "Properties": [{
            "Data": [{
                "Key": "Department",
                "Value": "AppDevelopment"
            }, {
                "Key": "Environment",
                "Value": "Production"
            }],
            "LastReportedAt": "2021-11-15T14:48:29Z",
            "Name": "tags"
        }],
        "Region": "us-west-2",
        "ResourceType": "ec2:network-acl",
        "Service": "ec2"
    }, {
        "Arn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-1a2b3c4d",
        "LastReportedAt": "2022-07-21T21:22:23Z",
        "OwningAccountId": "123456789012",
        "Properties": [{
            "Data": [{
                "Key": "Department",
                "Value": "AppDevelopment"
            }, {
                "Key": "Environment",
                "Value": "Production"
            }],
            "LastReportedAt": "2021-07-29T19:02:39Z",
            "Name": "tags"
        }],
        "Region": "us-west-2",
        "ResourceType": "ec2:subnet",
        "Service": "ec2"
    }, {
        "Arn": "arn:aws:ec2:us-west-2:123456789012:dhcp-options/dopt-1a2b3c4d",
        "LastReportedAt": "2022-07-21T06:08:53Z",
        "OwningAccountId": "123456789012",
        "Properties": [{
            "Data": [{
                "Key": "Department",
                "Value": "AppDevelopment"
```

```
            }, {
                "Key": "Environment",
                "Value": "Production"
            }],
            "LastReportedAt": "2021-11-15T15:11:05Z",
            "Name": "tags"
        }],
        "Region": "us-west-2",
        "ResourceType": "ec2:dhcpoptions",
        "Service": "ec2"
    }],
    "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-EC2-view/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Using AWS Resource Explorer to search for resources in the *AWS Resource Explorer Users Guide*.

- For API details, see Search in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a Resource Explorer view

The following `tag-resource` example adds the tag key "environment" with the value "production" to the view with the specified ARN.

```
aws resource-explorer-2 tag-resource \
    --resource-arn arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-View//
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags environment=production
```

This command produces no output.

For more information, see Adding tags to views in the *AWS Resource Explorer Users Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a Resource Explorer view

The following `untag-resource` example removes any tag with the key name "environment" from the view with the specified ARN.

```
aws resource-explorer-2 untag-resource \
    --resource-arn arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-View//
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tag-keys environment
```

This command produces no output.

For more information, see Adding tags to views in the *AWS Resource Explorer Users Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-index-type`

The following code example shows how to use `update-index-type`.

AWS CLI

To change the type of a Resource Explorer index

The following `update-index-type` example converts the specified index from type `local` to type `aggregator` to turn on the ability to search for resources across all AWS Regions in the account. You must send the request to the AWS Region that contains the index you want to update.

```
aws resource-explorer-2 update-index-type \
    --arn arn:aws:resource-explorer-2:us-west-2:123456789012:index/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --type aggregator \
    --region us-west-2
```

Output:

```
{
    "Arn":"arn:aws:resource-explorer-2:us-west-2:123456789012:index/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "LastUpdatedAt":"2022-07-13T18:41:58.799Z",
    "State":"updating",
    "Type":"aggregator"
}
```

For more information about changing an index's type, see Turning on cross-Region search by creating an aggregator index in the *AWS Resource Explorer Users Guide*.

- For API details, see UpdateIndexType in *AWS CLI Command Reference*.

`update-view`

The following code example shows how to use `update-view`.

AWS CLI

Example 1: To update the IncludedProperties field for a Resource Explorer view

The following `update-view` example updates the specified view by adding `` `tags` `` to the optional `` `IncludedProperties` ``. After running this operation, search operations that use this view include information about the tags attached to the resources that appear in the results.

```
aws resource-explorer-2 update-view \
    --included-properties Name=tags \
    --view-arn arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-View/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "View": {
        "Filters": {
            "FilterString": ""
        },
        "IncludedProperties": [
```

```
            {
                "Name": "tags"
            }
        ],
        "LastUpdatedAt": "2022-07-19T17:41:21.710000+00:00",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-EC2-
Only-View/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

Example 2: To update the filters attached to a view

The following `update-view` example updates the specified view to use a filter that limits results to only resource types that are associated with the Amazon EC2 service.

```
aws resource-explorer-2 update-view \
    --filters FilterString="service:ec2" \
    --view-arn arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-View/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "View": {
    "Filters": {
        "FilterString": "service:ec2"
    },
    "IncludedProperties": [],
    "LastUpdatedAt": "2022-07-19T17:41:21.710000+00:00",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-west-2:123456789012:view/My-View/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    }
}
```

For more information about views, see Working with views in the *AWS Resource Explorer Users Guide*.

- For API details, see UpdateView in *AWS CLI Command Reference*.

Resource Groups examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

Example 1: To create a tag-based resource group

The following `create-group` example creates a tag-based resource group of Amazon EC2 instances in the current region. It's based on a query for resources that are tagged with the key `Name`, and the value `WebServers`. The group name is `tbq-WebServer`. The query is in a separate JSON file that is passed to the command.

```
aws resource-groups create-group \
    --name tbq-WebServer \
    --resource-query file://query.json
```

Contents of `query.json`:

```
{
    "Type": "TAG_FILTERS_1_0",
    "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
}
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer"
    },
    "ResourceQuery": {
        "Type": "TAG_FILTERS_1_0",
        "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
    }
}
```

Example 2: To create a CloudFormation stack-based resource group

The following `create-group` example creates an AWS CloudFormation stack-based resource group named `sampleCFNstackgroup`. The query includes all resources in the specified CloudFormation stack that are supported by AWS Resource Groups.

```
aws resource-groups create-group \
    --name cbq-CFNstackgroup \
    --resource-query file://query.json
```

Contents of `query.json`:

```
{
    "Type": "CLOUDFORMATION_STACK_1_0",
    "Query": "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier\":
\"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111\"}"
}
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNstackgroup",
        "Name": "cbq-CFNstackgroup"
    },
```

```
    "ResourceQuery": {
        "Type": "CLOUDFORMATION_STACK_1_0",
        "Query": "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier
\":\"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111\"}"
    }
}
```

For more information, see Create Groups in the *AWS Resource Groups User Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To update the description for a resource group

The following `delete-group` example updates the specified resource group.

```
aws resource-groups delete-group \
    --group-name tbq-WebServer
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:1234567890:group/tbq-
WebServer",
        "Name": "tbq-WebServer"
    }
}
```

For more information, see Delete Groups in the *AWS Resource Groups User Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

`get-group-query`

The following code example shows how to use `get-group-query`.

AWS CLI

To get the query attached to a resource group

The following `get-group-query` example displays query attached to the specified resource group.

```
aws resource-groups get-group-query \
    --group-name tbq-WebServer
```

Output:

```
{
    "GroupQuery": {
        "GroupName": "tbq-WebServer",
        "ResourceQuery": {
            "Type": "TAG_FILTERS_1_0",
            "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters
\":[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
        }
    }
}
```

For more information, see Creating query-based groups in AWS Resource Groups in the *AWS Resource Groups User Guide*.

- For API details, see GetGroupQuery in *AWS CLI Command Reference*.

`get-group`

The following code example shows how to use `get-group`.

AWS CLI

To get information about a resource group

The following `get-group` example displays details about the specified resource group. To get the query attached to the group, use `get-group-query`.

```
aws resource-groups get-group \
    --group-name tbq-WebServer
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer",
        "Description": "A tag-based query resource group of WebServers."
    }
}
```

For more information, see What are resource groups? in the *AWS Resource Groups User Guide*.

- For API details, see GetGroup in *AWS CLI Command Reference*.

`get-tags`

The following code example shows how to use `get-tags`.

AWS CLI

To retrieve the tags attached to a resource group

The following `get-tags` example displays the tag key and value pairs attached to the specified resource group (the group itself, not its members).

```
aws resource-groups get-tags \
    --arn arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer
```

Output:

```
{
    "Arn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",
    "Tags": {
        "QueryType": "tags",
        "QueryResources": "ec2-instances"
    }
}
```

For more information, see What are resource groups? in the *AWS Resource Groups User Guide*.

- For API details, see GetTags in *AWS CLI Command Reference*.

`list-group-resources`

The following code example shows how to use `list-group-resources`.

AWS CLI

Example 1: To list all of the resources in a resource group

The following `list-group-resources` example lists all of the resources that are part of the specified resource group.

```
aws resource-groups list-group-resources \
    --group-name tbq-WebServer
```

Output:

```
{
    "ResourceIdentifiers": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-09f77fa38c12345ab",
            "ResourceType": "AWS::EC2::Instance"
        }
    ]
}
```

Example 2: To list the resources of a specific type in a resource group

The following `list-group-resources` example lists all of the resources in the group that also have a `resource-type` of `AWS::EC2::Instance`.

```
aws resource-groups list-group-resources \
    --group-name tbq-WebServer \
    --filters Name=resource-type,Values=AWS::EC2::Instance
```

Output:

```
{
    "ResourceIdentifiers": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-09f77fa38c12345ab",
```

```
            "ResourceType": "AWS::EC2::Instance"
        }
    ]
}
```

For more information, see What are resource groups? in the *AWS Resource Groups User Guide*.

- For API details, see ListGroupResources in *AWS CLI Command Reference*.

`list-groups`

The following code example shows how to use `list-groups`.

AWS CLI

To list the available resource groups

The following `list-groups` example displays a list of all of the resource groups.

```
aws resource-groups list-groups
```

Output:

```
{
    "GroupIdentifiers": [
        {
            "GroupName": "tbq-WebServer",
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer3"
        },
        {
            "GroupName": "cbq-CFNStackQuery",
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNStackQuery"
        }
    ],
    "Groups": [
        {
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
            "Name": "tbq-WebServer"
        },
        {
```

```
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNStackQuery",
            "Name": "cbq-CFNStackQuery"
        }
    ]
}
```

For more information, see What are resource groups? in the *AWS Resource Groups User Guide*.

- For API details, see ListGroups in *AWS CLI Command Reference*.

`put-group-configuration`

The following code example shows how to use `put-group-configuration`.

AWS CLI

To attach a service configuration to a resource group

The following `put-group-configuration` example specifies that the resource group is to contain only Amazon EC2 capacity reservations for instances in the `C5` or `M5` families.

```
aws resource-groups put-group-configuration \
    --group MyTestGroup \
    --configuration file://config.json
```

Contents of `config.json`:

```
[
    {
        "Type": "AWS::EC2::HostManagement",
        "Parameters": [
            {
                "Name": "allowed-host-families",
                "Values": [ "c5", "m5" ]
            },
                {
                    "Name": "any-host-based-license-configuration",
                    "Values": [ "true" ]
                }
        ]
    },
```

```
    {
        "Type": "AWS::ResourceGroups::Generic",
        "Parameters": [
            {
                "Name": "allowed-resource-types",
                "Values": [ "AWS::EC2::Host" ]
            },
            {
                "Name": "deletion-protection",
                "Values": [ "UNLESS_EMPTY" ]
            }
        ]
    }
]
```

This command produces no output.

For more information, see Service configurations for resource groups in the *AWS Resource Groups User Guide*.

- For API details, see PutGroupConfiguration in *AWS CLI Command Reference*.

`search-resources`

The following code example shows how to use `search-resources`.

AWS CLI

To find resources that match a query

The following `search-resources` example retrieves a list of all AWS resources that match the specified query.

```
aws resource-groups search-resources \
    --resource-query file://query.json
```

Contents of `query.json`:

```
{
    "Type": "TAG_FILTERS_1_0",
    "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Patch Group\", \"Values\":[\"Dev\"]}]}"
```

```
}
```

Output:

```
{
    "ResourceIdentifiers": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-01a23bc45d67890ef",
            "ResourceType": "AWS::EC2::Instance"
        }
    ]
}
```

For more information, see Creating query-based groups in AWS Resource Groups in the *AWS Resource Groups User Guide*.

- For API details, see SearchResources in *AWS CLI Command Reference*.

`tag`

The following code example shows how to use `tag`.

AWS CLI

To attach a tag to a resource group

The following `tag` example attaches the specified tag key and value pairs to the specified resource group (the group itself, not its members).

```
aws resource-groups tag \
    --tags QueryType=tags,QueryResources=ec2-instances \
    --arn arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer
```

Output:

```
{
    "Arn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",
    "Tags": {
        "QueryType": "tags",
        "QueryResources": "ec2-instances"
```

```
    }
}
```

For more information, see Manage tags in the *AWS Resource Groups User Guide*.

- For API details, see Tag in *AWS CLI Command Reference*.

`untag`

The following code example shows how to use `untag`.

AWS CLI

To remove tags from a resource group

The following `untag` example removes any tag with the specified key from the resource group itself, not its members.

```
aws resource-groups untag \
    --arn arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer \
    --keys QueryType
```

Output:

```
{
    "Arn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",
    "Keys": [
        "QueryType"
    ]
}
```

For more information, see Manage tags in the *AWS Resource Groups User Guide*.

- For API details, see Untag in *AWS CLI Command Reference*.

`update-group-query`

The following code example shows how to use `update-group-query`.

AWS CLI

Example 1: To update the query for a tag-based resource group

The following `update-group-query` example updates the query attached to the specified tag-based resource group.

```
aws resource-groups update-group-query \
    --group-name tbq-WebServer \
    --resource-query '{"Type":"TAG_FILTERS_1_0", "Query":"{\"ResourceTypeFilters\":
[\"AWS::EC2::Instance\"],\"TagFilters\":[{\"Key\":\"Name\", \"Values\":[\"WebServers
\"]}]}"}'
```

Output:

```
{
    "GroupQuery": {
        "GroupName": "tbq-WebServer",
        "ResourceQuery": {
            "Type": "TAG_FILTERS_1_0",
            "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters
\":[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
        }
    }
}
```

For more information, see Update Groups in the *AWS Resource Groups User Guide*.

Example 2: To update the query for a CloudFormation stack-based resource group

The following `update-group-query` example updates the query attached to the specified AWS CloudFormation stack-based resource group.

```
aws resource-groups update-group-query \
    --group-name cbq-CFNstackgroup \
    --resource-query '{"Type": "CLOUDFORMATION_STACK_1_0", "Query":
 "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier\":
\"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111\"}"}'
```

Output:

```
{
    "GroupQuery": {
        "GroupName": "cbq-CFNstackgroup",
```

```
        "ResourceQuery": {
            "Type": "CLOUDFORMATION_STACK_1_0",
            "Query": "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],
\"StackIdentifier\":\"arn:aws:cloudformation:us-west-2:123456789012:stack/
MyCFNStack/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111\"}"
        }
    }
}
```

For more information, see Update Groups in the *AWS Resource Groups User Guide*.

- For API details, see UpdateGroupQuery in *AWS CLI Command Reference*.

`update-group`

The following code example shows how to use `update-group`.

AWS CLI

To update the description for a resource group

The following `update-group` example updates the description for the specified resource group.

```
aws resource-groups update-group \
    --group-name tbq-WebServer \
    --description "Resource group for all web server resources."
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer",
        "Description": "Resource group for all web server resources."
    }
}
```

For more information, see Update Groups in the *AWS Resource Groups User Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

Resource Groups Tagging API examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups Tagging API.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`get-resources`

The following code example shows how to use `get-resources`.

AWS CLI

To get a list of tagged resources

The following `get-resources` example displays a list of resources in the account that are tagged with the specified key name and value.

```
aws resourcegroupstaggingapi get-resources \
    --tag-filters Key=Environment,Values=Production \
    --tags-per-page 100
```

Output:

```
{
    "ResourceTagMappingList": [
        {
            "ResourceARN": " arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-7sbz2Kz0",
            "Tags": [
```

```
                {
                    "Key": "Environment",
                    "Value": "Production"
                }
            ]
        }
    ]
}
```

For more information, see Finding resources to tag in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see GetResources in *AWS CLI Command Reference*.

`get-tag-keys`

The following code example shows how to use `get-tag-keys`.

AWS CLI

To get a list of all tag keys

The following `get-tag-keys` example retrieves the list of all tag key names used by resources in the account.

```
aws resourcegroupstaggingapi get-tag-keys
```

Output:

```
{
    "TagKeys": [
        "Environment",
        "CostCenter",
        "Department"
    ]
}
```

For more information, see What is Tag Editor? in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see GetTagKeys in *AWS CLI Command Reference*.

`get-tag-values`

The following code example shows how to use `get-tag-values`.

AWS CLI

To get a list of all tag values

The following `get-tag-values` example displays all of the values used for the specified key for all resources in the current AWS Region.

```
aws resourcegroupstaggingapi get-tag-values \
    --key=Environment
```

Output:

```
{
    "TagValues": [
        "Alpha",
        "Gamma",
        "Production"
    ]
}
```

For more information, see What is Tag Editor? in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see GetTagValues in *AWS CLI Command Reference*.

`tag-resources`

The following code example shows how to use `tag-resources`.

AWS CLI

To attach a tag to a resource

The following `tag-resources` example tags the specified resource with a key name and value.

```
aws resourcegroupstaggingapi tag-resources \
    --resource-arn-list arn:aws:s3:::MyProductionBucket \
    --tags Environment=Production,CostCenter=1234
```

Output:

```
{
    "FailedResourcesMap": {}
}
```

For more information, see Managing tags with Tag Editor in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see TagResources in *AWS CLI Command Reference*.

`untag-resources`

The following code example shows how to use `untag-resources`.

AWS CLI

To remove a tag from a resource

The following `untag-resources` example removes the specified tag keys and any associated values from the specified resource.

```
aws resourcegroupstaggingapi untag-resources \
    --resource-arn-list arn:aws:s3:::amzn-s3-demo-bucket \
    --tag-keys Environment CostCenter
```

Output:

```
{
    "FailedResourcesMap": {}
}
```

For more information, see Managing tags with Tag Editor in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see UntagResources in *AWS CLI Command Reference*.

Route 53 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`change-resource-record-sets`

The following code example shows how to use `change-resource-record-sets`.

AWS CLI

To create, update, or delete a resource record set

The following `change-resource-record-sets` example creates a resource record set using the `hosted-zone-id` `Z1R8UBAEXAMPLE` and the JSON-formatted configuration in the file `C:\awscli\route53\change-resource-record-sets.json`.

```
aws route53 change-resource-record-sets \
    --hosted-zone-id Z1R8UBAEXAMPLE \
    --change-batch file://C:\awscli\route53\change-resource-record-sets.json
```

Contents of `C:\awscli\route53\change-resource-record-sets.json`:

```
{
    "Comment": "Create a basic A record for www.example.com",
    "Changes": [
        {
            "Action": "CREATE",
            "ResourceRecordSet": {
                "Name": "www.example.com",
                "Type": "A",
                "TTL": 300,
                "ResourceRecords": [
                    {
```

```
                        "Value": "192.0.2.44"
                    }
                ]
            }
        }
    ]
}
```

Output:

```
{
    "ChangeInfo": {
        "Id": "/change/CWPIK4URU2I5S",
        "Status": "PENDING",
        "SubmittedAt": "2025-01-15T18:21:11.930000+00:00"
    }
}
```

The configuration in the JSON file depends on the kind of resource record set you want to create:

    ]
}
```

For more information, see Working with records in the *Amazon Route 53 Developer Guide*.

- For API details, see ChangeResourceRecordSets in *AWS CLI Command Reference*.

`change-tags-for-resource`

The following code example shows how to use `change-tags-for-resource`.

AWS CLI

Example 1: To add a tag to a health check

The following `change-tags-for-resource` example adds a tag named `owner` to a health check resource specified by ID.

```
aws route53 change-tags-for-resource \
    --resource-type healthcheck \
    --resource-id 6233434j-18c1-34433-ba8e-3443434 \
    --add-tags Key=owner,Value=myboss
```

This command produces no output.

Example 2: To remove a tag from a hosted zone

The following `change-tags-for-resource` example removes a tag named `owner` from a hosted zone resource specified by ID.

```
aws route53 change-tags-for-resource \
    --resource-type hostedzone \
    --resource-id Z1523434445 \
    --remove-tag-keys owner
```

This command produces no output.

For more information, see Tagging Amazon Route 53 resources in the *Amazon Route 53 Developer Guide*.

- For API details, see ChangeTagsForResource in *AWS CLI Command Reference*.

`create-health-check`

The following code example shows how to use `create-health-check`.

AWS CLI

To create a health check

The following `create-health-check` example creates a health check using the caller reference `2014-04-01-18:47` and the JSON-formatted configuration in the file `C:\awscli\route53\create-health-check.json`.

```
aws route53 create-health-check \
    --caller-reference 2014-04-01-18:47 \
    --health-check-config file://C:\awscli\route53\create-health-check.json
```

Contents of `C:\awscli\route53\create-health-check.json`:

```
{
    "IPAddress": "192.0.2.44",
    "Port": 80,
    "Type": "HTTP",
    "ResourcePath": "/index.html",
    "FullyQualifiedDomainName": "www.example.com",
    "RequestInterval": 30,
    "FailureThreshold": 3
```

```
}
```

JSON syntax:

```
{
    "IPAddress": "IP address of the endpoint to check",
    "Port": port on the endpoint to check--required when Type is "TCP",
    "Type": "HTTP"|"HTTPS"|"HTTP_STR_MATCH"|"HTTPS_STR_MATCH"|"TCP",
    "ResourcePath": "path of the file that you want Amazon Route 53 to request--all
 Types except TCP",
    "FullyQualifiedDomainName": "domain name of the endpoint to check--all Types
 except TCP",
    "SearchString": "if Type is HTTP_STR_MATCH or HTTPS_STR_MATCH, the string to
 search for in the response body from the specified resource",
    "RequestInterval": 10 | 30,
    "FailureThreshold": integer between 1 and 10
}
```

Output:

```
{
    "Location": "https://route53.amazonaws.com/2013-04-01/healthcheck/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "HealthCheck": {
        "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CallerReference": "2014-04-01-18:47",
        "HealthCheckConfig": {
            "IPAddress": "192.0.2.44",
            "Port": 80,
            "Type": "HTTP",
            "ResourcePath": "/docs/route53-health-check.html",
            "FullyQualifiedDomainName": "example.com",
            "RequestInterval": 30,
            "FailureThreshold": 3,
            "MeasureLatency": false,
            "Inverted": false,
            "Disabled": false,
            "EnableSNI": false
        },
        "HealthCheckVersion": 1
    }
}
```

To add the health check to a Route 53 resource record set, use the `change-resource-record-sets` command.

For more information, see Creating and updating health checks in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateHealthCheck in *AWS CLI Command Reference*.

`create-hosted-zone`

The following code example shows how to use `create-hosted-zone`.

AWS CLI

To create a hosted zone

The following `create-hosted-zone` example adds a hosted zone named `example.com` using the caller reference `2014-04-01-18:47`. The optional comment includes a space, so it must be enclosed in quotation marks.

```
aws route53 create-hosted-zone \
    --name example.com \
    --caller-reference 2014-04-01-18:47 \
    --hosted-zone-config Comment="command-line version"
```

Output:

```
{
    "Location": "https://route53.amazonaws.com/2013-04-01/hostedzone/
Z1D633PJEXAMPLE",
    "HostedZone": {
        "Id": "/hostedzone/Z1D633PJEXAMPLE",
        "Name": "example.com.",
        "CallerReference": "2014-04-01-18:47",
        "Config": {
            "Comment": "command-line version",
            "PrivateZone": false
        },
        "ResourceRecordSetCount": 2
    },
    "ChangeInfo": {
        "Id": "/change/C1PA6795EXAMPLE",
```

```
        "Status": "PENDING",
        "SubmittedAt": "2014-04-01T18:47:10.123Z"
    },
    "DelegationSet": {
        "NameServers": [
            "ns-2048.awsdns-64.com",
            "ns-2049.awsdns-65.net",
            "ns-2050.awsdns-66.org",
            "ns-2051.awsdns-67.co.uk"
        ]
    }
}
```

For more information, see Creating a public hosted zone in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateHostedZone in *AWS CLI Command Reference*.

`delete-health-check`

The following code example shows how to use `delete-health-check`.

AWS CLI

To delete a health check

The following `delete-health-check` example deletes the health check with a `health-check-id` of `a1b2c3d4-5678-90ab-cdef-EXAMPLE11111`.

```
aws route53 delete-health-check \
    --health-check-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Deleting health checks in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteHealthCheck in *AWS CLI Command Reference*.

`delete-hosted-zone`

The following code example shows how to use `delete-hosted-zone`.

AWS CLI

To delete a hosted zone

The following `delete-hosted-zone` example deletes the hosted zone with an `id` of `Z36KTIQEXAMPLE`.

```
aws route53 delete-hosted-zone \
    --id Z36KTIQEXAMPLE
```

Output:

```
{
    "ChangeInfo": {
        "Id": "/change/C2682N5HEXAMPLE",
        "Status": "PENDING",
        "SubmittedAt": "2014-04-01T19:12:45.384Z"
    }
}
```

For more information, see Deleting a public hosted zone in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteHostedZone in *AWS CLI Command Reference*.

`get-change`

The following code example shows how to use `get-change`.

AWS CLI

To get the status of a change to resource record sets

The following `get-change` example gets the status and other information about the `change-resource-record-sets` request that has an `Id` of `/change/CWPIK4URU2I5S`.

```
aws route53 get-change \
    --id /change/CWPIK4URU2I5S
```

Output:

```
{
    "ChangeInfo": {
        "Id": "/change/CWPIK4URU2I5S",
        "Status": "INSYNC",
        "SubmittedAt": "2014-04-01T18:47:10.123Z"
    }
}
```

For more information, see Working with records in the *Amazon Route 53 Developer Guide*.

- For API details, see GetChange in *AWS CLI Command Reference*.

`get-health-check`

The following code example shows how to use `get-health-check`.

AWS CLI

To get information about a health check

The following `get-health-check` example gets information about the health check that has a `health-check-id` of `a1b2c3d4-5678-90ab-cdef-EXAMPLE11111`.

```
aws route53 get-health-check \
    --health-check-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "HealthCheck": {
        "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CallerReference": "2014-04-01-18:47",
        "HealthCheckConfig": {
            "IPAddress": "192.0.2.44",
            "Port": 80,
            "Type": "HTTP",
            "ResourcePath": "/docs/route53-health-check.html",
            "FullyQualifiedDomainName": "example.com",
            "RequestInterval": 30,
            "FailureThreshold": 3,
            "MeasureLatency": false,
```

```
            "Inverted": false,
            "Disabled": false,
            "EnableSNI": false
        },
        "HealthCheckVersion": 1
    }
}
```

For more information, see Creating, updating, and deleting health checks in the *Amazon Route 53 Developer Guide*.

- For API details, see GetHealthCheck in *AWS CLI Command Reference*.

`get-hosted-zone`

The following code example shows how to use `get-hosted-zone`.

AWS CLI

To get information about a hosted zone

The following `get-hosted-zone` example gets information about the hosted zone with an `id` of `Z1R8UBAEXAMPLE`.

```
aws route53 get-hosted-zone \
    --id Z1R8UBAEXAMPLE
```

Output:

```
{
    "HostedZone": {
        "Id": "/hostedzone/Z1R8UBAEXAMPLE",
        "Name": "example.com.",
        "CallerReference": "2014-04-01-18:47",
        "Config": {
            "Comment": "command-line version",
            "PrivateZone": false
        },
        "ResourceRecordSetCount": 2
    },
    "DelegationSet": {
        "NameServers": [
```

```
            "ns-2048.awsdns-64.com",
            "ns-2049.awsdns-65.net",
            "ns-2050.awsdns-66.org",
            "ns-2051.awsdns-67.co.uk"
        ]
    }
}
```

For more information, see Working with hosted zones in the *Amazon Route 53 Developer Guide*.

- For API details, see GetHostedZone in *AWS CLI Command Reference*.

`list-health-checks`

The following code example shows how to use `list-health-checks`.

AWS CLI

To list the health checks associated with the current AWS account

The following `list-health-checks` example lists detailed information about the first 100 health checks that are associated with the current AWS account.

```
aws route53 list-health-checks
```

Output:

```
{
    "HealthChecks": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CallerReference": "2014-04-01-18:47",
            "HealthCheckConfig": {
                "IPAddress": "192.0.2.44",
                "Port": 80,
                "Type": "HTTP",
                "ResourcePath": "/docs/route53-health-check.html",
                "FullyQualifiedDomainName": "example.com",
                "RequestInterval": 30,
                "FailureThreshold": 3,
                "MeasureLatency": false,
                "Inverted": false,
```

```
                "Disabled": false,
                "EnableSNI": false
            },
            "HealthCheckVersion": 1
        }
    ]
}
```

If you have more than 100 health checks, or if you want to list them in groups smaller than 100, include the `--maxitems` parameter. For example, to list health checks one at a time, use the following command.

```
aws route53 list-health-checks \
    --max-items 1
```

To view the next health check, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, as shown in the following example.

```
aws route53 list-health-checks \
    --max-items 1 \
    --starting-token Z3M3LMPEXAMPLE
```

For more information, see Creating, updating, and deleting health checks in the *Amazon Route 53 Developer Guide*.

- For API details, see ListHealthChecks in *AWS CLI Command Reference*.

`list-hosted-zones-by-name`

The following code example shows how to use `list-hosted-zones-by-name`.

AWS CLI

Example 1: To list hosted zones ordered by domain name

The following `list-hosted-zones-by-name` example lists up to 100 hosted zones ordered by domain name.

```
aws route53 list-hosted-zones-by-name
```

Output:

```
{
    "HostedZones": [
        {
            "ResourceRecordSetCount": 2,
            "CallerReference": "test20150527-2",
            "Config": {
                "Comment": "test2",
                "PrivateZone": false
            },
            "Id": "/hostedzone/Z119WBBTVP5WFX",
            "Name": "2.example.com."
        },
        {
            "ResourceRecordSetCount": 2,
            "CallerReference": "test20150527-1",
            "Config": {
                "Comment": "test",
                "PrivateZone": false
            },
            "Id": "/hostedzone/Z3P5QSUBK4POTI",
            "Name": "www.example.com."
        }
    ],
    "IsTruncated": false,
    "MaxItems": "100"
}
```

Example 2: To list hosted zones beginning with a specified domain name

The following `list-hosted-zones-by-name` example lists hosted zones ordered by name, beginning with `www.example.com`.

```
aws route53 list-hosted-zones-by-name \
    --dns-name www.example.com
```

Output:

```
{
    "HostedZones": [
        {
```

```
            "ResourceRecordSetCount": 2,
            "CallerReference": "mwunderl20150527-1",
            "Config": {
                "Comment": "test",
                "PrivateZone": false
            },
            "Id": "/hostedzone/Z3P5QSUBK4POTI",
            "Name": "www.example.com."
        }
    ],
    "DNSName": "www.example.com",
    "IsTruncated": false,
    "MaxItems": "100"
}
```

For more information, see Listing public hosted zones in the *Amazon Route 53 Developer Guide*.

- For API details, see ListHostedZonesByName in *AWS CLI Command Reference*.

`list-hosted-zones`

The following code example shows how to use `list-hosted-zones`.

AWS CLI

To list the hosted zones associated with the current AWS account

The following `list-hosted-zones` example lists summary information about the first 100 hosted zones that are associated with the current AWS account.

```
aws route53 list-hosted-zones
```

Output:

```
{
    "HostedZones": [
        {
            "Id": "/hostedzone/Z1R8UBAEXAMPLE",
            "Name": "example.com.",
            "CallerReference": "2014-04-01-18:47",
            "Config": {
                "Comment": "command-line version",
```

```
                "PrivateZone": false
            },
            "ResourceRecordSetCount": 2
        }
    ]
}
```

If you have more than 100 hosted zones, or if you want to list them in groups smaller than 100, include the `--max-items` parameter. For example, to list hosted zones one at a time, use the following command.

```
aws route53 list-hosted-zones \
    --max-items 1
```

To view information about the next hosted zone, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, as shown in the following example.

```
aws route53 list-hosted-zones \
    --max-items 1 \
    --starting-token Z3M3LMPEXAMPLE
```

For more information, see Listing public hosted zones in the *Amazon Route 53 Developer Guide*.

- For API details, see ListHostedZones in *AWS CLI Command Reference*.

`list-query-logging-configs`

The following code example shows how to use `list-query-logging-configs`.

AWS CLI

To list query logging configurations

The following `list-query-logging-configs` example lists information about the first 100 query logging configurations in your AWS account, for the hosted zone `Z10X3WQEXAMPLE`.

```
aws route53 list-query-logging-configs \
    --hosted-zone-id Z10X3WQEXAMPLE
```

Output:

```
{
    "QueryLoggingConfigs": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "HostedZoneId": "Z1OX3WQEXAMPLE",
            "CloudWatchLogsLogGroupArn": "arn:aws:logs:us-east-1:123456789012:log-
group:/aws/route53/example.com:*"
        }
    ]
}
```

For more information, see Logging DNS queries in the *Amazon Route 53 Developer Guide*.

- For API details, see ListQueryLoggingConfigs in *AWS CLI Command Reference*.

`list-resource-record-sets`

The following code example shows how to use `list-resource-record-sets`.

AWS CLI

To list the resource record sets in a hosted zone

The following `list-resource-record-sets` example lists summary information about the first 100 resource record sets in a specified hosted zone.

```
aws route53 list-resource-record-sets \
    --hosted-zone-id Z2LD58HEXAMPLE
```

Output:

```
{
    "ResourceRecordSets": [
        {
            "Name": "example.domain.",
            "Type": "NS",
            "TTL": 172800,
            "ResourceRecords": [
                {
```

```
                    "Value": "ns-2048.awsdns-64.com."
                },
                {
                    "Value": "ns-2049.awsdns-65.net."
                },
                {
                    "Value": "ns-2050.awsdns-66.org."
                },
                {
                    "Value": "ns-2051.awsdns-67.co.uk."
                }
            ]
        },
        {
            "Name": "example.domain.",
            "Type": "SOA",
            "TTL": 900,
            "ResourceRecords": [
                {
                    "Value": "ns-2048.awsdns-64.com. awsdns-hostmaster.amazon.com. 1
 7200 900 1209600 86400"
                }
            ]
        }
    ]
}
```

If the hosted zone contains more than 100 resource record sets, or if you want to list them in groups smaller than 100, include the `--maxitems` parameter. For example, to list resource record sets one at a time, use the following command.

```
aws route53 list-resource-record-sets \
    --hosted-zone-id Z2LD58HEXAMPLE \
    --max-items 1
```

To view information about the next resource record set in the hosted zone, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, as shown in the following example.

```
aws route53 list-resource-record-sets \
    --hosted-zone-id Z2LD58HEXAMPLE \
    --max-items 1 \
```

```
    --starting-token Z3M3LMPEXAMPLE
```

To view all the resource record sets of a particular name, use the `--query` parameter to filter them out, as shown in the following example.

```
aws route53 list-resource-record-sets \
    --hosted-zone-id Z2LD58HEXAMPLE \
    --query "ResourceRecordSets[?Name == 'example.domain.']"
```

For more information, see Listing records in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResourceRecordSets in *AWS CLI Command Reference*.

Route 53 domain registration examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 domain registration.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`check-domain-availability`

The following code example shows how to use `check-domain-availability`.

AWS CLI

To determine whether you can register a domain name with Route 53

The following `check-domain-availability` example returns information about whether the domain name `example.com` is available to be registered using Route 53.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains check-domain-availability \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "Availability": "UNAVAILABLE"
}
```

Route 53 supports a large number of top-level domains (TLDs), such as `.com` and `.jp`, but we don't support all available TLDs. If you check the availability of a domain and Route 53 doesn't support the TLD, `check-domain-availability` returns the following message.

```
An error occurred (UnsupportedTLD) when calling the CheckDomainAvailability
 operation: <top-level domain> tld is not supported.
```

For a list of the TLDs that you can use when registering a domain with Route 53, see Domains That You Can Register with Amazon Route 53 in the *Amazon Route 53 Developer Guide*. For more information about registering domains with Amazon Route 53, see Registering a New Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see CheckDomainAvailability in *AWS CLI Command Reference*.

`check-domain-transferability`

The following code example shows how to use `check-domain-transferability`.

AWS CLI

To determine whether a domain can be transferred to Route 53

The following `check-domain-transferability` example returns information about whether you can transfer the domain name `example.com` to Route 53.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains check-domain-transferability \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "Transferability": {
        "Transferable": "UNTRANSFERABLE"
    }
}
```

For more information, see Transferring Registration for a Domain to Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

- For API details, see CheckDomainTransferability in *AWS CLI Command Reference*.

`delete-tags-for-domain`

The following code example shows how to use `delete-tags-for-domain`.

AWS CLI

To delete tags for a domain

The following `delete-tags-for-domain` example deletes three tags from the specified domain. Note that you specify only the tag key, not the tag value.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains delete-tags-for-domain \
    --region us-east-1 \
    --domain-name example.com \
    --tags-to-delete accounting-key hr-key engineering-key
```

This command produces no output.

To confirm that the tags were deleted, you can run list-tags-for-domain . For more information, see Tagging Amazon Route 53 Resources in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteTagsForDomain in *AWS CLI Command Reference*.

`disable-domain-auto-renew`

The following code example shows how to use `disable-domain-auto-renew`.

AWS CLI

To disable automatic renewal of a domain

The following `disable-domain-auto-renew` example configures Route 53 to *not* automatically renew the domain `example.com` before registration for the domain expires.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains disable-domain-auto-renew \
    --region us-east-1 \
    --domain-name example.com
```

This command produces no output.

To confirm that the setting was changed, you can run get-domain-detail . If automatic renewal is disabled, the value of `AutoRenew` is `False`.

For more information, see Renewing registration for a domain in the *Amazon Route 53 Developer Guide*.

- For API details, see DisableDomainAutoRenew in *AWS CLI Command Reference*.

`disable-domain-transfer-lock`

The following code example shows how to use `disable-domain-transfer-lock`.

AWS CLI

To disable the transfer lock on a domain

The following `disable-domain-transfer-lock` example removes the transfer lock on the domain `example.com` so that the domain can be transferred to another registrar. This command changes the `clientTransferProhibited` status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains disable-domain-transfer-lock \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

To confirm that the transfer lock has been changed, you can run get-domain-detail . When the transfer lock is disabled, the value of `StatusList` does *not* include `clientTransferProhibited`.

For more information about the transfer process, see Transferring a Domain from Amazon Route 53 to Another Registrar in the *Amazon Route 53 Developer Guide*.

- For API details, see DisableDomainTransferLock in *AWS CLI Command Reference*.

`enable-domain-auto-renew`

The following code example shows how to use `enable-domain-auto-renew`.

AWS CLI

To enable automatic renewal of a domain

The following `enable-domain-auto-renew` example configures Route 53 to automatically renew the domain `example.com` before registration for the domain expires.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains enable-domain-auto-renew \
    --region us-east-1 \
    --domain-name example.com
```

This command produces no output. To confirm that the setting was changed, you can run get-domain-detail . If automatic renewal is enabled, the value of `AutoRenew` is `True`.

For more information, see Renewing registration for a domain in the *Amazon Route 53 Developer Guide*.

- For API details, see EnableDomainAutoRenew in *AWS CLI Command Reference*.

`enable-domain-transfer-lock`

The following code example shows how to use `enable-domain-transfer-lock`.

AWS CLI

To enable the transfer lock on a domain

The following `enable-domain-transfer-lock` example locks the specified domain so that it can't be transferred to another registrar. This command changes the `clientTransferProhibited` status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains enable-domain-transfer-lock \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

To confirm that the transfer lock has been changed, you can run get-domain-detail . When the transfer lock is enabled, the value of `StatusList` includes `clientTransferProhibited`.

For more information about the transfer process, see Transferring a Domain from Amazon Route 53 to Another Registrar in the *Amazon Route 53 Developer Guide*.

- For API details, see EnableDomainTransferLock in *AWS CLI Command Reference*.

`get-contact-reachability-status`

The following code example shows how to use `get-contact-reachability-status`.

AWS CLI

To determine whether the registrant contact has responded to a confirmation email

The following `get-contact-reachability-status` example returns information about whether the registrant contact for the specified domain has responded to a confirmation email.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-contact-reachability-status \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "domainName": "example.com",
    "status": "DONE"
}
```

For more information, see Resending Authorization and Confirmation Emails in the *Amazon Route 53 Developer Guide*.

- For API details, see GetContactReachabilityStatus in *AWS CLI Command Reference*.

`get-domain-detail`

The following code example shows how to use `get-domain-detail`.

AWS CLI

To get detailed information about a specified domain

The following `get-domain-detail` example displays detailed information about the specified domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-domain-detail \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "DomainName": "example.com",
    "Nameservers": [
        {
            "Name": "ns-2048.awsdns-64.com",
            "GlueIps": []
        },
        {
            "Name": "ns-2049.awsdns-65.net",
            "GlueIps": []
        },
        {
            "Name": "ns-2050.awsdns-66.org",
            "GlueIps": []
        },
        {
            "Name": "ns-2051.awsdns-67.co.uk",
            "GlueIps": []
        }
    ],
    "AutoRenew": true,

    ]
}
```

For more information, see Registering and managing domains using Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

- For API details, see GetDomainDetail in *AWS CLI Command Reference*.

`get-domain-suggestions`

The following code example shows how to use `get-domain-suggestions`.

AWS CLI

To get a list of suggested domain names

The following `get-domain-suggestions` example displays a list of suggested domain names based on the domain name `example.com`. The response includes only domain names that are available. This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-domain-suggestions \
    --region us-east-1 \
    --domain-name example.com \
    --suggestion-count 10 \
    --only-available
```

Output:

```
{
    "SuggestionsList": [
        {
            "DomainName": "egzaampal.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "examplelaw.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "examplehouse.net",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "homeexample.net",
            "Availability": "AVAILABLE"
        },
        {
```

```
            "DomainName": "examplelist.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "examplenews.net",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "officeexample.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "exampleworld.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "exampleart.com",
            "Availability": "AVAILABLE"
        }
    ]
}
```

For more information, see Registering a new domain in the *Amazon Route 53 Developer Guide*.

- For API details, see GetDomainSuggestions in *AWS CLI Command Reference*.

`get-operation-detail`

The following code example shows how to use `get-operation-detail`.

AWS CLI

To get the current status of an operation

The following `get-operation-detail` example returns the status of the specified operation. Some domain registration operations operate asynchronously and return a response before they finish. These operations return an operation ID that you can use to get the current status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-operation-detail \
    --region us-east-1 \
```

```
    --operation-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Status": "SUCCESSFUL",
    "DomainName": "example.com",
    "Type": "DOMAIN_LOCK",
    "SubmittedDate": 1573749367.864
}
```

For more information, see Viewing the status of a domain registration in the *Amazon Route 53 Developer Guide*.

- For API details, see GetOperationDetail in *AWS CLI Command Reference*.

`list-domains`

The following code example shows how to use `list-domains`.

AWS CLI

To list the domains that are registered with the current AWS account

The following `list-domains` example lists summary information about the domains that are registered with the current AWS account.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-domains \
    --region us-east-1
```

Output:

```
{
    "Domains": [
        {
            "DomainName": "example.com",
            "AutoRenew": true,
            "TransferLock": true,
```

```
            "Expiry": 1602712345.0
        },
        {
            "DomainName": "example.net",
            "AutoRenew": true,
            "TransferLock": true,
            "Expiry": 1602723456.0
        },
        {
            "DomainName": "example.org",
            "AutoRenew": true,
            "TransferLock": true,
            "Expiry": 1602734567.0
        }
    ]
}
```

For more information, see Registering and managing domains using Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

- For API details, see ListDomains in *AWS CLI Command Reference*.

`list-operations`

The following code example shows how to use `list-operations`.

AWS CLI

To list the status of operations that return an operation ID

The following `list-operations` example lists summary information, including the status, about the current domain-registration operations. Some domain registration operations run asynchronously and return a response before they finish. These operations return an operation ID that you can use to get the current status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-operations \
    --region us-east-1
```

Output:

```
{
    "Operations": [
        {
            "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Status": "SUCCESSFUL",
            "Type": "DOMAIN_LOCK",
            "SubmittedDate": 1455321739.986
        },
        {
            "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Status": "SUCCESSFUL",
            "Type": "UPDATE_NAMESERVER",
            "SubmittedDate": 1468960475.109
        },
        {
            "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Status": "SUCCESSFUL",
            "Type": "RENEW_DOMAIN",
            "SubmittedDate": 1473561835.943
        },
        {
            "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Status": "SUCCESSFUL",
            "Type": "UPDATE_DOMAIN_CONTACT",
            "SubmittedDate": 1547501003.41
        }
    ]
}
```

The output includes all the operations that return an operation ID and that you have performed on all the domains that you have ever registered using the current AWS account. If you want to get only the operations that you submitted after a specified date, you can include the `submitted-since` parameter and specify a date in Unix format and Coordinated Universal Time (UTC). The following command gets the status of all operations that were submitted after 12:00 am UTC on January 1, 2020.

```
aws route53domains list-operations \
    --submitted-since 1577836800
```

For more information, see Viewing the status of a domain registration in the *Amazon Route 53 Developer Guide*.

- For API details, see ListOperations in *AWS CLI Command Reference*.

`list-tags-for-domain`

The following code example shows how to use `list-tags-for-domain`.

AWS CLI

To list tags for a domain

The following `list-tags-for-domain` example lists the tags that are currently associated with the specified domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-tags-for-domain \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "TagList": [
        {
            "Key": "key1",
            "Value": "value1"
        },
        {
            "Key": "key2",
            "Value": "value2"
        }
    ]
}
```

For more information, see Tagging Amazon Route 53 Resources in the *Amazon Route 53 Developer Guide*.

- For API details, see ListTagsForDomain in *AWS CLI Command Reference*.

`register-domain`

The following code example shows how to use `register-domain`.

AWS CLI

To register a domain

The following `register-domain` example registers a domain, retrieving all parameter values from a JSON-formatted file.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains register-domain \
    --region us-east-1 \
    --cli-input-json file://register-domain.json
```

Contents of `register-domain.json`:

```
{
    "DomainName": "example.com",
    "DurationInYears": 1,
    "AutoRenew": true,
    "AdminContact": {
        "FirstName": "Martha",
        "LastName": "Rivera",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "mrivera@example.com"
    },
    "RegistrantContact": {
        "FirstName": "Li",
        "LastName": "Juan",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
```

```
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "ljuan@example.com"
    },
    "TechContact": {
        "FirstName": "Mateo",
        "LastName": "Jackson",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "mjackson@example.com"
    },
    "PrivacyProtectAdminContact": true,
    "PrivacyProtectRegistrantContact": true,
    "PrivacyProtectTechContact": true
}
```

Output:

```
{
    "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail .

For information about which top-level domains (TLDs) require values for `ExtraParams` and what the valid values are, see Domains that you can register with Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

For more information, see Registering a New Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see RegisterDomain in *AWS CLI Command Reference*.

`renew-domain`

The following code example shows how to use `renew-domain`.

AWS CLI

To renew a domain

The following `renew-domain` example renews the specified domain for five years. To get the value for `current-expiry-year`, use the `get-domain-detail` command, and convert the value of `ExpirationDate` from Unix format.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains renew-domain \
    --region us-east-1 \
    --domain-name example.com \
    --duration-in-years 5 \
    --current-expiry-year 2020
```

Output:

```
{
    "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail.

The registry for each top-level domain (TLD), such as .com or .org, controls the maximum number of years that you can renew a domain for. To get the maximum renewal period for your domain, see the "Registration and Renewal Period" section for your TLD in Domains That You Can Register with Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

For more information, see Renewing Registration for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see RenewDomain in *AWS CLI Command Reference*.

`resend-contact-reachability-email`

The following code example shows how to use `resend-contact-reachability-email`.

AWS CLI

To resend the confirmation email to the current email address for the registrant contact

The following `resend-contact-reachability-email` example resends the confirmation email to the current email address for the registrant contact for the example.com domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains resend-contact-reachability-email \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "domainName": "example.com",
    "emailAddress": "moliveira@example.com",
    "isAlreadyVerified": true
}
```

If the value of `isAlreadyVerified` is `true`, as in this example, the registrant contact has already confirmed that the specified email address is reachable.

For more information, see Resending Authorization and Confirmation Emails in the *Amazon Route 53 Developer Guide*.

- For API details, see ResendContactReachabilityEmail in *AWS CLI Command Reference*.

`retrieve-domain-auth-code`

The following code example shows how to use `retrieve-domain-auth-code`.

AWS CLI

To get the authorization code for a domain so you can transfer the domain to another registrar

The following `retrieve-domain-auth-code` example gets the current authorization code for the example.com domain. You give this value to another domain registrar when you want to transfer the domain to that registrar.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains retrieve-domain-auth-code \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "AuthCode": ")o!v3dJeXampLe"
}
```

For more information, see Transferring a Domain from Amazon Route 53 to Another Registrar in the *Amazon Route 53 Developer Guide*.

- For API details, see RetrieveDomainAuthCode in *AWS CLI Command Reference*.

`transfer-domain`

The following code example shows how to use `transfer-domain`.

AWS CLI

To transfer a domain to Amazon Route 53

The following `transfer-domain` example transfers a domain to Route 53, with the parameters provided by the JSON-formatted file `C:\temp\transfer-domain.json`.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains transfer-domain \
    --region us-east-1 \
    --cli-input-json file://C:\temp\transfer-domain.json
```

Contents of `C:\temp\transfer-domain.json`:

```
{
    "DomainName": "example.com",
    "DurationInYears": 1,
    "Nameservers": [
        {
            "Name": "ns-2048.awsdns-64.com"
        },
        {
            "Name": "ns-2049.awsdns-65.net"
        },
        {
            "Name": "ns-2050.awsdns-66.org"
        },
        {
            "Name": "ns-2051.awsdns-67.co.uk"
        }
    ],
    "AuthCode": ")o!v3dJeXampLe",
    "AutoRenew": true,
    "AdminContact": {
        "FirstName": "Martha",
        "LastName": "Rivera",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "mrivera@example.com"
    },
    "RegistrantContact": {
        "FirstName": "Li",
        "LastName": "Juan",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
```

```
        "PhoneNumber": "+1.8005551212",
        "Email": "ljuan@example.com"
    },
    "TechContact": {
        "FirstName": "Mateo",
        "LastName": "Jackson",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "mjackson@example.com"
    },
    "PrivacyProtectAdminContact": true,
    "PrivacyProtectRegistrantContact": true,
    "PrivacyProtectTechContact": true
}
```

Output:

```
{
    "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail .

For more information, see Transferring Registration for a Domain to Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

- For API details, see TransferDomain in *AWS CLI Command Reference*.

`update-domain-contact-privacy`

The following code example shows how to use `update-domain-contact-privacy`.

AWS CLI

To update the privacy settings for the contacts for a domain

The following `update-domain-contact-privacy` example turns off privacy protection for the administrative contact for the example.com domain. This command runs only in the `us-east-1` Region.

If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-contact-privacy \
    --region us-east-1 \
    --domain-name example.com \
    --no-admin-privacy
```

Output:

```
{
    "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail .

For more information, see Enabling or Disabling Privacy Protection for Contact Information for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateDomainContactPrivacy in *AWS CLI Command Reference*.

`update-domain-contact`

The following code example shows how to use `update-domain-contact`.

AWS CLI

To update the contact information for a domain

The following `update-domain-contact` example updates the contact information for a domain, getting the parameters from the JSON-formatted file `C:\temp\update-domain-contact.json`.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-contact \
```

```
    --region us-east-1 \
    --cli-input-json file://C:\temp\update-domain-contact.json
```

Contents of `C:\temp\update-domain-contact.json`:

```
{
    "AdminContact": {
        "AddressLine1": "101 Main Street",
        "AddressLine2": "Suite 1a",
        "City": "Seattle",
        "ContactType": "COMPANY",
        "CountryCode": "US",
        "Email": "w.xiulan@example.com",
        "FirstName": "Wang",
        "LastName": "Xiulan",
        "OrganizationName": "Example",
        "PhoneNumber": "+1.8005551212",
        "State": "WA",
        "ZipCode": "98101"
    },
    "DomainName": "example.com",
    "RegistrantContact": {
        "AddressLine1": "101 Main Street",
        "AddressLine2": "Suite 1a",
        "City": "Seattle",
        "ContactType": "COMPANY",
        "CountryCode": "US",
        "Email": "w.xiulan@example.com",
        "FirstName": "Wang",
        "LastName": "Xiulan",
        "OrganizationName": "Example",
        "PhoneNumber": "+1.8005551212",
        "State": "WA",
        "ZipCode": "98101"
    },
    "TechContact": {
        "AddressLine1": "101 Main Street",
        "AddressLine2": "Suite 1a",
        "City": "Seattle",
        "ContactType": "COMPANY",
        "CountryCode": "US",
        "Email": "w.xiulan@example.com",
        "FirstName": "Wang",
```

```
        "LastName": "Xiulan",
        "OrganizationName": "Example",
        "PhoneNumber": "+1.8005551212",
        "State": "WA",
        "ZipCode": "98101"
    }
}
```

Output:

```
{
    "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

To confirm that the operation succeeded, you can run get-domain-detail . For more information, see Updating Contact Information for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateDomainContact in *AWS CLI Command Reference*.

`update-domain-nameservers`

The following code example shows how to use `update-domain-nameservers`.

AWS CLI

To update the name servers for a domain

The following `update-domain-nameservers` example updates the name servers for a domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-nameservers \
    --region us-east-1 \
    --domain-name example.com \
    --
nameservers Name=ns-1.awsdns-01.org Name=ns-2.awsdns-02.co.uk Name=ns-3.awsdns-03.net Name=n
```

Output:

```
{
```

```
    "OperationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

To confirm that the operation succeeded, you can run get-domain-detail .

For more information, see Adding or Changing Name Servers and Glue Records for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateDomainNameservers in *AWS CLI Command Reference*.

`update-tags-for-domain`

The following code example shows how to use `update-tags-for-domain`.

AWS CLI

To add or update tags for a domain

The following `update-tags-for-domain` example adds or updates two keys and the corresponding values for the example.com domain. To update the value for a key, just include the key and the new value. You can add or update tags in only one domain at a time.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-tags-for-domain \
    --region us-east-1 \
    --domain-name example.com \
    --tags-to-update "Key=key1,Value=value1" "Key=key2,Value=value2"
```

This command produces no output. To confirm that the tags were added or updated, you can run list-tags-for-domain .

For more information, see Tagging Amazon Route 53 Resources in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateTagsForDomain in *AWS CLI Command Reference*.

`view-billing`

The following code example shows how to use `view-billing`.

AWS CLI

To get billing information for domain registration charges for the current AWS account

The following `view-billing` example returns all the domain-related billing records for the current account for the period from January 1, 2018 (1514764800 in Unix time) and midnight on December 31, 2019 (1577836800 in Unix time).

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains view-billing \
    --region us-east-1 \
    --start-time 1514764800 \
    --end-time 1577836800
```

Output:

```
{
    "BillingRecords": [
        {
            "DomainName": "example.com",
            "Operation": "RENEW_DOMAIN",
            "InvoiceId": "149962827",
            "BillDate": 1536618063.181,
            "Price": 12.0
        },
        {
            "DomainName": "example.com",
            "Operation": "RENEW_DOMAIN",
            "InvoiceId": "290913289",
            "BillDate": 1568162630.884,
            "Price": 12.0
        }
    ]
}
```

For more information, see Downloading a domain billing report in the *Amazon Route 53 Developer Guide*.

- For API details, see ViewBilling in *AWS CLI Command Reference*.

Route 53 Profiles examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 Profiles.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`associate-profile`

The following code example shows how to use `associate-profile`.

AWS CLI

To associate a Profile

The following `associate-profile` example associates a Profile to a VPC.

```
aws route53profiles associate-profile \
    --name test-association \
    --profile-id rp-4987774726example \
    --resource-id vpc-0af3b96b3example
```

Output:

```
{
    "ProfileAssociation": {
        "CreationTime": 1710851336.527,
        "Id": "rpassoc-489ce212fexample",
        "ModificationTime": 1710851336.527,
        "Name": "test-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
```

```
        "ResourceId": "vpc-0af3b96b3example",
        "Status": "CREATING",
        "StatusMessage": "Creating Profile Association"
    }
}
```

For more information, see Using Profiles in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateProfile in *AWS CLI Command Reference*.

`associate-resource-to-profile`

The following code example shows how to use `associate-resource-to-profile`.

AWS CLI

To associate a resource to a Profile

The following `associate-resource-to-profile` example associates a DNS Firewall rule group with the priority of 102 to a Profile.

```
aws route53profiles associate-resource-to-profile \
    --name test-resource-association \
    --profile-id rp-4987774726example \
    --resource-arn arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-
group/rslvr-frg-cfe7f72example \
    --resource-properties "{\"priority\": 102}"
```

Output:

```
{
    "ProfileResourceAssociation": {
        "CreationTime": 1710851216.613,
        "Id": "rpr-001913120a7example",
        "ModificationTime": 1710851216.613,
        "Name": "test-resource-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceArn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-
rule-group/rslvr-frg-cfe7f72example",
        "ResourceProperties": "{\"priority\":102}",
        "ResourceType": "FIREWALL_RULE_GROUP",
        "Status": "UPDATING",
```

```
        "StatusMessage": "Updating the Profile to DNS Firewall rule group
 association"
    }
}
```

For more information, see Associate DNS Firewall rule groups to a Route 53 Profile in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateResourceToProfile in *AWS CLI Command Reference*.

`create-profile`

The following code example shows how to use `create-profile`.

AWS CLI

To create a Profile

The following `create-profile` example creates a Profile.

```
aws route53profiles create-profile \
    --name test
```

Output:

```
{
    "Profile": {
        "Arn": "arn:aws:route53profiles:us-west-2:123456789012:profile/
rp-6ffe47d5example",
        "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1710850903.578,
        "Id": "rp-6ffe47d5example",
        "ModificationTime": 1710850903.578,
        "Name": "test",
        "OwnerId": "123456789012",
        "ShareStatus": "NOT_SHARED",
        "Status": "COMPLETE",
        "StatusMessage": "Created Profile"
    }
}
```

For more information, see Creating Route 53 Profiles in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateProfile in *AWS CLI Command Reference*.

`delete-profile`

The following code example shows how to use `delete-profile`.

AWS CLI

To delete a Profile

The following `delete-profile` example deletes a Profile.

```
aws route53profiles delete-profile \
    --profile-id rp-6ffe47d5example
```

Output:

```
{
    "Profile": {
        "Arn": "arn:aws:route53profiles:us-west-2:123456789012:profile/
rp-6ffe47d5example",
        "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1710850903.578,
        "Id": "rp-6ffe47d5example",
        "ModificationTime": 1710850903.578,
        "Name": "test",
        "OwnerId": "123456789012",
        "ShareStatus": "NOT_SHARED",
        "Status": "DELETED",
        "StatusMessage": "Deleted Profile"
    }
}
```

For more information, see Viewing and updating Amazon Route 53 Profiles in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteProfile in *AWS CLI Command Reference*.

`disassociate-profile`

The following code example shows how to use `disassociate-profile`.

AWS CLI

To disassociate a Profile

The following `disassociate-profile` example disassociates a Profile from a VPC.

```
aws route53profiles disassociate-profile \
    --profile-id rp-4987774726example \
    --resource-id vpc-0af3b96b3example
```

Output:

```
{
    "ProfileAssociation": {
        "CreationTime": 1710851336.527,
        "Id": "rpassoc-489ce212fexample",
        "ModificationTime": 1710851401.362,
        "Name": "test-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceId": "vpc-0af3b96b3example",
        "Status": "DELETING",
        "StatusMessage": "Deleting Profile Association"
    }
}
```

For more information, see Viewing VPCs associated to an Amazon Route 53 Profile in the *Amazon Route 53 Developer Guide*.

- For API details, see DisassociateProfile in *AWS CLI Command Reference*.

`disassociate-resource-from-profile`

The following code example shows how to use `disassociate-resource-from-profile`.

AWS CLI

To disassociate a resource from Profile

The following `disassociate-resource-from-profile` example disassociates a DNS Firewall rule group from a Profile.

```
aws route53profiles disassociate-resource-from-profile \
    --profile-id rp-4987774726example \
    --resource-arn arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-
group/rslvr-frg-cfe7f72example
```

Output:

```
{
    "ProfileResourceAssociation": {
        "CreationTime": 1710851216.613,
        "Id": "rpr-001913120a7example",
        "ModificationTime": 1710852624.36,
        "Name": "test-resource-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceArn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-
rule-group/rslvr-frg-cfe7f72example",
        "ResourceProperties": "{\"priority\":105}",
        "ResourceType": "FIREWALL_RULE_GROUP",
        "Status": "DELETING",
        "StatusMessage": "Deleting the Profile to DNS Firewall rule group
 association"
    }
}
```

For more information, see Disassociating a resource from an Amazon Route 53 Profile in the *Amazon Route 53 Developer Guide*.

- For API details, see DisassociateResourceFromProfile in *AWS CLI Command Reference*.

`get-profile-association`

The following code example shows how to use `get-profile-association`.

AWS CLI

To get information about a Profile association

The following `get-profile-association` example returns information about the specified Profile association.

```
aws route53profiles get-profile-association \
```

```
    --profile-association-id rpassoc-489ce212fexample
```

Output:

```
{
    "ProfileAssociation": {
        "CreationTime": 1709338817.148,
        "Id": "rrpassoc-489ce212fexample",
        "ModificationTime": 1709338974.772,
        "Name": "test-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceId": "vpc-0af3b96b3example",
        "Status": "COMPLETE",
        "StatusMessage": "Created Profile Association"
    }
}
```

For more information, see Viewing VPCs associated to an Amazon Route 53 Profile in the *Amazon Route 53 Developer Guide*.

- For API details, see GetProfileAssociation in *AWS CLI Command Reference*.

`get-profile-resource-association`

The following code example shows how to use `get-profile-resource-association`.

AWS CLI

To get information about a resource associated to a Profile

The following `get-profile-resource-association` example returns information about the specified resource association to a Profile.

```
aws route53profiles get-profile-resource-association \
    --profile-resource-association-id rpr-001913120a7example
```

Output:

```
{
```

```
    "ProfileResourceAssociation": {
        "CreationTime": 1710851216.613,
        "Id": "rpr-001913120a7example",
        "ModificationTime": 1710852303.798,
        "Name": "test-resource-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceArn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-
rule-group/rslvr-frg-cfe7f72example",
        "ResourceProperties": "{\"priority\":105}",
        "ResourceType": "FIREWALL_RULE_GROUP",
        "Status": "COMPLETE",
        "StatusMessage": "Completed creation of Profile to DNS Firewall rule group
 association"
    }
}
```

For more information, see Viewing and updating Route 53 resources associated to an Amazon Route 53 Profile in the *Amazon Route 53 Developer Guide*.

- For API details, see GetProfileResourceAssociation in *AWS CLI Command Reference*.

`get-profile`

The following code example shows how to use `get-profile`.

AWS CLI

To get information about a Profile

The following `get-profile` example returns information about the specified Profile.

```
aws route53profiles get-profile \
    --profile-id rp-4987774726example
```

Output:

```
{
    "Profile": {
        "Arn": "arn:aws:route53profiles:us-west-2:123456789012:profile/
rp-4987774726example",
        "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
        "CreationTime": 1710851044.288,
        "Id": "rp-4987774726example",
        "ModificationTime": 1710851044.288,
        "Name": "test",
        "OwnerId": "123456789012",
        "ShareStatus": "NOT_SHARED",
        "Status": "COMPLETE",
        "StatusMessage": "Created Profile"
    }
}
```

For more information, see Viewing and updating Amazon Route 53 Profiles in the *Amazon Route 53 Developer Guide*.

- For API details, see GetProfile in *AWS CLI Command Reference*.

`list-profile-associations`

The following code example shows how to use `list-profile-associations`.

AWS CLI

To list Profile associations

The following `list-profile-associations` example lists the Profile associations in your AWS account.

```
aws route53profiles list-profile-associations
```

Output:

```
{
    "ProfileAssociations": [
        {
            "CreationTime": 1709338817.148,
            "Id": "rpassoc-489ce212fexample",
            "ModificationTime": 1709338974.772,
            "Name": "test-association",
            "OwnerId": "123456789012",
            "ProfileId": "rp-4987774726example",
            "ResourceId": "vpc-0af3b96b3example",
```

```
            "Status": "COMPLETE",
            "StatusMessage": "Created Profile Association"
        }
    ]
}
```

For more information, see Viewing VPCs associated to an Amazon Route 53 Profile in the *Amazon Route 53 Developer Guide*.

- For API details, see ListProfileAssociations in *AWS CLI Command Reference*.

`list-profile-resource-associations`

The following code example shows how to use `list-profile-resource-associations`.

AWS CLI

To list Profile resource associations

The following `list-profile-resource-associations` example lists the Profile resource associations for the specified Profile.

```
aws route53profiles list-profile-resource-associations \
    --profile-id rp-4987774726example
```

Output:

```
{
    "ProfileResourceAssociations": [
        {
            "CreationTime": 1710851216.613,
            "Id": "rpr-001913120a7example",
            "ModificationTime": 1710851216.613,
            "Name": "test-resource-association",
            "OwnerId": "123456789012",
            "ProfileId": "rp-4987774726example",
            "ResourceArn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-
rule-group/rslvr-frg-cfe7f72example",
            "ResourceProperties": "{\"priority\":102}",
            "ResourceType": "FIREWALL_RULE_GROUP",
            "Status": "COMPLETE",
```

```
            "StatusMessage": "Completed creation of Profile to DNS Firewall rule
 group association"
        }
    ]
}
```

For more information, see Viewing and updating Route 53 resources associated to an Amazon Route 53 Profile in the *Amazon Route 53 Developer Guide*.

- For API details, see ListProfileResourceAssociations in *AWS CLI Command Reference*.

`list-profiles`

The following code example shows how to use `list-profiles`.

AWS CLI

To list Profiles

The following `list-profiles` example lists the Profiles in your AWS account and displays additional information about them.

```
aws route53profiles list-profiles
```

Output:

```
{
    "ProfileSummaries": [
        {
            "Arn": "arn:aws:route53profiles:us-west-2:123456789012:profile/
rp-4987774726example",
            "Id": "rp-4987774726example",
            "Name": "test",
            "ShareStatus": "NOT_SHARED"
        }
    ]
}
```

For more information, see Viewing and updating Amazon Route 53 Profiles in the *Amazon Route 53 Developer Guide*.

- For API details, see ListProfiles in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example lists tags for the specified resource.

```
aws route53profiles list-tags-for-resource \
    --resource-arn arn:aws:route53profiles:us-west-2:123456789012:profile/
rp-4987774726example
```

Output:

```
{
    "Tags": {
        "my-key-2": "my-value-2",
        "my-key-1": "my-value-1"
    }
}
```

For more information, see Tagging Amazon Route 53 resources in the *Amazon Route 53 Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`update-profile-resource-association`

The following code example shows how to use `update-profile-resource-association`.

AWS CLI

To update a resource associated to a Profile

The following `update-profile-resource-association` example updates a priority of a DNS Firewall rule group that is associated to the Profile.

```
aws route53profiles update-profile-resource-association \
```

```
    --profile-resource-association-id rpr-001913120a7example \
    --resource-properties "{\"priority\": 105}"
```

Output:

```
{
    "ProfileResourceAssociation": {
        "CreationTime": 1710851216.613,
        "Id": "rpr-001913120a7example",
        "ModificationTime": 1710852303.798,
        "Name": "test-resource-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceArn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-
rule-group/rslvr-frg-cfe7f72example",
        "ResourceProperties": "{\"priority\":105}",
        "ResourceType": "FIREWALL_RULE_GROUP",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Profile to DNS Firewall rule group
 association"
    }
}
```

For more information, see Viewing and updating Route 53 resources associated to an Amazon Route 53 Profile in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateProfileResourceAssociation in *AWS CLI Command Reference*.

Route 53 Resolver examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 Resolver.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-firewall-rule-group`

The following code example shows how to use `associate-firewall-rule-group`.

AWS CLI

To associate a firewall rule group with a VPC

The following `associate-firewall-rule-group` example associates a DNS Firewall rule group with an Amazon VPC.

```
aws route53resolver associate-firewall-rule-group \
    --name test-association \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --vpc-id vpc-31e92222 \
    --priority 101
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 101,
        "MutationProtection": "DISABLED",
        "Status": "UPDATING",
        "StatusMessage": "Creating Firewall Rule Group Association",
        "CreatorRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:47:48.755768Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateFirewallRuleGroup in *AWS CLI Command Reference*.

`associate-resolver-endpoint-ip-address`

The following code example shows how to use `associate-resolver-endpoint-ip-address`.

AWS CLI

To associate another IP address with a Resolver endpoint

The following `associate-resolver-endpoint-ip-address` example associates another IP address with an inbound Resolver endpoint. If you specify only a subnet ID and omit the IP address from the `--ip-address` parameter, Resolver chooses an IP address for you from among the available IP addresses in the specified subnet.

```
aws route53resolver associate-resolver-endpoint-ip-address \
    --resolver-endpoint-id rslvr-in-497098ad5example \
    --ip-address="SubnetId=subnet-12d8exam,Ip=192.0.2.118"
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-497098ad5example",
        "CreatorRequestId": "AWSConsole.25.0123456789",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-endpoint/
rslvr-in-497098ad5example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 3,
        "HostVPCId": "vpc-304bexam",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Resolver Endpoint",
        "CreationTime": "2020-01-02T23:25:45.538Z",
        "ModificationTime": "2020-01-02T23:25:45.538Z"
    }
}
```

For more information, see Values That You Specify When You Create or Edit Inbound Endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateResolverEndpointIpAddress in *AWS CLI Command Reference*.

`associate-resolver-rule`

The following code example shows how to use `associate-resolver-rule`.

AWS CLI

To associate a Resolver rule with a VPC

The following `associate-resolver-rule` example associates a Resolver rule with an Amazon VPC. After you run the command, Resolver starts to forward DNS queries to your network based on the settings in the rule, such as the domain name of the queries that are forwarded.

```
aws route53resolver associate-resolver-rule \
    --name my-resolver-rule-association \
    --resolver-rule-id rslvr-rr-42b60677c0example \
    --vpc-id vpc-304bexam
```

Output:

```
{
    "ResolverRuleAssociation": {
        "Id": "rslvr-rrassoc-d61cbb2c8bexample",
        "ResolverRuleId": "rslvr-rr-42b60677c0example",
        "Name": "my-resolver-rule-association",
        "VPCId": "vpc-304bexam",
        "Status": "CREATING",
        "StatusMessage": "[Trace id: 1-5dc5a8fa-ec2cc480d2ef07617example] Creating
 the association."
    }
}
```

For more information, see Forwarding Outbound DNS Queries to Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateResolverRule in *AWS CLI Command Reference*.

`create-firewall-domain-list`

The following code example shows how to use `create-firewall-domain-list`.

AWS CLI

To create a Route 53 Resolver DNS Firewall domain list

The following `create-firewall-domain-list` example creates a Route 53 Resolver DNS Firewall domain list, named test, in your AWS account.

```
aws route53resolver create-firewall-domain-list \
    --creator-request-id my-request-id \
    --name test
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-d61cbb2cbexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/
rslvr-fdl-d61cbb2cbexample",
        "Name": "test",
        "DomainCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Domain List",
        "CreatorRequestId": "my-request-id",
        "CreationTime": "2021-05-25T15:55:51.115365Z",
        "ModificationTime": "2021-05-25T15:55:51.115365Z"
    }
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateFirewallDomainList in *AWS CLI Command Reference*.

`create-firewall-rule-group`

The following code example shows how to use `create-firewall-rule-group`.

AWS CLI

To create a Firewall rule group

The following `create-firewall-rule-group` example creates a DNS Firewall rule group.

```
aws route53resolver create-firewall-rule-group \
    --creator-request-id my-request-id \
    --name test
```

Output:

```
{
    "FirewallRuleGroup": {
        "Id": "rslvr-frg-47f93271fexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/
rslvr-frg-47f93271fexample",
        "Name": "test",
        "RuleCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Rule Group",
        "OwnerId": "123456789012",
        "CreatorRequestId": "my-request-id",
        "ShareStatus": "NOT_SHARED",
        "CreationTime": "2021-05-25T18:59:26.490017Z",
        "ModificationTime": "2021-05-25T18:59:26.490017Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateFirewallRuleGroup in *AWS CLI Command Reference*.

`create-firewall-rule`

The following code example shows how to use `create-firewall-rule`.

AWS CLI

To create a firewall rule

The following `create-firewall-rule` example creates a firewall rule in a DNS Firewall rule for domains listed in a DNS Firewall domain list.

```
aws route53resolver create-firewall-rule \
    --name allow-rule \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
```

```
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample \
    --priority 101 \
    --action ALLOW
```

Output:

```
{
    "FirewallRule": {
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
        "Name": "allow-rule",
        "Priority": 101,
        "Action": "ALLOW",
        "CreatorRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:44:00.346093Z",
        "ModificationTime": "2021-05-25T21:44:00.346093Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateFirewallRule in *AWS CLI Command Reference*.

`create-resolver-endpoint`

The following code example shows how to use `create-resolver-endpoint`.

AWS CLI

Example 1: To create an inbound Resolver endpoint

The following `create-resolver-endpoint` example creates an inbound Resolver endpoint. You can use the same command to create both inbound and outbound endpoints.

aws route53resolver create-resolver-endpoint --name my-inbound-endpoint --creator-request-id 2020-01-01-18:47 --security-group-ids "sg-f62bexam" --direction INBOUND --ip-addresses SubnetId=subnet-ba47exam,Ip=192.0.2.255 SubnetId=subnet-12d8exam,Ip=192.0.2.254

Output:

```
{
    "ResolverEndpoint": {
```

```
        "Id": "rslvr-in-f9ab8a03f1example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-endpoint/
rslvr-in-f9ab8a03f1example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304examp",
        "Status": "CREATING",
        "StatusMessage": "[Trace id: 1-5dc1ff84-f3477826e4a190025example] Creating
 the Resolver Endpoint",
        "CreationTime": "2020-01-01T23:02:29.583Z",
        "ModificationTime": "2020-01-01T23:02:29.583Z"
    }
}
```

Example 2: To create an outbound Resolver endpoint

The following `create-resolver-endpoint` example creates an outbound resolver endpoint using the values in the JSON-formatted document `create-outbound-resolver-endpoint.json`.

```
aws route53resolver create-resolver-endpoint \
    --cli-input-json file://c:\temp\create-outbound-resolver-endpoint.json
```

Contents of `c:\temp\create-outbound-resolver-endpoint.json`:

```
{
    "CreatorRequestId": "2020-01-01-18:47",
    "Direction": "OUTBOUND",
    "IpAddresses": [
        {
            "Ip": "192.0.2.255",
            "SubnetId": "subnet-ba47exam"
        },
        {
            "Ip": "192.0.2.254",
            "SubnetId": "subnet-12d8exam"
        }
    ],
```

```
    "Name": "my-outbound-endpoint",
    "SecurityGroupIds": [
        "sg-05cd7b25d6example"
    ],
    "Tags": [
        {
            "Key": "my-key-name",
            "Value": "my-key-value"
        }
    ]
}
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-out-f9ab8a03f1example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-endpoint/
rslvr-out-f9ab8a03f1example",
        "Name": "my-outbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "OUTBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304examp",
        "Status": "CREATING",
        "StatusMessage": "[Trace id: 1-5dc1ff84-f3477826e4a190025example] Creating
 the Resolver Endpoint",
        "CreationTime": "2020-01-01T23:50:50.979Z",
        "ModificationTime": "2020-01-01T23:50:50.979Z"
    }
}
```

For more information, see Resolving DNS Queries Between VPCs and Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateResolverEndpoint in *AWS CLI Command Reference*.

`create-resolver-rule`

The following code example shows how to use `create-resolver-rule`.

AWS CLI

To create a Resolver rule

The following `create-resolver-rule` example creates a Resolver forwarding rule. The rule uses the outbound endpoint rslvr-out-d5e5920e37example to forward DNS queries for `example.com` to the IP addresses 10.24.8.75 and 10.24.8.156.

```
aws route53resolver create-resolver-rule \
    --creator-request-id 2020-01-02-18:47 \
    --domain-name example.com \
    --name my-rule \
    --resolver-endpoint-id rslvr-out-d5e5920e37example \
    --rule-type FORWARD \
    --target-ips "Ip=10.24.8.75" "Ip=10.24.8.156"
```

Output:

```
{
    "ResolverRule": {
        "Status": "COMPLETE",
        "RuleType": "FORWARD",
        "ResolverEndpointId": "rslvr-out-d5e5920e37example",
        "Name": "my-rule",
        "DomainName": "example.com.",
        "CreationTime": "2022-05-10T21:35:30.923187Z",
        "TargetIps": [
            {
                "Ip": "10.24.8.75",
                "Port": 53
            },
            {
                "Ip": "10.24.8.156",
                "Port": 53
            }
        ],
        "CreatorRequestId": "2022-05-10-16:33",
        "ModificationTime": "2022-05-10T21:35:30.923187Z",
        "ShareStatus": "NOT_SHARED",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-rule/rslvr-
rr-b1e0b905e93611111",
        "OwnerId": "123456789012",
        "Id": "rslvr-rr-rslvr-rr-b1e0b905e93611111",
```

```
        "StatusMessage": "[Trace id: 1-22222222-3e56afcc71a3724664f22e24]
 Successfully created Resolver Rule."
    }
}
```

For more information, see Managing forwarding rules in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateResolverRule in *AWS CLI Command Reference*.

`delete-firewall-domain-list`

The following code example shows how to use `delete-firewall-domain-list`.

AWS CLI

To delete a Route 53 Resolver DNS Firewall domain list

The following `delete-firewall-domain-list` example deletes a Route 53 Resolver DNS Firewall domain list, named test, in your AWS account.

```
aws route53resolver delete-firewall-domain-list \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-9e956e9ffexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/
rslvr-fdl-9e956e9ffexample",
        "Name": "test",
        "DomainCount": 6,
        "Status": "DELETING",
        "StatusMessage": "Deleting the Firewall Domain List",
        "CreatorRequestId": "my-request-id",
        "CreationTime": "2021-05-25T15:55:51.115365Z",
        "ModificationTime": "2021-05-25T18:58:05.588024Z"
    }
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteFirewallDomainList in *AWS CLI Command Reference*.

`delete-firewall-rule-group`

The following code example shows how to use `delete-firewall-rule-group`.

AWS CLI

To delete a firewall rule group

The following `delete-firewall-rule-group` example deletes a firewall rule group.

```
aws route53resolver delete-firewall-rule-group \
    --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
    "FirewallRuleGroup": {
        "Id": "rslvr-frg-47f93271fexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/
rslvr-frg-47f93271fexample",
        "Name": "test",
        "RuleCount": 0,
        "Status": "UPDATING",
        "StatusMessage": "Updating Firewall Rule Group",
        "OwnerId": "123456789012",
        "CreatorRequestId": "my-request-id",
        "ShareStatus": "NOT_SHARED",
        "CreationTime": "2021-05-25T18:59:26.490017Z",
        "ModificationTime": "2021-05-25T21:51:53.028688Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteFirewallRuleGroup in *AWS CLI Command Reference*.

`delete-firewall-rule`

The following code example shows how to use `delete-firewall-rule`.

AWS CLI

To delete a firewall rule

The following `delete-firewall-rule` example deletes a specified firewall rule.

```
aws route53resolver delete-firewall-rule \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample
```

Output:

```
{
    "FirewallRule": {
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
        "Name": "allow-rule",
        "Priority": 102,
        "Action": "ALLOW",
        "CreatorRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:44:00.346093Z",
        "ModificationTime": "2021-05-25T21:45:59.611600Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteFirewallRule in *AWS CLI Command Reference*.

`delete-resolver-endpoint`

The following code example shows how to use `delete-resolver-endpoint`.

AWS CLI

To delete a Resolver endpoint

The following `delete-resolver-endpoint` example deletes the specified endpoint.

Important If you delete an inbound endpoint, DNS queries from your network are no longer forwarded to Resolver in the VPC that you specified in the endpoint. If you delete an outbound

endpoint, Resolver stops forwarding DNS queries from your VPC to your network for rules that specify the deleted outbound endpoint.

```
aws route53resolver delete-resolver-endpoint \
    --resolver-endpoint-id rslvr-in-497098ad59example
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-497098ad59example",
        "CreatorRequestId": "AWSConsole.25.157290example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-endpoint/
rslvr-in-497098ad59example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 5,
        "HostVPCId": "vpc-304bexam",
        "Status": "DELETING",
        "StatusMessage": "[Trace id: 1-5dc5b658-811b5be0922bbc382example] Deleting
 ResolverEndpoint.",
        "CreationTime": "2020-01-01T23:25:45.538Z",
        "ModificationTime": "2020-01-02T23:25:45.538Z"
    }
}
```

For more information, see Managing inbound endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteResolverEndpoint in *AWS CLI Command Reference*.

`delete-resolver-rule`

The following code example shows how to use `delete-resolver-rule`.

AWS CLI

To delete a Resolver rule

The following `delete-resolver-rule` example deletes the specified rule.

Note If a rule is associated with any VPCs, you must first disassociate the rule from the VPCs before you can delete it.

```
aws route53resolver delete-resolver-rule \
    --resolver-rule-id rslvr-rr-5b3809426bexample
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-5b3809426bexample",
        "CreatorRequestId": "2020-01-03-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-rule/rslvr-
rr-5b3809426bexample",
        "DomainName": "zenith.example.com.",
        "Status": "DELETING",
        "StatusMessage": "[Trace id: 1-5dc5e05b-602e67b052cb74f05example] Deleting
 Resolver Rule.",
        "RuleType": "FORWARD",
        "Name": "my-resolver-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.50",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-d5e5920e3example",
        "OwnerId": "123456789012",
        "ShareStatus": "NOT_SHARED"
    }
}
```

For more information, see Managing forwarding rules in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteResolverRule in *AWS CLI Command Reference*.

`disassociate-firewall-rule-group`

The following code example shows how to use `disassociate-firewall-rule-group`.

AWS CLI

To disassociate a firewall rule group from a VPC

The following `disassociate-firewall-rule-group` example disassociates a DNS Firewall rule group from an Amazon VPC.

```
aws route53resolver disassociate-firewall-rule-group \
    --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 103,
        "MutationProtection": "DISABLED",
        "Status": "DELETING",
        "StatusMessage": "Deleting the Firewall Rule Group Association",
        "CreatorRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:51:02.377887Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the *Amazon Route 53 Developer Guide*.

- For API details, see DisassociateFirewallRuleGroup in *AWS CLI Command Reference*.

`disassociate-resolver-endpoint-ip-address`

The following code example shows how to use `disassociate-resolver-endpoint-ip-address`.

AWS CLI

To disassociate an IP address from a Resolver endpoint

The following `disassociate-resolver-endpoint-ip-address` example removes an IP address from a specified Resolver inbound or outbound endpoint.

Note An endpoint must have at least two IP addresses. If an endpoint currently has only two IP addresses and you want to replace one address with another address, you must first use associate-resolver-endpoint-ip-address to associate the new IP address. Then you can disassociate one of the original IP addresses from the endpoint.

```
aws route53resolver disassociate-resolver-endpoint-ip-address \
    --resolver-endpoint-id rslvr-in-f9ab8a03f1example \
    --ip-address="SubnetId=subnet-12d8a459,Ip=172.31.40.121"
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-f9ab8a03f1example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-endpoint/
rslvr-in-f9ab8a03f1example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 3,
        "HostVPCId": "vpc-304bexam",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Resolver Endpoint",
        "CreationTime": "2020-01-01T23:02:29.583Z",
        "ModificationTime": "2020-01-05T23:02:29.583Z"
    }
}
```

For more information, see Managing inbound endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see DisassociateResolverEndpointIpAddress in *AWS CLI Command Reference*.

`disassociate-resolver-rule`

The following code example shows how to use `disassociate-resolver-rule`.

AWS CLI

To disassociate a Resolver rule from an Amazon VPC

The following `disassociate-resolver-rule` example removes the association between the specified Resolver rule and the specified VPC. You can disassociate a rule from a VPC in the following circumstances:

For DNS queries that originate in this VPC, you want Resolver to stop forwarding queries to your network for the domain name that is specified in the rule.You want to delete the forwarding rule. If a rule is currently associated with one or more VPCs, you must disassociate the rule from all VPCs before you can delete it.

```
aws route53resolver disassociate-resolver-rule \
    --resolver-rule-id rslvr-rr-4955cb98ceexample \
    --vpc-id vpc-304bexam
```

Output:

```
{
    "ResolverRuleAssociation": {
        "Id": "rslvr-rrassoc-322f4e8b9cexample",
        "ResolverRuleId": "rslvr-rr-4955cb98ceexample",
        "Name": "my-resolver-rule-association",
        "VPCId": "vpc-304bexam",
        "Status": "DELETING",
        "StatusMessage": "[Trace id: 1-5dc5ffa2-a26c38004c1f94006example] Deleting
 Association"
    }
}
```

For more information, see Managing forwarding rules in the *Amazon Route 53 Developer Guide*.

- For API details, see DisassociateResolverRule in *AWS CLI Command Reference*.

`get-firewall-config`

The following code example shows how to use `get-firewall-config`.

AWS CLI

To get a firewall config for a VPC

The following `get-firewall-config` example retrieves the DNS Firewall behavior for the specified VPC.

```
aws route53resolver get-firewall-config \
    --resource-id vpc-31e92222
```

Output:

```
{
    "FirewallConfig": {
        "Id": "rslvr-fc-86016850cexample",
        "ResourceId": "vpc-31e9222",
        "OwnerId": "123456789012",
        "FirewallFailOpen": "DISABLED"
    }
}
```

For more information, see DNS Firewall VPC configuration in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallConfig in *AWS CLI Command Reference*.

`get-firewall-domain-list`

The following code example shows how to use `get-firewall-domain-list`.

AWS CLI

To get a Route 53 Resolver DNS Firewall domain list

The following `get-firewall-domain-list` example retrieves the domain list with the ID you specify.

```
aws route53resolver get-firewall-domain-list \
    --firewall-domain-list-id rslvr-fdl-42b60677cexample
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-9e956e9ffexample",
```

```
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/
rslvr-fdl-42b60677cexample",
        "Name": "test",
        "DomainCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Domain List",
        "CreatorRequestId": "my-request-id",
        "CreationTime": "2021-05-25T15:55:51.115365Z",
        "ModificationTime": "2021-05-25T15:55:51.115365Z"
    }
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallDomainList in *AWS CLI Command Reference*.

`get-firewall-rule-group-association`

The following code example shows how to use `get-firewall-rule-group-association`.

AWS CLI

To get a firewall rule group association

The following `get-firewall-rule-group-association` example retrieves a firewall rule group association.

```
aws route53resolver get-firewall-rule-group-association \
    --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 101,
        "MutationProtection": "DISABLED",
```

```
        "Status": "COMPLETE",
        "StatusMessage": "Finished rule group association update",
        "CreatorRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:47:48.755768Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallRuleGroupAssociation in *AWS CLI Command Reference*.

`get-firewall-rule-group-policy`

The following code example shows how to use `get-firewall-rule-group-policy`.

AWS CLI

To get an AWS IAM policy

The following `get-firewall-rule-group-policy` example gets the AWS Identity and Access Management (AWS IAM) policy for sharing the specified rule group.

```
aws route53resolver get-firewall-rule-group-policy \
    --arn arn:aws:route53resolver:us-west-2:AWS_ACCOUNT_ID:firewall-rule-group/
rslvr-frg-47f93271fexample
```

Output:

```
{
    "FirewallRuleGroupPolicy": "{\"Version\":\"2012-10-17\",
\"Statement\":[{\"Sid\":\"test\",\"Effect\":\"Allow\",\"Principal
\":{\"AWS\":\"arn:aws:iam::AWS_ACCOUNT_ID:root\"},\"Action\":
[\"route53resolver:GetFirewallRuleGroup\",\"route53resolver:ListFirewallRuleGroups
\"],\"Resource\":\"arn:aws:route53resolver:us-west-2:AWS_ACCOUNT_ID:firewall-rule-
group/rslvr-frg-47f93271fexample\"}]}"
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallRuleGroupPolicy in *AWS CLI Command Reference*.

`get-firewall-rule-group`

The following code example shows how to use `get-firewall-rule-group`.

AWS CLI

To get a Firewall rule group

The following `get-firewall-rule-group` example retrieves information about a DNS Firewall rule group with the ID you provide.

```
aws route53resolver get-firewall-rule-group \
    --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
    "FirewallRuleGroup": {
        "Id": "rslvr-frg-47f93271fexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/
rslvr-frg-47f93271fexample",
        "Name": "test",
        "RuleCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Rule Group",
        "OwnerId": "123456789012",
        "CreatorRequestId": "my-request-id",
        "ShareStatus": "NOT_SHARED",
        "CreationTime": "2021-05-25T18:59:26.490017Z",
        "ModificationTime": "2021-05-25T18:59:26.490017Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallRuleGroup in *AWS CLI Command Reference*.

`get-resolver-endpoint`

The following code example shows how to use `get-resolver-endpoint`.

AWS CLI

To get information about a Resolver endpoint

The following `get-resolver-endpoint` example displays details for the outbound specified endpoint. You can use `get-resolver-endpoint` for both inbound and outbound endpoints by specifying the applicable endpoint ID.

```
aws route53resolver get-resolver-endpoint \
    --resolver-endpoint-id rslvr-out-d5e5920e37example
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-out-d5e5920e37example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-endpoint/
rslvr-out-d5e5920e37example",
        "Name": "my-outbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "OUTBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304bexam",
        "Status": "OPERATIONAL",
        "StatusMessage": "This Resolver Endpoint is operational.",
        "CreationTime": "2020-01-01T23:50:50.979Z",
        "ModificationTime": "2020-01-02T23:50:50.979Z"
    }
}
```

For more information, see Values That You Specify When You Create or Edit Inbound Endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see GetResolverEndpoint in *AWS CLI Command Reference*.

`get-resolver-rule-association`

The following code example shows how to use `get-resolver-rule-association`.

AWS CLI

To get information about the association between a Resolver rule and a VPC

The following `get-resolver-rule-association` example displays details about the association between a specified Resolver rule and a VPC. You associate a resolver rule and a VPC using associate-resolver-rule.

```
aws route53resolver get-resolver-rule-association \
    --resolver-rule-association-id rslvr-rrassoc-d61cbb2c8bexample
```

Output:

```
{
    "ResolverRuleAssociation": {
        "Id": "rslvr-rrassoc-d61cbb2c8bexample",
        "ResolverRuleId": "rslvr-rr-42b60677c0example",
        "Name": "my-resolver-rule-association",
        "VPCId": "vpc-304bexam",
        "Status": "COMPLETE",
        "StatusMessage": ""
    }
}
```

For more information, see Managing forwarding rules in the *Amazon Route 53 Developer Guide*.

- For API details, see GetResolverRuleAssociation in *AWS CLI Command Reference*.

`get-resolver-rule`

The following code example shows how to use `get-resolver-rule`.

AWS CLI

To get information about a Resolver rule

The following `get-resolver-rule` example displays details about the specified Resolver rule, such as the domain name that the rule forwards DNS queries for and the ID of the outbound resolver endpoint that the rule is associated with.

```
aws route53resolver get-resolver-rule \
    --resolver-rule-id rslvr-rr-42b60677c0example
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-42b60677c0example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-rule/rslvr-
rr-42b60677c0example",
        "DomainName": "example.com.",
        "Status": "COMPLETE",
        "StatusMessage": "[Trace id: 1-5dc4b177-ff1d9d001a0f80005example]
 Successfully created Resolver Rule.",
        "RuleType": "FORWARD",
        "Name": "my-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.45",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-d5e5920e37example",
        "OwnerId": "123456789012",
        "ShareStatus": "NOT_SHARED"
    }
}
```

For more information, see Values That You Specify When You Create or Edit Rules in the *Amazon Route 53 Developer Guide*.

- For API details, see GetResolverRule in *AWS CLI Command Reference*.

`import-firewall-domains`

The following code example shows how to use `import-firewall-domains`.

AWS CLI

To import domains into a domain list

The following `import-firewall-domains` example imports a set of domains from a file into a DNS Firewall domain list that you specify.

```
aws route53resolver import-firewall-domains \
```

```
    --firewall-domain-list-id rslvr-fdl-d61cbb2cbexample \
    --operation REPLACE \
    --domain-file-url s3://PATH/TO/YOUR/FILE
```

Output:

```
{
    "Id": "rslvr-fdl-d61cbb2cbexample",
    "Name": "test",
    "Status": "IMPORTING",
    "StatusMessage": "Importing domains from provided file."
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see ImportFirewallDomains in *AWS CLI Command Reference*.

`list-firewall-configs`

The following code example shows how to use `list-firewall-configs`.

AWS CLI

To list firewall configs

The following `list-firewall-configs` example lists your DNS Firewall configurations.

```
aws route53resolver list-firewall-configs
```

Output:

```
{
    "FirewallConfigs": [
        {
            "Id": "rslvr-fc-86016850cexample",
            "ResourceId": "vpc-31e92222",
            "OwnerId": "123456789012",
            "FirewallFailOpen": "DISABLED"
        }
    ]
}
```

For more information, see DNS Firewall VPC configuration in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallConfigs in *AWS CLI Command Reference*.

`list-firewall-domain-lists`

The following code example shows how to use `list-firewall-domain-lists`.

AWS CLI

To list all of Route 53 Resolver DNS Firewall domain lists

The following `list-firewall-domain-lists` example lists all the domain lists.

```
aws route53resolver list-firewall-domain-lists
```

Output:

```
{
    "FirewallDomainLists": [
        {
            "Id": "rslvr-fdl-2c46f2ecfexample",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-
list/rslvr-fdl-2c46f2ecfexample",
            "Name": "AWSManagedDomainsMalwareDomainList",
            "CreatorRequestId": "AWSManagedDomainsMalwareDomainList",
            "ManagedOwnerName": "Route 53 Resolver DNS Firewall"
        },
        {
            "Id": "rslvr-fdl-aa970e9e1example",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-
list/rslvr-fdl-aa970e9e1example",
            "Name": "AWSManagedDomainsBotnetCommandandControl",
            "CreatorRequestId": "AWSManagedDomainsBotnetCommandandControl",
            "ManagedOwnerName": "Route 53 Resolver DNS Firewall"
        },
        {
            "Id": "rslvr-fdl-42b60677cexample",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789111:firewall-domain-
list/rslvr-fdl-42b60677cexample",
            "Name": "test",
            "CreatorRequestId": "my-request-id"
```

```
        }
    ]
}
```

For more information, see Route 53 Resolver DNS Firewall domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallDomainLists in *AWS CLI Command Reference*.

`list-firewall-domains`

The following code example shows how to use `list-firewall-domains`.

AWS CLI

To list domains in a domain list

The following `list-firewall-domains` example lists the domains in a DNS Firewall domain list that you specify.

```
aws route53resolver list-firewall-domains \
    --firewall-domain-list-id rslvr-fdl-d61cbb2cbexample
```

Output:

```
{
    "Domains": [
        "test1.com.",
        "test2.com.",
        "test3.com."
    ]
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallDomains in *AWS CLI Command Reference*.

`list-firewall-rule-group-associations`

The following code example shows how to use `list-firewall-rule-group-associations`.

AWS CLI

To list DNS Firewall rule group associations

The following `list-firewall-rule-group-associations` example lists your DNS Firewall rule group associations with Amazon VPCs.

```
aws route53resolver list-firewall-rule-group-associations
```

Output:

```
{
    "FirewallRuleGroupAssociations": [
        {
            "Id": "rslvr-frgassoc-57e8873d7example",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-
group-association/rslvr-frgassoc-57e8873d7example",
            "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
            "VpcId": "vpc-31e92222",
            "Name": "test-association",
            "Priority": 101,
            "MutationProtection": "DISABLED",
            "Status": "UPDATING",
            "StatusMessage": "Creating Firewall Rule Group Association",
            "CreatorRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CreationTime": "2021-05-25T21:47:48.755768Z",
            "ModificationTime": "2021-05-25T21:47:48.755768Z"
        }
    ]
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule group in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallRuleGroupAssociations in *AWS CLI Command Reference*.

`list-firewall-rule-groups`

The following code example shows how to use `list-firewall-rule-groups`.

AWS CLI

To get a list of your Firewall rule groups

The following `list-firewall-rule-groups` example lists your DNS Firewall rule groups.

```
aws route53resolver list-firewall-rule-groups
```

Output:

```
{
    "FirewallRuleGroups": [
        {
            "Id": "rslvr-frg-47f93271fexample",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-
group/rslvr-frg-47f93271fexample",
            "Name": "test",
            "OwnerId": "123456789012",
            "CreatorRequestId": "my-request-id",
            "ShareStatus": "NOT_SHARED"
        }
    ]
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallRuleGroups in *AWS CLI Command Reference*.

`list-firewall-rules`

The following code example shows how to use `list-firewall-rules`.

AWS CLI

To list firewall rules

The following `list-firewall-rules` example list all of your DNS Firewall rules within a firewall rule group.

```
aws route53resolver list-firewall-rules \
    --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
```

```
    "FirewallRules": [
        {
            "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
            "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
            "Name": "allow-rule",
            "Priority": 101,
            "Action": "ALLOW",
            "CreatorRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CreationTime": "2021-05-25T21:44:00.346093Z",
            "ModificationTime": "2021-05-25T21:44:00.346093Z"
        }
    ]
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallRules in *AWS CLI Command Reference*.

`list-resolver-endpoint-ip-addresses`

The following code example shows how to use `list-resolver-endpoint-ip-addresses`.

AWS CLI

To list IP addresses for a specified inbound or outbound endpoint

The following `list-resolver-endpoint-ip-addresses` example lists information about the IP addresses that are associated with the inbound endpoint `rslvr-in-f9ab8a03f1example`. You can also use `list-resolver-endpoint-ip-addresses` for outbound endpoints by specifying the applicable endpoint ID.

```
aws route53resolver list-resolver-endpoint-ip-addresses \
    --resolver-endpoint-id rslvr-in-f9ab8a03f1example
```

Output:

```
{
    "MaxResults": 10,
    "IpAddresses": [
        {
```

```
            "IpId": "rni-1de60cdbfeexample",
            "SubnetId": "subnet-ba47exam",
            "Ip": "192.0.2.44",
            "Status": "ATTACHED",
            "StatusMessage": "This IP address is operational.",
            "CreationTime": "2020-01-03T23:02:29.587Z",
            "ModificationTime": "2020-01-03T23:03:05.555Z"
        },
        {
            "IpId": "rni-aac7085e38example",
            "SubnetId": "subnet-12d8exam",
            "Ip": "192.0.2.45",
            "Status": "ATTACHED",
            "StatusMessage": "This IP address is operational.",
            "CreationTime": "2020-01-03T23:02:29.593Z",
            "ModificationTime": "2020-01-03T23:02:55.060Z"
        }
    ]
}
```

For more information about the values in the output, see Values that you specify when you create or edit inbound endpoints and Values that you specify when you create or edit outbound endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResolverEndpointIpAddresses in *AWS CLI Command Reference*.

`list-resolver-endpoints`

The following code example shows how to use `list-resolver-endpoints`.

AWS CLI

To list Resolver endpoints in an AWS Region

The following `list-resolver-endpoints` example lists the inbound and outbound Resolver endpoints that exist in the current account.

```
aws route53resolver list-resolver-endpoints
```

Output:

```
{
```

```
    "MaxResults": 10,
    "ResolverEndpoints": [
        {
            "Id": "rslvr-in-497098ad59example",
            "CreatorRequestId": "2020-01-01-18:47",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-
endpoint/rslvr-in-497098ad59example",
            "Name": "my-inbound-endpoint",
            "SecurityGroupIds": [
                "sg-05cd7b25d6example"
            ],
            "Direction": "INBOUND",
            "IpAddressCount": 2,
            "HostVPCId": "vpc-304bexam",
            "Status": "OPERATIONAL",
            "StatusMessage": "This Resolver Endpoint is operational.",
            "CreationTime": "2020-01-01T23:25:45.538Z",
            "ModificationTime": "2020-01-01T23:25:45.538Z"
        },
        {
            "Id": "rslvr-out-d5e5920e37example",
            "CreatorRequestId": "2020-01-01-18:48",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-
endpoint/rslvr-out-d5e5920e37example",
            "Name": "my-outbound-endpoint",
            "SecurityGroupIds": [
                "sg-05cd7b25d6example"
            ],
            "Direction": "OUTBOUND",
            "IpAddressCount": 2,
            "HostVPCId": "vpc-304bexam",
            "Status": "OPERATIONAL",
            "StatusMessage": "This Resolver Endpoint is operational.",
            "CreationTime": "2020-01-01T23:50:50.979Z",
            "ModificationTime": "2020-01-01T23:50:50.979Z"
        }
    ]
}
```

For more information, see Managing inbound endpoints and Managing outbound endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResolverEndpoints in *AWS CLI Command Reference*.

`list-resolver-rule-associations`

The following code example shows how to use `list-resolver-rule-associations`.

AWS CLI

To list associations between Resolver rules and VPCs

The following `list-resolver-rule-associations` example lists the associations between resolver rules and VPCs in the current AWS account.

```
aws route53resolver list-resolver-rule-associations
```

Output:

```
{
    "MaxResults": 30,
    "ResolverRuleAssociations": [
        {
            "Id": "rslvr-autodefined-assoc-vpc-304bexam-internet-resolver",
            "ResolverRuleId": "rslvr-autodefined-rr-internet-resolver",
            "Name": "System Rule Association",
            "VPCId": "vpc-304bexam",
            "Status": "COMPLETE",
            "StatusMessage": ""
        },
        {
            "Id": "rslvr-rrassoc-d61cbb2c8bexample",
            "ResolverRuleId": "rslvr-rr-42b60677c0example",
            "Name": "my-resolver-rule-association",
            "VPCId": "vpc-304bexam",
            "Status": "COMPLETE",
            "StatusMessage": ""
        }
    ]
}
```

For more information, see How Route 53 Resolver Forwards DNS Queries from Your VPCs to Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResolverRuleAssociations in *AWS CLI Command Reference*.

`list-resolver-rules`

The following code example shows how to use `list-resolver-rules`.

AWS CLI

To list Resolver rules

The following `list-resolver-rules` example lists all the Resolver rules in the current AWS account.

```
aws route53resolver list-resolver-rules
```

Output:

```
{
    "MaxResults": 30,
    "ResolverRules": [
        {
            "Id": "rslvr-autodefined-rr-internet-resolver",
            "CreatorRequestId": "",
            "Arn": "arn:aws:route53resolver:us-west-2::autodefined-rule/rslvr-
autodefined-rr-internet-resolver",
            "DomainName": ".",
            "Status": "COMPLETE",
            "RuleType": "RECURSIVE",
            "Name": "Internet Resolver",
            "OwnerId": "Route 53 Resolver",
            "ShareStatus": "NOT_SHARED"
        },
        {
            "Id": "rslvr-rr-42b60677c0example",
            "CreatorRequestId": "2020-01-01-18:47",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-rule/
rslvr-rr-42b60677c0bc4e299",
            "DomainName": "example.com.",
            "Status": "COMPLETE",
            "StatusMessage": "[Trace id: 1-5dc4b177-ff1d9d001a0f80005example]
 Successfully created Resolver Rule.",
            "RuleType": "FORWARD",
            "Name": "my-rule",
            "TargetIps": [
                {
```

```
                    "Ip": "192.0.2.45",
                    "Port": 53
                }
            ],
            "ResolverEndpointId": "rslvr-out-d5e5920e37example",
            "OwnerId": "123456789012",
            "ShareStatus": "NOT_SHARED"
        }
    ]
}
```

For more information, see How Route 53 Resolver Forwards DNS Queries from Your VPCs to Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResolverRules in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a Resolver resource

The following `list-tags-for-resource` example lists the tags that are assigned to the specified Resolver rule.

```
aws route53resolver list-tags-for-resource \
    --resource-arn "arn:aws:route53resolver:us-west-2:123456789012:resolver-rule/
rslvr-rr-42b60677c0example"
```

Output:

```
{
    "Tags": [
        {
            "Key": "my-key-1",
            "Value": "my-value-1"
        },
        {
            "Key": "my-key-2",
```

```
            "Value": "my-value-2"
        }
    ]
}
```

For information about using tags for cost allocation, see Using Cost Allocation Tags in the *AWS Billing and Cost Management User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-firewall-rule-group-policy`

The following code example shows how to use `put-firewall-rule-group-policy`.

AWS CLI

To attach an AWS IAM policy to share a Firewall rule group policy

The following `put-firewall-rule-group-policy` example attaches an AWS Identity and Access Management (AWS IAM) policy for sharing the rule group.

```
aws route53resolver put-firewall-rule-group-policy \
    --arn arn:aws:route53resolver:us-west-2:AWS_ACCOUNT_ID:firewall-rule-group/
rslvr-frg-47f93271fexample \
    --firewall-rule-group-policy "{\"Version\":\"2012-10-17\",
\"Statement\":[{\"Sid\":\"test\",\"Effect\":\"Allow\",\"Principal
\":{\"AWS\":\"arn:aws:iam::AWS_ACCOUNT_ID:root\"},\"Action\":
[\"route53resolver:GetFirewallRuleGroup\",\"route53resolver:ListFirewallRuleGroups
\"],\"Resource\":\"arn:aws:route53resolver:us-west-2:AWS_ACCOUNT_ID:firewall-rule-
group/rslvr-frg-47f93271fexample\"}]}"
```

Output:

```
{
    "ReturnValue": true
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see PutFirewallRuleGroupPolicy in *AWS CLI Command Reference*.

put-resolver-rule-policy

The following code example shows how to use `put-resolver-rule-policy`.

AWS CLI

To share a Resolver rule with another AWS account

The following `put-resolver-rule-policy` example specifies a Resolver rule that you want to share with another AWS account, the account that you want to share the rule with, and the rule-related operations that you want the account to be able to perform on the rules.

Note You must run this command using credentials from the same account that created the rule.

```
aws route53resolver put-resolver-rule-policy \
    --arn "arn:aws:route53resolver:us-west-2:123456789111:resolver-rule/rslvr-rr-42b60677c0example" \
    --resolver-rule-policy "{\"Version\": \"2012-10-17\", \
        \"Statement\": [ { \
        \"Effect\" : \"Allow\", \
        \"Principal\" : {\"AWS\" : \"123456789222\" }, \
        \"Action\" : [ \
            \"route53resolver:GetResolverRule\", \
            \"route53resolver:AssociateResolverRule\", \
            \"route53resolver:DisassociateResolverRule\", \
            \"route53resolver:ListResolverRules\", \
            \"route53resolver:ListResolverRuleAssociations\" ], \
        \"Resource\" : [ \"arn:aws:route53resolver:us-west-2:123456789111:resolver-rule/rslvr-rr-42b60677c0example\" ] } ] }"
```

Output:

```
{
    "ReturnValue": true
}
```

After you run `put-resolver-rule-policy`, you can run the following two Resource Access Manager (RAM) commands. You must use the account that you want to share the rule with:

`get-resource-share-invitations` returns the value `resourceShareInvitationArn`. You need this value to accept the invitation to use the shared rule.`accept-resource-share-invitation` accepts the invitation to use the shared rule.

For more information, see the following documentation:

get-resource-share-invitationsaccept-resource-share-invitationsSharing Forwarding Rules with Other AWS Accounts and Using Shared Rules in the *Amazon Route 53 Developer Guide*.

- For API details, see PutResolverRulePolicy in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To associate tags with a Resolver resource

The following `tag-resource` example associates two tag key/value pairs with the specified Resolver rule.

```
aws route53resolver tag-resource \
    --resource-arn "arn:aws:route53resolver:us-west-2:123456789012:resolver-rule/
rslvr-rr-42b60677c0example" \
    --tags "Key=my-key-1,Value=my-value-1" "Key=my-key-2,Value=my-value-2"
```

This command produces no output.

For information about using tags for cost allocation, see Using Cost Allocation Tags in the *AWS Billing and Cost Management User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a Resolver resource

The following `untag-resource` example removes two tags from the specified Resolver rule.

```
aws route53resolver untag-resource \
    --resource-arn "arn:aws:route53resolver:us-west-2:123456789012:resolver-rule/
rslvr-rr-42b60677c0example" \
    --tag-keys my-key-1 my-key-2
```

This command produces no output. To confirm that the tags were removed, you can use list-tags-for-resource.

For information about using tags for cost allocation, see Using Cost Allocation Tags in the *AWS Billing and Cost Management User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-firewall-config`

The following code example shows how to use `update-firewall-config`.

AWS CLI

To update a firewall config

The following `update-firewall-config` example updates DNS Firewall configuration.

```
aws route53resolver update-firewall-config \
    --resource-id vpc-31e92222 \
    --firewall-fail-open DISABLED
```

Output:

```
{
    "FirewallConfig": {
        "Id": "rslvr-fc-86016850cexample",
        "ResourceId": "vpc-31e92222",
        "OwnerId": "123456789012",
        "FirewallFailOpen": "DISABLED"
    }
}
```

For more information, see DNS Firewall VPC configuration in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallConfig in *AWS CLI Command Reference*.

update-firewall-domains

The following code example shows how to use update-firewall-domains.

AWS CLI

To update a domain list

The following update-firewall-domains example adds the domains to a domain list with the ID you provide.

```
aws route53resolver update-firewall-domains \
    --firewall-domain-list-id rslvr-fdl-42b60677cexampleb \
    --operation ADD \
    --domains test1.com test2.com test3.com
```

Output:

```
{
    "Id": "rslvr-fdl-42b60677cexample",
    "Name": "test",
    "Status": "UPDATING",
    "StatusMessage": "Updating the Firewall Domain List"
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallDomains in *AWS CLI Command Reference*.

update-firewall-rule-group-association

The following code example shows how to use update-firewall-rule-group-association.

AWS CLI

To update a firewall rule group association

The following update-firewall-rule-group-association example updates a firewall rule group association.

```
aws route53resolver update-firewall-rule-group-association \
    --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example \
```

```
    --priority 103
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 103,
        "MutationProtection": "DISABLED",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Firewall Rule Group Association Attributes",
        "CreatorRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:50:09.272569Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule group in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallRuleGroupAssociation in *AWS CLI Command Reference*.

`update-firewall-rule`

The following code example shows how to use `update-firewall-rule`.

AWS CLI

To update a firewall rule

The following `update-firewall-rule` example updates a firewall rule with the parameters you specify.

```
aws route53resolver update-firewall-rule \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample \
    --priority 102
```

Output:

```
{
    "FirewallRule": {
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
        "Name": "allow-rule",
        "Priority": 102,
        "Action": "ALLOW",
        "CreatorRequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:44:00.346093Z",
        "ModificationTime": "2021-05-25T21:45:59.611600Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallRule in *AWS CLI Command Reference*.

`update-resolver-endpoint`

The following code example shows how to use `update-resolver-endpoint`.

AWS CLI

To update the name of a Resolver endpoint

The following `update-resolver-endpoint` example updates the name of a Resolver endpoint. Updating other values isn't supported.

```
aws route53resolver update-resolver-endpoint \
    --resolver-endpoint-id rslvr-in-b5d45e32bdc445f09 \
    --name my-renamed-inbound-endpoint
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-b5d45e32bdexample",
        "CreatorRequestId": "2020-01-02-18:48",
```

```
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-endpoint/
rslvr-in-b5d45e32bdexample",
        "Name": "my-renamed-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304bexam",
        "Status": "OPERATIONAL",
        "StatusMessage": "This Resolver Endpoint is operational.",
        "CreationTime": "2020-01-01T18:33:59.265Z",
        "ModificationTime": "2020-01-08T18:33:59.265Z"
    }
}
```

For more information, see Managing inbound endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateResolverEndpoint in *AWS CLI Command Reference*.

`update-resolver-rule`

The following code example shows how to use `update-resolver-rule`.

AWS CLI

Example 1: To update settings Resolver endpoint

The following `update-resolver-rule` example updates the name of the rule, the IP addresses on your on-premises network that DNS queries are forwarded to, and the ID of the outbound Resolver endpoint that you're using to forward queries to your network.

Note Existing values for `TargetIps` are overwritten, so you must specify all the IP addresses that you want the rule to have after the update.

```
aws route53resolver update-resolver-rule \
    --resolver-rule-id rslvr-rr-1247fa64f3example \
    --config Name="my-2nd-rule",TargetIps=[{Ip=192.0.2.45,Port=53},
{Ip=192.0.2.46,Port=53}],ResolverEndpointId=rslvr-out-7b89ed0d25example
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-1247fa64f3example",
        "CreatorRequestId": "2020-01-02-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-rule/rslvr-
rr-1247fa64f3example",
        "DomainName": "www.example.com.",
        "Status": "COMPLETE",
        "StatusMessage": "[Trace id: 1-5dcc90b9-8a8ee860aba1ebd89example]
 Successfully updated Resolver Rule.",
        "RuleType": "FORWARD",
        "Name": "my-2nd-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.45",
                "Port": 53
            },
            {
                "Ip": "192.0.2.46",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-7b89ed0d25example",
        "OwnerId": "123456789012",
        "ShareStatus": "NOT_SHARED"
    }
}
```

Example 2: To update settings Resolver endpoint using a file for ``config`` settings

The following `update-resolver-rule` example updates the same settings as Example 1. You can alternatively include the `config` settings in a JSON file and then specify that file when you call `update-resolver-rule`.

```
aws route53resolver update-resolver-rule \
    --resolver-rule-id rslvr-rr-1247fa64f3example \
    --config file://c:\temp\update-resolver-rule.json
```

Contents of `c:\temp\update-resolver-rule.json`:

```
{
    "Name": "my-2nd-rule",
```

```
    "TargetIps": [
        {
            "Ip": "192.0.2.45",
            "Port": 53
        },
        {
            "Ip": "192.0.2.46",
            "Port": 53
        }
    ],
    "ResolverEndpointId": "rslvr-out-7b89ed0d25example"
}
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-1247fa64f3example",
        "CreatorRequestId": "2020-01-02-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:resolver-rule/rslvr-
rr-1247fa64f3example",
        "DomainName": "www.example.com.",
        "Status": "COMPLETE",
        "StatusMessage": "[Trace id: 1-5dcc90b9-8a8ee860aba1ebd89example]
 Successfully updated Resolver Rule.",
        "RuleType": "FORWARD",
        "Name": "my-2nd-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.45",
                "Port": 53
            },
            {
                "Ip": "192.0.2.46",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-7b89ed0d25example",
        "OwnerId": "123456789012",
        "ShareStatus": "NOT_SHARED"
    }
}
```

For more information, see Values That You Specify When You Create or Edit Rules in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateResolverRule in *AWS CLI Command Reference*.

Amazon S3 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon S3.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`abort-multipart-upload`

The following code example shows how to use `abort-multipart-upload`.

AWS CLI

To abort the specified multipart upload

The following `abort-multipart-upload` example aborts a multipart upload for the key `multipart/01` in the bucket `amzn-s3-demo-bucket`.

```
aws s3api abort-multipart-upload \
    --bucket amzn-s3-demo-bucket \
    --key multipart/01 \
    --upload-
id dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3UR
```

This command produces no output.

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

For more information, see Aborting a multipart upload in the *Amazon S3 User Guide*.

- For API details, see AbortMultipartUpload in *AWS CLI Command Reference*.

`complete-multipart-upload`

The following code example shows how to use `complete-multipart-upload`.

AWS CLI

To complete a multipart upload

The following `complete-multipart-upload` example completes a multipart upload for the key `multipart/01` in the bucket `amzn-s3-demo-bucket`.

```
aws s3api complete-multipart-upload \
    --multipart-upload file://mpustruct \
    --bucket amzn-s3-demo-bucket \
    --key 'multipart/01' \
    --upload-
id dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3UR
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

The multipart upload option in the above command takes a JSON structure that describes the parts of the multipart upload that should be reassembled into the complete file. In this example, the `file://` prefix is used to load the JSON structure from a file in the local folder named `mpustruct`.

Contents of `mpustruct`:

```
{
    "Parts": [
        {
            "ETag": "e868e0f4719e394144ef36531ee6824c",
            "PartNumber": 1
        },
        {
```

```
            "ETag": "6bb2b12753d66fe86da4998aa33fffb0",
            "PartNumber": 2
        },
        {
            "ETag": "d0a0112e841abec9c9ec83406f0159c8",
            "PartNumber": 3
        }
    ]
}
```

The ETag value for each part is upload is output each time you upload a part using the `upload-part` command and can also be retrieved by calling `list-parts` or calculated by taking the MD5 checksum of each part.

Output:

```
{
    "ETag": "\"3944a9f7a4faab7f78788ff6210f63f0-3\"",
    "Bucket": "amzn-s3-demo-bucket",
    "Location": "https://amzn-s3-demo-bucket.s3.amazonaws.com/multipart%2F01",
    "Key": "multipart/01"
}
```

For more information, see Uploading and copying objects using multipart upload in Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see CompleteMultipartUpload in *AWS CLI Command Reference*.

`copy-object`

The following code example shows how to use `copy-object`.

AWS CLI

To copy an object

The following `copy-object` example copies an object from `bucket-1` to `amzn-s3-demo-bucket2`.

```
aws s3api copy-object \
    --copy-source bucket-1/test.txt \
    --key test.txt \
```

```
    --bucket amzn-s3-demo-bucket2
```

Output:

```
{
    "CopyObjectResult": {
        "LastModified": "2015-11-10T01:07:25.000Z",
        "ETag": "\"589c8b79c230a6ecd5a7e1d040a9a030\""
    },
    "VersionId": "YdnYvTCVDqRRFA.NFJjy36p0hxifMlkA"
}
```

For more information, see Copying, moving, and renaming objects in the *Amazon S3 User Guide*.

- For API details, see CopyObject in *AWS CLI Command Reference*.

cp

The following code example shows how to use cp.

AWS CLI

Example 1: To copy a local file to S3

The following cp example copies a single file to a specified bucket and key.

```
aws s3 cp test.txt s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
upload: test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 2: To copy a local file to S3 with an expiration date

The following cp example copies a single file to a specified bucket and key that expires at the specified ISO 8601 timestamp.

```
aws s3 cp test.txt s3://amzn-s3-demo-bucket/test2.txt \
    --expires 2014-10-01T20:30:00Z
```

Output:

```
upload: test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 3: To copy a file from S3 to S3

The following cp example copies a single S3 object to a specified bucket and key.

```
aws s3 cp s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
copy: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 4: To copy an S3 object to a local file

The following cp example copies a single object to a specified file locally.

```
aws s3 cp s3://amzn-s3-demo-bucket/test.txt test2.txt
```

Output:

```
download: s3://amzn-s3-demo-bucket/test.txt to test2.txt
```

Example 5: To copy an S3 object from one bucket to another

The following cp example copies a single object to a specified bucket while retaining its original name.

```
aws s3 cp s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket2/
```

Output:

```
copy: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket2/test.txt
```

Example 6: To recursively copy S3 objects to a local directory

The following cp example recursively copies all objects under a specified prefix and bucket to a specified directory when passed with the parameter `--recursive`. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `test2.txt`.

```
aws s3 cp s3://amzn-s3-demo-bucket . \
```

```
    --recursive
```

Output:

```
download: s3://amzn-s3-demo-bucket/test1.txt to test1.txt
download: s3://amzn-s3-demo-bucket/test2.txt to test2.txt
```

Example 7: To recursively copy local files to S3

The following cp example recursively copies all files under a specified directory to a specified bucket and prefix when passed with the parameter `--recursive`, while excluding some files by using an `--exclude` parameter. In this example, the directory `myDir` has the files `test1.txt` and `test2.jpg`.

```
aws s3 cp myDir s3://amzn-s3-demo-bucket/ \
    --recursive \
    --exclude "*.jpg"
```

Output:

```
upload: myDir/test1.txt to s3://amzn-s3-demo-bucket/test1.txt
```

Example 8: To recursively copy S3 objects to another bucket

The following cp example recursively copies all objects under a specified bucket to another bucket when passed with the parameter `--recursive`, while excluding some objects by using an `--exclude` parameter. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `another/test1.txt`.

```
aws s3 cp s3://amzn-s3-demo-bucket/ s3://amzn-s3-demo-bucket2/ \
    --recursive \
    --exclude "another/*"
```

Output:

```
copy: s3://amzn-s3-demo-bucket/test1.txt to s3://amzn-s3-demo-bucket2/test1.txt
```

You can combine `--exclude` and `--include` options to copy only objects that match a pattern, excluding all others.

```
aws s3 cp s3://amzn-s3-demo-bucket/logs/ s3://amzn-s3-demo-bucket2/logs/ \
    --recursive \
    --exclude "*" \
    --include "*.log"
```

Output:

```
copy: s3://amzn-s3-demo-bucket/logs/test/test.log to s3://amzn-s3-demo-bucket2/logs/
test/test.log
copy: s3://amzn-s3-demo-bucket/logs/test3.log to s3://amzn-s3-demo-bucket2/logs/
test3.log
```

Example 9: To set the Access Control List (ACL) while copying an S3 object

The following `cp` example copies a single object to a specified bucket and key while setting the ACL to `public-read-write`.

```
aws s3 cp s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket/test2.txt \
    --acl public-read-write
```

Output:

```
copy: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Note that if you're using the `--acl` option, ensure that any associated IAM policies include the `"s3:PutObjectAcl"` action.

```
aws iam get-user-policy \
    --user-name myuser \
    --policy-name mypolicy
```

Output:

```
{
    "UserName": "myuser",
    "PolicyName": "mypolicy",
    "PolicyDocument": {
        "Version":"2012-10-17",
        "Statement": [
            {
                "Action": [
```

```
                    "s3:PutObject",
                    "s3:PutObjectAcl"
                ],
                "Resource": [
                    "arn:aws:s3:::amzn-s3-demo-bucket/*"
                ],
                "Effect": "Allow",
                "Sid": "Stmt1234567891234"
            }
        ]
    }
}
```

Example 10: To grant permissions for an S3 object

The following cp example uses the `--grants` option to grant read access to all users identified by URI and full control to a specific user identified by their Canonical ID.

```
aws s3 cp file.txt s3://amzn-s3-demo-bucket/ \
    --grants read=uri=http://acs.amazonaws.com/groups/global/
AllUsers full=id=79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be
```

Output:

```
upload: file.txt to s3://amzn-s3-demo-bucket/file.txt
```

Example 11: To upload a local file stream to S3

The following cp example uploads a local file stream from standard input to a specified bucket and key.

```
aws s3 cp - s3://amzn-s3-demo-bucket/stream.txt
```

This command produces no output.

PowerShell may alter the encoding of or add a CRLF to piped input.

Example 12: To upload a local file stream that is larger than 50GB to S3

The following cp example uploads a 51GB local file stream from standard input to a specified bucket and key. The `--expected-size` option must be provided, or the upload may fail when it reaches the default part limit of 10,000.

```
aws s3 cp - s3://amzn-s3-demo-bucket/stream.txt \
    --expected-size 54760833024
```

This command produces no output.

Example 13: To download an S3 object as a local file stream

The following cp example downloads an S3 object locally as a stream to standard output. Downloading as a stream is not currently compatible with the `--recursive` parameter.

```
aws s3 cp s3://amzn-s3-demo-bucket/stream.txt -
```

PowerShell may alter the encoding of or add a CRLF to piped or redirected output.

Example 14: To upload to an S3 access point

The following cp example uploads a single file (`mydoc.txt`) to the access point (`myaccesspoint`) at the key (`mykey`).

```
aws s3 cp mydoc.txt s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

Output:

```
upload: mydoc.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

Example 15: To download from an S3 access point

The following cp example downloads a single object (`mykey`) from the access point (`myaccesspoint`) to the local file (`mydoc.txt`).

```
aws s3 cp s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
mykey mydoc.txt
```

Output:

```
download: s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey to
 mydoc.txt
```

Example 16: To upload a file with tags

The following cp example uploads a single file (mydoc.txt) to a specified bucket and key while setting two tags on the object. Specify --tags once per tag, separating the key and value with a space. Tags are supported only when transferring from a local path to S3.

```
aws s3 cp mydoc.txt s3://amzn-s3-demo-bucket/mydoc.txt \
    --tags key1 value1 \
    --tags key2 value2
```

Output:

```
upload: mydoc.txt to s3://amzn-s3-demo-bucket/mydoc.txt
```

For more information, see Using high-level (s3) commands in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see Cp in *AWS CLI Command Reference*.

create-bucket

The following code example shows how to use create-bucket.

AWS CLI

Example 1: To create a bucket

The following create-bucket example creates a bucket named amzn-s3-demo-bucket.

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region us-east-1
```

Output:

```
{
    "Location": "/amzn-s3-demo-bucket"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

Example 2: To create a bucket with owner enforced

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket` that uses the bucket owner enforced setting for S3 Object Ownership.

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region us-east-1 \
    --object-ownership BucketOwnerEnforced
```

Output:

```
{
    "Location": "/amzn-s3-demo-bucket"
}
```

For more information, see Controlling ownership of objects and disabling ACLs in the *Amazon S3 User Guide*.

Example 3: To create a bucket outside of the ``us-east-1`` region

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket` in the `us-west-2` region. Regions outside of `us-east-1` require the appropriate `LocationConstraint` to be specified in order to create the bucket in the desired region.

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region us-west-2 \
    --create-bucket-configuration LocationConstraint=us-west-2
```

Output:

```
{
    "Location": "http://amzn-s3-demo-bucket.s3.amazonaws.com/"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

- For API details, see CreateBucket in *AWS CLI Command Reference*.

`create-multipart-upload`

The following code example shows how to use `create-multipart-upload`.

AWS CLI

To create a multipart upload

The following `create-multipart-upload` example creates a multipart upload in the bucket `amzn-s3-demo-bucket` with the key `multipart/01`.

```
aws s3api create-multipart-upload \
    --bucket amzn-s3-demo-bucket \
    --key 'multipart/01'
```

Output:

```
{
    "Bucket": "amzn-s3-demo-bucket",
    "UploadId":
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URC
    "Key": "multipart/01"
}
```

The completed file will be named `01` in a folder called `multipart` in the bucket `amzn-s3-demo-bucket`. Save the upload ID, key and bucket name for use with the `upload-part` command.

For more information, see Uploading and copying objects using multipart upload in Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see CreateMultipartUpload in *AWS CLI Command Reference*.

`delete-bucket-analytics-configuration`

The following code example shows how to use `delete-bucket-analytics-configuration`.

AWS CLI

To delete an analytics configuration for a bucket

The following `delete-bucket-analytics-configuration` example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket \
```

```
    --id 1
```

This command produces no output.

For more information, see Amazon S3 analytics - Storage Class Analysis in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

`delete-bucket-cors`

The following code example shows how to use `delete-bucket-cors`.

AWS CLI

To delete the CORS configuration of a bucket

The following `delete-bucket-cors` example deletes a Cross-Origin Resource Sharing configuration from a bucket named `amzn-s3-demo-bucket`.

```
aws s3api delete-bucket-cors \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Using cross-origin resource sharing (CORS) in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketCors in *AWS CLI Command Reference*.

`delete-bucket-encryption`

The following code example shows how to use `delete-bucket-encryption`.

AWS CLI

To delete the server-side encryption configuration of a bucket

The following `delete-bucket-encryption` example deletes the server-side encryption configuration of the specified bucket.

```
aws s3api delete-bucket-encryption \
```

```
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Setting default server-side encryption behavior for Amazon S3 buckets in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketEncryption in *AWS CLI Command Reference*.

`delete-bucket-intelligent-tiering-configuration`

The following code example shows how to use `delete-bucket-intelligent-tiering-configuration`.

AWS CLI

To remove an S3 Intelligent-Tiering configuration on a bucket

The following `delete-bucket-intelligent-tiering-configuration` example removes an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket.

```
aws s3api delete-bucket-intelligent-tiering-configuration \
    --bucket amzn-s3-demo-bucket \
    --id ExampleConfig
```

This command produces no output.

For more information, see Using S3 Intelligent-Tiering in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketIntelligentTieringConfiguration in *AWS CLI Command Reference*.

`delete-bucket-inventory-configuration`

The following code example shows how to use `delete-bucket-inventory-configuration`.

AWS CLI

To delete the inventory configuration of a bucket

The following `delete-bucket-inventory-configuration` example deletes the inventory configuration with ID 1 for the specified bucket.

```
aws s3api delete-bucket-inventory-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

This command produces no output.

For more information, see Cataloging and analyzing your data with S3 Inventory in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketInventoryConfiguration in *AWS CLI Command Reference*.

`delete-bucket-lifecycle`

The following code example shows how to use `delete-bucket-lifecycle`.

AWS CLI

To delete the lifecycle configuration of a bucket

The following `delete-bucket-lifecycle` example deletes a lifecycle configuration from a bucket named `amzn-s3-demo-bucket`.

```
aws s3api delete-bucket-lifecycle \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Managing the lifecycle of objects in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketLifecycle in *AWS CLI Command Reference*.

`delete-bucket-metrics-configuration`

The following code example shows how to use `delete-bucket-metrics-configuration`.

AWS CLI

To delete a metrics configuration for a bucket

The following `delete-bucket-metrics-configuration` example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123
```

This command produces no output.

For more information, see CloudWatch metrics configurations in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketMetricsConfiguration in *AWS CLI Command Reference*.

`delete-bucket-ownership-controls`

The following code example shows how to use `delete-bucket-ownership-controls`.

AWS CLI

To remove the bucket ownership settings of a bucket

The following `delete-bucket-ownership-controls` example removes the bucket ownership settings of a bucket.

```
aws s3api delete-bucket-ownership-controls \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Setting Object Ownership on an existing bucket in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketOwnershipControls in *AWS CLI Command Reference*.

`delete-bucket-policy`

The following code example shows how to use `delete-bucket-policy`.

AWS CLI

To delete a bucket policy

The following `delete-bucket-policy` example deletes a bucket policy from a bucket named `amzn-s3-demo-bucket`.

```
aws s3api delete-bucket-policy \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Bucket policies for Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketPolicy in *AWS CLI Command Reference*.

`delete-bucket-replication`

The following code example shows how to use `delete-bucket-replication`.

AWS CLI

To delete the replication configuration of a bucket

The following `delete-bucket-replication` example deletes a replication configuration from a bucket named `amzn-s3-demo-bucket`.

```
aws s3api delete-bucket-replication \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Replicating objects within and across Regions in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketReplication in *AWS CLI Command Reference*.

`delete-bucket-tagging`

The following code example shows how to use `delete-bucket-tagging`.

AWS CLI

To delete the tagging configuration of a bucket

The following `delete-bucket-tagging` example deletes a tagging configuration from a bucket named `amzn-s3-demo-bucket`.

```
aws s3api delete-bucket-tagging \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Using cost allocation S3 bucket tags in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketTagging in *AWS CLI Command Reference*.

`delete-bucket-website`

The following code example shows how to use `delete-bucket-website`.

AWS CLI

To delete the website configuration of a bucket

The following `delete-bucket-website` example deletes a website configuration from a bucket named `amzn-s3-demo-bucket`.

```
aws s3api delete-bucket-website \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Hosting a static website using Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketWebsite in *AWS CLI Command Reference*.

`delete-bucket`

The following code example shows how to use `delete-bucket`.

AWS CLI

To delete a bucket

The following `delete-bucket` example deletes a bucket named `amzn-s3-demo-bucket`.

```
aws s3api delete-bucket \
```

```
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Deleting a general purpose bucket in the *Amazon S3 User Guide*.

- For API details, see DeleteBucket in *AWS CLI Command Reference*.

`delete-object-tagging`

The following code example shows how to use `delete-object-tagging`.

AWS CLI

To delete the tag sets of an object

The following `delete-object-tagging` example deletes the tag with the specified key from the object `doc1.rtf`.

```
aws s3api delete-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf
```

This command produces no output.

For more information, see Tagging your objects in the *Amazon S3 User Guide*.

- For API details, see DeleteObjectTagging in *AWS CLI Command Reference*.

`delete-object`

The following code example shows how to use `delete-object`.

AWS CLI

To delete an object

The following `delete-object` example deletes an object named `test.txt` from a bucket named `amzn-s3-demo-bucket`.

```
aws s3api delete-object \
    --bucket amzn-s3-demo-bucket \
```

```
    --key test.txt
```

If bucket versioning is enabled, the output contains the version ID of the delete marker.

Output:

```
{
    "VersionId": "9_gKg5vG56F.TTEUdwkxGpJ3tNDlWlGq",
    "DeleteMarker": true
}
```

For more information, see Deleting a single object in the *Amazon S3 User Guide*.

- For API details, see DeleteObject in *AWS CLI Command Reference*.

`delete-objects`

The following code example shows how to use `delete-objects`.

AWS CLI

To delete an object by using a JSON file

The following `delete-objects` example deletes an object from a bucket named `amzn-s3-demo-bucket`.

```
aws s3api delete-objects \
    --bucket amzn-s3-demo-bucket \
    --delete file://delete.json
```

The file `delete.json` is a JSON document in the current directory that specifies the object to delete.

Contents of `delete.json`:

```
{
    "Objects": [
        {
            "Key": "test1.txt"
        }
    ],
    "Quiet": false
```

```
}
```

Output:

```
{
    "Deleted": [
        {
            "DeleteMarkerVersionId": "mYAT5Mc6F7aeUL8SS7FAAqUPO1koHwzU",
            "Key": "test1.txt",
            "DeleteMarker": true
        }
    ]
}
```

For more information, see Deleting multiple objects in the *Amazon S3 User Guide*.

- For API details, see DeleteObjects in *AWS CLI Command Reference*.

`delete-public-access-block`

The following code example shows how to use `delete-public-access-block`.

AWS CLI

To delete the block public access configuration for a bucket

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Blocking public access to your Amazon S3 storage in the *Amazon S3 User Guide*.

- For API details, see DeletePublicAccessBlock in *AWS CLI Command Reference*.

`get-bucket-accelerate-configuration`

The following code example shows how to use `get-bucket-accelerate-configuration`.

AWS CLI

To retrieve the accelerate configuration of a bucket

The following `get-bucket-accelerate-configuration` example retrieves the accelerate configuration for the specified bucket.

```
aws s3api get-bucket-accelerate-configuration \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Status": "Enabled"
}
```

For more information, see Configuring fast, secure file transfers using Amazon S3 Transfer Acceleration in the *Amazon S3 User Guide*.

- For API details, see GetBucketAccelerateConfiguration in *AWS CLI Command Reference*.

`get-bucket-acl`

The following code example shows how to use `get-bucket-acl`.

AWS CLI

To retrieve the access control list of a bucket

The following `get-bucket-acl` example retrieves the access control list for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-acl \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Owner": {
        "DisplayName": "my-username",
        "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
    },
```

```
    "Grants": [
        {
            "Grantee": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
            },
            "Permission": "FULL_CONTROL"
        }
    ]
}
```

For more information, see Access control list (ACL) overview in the *Amazon S3 User Guide*.

- For API details, see GetBucketAcl in *AWS CLI Command Reference*.

`get-bucket-analytics-configuration`

The following code example shows how to use `get-bucket-analytics-configuration`.

AWS CLI

To retrieve the analytics configuration for a bucket with a specific ID

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

Output:

```
{
    "AnalyticsConfiguration": {
        "StorageClassAnalysis": {},
        "Id": "1"
    }
}
```

For more information, see Amazon S3 analytics - Storage Class Analysis in the *Amazon S3 User Guide*.

- For API details, see GetBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

`get-bucket-cors`

The following code example shows how to use `get-bucket-cors`.

AWS CLI

To retrieve the CORS configuration of a bucket

The following `get-bucket-cors` example retrieves the Cross-Origin Resource Sharing configuration for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-cors \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "CORSRules": [
        {
            "AllowedHeaders": [
                "*"
            ],
            "ExposeHeaders": [
                "x-amz-server-side-encryption"
            ],
            "AllowedMethods": [
                "PUT",
                "POST",
                "DELETE"
            ],
            "MaxAgeSeconds": 3000,
            "AllowedOrigins": [
                "http://www.example.com"
            ]
        },
        {
            "AllowedHeaders": [
                "Authorization"
            ],
            "MaxAgeSeconds": 3000,
```

```
            "AllowedMethods": [
                "GET"
            ],
            "AllowedOrigins": [
                "*"
            ]
        }
    ]
}
```

For more information, see Using cross-origin resource sharing (CORS) in the *Amazon S3 User Guide*.

- For API details, see GetBucketCors in *AWS CLI Command Reference*.

`get-bucket-encryption`

The following code example shows how to use `get-bucket-encryption`.

AWS CLI

To retrieve the server-side encryption configuration for a bucket

The following `get-bucket-encryption` example retrieves the server-side encryption configuration for the bucket `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-encryption \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "ServerSideEncryptionConfiguration": {
        "Rules": [
            {
                "ApplyServerSideEncryptionByDefault": {
                    "SSEAlgorithm": "AES256"
                }
            }
        ]
    }
}
```

For more information, see Setting default server-side encryption behavior for Amazon S3 buckets in the *Amazon S3 User Guide*.

- For API details, see GetBucketEncryption in *AWS CLI Command Reference*.

`get-bucket-intelligent-tiering-configuration`

The following code example shows how to use `get-bucket-intelligent-tiering-configuration`.

AWS CLI

To retrieve an S3 Intelligent-Tiering configuration on a bucket

The following `get-bucket-intelligent-tiering-configuration` example retrieves an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket.

```
aws s3api get-bucket-intelligent-tiering-configuration \
    --bucket amzn-s3-demo-bucket \
    --id ExampleConfig
```

Output:

```
{
    "IntelligentTieringConfiguration": {
        "Id": "ExampleConfig2",
        "Filter": {
            "Prefix": "images"
        },
        "Status": "Enabled",
        "Tierings": [
            {
                "Days": 90,
                "AccessTier": "ARCHIVE_ACCESS"
            },
            {
                "Days": 180,
                "AccessTier": "DEEP_ARCHIVE_ACCESS"
            }
        ]
    }
}
```

For more information, see Using S3 Intelligent-Tiering in the *Amazon S3 User Guide*.

- For API details, see GetBucketIntelligentTieringConfiguration in *AWS CLI Command Reference*.

`get-bucket-inventory-configuration`

The following code example shows how to use `get-bucket-inventory-configuration`.

AWS CLI

To retrieve the inventory configuration for a bucket

The following `get-bucket-inventory-configuration` example retrieves the inventory configuration for the specified bucket with ID 1.

```
aws s3api get-bucket-inventory-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

Output:

```
{
    "InventoryConfiguration": {
        "IsEnabled": true,
        "Destination": {
            "S3BucketDestination": {
                "Format": "ORC",
                "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
                "AccountId": "123456789012"
            }
        },
        "IncludedObjectVersions": "Current",
        "Id": "1",
        "Schedule": {
            "Frequency": "Weekly"
        }
    }
}
```

For more information, see Cataloging and analyzing your data with S3 Inventory in the *Amazon S3 User Guide*.

- For API details, see GetBucketInventoryConfiguration in *AWS CLI Command Reference*.

get-bucket-lifecycle-configuration

The following code example shows how to use `get-bucket-lifecycle-configuration`.

AWS CLI

To retrieve the lifecycle configuration of a bucket

The following `get-bucket-lifecycle-configuration` example retrieves the lifecycle configuration for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-lifecycle-configuration \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        },
        {
            "Status": "Enabled",
            "Prefix": "",
            "NoncurrentVersionTransitions": [
                {
                    "NoncurrentDays": 0,
                    "StorageClass": "GLACIER"
                }
            ],
            "ID": "Move old versions to Glacier"
        }
    ]
}
```

For more information, see Managing the lifecycle of objects in the *Amazon S3 User Guide*.

- For API details, see GetBucketLifecycleConfiguration in *AWS CLI Command Reference*.

`get-bucket-lifecycle`

The following code example shows how to use `get-bucket-lifecycle`.

AWS CLI

To retrieve the lifecycle configuration of a bucket

The following `get-bucket-lifecycle` example retrieves the lifecycle configuration for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-lifecycle \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Rules": [
        {
            "ID": "Move to Glacier after sixty days (objects in logs/2015/)",
            "Prefix": "logs/2015/",
            "Status": "Enabled",
            "Transition": {
                "Days": 60,
                "StorageClass": "GLACIER"
            }
        },
        {
            "Expiration": {
                "Date": "2016-01-01T00:00:00.000Z"
            },
            "ID": "Delete 2014 logs in 2016.",
            "Prefix": "logs/2014/",
            "Status": "Enabled"
        }
    ]
}
```

For more information, see Managing the lifecycle of objects in the *Amazon S3 User Guide*.

- For API details, see GetBucketLifecycle in *AWS CLI Command Reference*.

`get-bucket-location`

The following code example shows how to use `get-bucket-location`.

AWS CLI

To retrieve the location constraint of a bucket

The following `get-bucket-location` example retrieves the location constraint for a bucket named `amzn-s3-demo-bucket`, if a constraint exists.

```
aws s3api get-bucket-location \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "LocationConstraint": "us-west-2"
}
```

For more information, see General purpose buckets overview in the *Amazon S3 User Guide*.

- For API details, see GetBucketLocation in *AWS CLI Command Reference*.

`get-bucket-logging`

The following code example shows how to use `get-bucket-logging`.

AWS CLI

To retrieve the logging status for a bucket

The following `get-bucket-logging` example retrieves the logging status for the specified bucket.

```
aws s3api get-bucket-logging \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "LoggingEnabled": {
        "TargetPrefix": "",
        "TargetBucket": "amzn-s3-demo-bucket-logs"
    }
}
```

For more information, see Logging requests with server access logging in the *Amazon S3 User Guide*.

- For API details, see GetBucketLogging in *AWS CLI Command Reference*.

`get-bucket-metrics-configuration`

The following code example shows how to use `get-bucket-metrics-configuration`.

AWS CLI

To retrieve the metrics configuration for a bucket with a specific ID

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123
```

Output:

```
{
    "MetricsConfiguration": {
        "Filter": {
            "Prefix": "logs"
        },
        "Id": "123"
    }
}
```

For more information, see CloudWatch metrics configurations in the *Amazon S3 User Guide*.

- For API details, see GetBucketMetricsConfiguration in *AWS CLI Command Reference*.

`get-bucket-notification-configuration`

The following code example shows how to use `get-bucket-notification-configuration`.

AWS CLI

To retrieve the notification configuration of a bucket

The following `get-bucket-notification-configuration` example retrieves the notification configuration for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-notification-configuration \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "TopicConfigurations": [
        {
            "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWNl",
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
            "Events": [
                "s3:ObjectCreated:*"
            ]
        }
    ]
}
```

For more information, see Amazon S3 Event Notifications in the *Amazon S3 User Guide*.

- For API details, see GetBucketNotificationConfiguration in *AWS CLI Command Reference*.

`get-bucket-notification`

The following code example shows how to use `get-bucket-notification`.

AWS CLI

To retrieve the notification configuration of a bucket

The following `get-bucket-notification` example retrieves the notification configuration for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-notification \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "TopicConfiguration": {
        "Topic": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
        "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWNl",
        "Event": "s3:ObjectCreated:*",
        "Events": [
            "s3:ObjectCreated:*"
        ]
    }
}
```

For more information, see Amazon S3 Event Notifications in the *Amazon S3 User Guide*.

- For API details, see GetBucketNotification in *AWS CLI Command Reference*.

`get-bucket-ownership-controls`

The following code example shows how to use `get-bucket-ownership-controls`.

AWS CLI

To retrieve the bucket ownership settings of a bucket

The following `get-bucket-ownership-controls` example retrieves the bucket ownership settings of a bucket.

```
aws s3api get-bucket-ownership-controls \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "OwnershipControls": {
        "Rules": [
            {
                "ObjectOwnership": "BucketOwnerEnforced"
```

```
            }
        ]
    }
}
```

For more information, see Viewing the Object Ownership setting for an S3 bucket in the *Amazon S3 User Guide*.

- For API details, see GetBucketOwnershipControls in *AWS CLI Command Reference*.

`get-bucket-policy-status`

The following code example shows how to use `get-bucket-policy-status`.

AWS CLI

To retrieve the policy status for a bucket indicating whether the bucket is public

The following `get-bucket-policy-status` example retrieves the policy status for the bucket `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-policy-status \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "PolicyStatus": {
        "IsPublic": false
    }
}
```

For more information, see Blocking public access to your Amazon S3 storage in the *Amazon S3 User Guide*.

- For API details, see GetBucketPolicyStatus in *AWS CLI Command Reference*.

`get-bucket-policy`

The following code example shows how to use `get-bucket-policy`.

AWS CLI

Example 1: To retrieve a bucket policy

The following `get-bucket-policy` example retrieves the bucket policy for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-policy \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Policy": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"\",\"Effect
\":\"Allow\",\"Principal\":\"*\",\"Action\":\"s3:GetObject\",\"Resource\":
\"arn:aws:s3:::amzn-s3-demo-bucket/*\"},{\"Sid\":\"\",\"Effect\":\"Deny\",
\"Principal\":\"*\",\"Action\":\"s3:GetObject\",\"Resource\":\"arn:aws:s3:::amzn-s3-
demo-bucket/secret/*\"}]}"
}
```

Example 2: To get and put a bucket policy

The following `get-bucket-policy` example shows how you can download an Amazon S3 bucket policy, make modifications to the file, and then use `put-bucket-policy` to apply the modified bucket policy. To download the bucket policy to a file, run the following command.

```
aws s3api get-bucket-policy \
    --bucket amzn-s3-demo-bucket \
    --query Policy \
    --output text > policy.json
```

This command produces no output.

You can then modify the `policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running the following command.

```
aws s3api put-bucket-policy \
    --bucket amzn-s3-demo-bucket \
    --policy file://policy.json
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "",
            "Effect": "Allow",
            "Principal": "*",
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*"
        },
        {
            "Sid": "",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/secret/*"
        }
    ]
}
```

This command produces no output.

For more information, see Bucket policies for Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see GetBucketPolicy in *AWS CLI Command Reference*.

`get-bucket-replication`

The following code example shows how to use `get-bucket-replication`.

AWS CLI

To retrieve the replication configuration of a bucket

The following `get-bucket-replication` example retrieves the replication configuration for a bucket named `amzn-s3-demo-bucket1`.

```
aws s3api get-bucket-replication \
    --bucket amzn-s3-demo-bucket1
```

Output:

```
{
    "ReplicationConfiguration": {
        "Rules": [
            {
                "Status": "Enabled",
                "Prefix": "",
                "Destination": {
                    "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket2",
                    "StorageClass": "STANDARD"
                },
                "ID": "ZmUwNzE4ZmQ4tMjVhOS00MTlkLOGI4NDkzZTIWJjNTUtYTA1"
            }
        ],
        "Role": "arn:aws:iam::123456789012:role/s3-replication-role"
    }
}
```

For more information, see Replicating objects within and across Regions in the *Amazon S3 User Guide*.

- For API details, see GetBucketReplication in *AWS CLI Command Reference*.

`get-bucket-request-payment`

The following code example shows how to use `get-bucket-request-payment`.

AWS CLI

To retrieve the request payment configuration for a bucket

The following `get-bucket-request-payment` example retrieves the requester pays configuration for the specified bucket.

```
aws s3api get-bucket-request-payment \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Payer": "BucketOwner"
}
```

For more information, see Using Requester Pays general purpose buckets for storage transfers and usage in the *Amazon S3 User Guide*.

- For API details, see GetBucketRequestPayment in *AWS CLI Command Reference*.

`get-bucket-tagging`

The following code example shows how to use `get-bucket-tagging`.

AWS CLI

To retrieve the tagging configuration of a bucket

The following `get-bucket-tagging` example retrieves the tagging configuration for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-tagging \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "TagSet": [
        {
            "Value": "marketing",
            "Key": "organization"
        }
    ]
}
```

For more information, see Using cost allocation S3 bucket tags in the *Amazon S3 User Guide*.

- For API details, see GetBucketTagging in *AWS CLI Command Reference*.

`get-bucket-versioning`

The following code example shows how to use `get-bucket-versioning`.

AWS CLI

To retrieve the versioning configuration of a bucket

The following `get-bucket-versioning` example retrieves the versioning configuration for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-versioning \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Status": "Enabled"
}
```

For more information, see Retaining multiple versions of objects with S3 Versioning in the *Amazon S3 User Guide*.

- For API details, see GetBucketVersioning in *AWS CLI Command Reference*.

`get-bucket-website`

The following code example shows how to use `get-bucket-website`.

AWS CLI

To retrieve the website configuration of a bucket

The following `get-bucket-website` example retrieves the static website configuration for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-website \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

For more information, see Hosting a static website using Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see GetBucketWebsite in *AWS CLI Command Reference*.

`get-object-acl`

The following code example shows how to use `get-object-acl`.

AWS CLI

To retrieve the access control list of an object

The following `get-object-acl` example retrieves the access control list for an object in a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-object-acl \
    --bucket amzn-s3-demo-bucket \
    --key index.html
```

Output:

```
{
    "Owner": {
        "DisplayName": "my-username",
        "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
    },
    "Grants": [
        {
            "Grantee": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
            },
            "Permission": "FULL_CONTROL"
        },
        {
            "Grantee": {
                "URI": "http://acs.amazonaws.com/groups/global/AllUsers"
            },
            "Permission": "READ"
        }
    ]
```

```
}
```

For more information, see Access control list (ACL) overview in the *Amazon S3 User Guide*.

- For API details, see GetObjectAcl in *AWS CLI Command Reference*.

`get-object-attributes`

The following code example shows how to use `get-object-attributes`.

AWS CLI

To retrieves metadata from an object without returning the object itself

The following `get-object-attributes` example retrieves metadata from the object `doc1.rtf`.

```
aws s3api get-object-attributes \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf \
    --object-attributes "StorageClass" "ETag" "ObjectSize"
```

Output:

```
{
    "LastModified": "2022-03-15T19:37:31+00:00",
    "VersionId": "IuCPjXTDzHNfldAuitVBIKJpF2p1fg4P",
    "ETag": "b662d79adeb7c8d787ea7eafb9ef6207",
    "StorageClass": "STANDARD",
    "ObjectSize": 405
}
```

For more information, see Working with object metadata in the *Amazon S3 User Guide*.

- For API details, see GetObjectAttributes in *AWS CLI Command Reference*.

`get-object-legal-hold`

The following code example shows how to use `get-object-legal-hold`.

AWS CLI

To retrieve the Legal Hold status of an object

The following `get-object-legal-hold` example retrieves the Legal Hold status for the specified object.

```
aws s3api get-object-legal-hold \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf
```

Output:

```
{
    "LegalHold": {
        "Status": "ON"
    }
}
```

For more information, see Locking objects with Object Lock in the *Amazon S3 User Guide*.

- For API details, see GetObjectLegalHold in *AWS CLI Command Reference*.

`get-object-lock-configuration`

The following code example shows how to use `get-object-lock-configuration`.

AWS CLI

To retrieve an object lock configuration for a bucket

The following `get-object-lock-configuration` example retrieves the object lock configuration for the specified bucket.

```
aws s3api get-object-lock-configuration \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "ObjectLockConfiguration": {
        "ObjectLockEnabled": "Enabled",
        "Rule": {
            "DefaultRetention": {
                "Mode": "COMPLIANCE",
```

```
                "Days": 50
            }
        }
    }
}
```

For more information, see Configuring S3 Object Lock in the *Amazon S3 User Guide*.

- For API details, see GetObjectLockConfiguration in *AWS CLI Command Reference*.

`get-object-retention`

The following code example shows how to use `get-object-retention`.

AWS CLI

To retrieve the object retention configuration for an object

The following `get-object-retention` example retrieves the object retention configuration for the specified object.

```
aws s3api get-object-retention \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf
```

Output:

```
{
    "Retention": {
        "Mode": "GOVERNANCE",
        "RetainUntilDate": "2025-01-01T00:00:00.000Z"
    }
}
```

For more information, see Locking objects with Object Lock in the *Amazon S3 User Guide*.

- For API details, see GetObjectRetention in *AWS CLI Command Reference*.

`get-object-tagging`

The following code example shows how to use `get-object-tagging`.

AWS CLI

To retrieve the tags attached to an object

The following `get-object-tagging` example retrieves the values for the specified key from the specified object.

```
aws s3api get-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf
```

Output:

```
{
    "TagSet": [
        {
            "Value": "confidential",
            "Key": "designation"
        }
    ]
}
```

The following `get-object-tagging` example tries to retrieve the tag sets of the object `doc2.rtf`, which has no tags.

```
aws s3api get-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc2.rtf
```

Output:

```
{
    "TagSet": []
}
```

The following `get-object-tagging` example retrieves the tag sets of the object `doc3.rtf`, which has multiple tags.

```
aws s3api get-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc3.rtf
```

Output:

```
{
    "TagSet": [
        {
            "Value": "confidential",
            "Key": "designation"
        },
        {
            "Value": "finance",
            "Key": "department"
        },
        {
            "Value": "payroll",
            "Key": "team"
        }
    ]
}
```

For more information, see Tagging your objects in the *Amazon S3 User Guide*.

- For API details, see GetObjectTagging in *AWS CLI Command Reference*.

`get-object-torrent`

The following code example shows how to use `get-object-torrent`.

AWS CLI

To create a torrent for an object

The following `get-object-torrent` example creates a torrent for an object in a bucket named `amzn-s3-demo-bucket`.

```
aws s3api get-object-torrent large-video-file.torrent \
    --bucket amzn-s3-demo-bucket \
    --key large-video-file.mp4
```

This command produces no output.

The torrent file is saved locally in the current folder. Note that the output filename (`large-video-file.torrent`) is specified without an option name.

For more information, see Working with objects in Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see GetObjectTorrent in *AWS CLI Command Reference*.

`get-object`

The following code example shows how to use `get-object`.

AWS CLI

Example 1: To download an object

The following `get-object` example downloads an object from Amazon S3.

```
aws s3api get-object my_images.tar.bz2 \
    --bucket amzn-s3-demo-bucket \
    --key dir/my_images.tar.bz2
```

Output:

```
{
    "AcceptRanges": "bytes",
    "LastModified": "2015-04-16T18:19:14+00:00",
    "ContentLength": 3191,
    "ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",
    "ContentType": "binary/octet-stream",
    "ServerSideEncryption": "AES256",
    "Metadata": {}
}
```

Note that the outfile parameter is specified without an option name such as "--outfile".

Example 2: To download a specific byte range from an object

The following `get-object` example uses `--range` to download a specific byte range from an object. Note the byte ranges need to be prefixed with "bytes=".

```
aws s3api get-object my_data_range \
    --bucket amzn-s3-demo-bucket \
    --key dir/my_data \
    --range bytes=8888-9999
```

Output:

```
{
    "AcceptRanges": "bytes",
    "LastModified": "2015-04-16T18:21:07+00:00",
    "ContentLength": 1112,
    "ETag": "\"0db5e5a2c4f0b9d3e1f6a7b8c9d0e1f2\"",
    "ContentRange": "bytes 8888-9999/20000",
    "ContentType": "binary/octet-stream",
    "ServerSideEncryption": "AES256",
    "Metadata": {}
}
```

For more information, see Downloading objects in the *Amazon S3 User Guide*.

- For API details, see GetObject in *AWS CLI Command Reference*.

`get-public-access-block`

The following code example shows how to use `get-public-access-block`.

AWS CLI

To set or modify the block public access configuration for a bucket

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "PublicAccessBlockConfiguration": {
        "IgnorePublicAcls": true,
        "BlockPublicPolicy": true,
        "BlockPublicAcls": true,
        "RestrictPublicBuckets": true
    }
}
```

For more information, see Configuring block public access settings for your S3 buckets in the *Amazon S3 User Guide*.

- For API details, see GetPublicAccessBlock in *AWS CLI Command Reference*.

`head-bucket`

The following code example shows how to use `head-bucket`.

AWS CLI

To verify access to a bucket

The following `head-bucket` example verifies access to a bucket named `amzn-s3-demo-bucket`.

```
aws s3api head-bucket \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "BucketRegion": "us-west-2",
    "AccessPointAlias": false
}
```

If the bucket exists and you have access to it, the output contains the Region of the bucket. Otherwise, an error message will be shown. For example:

```
A client error (404) occurred when calling the HeadBucket operation: Not Found
```

For more information, see General purpose buckets overview in the *Amazon S3 User Guide*.

- For API details, see HeadBucket in *AWS CLI Command Reference*.

`head-object`

The following code example shows how to use `head-object`.

AWS CLI

To retrieve metadata for an object

The following `head-object` example retrieves metadata for an object in a bucket named `amzn-s3-demo-bucket`.

```
aws s3api head-object \
    --bucket amzn-s3-demo-bucket \
    --key index.html
```

Output:

```
{
    "AcceptRanges": "bytes",
    "ContentType": "text/html",
    "LastModified": "Thu, 16 Apr 2015 18:19:14 GMT",
    "ContentLength": 77,
    "VersionId": "null",
    "ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",
    "Metadata": {}
}
```

For more information, see Working with object metadata in the *Amazon S3 User Guide*.

- For API details, see HeadObject in *AWS CLI Command Reference*.

`list-bucket-analytics-configurations`

The following code example shows how to use `list-bucket-analytics-configurations`.

AWS CLI

To retrieve a list of analytics configurations for a bucket

The following `list-bucket-analytics-configurations` example retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "AnalyticsConfigurationList": [
        {
```

```
            "StorageClassAnalysis": {},
            "Id": "1"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Amazon S3 analytics - Storage Class Analysis in the *Amazon S3 User Guide*.

- For API details, see ListBucketAnalyticsConfigurations in *AWS CLI Command Reference*.

`list-bucket-intelligent-tiering-configurations`

The following code example shows how to use `list-bucket-intelligent-tiering-configurations`.

AWS CLI

To retrieve all S3 Intelligent-Tiering configurations on a bucket

The following `list-bucket-intelligent-tiering-configurations` example retrieves all S3 Intelligent-Tiering configuration on a bucket.

```
aws s3api list-bucket-intelligent-tiering-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "IsTruncated": false,
    "IntelligentTieringConfigurationList": [
        {
            "Id": "ExampleConfig",
            "Filter": {
                "Prefix": "images"
            },
            "Status": "Enabled",
            "Tierings": [
                {
                    "Days": 90,
                    "AccessTier": "ARCHIVE_ACCESS"
```

```
                },
                {
                    "Days": 180,
                    "AccessTier": "DEEP_ARCHIVE_ACCESS"
                }
            ]
        },
        {
            "Id": "ExampleConfig2",
            "Status": "Disabled",
            "Tierings": [
                {
                    "Days": 730,
                    "AccessTier": "ARCHIVE_ACCESS"
                }
            ]
        },
        {
            "Id": "ExampleConfig3",
            "Filter": {
                "Tag": {
                    "Key": "documents",
                    "Value": "taxes"
                }
            },
            "Status": "Enabled",
            "Tierings": [
                {
                    "Days": 90,
                    "AccessTier": "ARCHIVE_ACCESS"
                },
                {
                    "Days": 365,
                    "AccessTier": "DEEP_ARCHIVE_ACCESS"
                }
            ]
        }
    ]
}
```

For more information, see Using S3 Intelligent-Tiering in the *Amazon S3 User Guide*.

- For API details, see ListBucketIntelligentTieringConfigurations in *AWS CLI Command Reference*.

`list-bucket-inventory-configurations`

The following code example shows how to use `list-bucket-inventory-configurations`.

AWS CLI

To retrieve a list of inventory configurations for a bucket

The following `list-bucket-inventory-configurations` example lists the inventory configurations for the specified bucket.

```
aws s3api list-bucket-inventory-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "InventoryConfigurationList": [
        {
            "IsEnabled": true,
            "Destination": {
                "S3BucketDestination": {
                    "Format": "ORC",
                    "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
                    "AccountId": "123456789012"
                }
            },
            "IncludedObjectVersions": "Current",
            "Id": "1",
            "Schedule": {
                "Frequency": "Weekly"
            }
        },
        {
            "IsEnabled": true,
            "Destination": {
                "S3BucketDestination": {
                    "Format": "CSV",
                    "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
                    "AccountId": "123456789012"
                }
            },
            "IncludedObjectVersions": "Current",
```

```
            "Id": "2",
            "Schedule": {
                "Frequency": "Daily"
            }
        }
    ],
    "IsTruncated": false
}
```

For more information, see Cataloging and analyzing your data with S3 Inventory in the *Amazon S3 User Guide*.

- For API details, see ListBucketInventoryConfigurations in *AWS CLI Command Reference*.

`list-bucket-metrics-configurations`

The following code example shows how to use `list-bucket-metrics-configurations`.

AWS CLI

To retrieve a list of metrics configurations for a bucket

The following `list-bucket-metrics-configurations` example retrieves a list of metrics configurations for the specified bucket.

```
aws s3api list-bucket-metrics-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "IsTruncated": false,
    "MetricsConfigurationList": [
        {
            "Filter": {
                "Prefix": "logs"
            },
            "Id": "123"
        },
        {
            "Filter": {
                "Prefix": "tmp"
            },
```

```
            "Id": "234"
        }
    ]
}
```

For more information, see CloudWatch metrics configurations in the *Amazon S3 User Guide*.

- For API details, see ListBucketMetricsConfigurations in *AWS CLI Command Reference*.

`list-buckets`

The following code example shows how to use `list-buckets`.

AWS CLI

To list the names of all your Amazon S3 buckets

The following `list-buckets` example displays the names of all your Amazon S3 buckets (across all regions).

```
aws s3api list-buckets \
    --query "Buckets[].Name"
```

Output:

```
[
    "amzn-s3-demo-bucket1",
    "amzn-s3-demo-bucket2"
]
```

The query option filters the output of `list-buckets` down to only the bucket names.

For more information, see General purpose buckets overview in the *Amazon S3 User Guide*.

- For API details, see ListBuckets in *AWS CLI Command Reference*.

`list-multipart-uploads`

The following code example shows how to use `list-multipart-uploads`.

AWS CLI

To list the active multipart uploads for a bucket

The following `list-multipart-uploads` example lists all of the active multipart uploads for a bucket named `amzn-s3-demo-bucket`.

```
aws s3api list-multipart-uploads \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Uploads": [
        {
            "Initiator": {
                "DisplayName": "username",
                "ID": "arn:aws:iam::0123456789012:user/username"
            },
            "Initiated": "2015-06-02T18:01:30.000Z",
            "UploadId":
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URC
            "StorageClass": "STANDARD",
            "Key": "multipart/01",
            "Owner": {
                "DisplayName": "aws-account-name",
                "ID":
 "100719349fc3b6dcd7c820a124bf7aecd408092c3d7b51b38494939801fc248b"
            }
        }
    ],
    "CommonPrefixes": []
}
```

In progress multipart uploads incur storage costs in Amazon S3. Complete or abort an active multipart upload to remove its parts from your account.

For more information, see Uploading and copying objects using multipart upload in Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see ListMultipartUploads in *AWS CLI Command Reference*.

`list-object-versions`

The following code example shows how to use `list-object-versions`.

AWS CLI

To retrieve version information for an object

The following `list-object-versions` example retrieves version information for an object in a bucket named `amzn-s3-demo-bucket`.

```
aws s3api list-object-versions \
    --bucket amzn-s3-demo-bucket \
    --prefix index.html
```

Output:

```
{
    "DeleteMarkers": [
        {
            "Owner": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd6606875a8875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": true,

            },
            "IsLatest": false,
            "Size": 533823
        }
    ]
}
```

For more information, see Retaining multiple versions of objects with S3 Versioning in the *Amazon S3 User Guide*.

- For API details, see ListObjectVersions in *AWS CLI Command Reference*.

`list-objects-v2`

The following code example shows how to use `list-objects-v2`.

AWS CLI

To get a list of objects in a bucket

The following `list-objects-v2` example lists the objects in the specified bucket.

```
aws s3api list-objects-v2 \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Contents": [
        {
            "LastModified": "2019-11-05T23:11:50.000Z",
            "ETag": "\"621503c373607d548b37cff8778d992c\"",
            "StorageClass": "STANDARD",
            "Key": "doc1.rtf",
            "Size": 391
        },
        {
            "LastModified": "2019-11-05T23:11:50.000Z",
            "ETag": "\"a2cecc36ab7c7fe3a71a273b9d45b1b5\"",
            "StorageClass": "STANDARD",
            "Key": "doc2.rtf",
            "Size": 373
        },
        {
            "LastModified": "2019-11-05T23:11:50.000Z",
            "ETag": "\"08210852f65a2e9cb999972539a64d68\"",
            "StorageClass": "STANDARD",
            "Key": "doc3.rtf",
            "Size": 399
        },
        {
            "LastModified": "2019-11-05T23:11:50.000Z",
```

```
            "ETag": "\"d1852dd683f4043065a9471af106988e\"",
            "StorageClass": "STANDARD",
            "Key": "doc4.rtf",
            "Size": 6225
        }
    ]
}
```

For more information, see Listing object keys programmatically in the *Amazon S3 User Guide*.

- For API details, see ListObjectsV2 in *AWS CLI Command Reference*.

`list-objects`

The following code example shows how to use `list-objects`.

AWS CLI

To list the objects in a bucket

The following `list-objects` example displays the names of all the objects in the specified bucket.

```
aws s3api list-objects \
    --bucket amzn-s3-demo-bucket \
    --query 'Contents[].{Key: Key, Size: Size}'
```

Output:

```
[
    {
        "Key": "dir/my_data",
        "Size": 20000
    },
    {
        "Key": "dir/my_images.tar.bz2",
        "Size": 3191
    }
]
```

The example uses the `--query` argument to filter the output of `list-objects` down to the key value and size for each object

For more information, see Listing object keys programmatically in the *Amazon S3 User Guide*.

- For API details, see ListObjects in *AWS CLI Command Reference*.

`list-parts`

The following code example shows how to use `list-parts`.

AWS CLI

To list the uploaded parts of a multipart upload

The following `list-parts` example lists all of the parts that have been uploaded for a multipart upload with key `multipart/01` in the bucket `amzn-s3-demo-bucket`.

```
aws s3api list-parts \
    --bucket amzn-s3-demo-bucket \
    --key 'multipart/01' \
    --upload-
id dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3UR
```

Output:

```
{
    "Owner": {
        "DisplayName": "aws-account-name",
        "ID": "100719349fc3b6dcd7c820a124bf7aecd408092c3d7b51b38494939801fc248b"
    },
    "Initiator": {
        "DisplayName": "username",
        "ID": "arn:aws:iam::0123456789012:user/username"
    },
    "Parts": [
        {
            "LastModified": "2015-06-02T18:07:35.000Z",
            "PartNumber": 1,
            "ETag": "\"e868e0f4719e394144ef36531ee6824c\"",
            "Size": 5242880
        },
        {
            "LastModified": "2015-06-02T18:07:42.000Z",
            "PartNumber": 2,
```

```
            "ETag": "\"6bb2b12753d66fe86da4998aa33fffb0\"",
            "Size": 5242880
        },
        {
            "LastModified": "2015-06-02T18:07:47.000Z",

            "ETag": "\"d0a0112e841abec9c9ec83406f0159c8\"",
            "Size": 5242880
        }
    ],
    "StorageClass": "STANDARD"
}
```

For more information, see Uploading and copying objects using multipart upload in Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see ListParts in *AWS CLI Command Reference*.

`ls`

The following code example shows how to use `ls`.

AWS CLI

Example 1: To list all user owned buckets

The following `ls` example lists all of the buckets owned by the user. In this example, the user owns the buckets `amzn-s3-demo-bucket` and `amzn-s3-demo-bucket2`. The timestamp is the date the bucket was created, shown in your machine's time zone. This date can change when making changes to your bucket, such as editing its bucket policy. Note if `s3://` is used for the path argument `<S3Uri>`, it will list all of the buckets as well.

```
aws s3 ls
```

Output:

```
2013-07-11 17:08:50 amzn-s3-demo-bucket
2013-07-24 14:55:44 amzn-s3-demo-bucket2
```

Example 2: To list all prefixes and objects in a bucket

The following `ls` example lists objects and common prefixes under a specified bucket and prefix. In this example, the user owns the bucket `amzn-s3-demo-bucket` with the objects `test.txt` and `somePrefix/test.txt`. The `LastWriteTime` and `Length` are arbitrary. Note that since the `ls` command has no interaction with the local filesystem, the `s3://` URI scheme is not required to resolve ambiguity and may be omitted.

```
aws s3 ls s3://amzn-s3-demo-bucket
```

Output:

```
                           PRE somePrefix/
2013-07-25 17:06:27         88 test.txt
```

Example 3: To list all prefixes and objects in a specific bucket and prefix

The following `ls` example lists objects and common prefixes under a specified bucket and prefix. However, there are no objects nor common prefixes under the specified bucket and prefix.

```
aws s3 ls s3://amzn-s3-demo-bucket/noExistPrefix
```

Output:

```
None
```

Example 4: To recursively list all prefixes and objects in a bucket

The following `ls` example recursively lists objects in a bucket. Rather than showing PRE `dirname/` in the output, all the content in a bucket will be listed in order.

```
aws s3 ls s3://amzn-s3-demo-bucket \
    --recursive
```

Output:

```
2013-09-02 21:37:53         10 a.txt
2013-09-02 21:37:53    2863288 foo.zip
2013-09-02 21:32:57         23 foo/bar/.baz/a
```

```
2013-09-02 21:32:58         41 foo/bar/.baz/b
2013-09-02 21:32:57        281 foo/bar/.baz/c
2013-09-02 21:32:57         73 foo/bar/.baz/d
2013-09-02 21:32:57        452 foo/bar/.baz/e
2013-09-02 21:32:57        896 foo/bar/.baz/hooks/bar
2013-09-02 21:32:57        189 foo/bar/.baz/hooks/foo
2013-09-02 21:32:57        398 z.txt
```

Example 5: To summarize all prefixes and objects in a bucket

The following `ls` example runs the same command as the previous example with the `--human-readable` and `--summarize` options. `--human-readable` displays file size in Bytes/MiB/KiB/GiB/TiB/PiB/EiB. `--summarize` displays the total number of objects and total size at the end of the result listing.

```
aws s3 ls s3://amzn-s3-demo-bucket \
    --recursive \
    --human-readable \
    --summarize
```

Output:

```
2013-09-02 21:37:53   10 Bytes a.txt
2013-09-02 21:37:53  2.9 MiB foo.zip
2013-09-02 21:32:57   23 Bytes foo/bar/.baz/a
2013-09-02 21:32:58   41 Bytes foo/bar/.baz/b
2013-09-02 21:32:57  281 Bytes foo/bar/.baz/c
2013-09-02 21:32:57   73 Bytes foo/bar/.baz/d
2013-09-02 21:32:57  452 Bytes foo/bar/.baz/e
2013-09-02 21:32:57  896 Bytes foo/bar/.baz/hooks/bar
2013-09-02 21:32:57  189 Bytes foo/bar/.baz/hooks/foo
2013-09-02 21:32:57  398 Bytes z.txt

Total Objects: 10
   Total Size: 2.9 MiB
```

Example 6: To list objects in an S3 access point

The following `ls` example lists objects from access point (`myaccesspoint`).

```
aws s3 ls s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
```

Output:

```
                           PRE somePrefix/
2013-07-25 17:06:27         88 test.txt
```

For more information, see Using high-level (s3) commands in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see Ls in *AWS CLI Command Reference*.

mb

The following code example shows how to use mb.

AWS CLI

Example 1: To create a bucket

The following mb example creates a bucket. In this example, the user makes the bucket amzn-s3-demo-bucket. The bucket is created in the region specified in the user's configuration file.

```
aws s3 mb s3://amzn-s3-demo-bucket
```

Output:

```
make_bucket: s3://amzn-s3-demo-bucket
```

Example 2: To create a bucket in the specified region

The following mb example creates a bucket in a region specified by the --region parameter. In this example, the user makes the bucket amzn-s3-demo-bucket in the region us-west-2.

```
aws s3 mb s3://amzn-s3-demo-bucket \
    --region us-west-2
```

Output:

```
make_bucket: s3://amzn-s3-demo-bucket
```

Example 3: To create a bucket with specified tags

The following mb example creates a bucket with specified tags using the --tags parameter. In this example, the user makes the bucket amzn-s3-demo-bucket with two tags with keys Key1 and Key2, respectively.

```
aws s3 mb s3://amzn-s3-demo-bucket \
    --tags Key1 Value1 \
    --tags Key2 Value2
```

Output:

```
make_bucket: s3://amzn-s3-demo-bucket
```

For more information, see Using high-level (s3) commands in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see Mb in *AWS CLI Command Reference*.

mv

The following code example shows how to use mv.

AWS CLI

Example 1: To move a local file to the specified bucket

The following mv example moves a single file to a specified bucket and key.

```
aws s3 mv test.txt s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
move: test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 2: To move an object to the specified bucket and key

The following mv example moves a single S3 object to a specified bucket and key.

```
aws s3 mv s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
move: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 3: To move an S3 object to the local directory

The following mv example moves a single object to a specified file locally.

```
aws s3 mv s3://amzn-s3-demo-bucket/test.txt test2.txt
```

Output:

```
move: s3://amzn-s3-demo-bucket/test.txt to test2.txt
```

Example 4: To move an object with its original name to the specified bucket

The following mv example moves a single object to a specified bucket while retaining its original name.

```
aws s3 mv s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket2/
```

Output:

```
move: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket2/test.txt
```

Example 5: To move all objects and prefixes in a bucket to the local directory

The following mv example recursively moves all objects under a specified prefix and bucket to a specified directory when passed with the parameter `--recursive`. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `test2.txt`.

```
aws s3 mv s3://amzn-s3-demo-bucket . \
    --recursive
```

Output:

```
move: s3://amzn-s3-demo-bucket/test1.txt to test1.txt
move: s3://amzn-s3-demo-bucket/test2.txt to test2.txt
```

Example 6: To move all files in a local directory to a bucket, except ``.jpg`` files

The following `mv` example recursively moves all files under a specified directory to a specified bucket and prefix when passed with the parameter `--recursive`, while excluding some files by using an `--exclude` parameter. In this example, the directory `myDir` has the files `test1.txt` and `test2.jpg`.

```
aws s3 mv myDir s3://amzn-s3-demo-bucket/ \
    --recursive \
    --exclude "*.jpg"
```

Output:

```
move: myDir/test1.txt to s3://amzn-s3-demo-bucket2/test1.txt
```

Example 7: To move all objects in a bucket to another bucket, except objects under a specified prefix

The following `mv` example recursively moves all objects under a specified bucket to another bucket when passed with the parameter `--recursive`, while excluding some objects by using an `--exclude` parameter. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `another/test1.txt`.

```
aws s3 mv s3://amzn-s3-demo-bucket/ s3://amzn-s3-demo-bucket2/ \
    --recursive \
    --exclude "amzn-s3-demo-bucket/another/*"
```

Output:

```
move: s3://amzn-s3-demo-bucket/test1.txt to s3://amzn-s3-demo-bucket2/test1.txt
```

Example 8: To move an object to the specified bucket and set the ACL

The following `mv` example moves a single object to a specified bucket and key while setting the ACL to `public-read-write`.

```
aws s3 mv s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket/test2.txt \
    --acl public-read-write
```

Output:

```
move: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 9: To move a local file to the specified bucket and grant permissions

The following `mv` example uses the `--grants` option to grant read access to all users and full control to a specific user identified by their email address.

```
aws s3 mv file.txt s3://amzn-s3-demo-bucket/ \
    --grants read=uri=http://acs.amazonaws.com/groups/global/
AllUsers full=emailaddress=user@example.com
```

Output:

```
move: file.txt to s3://amzn-s3-demo-bucket/file.txt
```

Example 10: To move a file to an S3 access point

The following `mv` example moves a single file named `mydoc.txt` to the access point named `myaccesspoint` at the key named `mykey`.

```
aws s3 mv mydoc.txt s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

Output:

```
move: mydoc.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
mykey
```

Example 11: To move a file with tags

The following `mv` example moves a single file (`file.txt`) to a specified bucket and key while setting two tags on the object. Specify `--tags` once per tag, separating the key and value with a space. Tags are supported only when transferring from a local path to S3.

```
aws s3 mv file.txt s3://amzn-s3-demo-bucket/file.txt \
    --tags key1 value1 \
    --tags key2 value2
```

Output:

```
move: file.txt to s3://amzn-s3-demo-bucket/file.txt
```

For more information, see Using high-level (s3) commands in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see Mv in *AWS CLI Command Reference*.

`presign`

The following code example shows how to use `presign`.

AWS CLI

Example 1: To create a pre-signed URL with the default one hour lifetime that links to an object in an S3 bucket

The following `presign` example generates a pre-signed URL for a specified bucket and key that is valid for one hour.

```
aws s3 presign s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
https://amzn-s3-demo-bucket.s3.us-west-2.amazonaws.com/key?X-Amz-Algorithm=AWS4-
HMAC-SHA256&X-Amz-Credential=AKIAEXAMPLE123456789%2F20210621%2Fus-
west-2%2Fs3%2Faws4_request&X-Amz-Date=20210621T041609Z&X-Amz-Expires=3600&X-Amz-
SignedHeaders=host&X-Amz-
Signature=EXAMPLE1234494d5fba3fed607f98018e1dfc62e2529ae96d844123456
```

Example 2: To create a pre-signed URL with a custom lifetime that links to an object in an S3 bucket

The following `presign` example generates a pre-signed URL for a specified bucket and key that is valid for one week.

```
aws s3 presign s3://amzn-s3-demo-bucket/test2.txt \
    --expires-in 604800
```

Output:

```
https://amzn-s3-demo-bucket.s3.us-west-2.amazonaws.com/key?X-Amz-Algorithm=AWS4-
HMAC-SHA256&X-Amz-Credential=AKIAEXAMPLE123456789%2F20210621%2Fus-
west-2%2Fs3%2Faws4_request&X-Amz-Date=20210621T041609Z&X-Amz-Expires=604800&X-Amz-
SignedHeaders=host&X-Amz-
Signature=EXAMPLE1234494d5fba3fed607f98018e1dfc62e2529ae96d844123456
```

For more information, see Share an Object with Others in the *Amazon S3 Developer Guide*.

- For API details, see Presign in *AWS CLI Command Reference*.

`put-bucket-accelerate-configuration`

The following code example shows how to use `put-bucket-accelerate-configuration`.

AWS CLI

To set the accelerate configuration of a bucket

The following `put-bucket-accelerate-configuration` example enables the accelerate configuration for the specified bucket.

```
aws s3api put-bucket-accelerate-configuration \
    --bucket amzn-s3-demo-bucket \
    --accelerate-configuration Status=Enabled
```

This command produces no output.

For more information, see Configuring fast, secure file transfers using Amazon S3 Transfer Acceleration in the *Amazon S3 User Guide*.

- For API details, see PutBucketAccelerateConfiguration in *AWS CLI Command Reference*.

`put-bucket-acl`

The following code example shows how to use `put-bucket-acl`.

AWS CLI

To set the access control list for a bucket

The following `put-bucket-acl` example grants `full control` to two AWS users (*user1@example.com* and *user2@example.com*) and `read` permission to everyone.

```
aws s3api put-bucket-acl \
    --bucket amzn-s3-demo-bucket \
    --grant-full-
control emailaddress=user1@example.com,emailaddress=user2@example.com \
    --grant-read uri=http://acs.amazonaws.com/groups/global/AllUsers
```

This command produces no output.

For more information, see Configuring ACLs in the *Amazon S3 User Guide*.

- For API details, see PutBucketAcl in *AWS CLI Command Reference*.

`put-bucket-analytics-configuration`

The following code example shows how to use `put-bucket-analytics-configuration`.

AWS CLI

To sets an analytics configuration for the bucket

The following `put-bucket-analytics-configuration` example configures analytics for the specified bucket.

```
aws s3api put-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1 \
    --analytics-configuration '{"Id": "1","StorageClassAnalysis": {}}'
```

This command produces no output.

For more information, see Amazon S3 analytics - Storage Class Analysis in the *Amazon S3 User Guide*.

- For API details, see PutBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

`put-bucket-cors`

The following code example shows how to use `put-bucket-cors`.

AWS CLI

To configure CORS for a bucket

The following `put-bucket-cors` example enables PUT, POST, and DELETE requests from *www.example.com*, and enables GET requests from any domain.

```
aws s3api put-bucket-cors \
    --bucket amzn-s3-demo-bucket \
    --cors-configuration file://cors.json
```

Contents of `cors.json`:

```
{
    "CORSRules": [
        {
            "AllowedOrigins": [
                "http://www.example.com"
            ],
            "AllowedHeaders": [
                "*"
            ],
            "AllowedMethods": [
                "PUT",
                "POST",
                "DELETE"
            ],
            "MaxAgeSeconds": 3000,
            "ExposeHeaders": [
                "x-amz-server-side-encryption"
            ]
        },
        {
            "AllowedOrigins": [
                "*"
            ],
            "AllowedHeaders": [
                "Authorization"
            ],
            "AllowedMethods": [
                "GET"
            ],
            "MaxAgeSeconds": 3000
        }
    ]
}
```

This command produces no output.

For more information, see Using cross-origin resource sharing (CORS) in the *Amazon S3 User Guide*.

- For API details, see PutBucketCors in *AWS CLI Command Reference*.

`put-bucket-encryption`

The following code example shows how to use `put-bucket-encryption`.

AWS CLI

To configure server-side encryption for a bucket

The following `put-bucket-encryption` example sets AES256 encryption as the default for the specified bucket.

```
aws s3api put-bucket-encryption \
    --bucket amzn-s3-demo-bucket \
    --server-side-encryption-configuration '{"Rules":
 [{"ApplyServerSideEncryptionByDefault": {"SSEAlgorithm": "AES256"}}]}'
```

This command produces no output.

For more information, see Setting default server-side encryption behavior for Amazon S3 buckets in the *Amazon S3 User Guide*.

- For API details, see PutBucketEncryption in *AWS CLI Command Reference*.

`put-bucket-intelligent-tiering-configuration`

The following code example shows how to use `put-bucket-intelligent-tiering-configuration`.

AWS CLI

To update an S3 Intelligent-Tiering configuration on a bucket

The following `put-bucket-intelligent-tiering-configuration` example updates an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket. The configuration will

transition objects that have not been accessed under the prefix images to Archive Access after 90 days and Deep Archive Access after 180 days.

```
aws s3api put-bucket-intelligent-tiering-configuration \
    --bucket amzn-s3-demo-bucket \
    --id "ExampleConfig" \
    --intelligent-tiering-configuration file://intelligent-tiering-
configuration.json
```

Contents of `intelligent-tiering-configuration.json`:

```
{
    "Id": "ExampleConfig",
    "Status": "Enabled",
    "Filter": {
        "Prefix": "images"
        },
    "Tierings": [
        {
            "Days": 90,
            "AccessTier": "ARCHIVE_ACCESS"
        },
        {
            "Days": 180,
            "AccessTier": "DEEP_ARCHIVE_ACCESS"
        }
    ]
}
```

This command produces no output.

For more information, see Setting Object Ownership on an existing bucket in the *Amazon S3 User Guide*.

- For API details, see PutBucketIntelligentTieringConfiguration in *AWS CLI Command Reference*.

`put-bucket-inventory-configuration`

The following code example shows how to use `put-bucket-inventory-configuration`.

AWS CLI

Example 1: To set an inventory configuration for a bucket

The following `put-bucket-inventory-configuration` example sets a weekly ORC-formatted inventory report for the bucket `amzn-s3-demo-bucket`.

```
aws s3api put-bucket-inventory-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1 \
    --inventory-configuration '{"Destination": { "S3BucketDestination":
 { "AccountId": "123456789012", "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
 "Format": "ORC" }}, "IsEnabled": true, "Id": "1", "IncludedObjectVersions":
 "Current", "Schedule": { "Frequency": "Weekly" }}'
```

This command produces no output.

For more information, see Cataloging and analyzing your data with S3 Inventory in the *Amazon S3 User Guide*.

Example 2: To set an inventory configuration for a bucket

The following `put-bucket-inventory-configuration` example sets a daily CSV-formatted inventory report for the bucket `amzn-s3-demo-bucket`.

```
aws s3api put-bucket-inventory-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 2 \
    --inventory-configuration '{"Destination": { "S3BucketDestination":
 { "AccountId": "123456789012", "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
 "Format": "CSV" }}, "IsEnabled": true, "Id": "2", "IncludedObjectVersions":
 "Current", "Schedule": { "Frequency": "Daily" }}'
```

This command produces no output.

For more information, see Cataloging and analyzing your data with S3 Inventory in the *Amazon S3 User Guide*.

- For API details, see PutBucketInventoryConfiguration in *AWS CLI Command Reference*.

`put-bucket-lifecycle-configuration`

The following code example shows how to use `put-bucket-lifecycle-configuration`.

AWS CLI

To apply a lifecycle configuration to a bucket

The following `put-bucket-lifecycle-configuration` example applies a lifecycle configuration to a bucket named `amzn-s3-demo-bucket`.

```
aws s3api put-bucket-lifecycle-configuration \
    --bucket amzn-s3-demo-bucket \
    --lifecycle-configuration file://lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules.

Contents of `lifecycle.json`:

```
{
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        },
        {
            "Status": "Enabled",
            "Prefix": "",
            "NoncurrentVersionTransitions": [
                {
                    "NoncurrentDays": 2,
                    "StorageClass": "GLACIER"
                }
            ],
            "ID": "Move old versions to Glacier"
        }
    ]
}
```

Output:

```
{
    "TransitionDefaultMinimumObjectSize": "all_storage_classes_128K"
```

```
}
```

The first rule moves files with the prefix `rotated` to Glacier on the specified date. The second rule moves old object versions to Glacier when they are no longer current. For information on acceptable timestamp formats, see Specifying parameter values in the AWS CLI in the *AWS CLI User Guide*.

For more information, see Managing the lifecycle of objects in the *Amazon S3 User Guide*.

- For API details, see PutBucketLifecycleConfiguration in *AWS CLI Command Reference*.

`put-bucket-lifecycle`

The following code example shows how to use `put-bucket-lifecycle`.

AWS CLI

To apply a lifecycle configuration to a bucket

The following `put-bucket-lifecycle` example applies a lifecycle configuration to the bucket `amzn-s3-demo-bucket`.

```
aws s3api put-bucket-lifecycle \
    --bucket amzn-s3-demo-bucket \
    --lifecycle-configuration file://lifecycle.json
```

This command produces no output.

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules.

Contents of `lifecycle.json`:

```
{
    "Rules": [
        {
            "ID": "Move to Glacier after sixty days (objects in logs/2015/)",
            "Prefix": "logs/2015/",
            "Status": "Enabled",
            "Transition": {
                "Days": 60,
                "StorageClass": "GLACIER"
```

```
            }
        },
        {
            "Expiration": {
                "Date": "2016-01-01T00:00:00.000Z"
            },
            "ID": "Delete 2014 logs in 2016.",
            "Prefix": "logs/2014/",
            "Status": "Enabled"
        }
    ]
}
```

The first rule moves files to Amazon Glacier after sixty days. The second rule deletes files from Amazon S3 on the specified date. For information on acceptable timestamp formats, see Specifying parameter values in the AWS CLI in the *AWS CLI User Guide*.

Each rule in the above example specifies a policy (`Transition` or `Expiration`) and file prefix (folder name) to which it applies. You can also create a rule that applies to an entire bucket by specifying a blank prefix:

```
{
    "Rules": [
        {
            "ID": "Move to Glacier after sixty days (all objects in bucket)",
            "Prefix": "",
            "Status": "Enabled",
            "Transition": {
                "Days": 60,
                "StorageClass": "GLACIER"
            }
        }
    ]
}
```

For more information, see Managing the lifecycle of objects in the *Amazon S3 User Guide*.

- For API details, see PutBucketLifecycle in *AWS CLI Command Reference*.

`put-bucket-logging`

The following code example shows how to use `put-bucket-logging`.

AWS CLI

Example 1: To set bucket policy logging

The following `put-bucket-logging` example sets the logging policy for *amzn-s3-demo-bucket*. First, grant the logging service principal permission in your bucket policy using the `put-bucket-policy` command.

```
aws s3api put-bucket-policy \
    --bucket amzn-s3-demo-bucket \
    --policy file://policy.json
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "S3ServerAccessLogsPolicy",
            "Effect": "Allow",
            "Principal": {"Service": "logging.s3.amazonaws.com"},
            "Action": "s3:PutObject",
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/Logs/*",
            "Condition": {
                "ArnLike": {"aws:SourceARN": "arn:aws:s3:::SOURCE-BUCKET-NAME"},
                "StringEquals": {"aws:SourceAccount": "SOURCE-AWS-ACCOUNT-ID"}
            }
        }
    ]
}
```

To apply the logging policy, use `put-bucket-logging`.

```
aws s3api put-bucket-logging \
    --bucket amzn-s3-demo-bucket \
    --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{
    "LoggingEnabled": {
```

```
        "TargetBucket": "amzn-s3-demo-bucket",
        "TargetPrefix": "Logs/"
    }
}
```

This command produces no output.

The `put-bucket-policy` command is required to grant `s3:PutObject` permissions to the logging service principal.

For more information, see Amazon S3 Server Access Logging in the *Amazon S3 User Guide*.

Example 2: To set a bucket policy for logging access to only a single user

The following `put-bucket-logging` example sets the logging policy for *amzn-s3-demo-bucket*. The AWS user *bob@example.com* will have full control over the log files, and no one else has any access. First, grant S3 permission with `put-bucket-acl`.

```
aws s3api put-bucket-acl \
    --bucket amzn-s3-demo-bucket \
    --grant-write URI=http://acs.amazonaws.com/groups/s3/LogDelivery \
    --grant-read-acp URI=http://acs.amazonaws.com/groups/s3/LogDelivery
```

Then apply the logging policy using `put-bucket-logging`.

```
aws s3api put-bucket-logging \
    --bucket amzn-s3-demo-bucket \
    --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{
    "LoggingEnabled": {
        "TargetBucket": "amzn-s3-demo-bucket",
        "TargetPrefix": "amzn-s3-demo-bucket-logs/",
        "TargetGrants": [
            {
                "Grantee": {
                    "Type": "AmazonCustomerByEmail",
                    "EmailAddress": "bob@example.com"
                },
                "Permission": "FULL_CONTROL"
```

```
            }
        ]
    }
}
```

This command produces no output.

the `put-bucket-acl` command is required to grant S3's log delivery system the necessary permissions (write and read-acp permissions).

For more information, see Amazon S3 Server Access Logging in the *Amazon S3 Developer Guide*.

- For API details, see PutBucketLogging in *AWS CLI Command Reference*.

`put-bucket-metrics-configuration`

The following code example shows how to use `put-bucket-metrics-configuration`.

AWS CLI

To set a metrics configuration for a bucket

The following `put-bucket-metrics-configuration` example sets a metric configuration with ID 123 for the specified bucket.

```
aws s3api put-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123 \
    --metrics-configuration '{"Id": "123", "Filter": {"Prefix": "logs"}}'
```

This command produces no output.

For more information, see CloudWatch metrics configurations in the *Amazon S3 User Guide*.

- For API details, see PutBucketMetricsConfiguration in *AWS CLI Command Reference*.

`put-bucket-notification-configuration`

The following code example shows how to use `put-bucket-notification-configuration`.

AWS CLI

To enable the specified notifications to a bucket

The following `put-bucket-notification-configuration` example applies a notification configuration to a bucket named `amzn-s3-demo-bucket`. The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor.

```
aws s3api put-bucket-notification-configuration \
    --bucket amzn-s3-demo-bucket \
    --notification-configuration file://notification.json
```

Contents of `notification.json`:

```
{
    "TopicConfigurations": [
        {
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic",
            "Events": [
                "s3:ObjectCreated:*"
            ]
        }
    ]
}
```

This command produces no output.

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it.

```
{
    "Version":"2012-10-17",
    "Id": "example-ID",
    "Statement": [
        {
            "Sid": "example-statement-ID",
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": [
                "SNS:Publish"
            ],
            "Resource": "arn:aws:sns:us-west-2:123456789012::s3-notification-topic",
            "Condition": {
                "ArnLike": {
                    "aws:SourceArn": "arn:aws:s3:*:*:amzn-s3-demo-bucket"
```

```
                }
            }
        }
    ]
}
```

For more information, see Amazon S3 Event Notifications in the *Amazon S3 User Guide*.

- For API details, see PutBucketNotificationConfiguration in *AWS CLI Command Reference*.

`put-bucket-notification`

The following code example shows how to use `put-bucket-notification`.

AWS CLI

To apply a notification configuration to a bucket

The following `put-bucket-notification` example applies a notification configuration to a bucket named `amzn-s3-demo-bucket`.

```
aws s3api put-bucket-notification \
    --bucket amzn-s3-demo-bucket \
    --notification-configuration file://notification.json
```

This command produces no output.

The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor.

Contents of `notification.json`:

```
{
    "TopicConfiguration": {
        "Event": "s3:ObjectCreated:*",
        "Topic": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic"
    }
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it:

```
{
```

```
    "Version":"2012-10-17",
    "Id": "example-ID",
    "Statement": [
        {
            "Sid": "example-statement-ID",
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": [
                "SNS:Publish"
            ],
            "Resource": "arn:aws:sns:us-west-2:123456789012:amzn-s3-demo-bucket",
            "Condition": {
                "ArnLike": {
                    "aws:SourceArn": "arn:aws:s3:*:*:amzn-s3-demo-bucket"
                }
            }
        }
    ]
}
```

For more information, see Amazon S3 Event Notifications in the *Amazon S3 User Guide*.

- For API details, see PutBucketNotification in *AWS CLI Command Reference*.

`put-bucket-ownership-controls`

The following code example shows how to use `put-bucket-ownership-controls`.

AWS CLI

To update the bucket ownership settings of a bucket

The following `put-bucket-ownership-controls` example updates the bucket ownership settings of a bucket.

```
aws s3api put-bucket-ownership-controls \
    --bucket amzn-s3-demo-bucket \
    --ownership-controls="Rules=[{ObjectOwnership=BucketOwnerEnforced}]"
```

This command produces no output.

For more information, see Setting Object Ownership on an existing bucket in the *Amazon S3 User Guide*.

- For API details, see PutBucketOwnershipControls in *AWS CLI Command Reference*.

`put-bucket-policy`

The following code example shows how to use `put-bucket-policy`.

AWS CLI

To apply a policy to a bucket

The following `put-bucket-policy` example allows all users to retrieve any object in *amzn-s3-demo-bucket* except those in the *MySecretFolder*. It also grants `put` and `delete` permission to the root user of the AWS account `1234-5678-9012`.

```
aws s3api put-bucket-policy \
    --bucket amzn-s3-demo-bucket \
    --policy file://policy.json
```

Contents of `policy.json`:

```
{
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": "*",
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*"
        },
        {
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/MySecretFolder/*"
        },
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
```

```
            "Action": [
                "s3:DeleteObject",
                "s3:PutObject"
            ],
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*"
        }
    ]
}
```

This command produces no output.

For more information, see Bucket policies for Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see PutBucketPolicy in *AWS CLI Command Reference*.

`put-bucket-replication`

The following code example shows how to use `put-bucket-replication`.

AWS CLI

To configure replication for an S3 bucket

The following `put-bucket-replication` example applies a replication configuration to the specified S3 bucket.

```
aws s3api put-bucket-replication \
    --bucket amzn-s3-demo-bucket1 \
    --replication-configuration file://replication.json
```

Contents of `replication.json`:

```
{
    "Role": "arn:aws:iam::123456789012:role/s3-replication-role",
    "Rules": [
        {
            "Status": "Enabled",
            "Priority": 1,
            "DeleteMarkerReplication": { "Status": "Disabled" },
            "Filter" : { "Prefix": ""},
            "Destination": {
                "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket2"
```

```
            }
        }
    ]
}
```

The destination bucket must have versioning enabled. The specified role must have permission to write to the destination bucket and have a trust relationship that allows Amazon S3 to assume the role.

Example role permission policy:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetReplicationConfiguration",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket1"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObjectVersion",
                "s3:GetObjectVersionAcl",
                "s3:GetObjectVersionTagging"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket1/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:ReplicateObject",
                "s3:ReplicateDelete",
                "s3:ReplicateTags"
            ],
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket2/*"
```

```
        }
    ]
}
```

Example trust relationship policy:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

This command produces no output.

For more information, see This is the topic title in the *Amazon Simple Storage Service Console User Guide*.

- For API details, see PutBucketReplication in *AWS CLI Command Reference*.

`put-bucket-request-payment`

The following code example shows how to use `put-bucket-request-payment`.

AWS CLI

Example 1: To enable ``requester pays`` configuration for a bucket

The following `put-bucket-request-payment` example enables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket amzn-s3-demo-bucket \
    --request-payment-configuration '{"Payer":"Requester"}'
```

This command produces no output.

For more information, see Using Requester Pays general purpose buckets for storage transfers and usage in the *Amazon S3 User Guide*.

Example 2: To disable ``requester pays`` configuration for a bucket

The following `put-bucket-request-payment` example disables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket amzn-s3-demo-bucket \
    --request-payment-configuration '{"Payer":"BucketOwner"}'
```

This command produces no output.

For more information, see Using Requester Pays general purpose buckets for storage transfers and usage in the *Amazon S3 User Guide*.

- For API details, see PutBucketRequestPayment in *AWS CLI Command Reference*.

put-bucket-tagging

The following code example shows how to use `put-bucket-tagging`.

AWS CLI

To apply a tagging configuration to a bucket

The following `put-bucket-tagging` example applies a tagging configuration to a bucket named `amzn-s3-demo-bucket`.

```
aws s3api put-bucket-tagging \
    --bucket amzn-s3-demo-bucket \
    --tagging file://tagging.json
```

This command produces no output.

The file `tagging.json` is a JSON document in the current folder that specifies tags.

Contents of `tagging.json`:

```
{
```

```
    "TagSet": [
        {
            "Key": "organization",
            "Value": "marketing"
        }
    ]
}
```

Alternatively, apply a tagging configuration to `amzn-s3-demo-bucket` directly from the command line.

```
aws s3api put-bucket-tagging \
    --bucket amzn-s3-demo-bucket \
    --tagging 'TagSet=[{Key=organization,Value=marketing}]'
```

This command produces no output.

For more information, see Using cost allocation S3 bucket tags in the *Amazon S3 User Guide*.

- For API details, see PutBucketTagging in *AWS CLI Command Reference*.

`put-bucket-versioning`

The following code example shows how to use `put-bucket-versioning`.

AWS CLI

To enable versioning on a bucket

The following `put-bucket-versioning` example enables versioning on a bucket named `amzn-s3-demo-bucket`.

```
aws s3api put-bucket-versioning \
    --bucket amzn-s3-demo-bucket \
    --versioning-configuration Status=Enabled
```

This command produces no output.

The following command enables versioning and uses an MFA code.

```
aws s3api put-bucket-versioning \
```

```
    --bucket amzn-s3-demo-bucket \
    --versioning-configuration Status=Enabled \
    --mfa "SERIAL 123456"
```

This command produces no output.

For more information, see Retaining multiple versions of objects with S3 Versioning in the *Amazon S3 User Guide*.

- For API details, see PutBucketVersioning in *AWS CLI Command Reference*.

`put-bucket-website`

The following code example shows how to use `put-bucket-website`.

AWS CLI

To apply a static website configuration to a bucket

The following `put-bucket-website` example applies a static website configuration to a bucket named `amzn-s3-demo-bucket`.

```
aws s3api put-bucket-website \
    --bucket amzn-s3-demo-bucket \
    --website-configuration file://website.json
```

This command produces no output.

The file `website.json` is a JSON document in the current folder that specifies index and error pages for the website.

Contents of `website.json`:

```
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

For more information, see Hosting a static website using Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see PutBucketWebsite in *AWS CLI Command Reference*.

`put-object-acl`

The following code example shows how to use `put-object-acl`.

AWS CLI

To set the access control list for an object

The following `put-object-acl` example grants `full control` to two AWS users (*user1@example.com* and *user2@example.com*) and `read` permission to everyone.

```
aws s3api put-object-acl \
    --bucket amzn-s3-demo-bucket \
    --key file.txt \
    --grant-full-
control emailaddress=user1@example.com,emailaddress=user2@example.com \
    --grant-read uri=http://acs.amazonaws.com/groups/global/AllUsers
```

This command produces no output.

For more information, see Access control list (ACL) overview in the *Amazon S3 User Guide*.

- For API details, see PutObjectAcl in *AWS CLI Command Reference*.

`put-object-legal-hold`

The following code example shows how to use `put-object-legal-hold`.

AWS CLI

To apply a Legal Hold to an object

The following `put-object-legal-hold` example sets a Legal Hold on the object `doc1.rtf`.

```
aws s3api put-object-legal-hold \
    --bucket amzn-s3-demo-bucket \
```

```
    --key doc1.rtf \
    --legal-hold Status=ON
```

This command produces no output.

For more information, see Locking objects with Object Lock in the *Amazon S3 User Guide*.

- For API details, see PutObjectLegalHold in *AWS CLI Command Reference*.

`put-object-lock-configuration`

The following code example shows how to use `put-object-lock-configuration`.

AWS CLI

To set an object lock configuration on a bucket

The following `put-object-lock-configuration` example sets a 50-day object lock on the specified bucket.

```
aws s3api put-object-lock-configuration \
    --bucket amzn-s3-demo-bucket \
    --object-lock-configuration '{ "ObjectLockEnabled": "Enabled", "Rule":
 { "DefaultRetention": { "Mode": "COMPLIANCE", "Days": 50 }}}'
```

This command produces no output.

For more information, see Locking objects with Object Lock in the *Amazon S3 User Guide*.

- For API details, see PutObjectLockConfiguration in *AWS CLI Command Reference*.

`put-object-retention`

The following code example shows how to use `put-object-retention`.

AWS CLI

To set an object retention configuration for an object

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```
aws s3api put-object-retention \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf \
    --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate": "2025-01-01T00:00:00" }'
```

This command produces no output.

For more information, see Locking objects with Object Lock in the *Amazon S3 User Guide*.

- For API details, see PutObjectRetention in *AWS CLI Command Reference*.

`put-object-tagging`

The following code example shows how to use `put-object-tagging`.

AWS CLI

To set a tag on an object

The following `put-object-tagging` example sets a tag with the key `designation` and the value `confidential` on the specified object.

```
aws s3api put-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf \
    --tagging '{"TagSet": [{ "Key": "designation", "Value": "confidential" }]}'
```

This command produces no output.

For more information, see Tagging your objects in the *Amazon S3 User Guide*.

The following `put-object-tagging` example sets multiple tags sets on the specified object.

```
aws s3api put-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc3.rtf \
    --tagging '{"TagSet": [{ "Key": "designation", "Value": "confidential" },
 { "Key": "department", "Value": "finance" }, { "Key": "team", "Value":
 "payroll" } ]}'
```

This command produces no output.

For more information, see Tagging your objects in the *Amazon S3 User Guide*.

- For API details, see PutObjectTagging in *AWS CLI Command Reference*.

`put-object`

The following code example shows how to use `put-object`.

AWS CLI

Example 1: To upload an object to Amazon S3

The following `put-object` example uploads an object to Amazon S3.

```
aws s3api put-object \
    --bucket amzn-s3-demo-bucket \
    --key my-dir/MySampleImage.png \
    --body MySampleImage.png
```

Output:

```
{
    "ETag": "\"6805f2cfc46c0f04559748bb039d69ae\"",
    "ChecksumCRC64NVME": "Kd3SA7ZjkPE=",
    "ChecksumType": "FULL_OBJECT",
    "ServerSideEncryption": "AES256"
}
```

For more information, see Uploading objects in the *Amazon S3 User Guide*.

Example 2: To upload a video file to Amazon S3

The following `put-object` example uploads a video file.

```
aws s3api put-object \
    --bucket amzn-s3-demo-bucket \
    --key my-dir/big-video-file.mp4 \
    --body /media/videos/f-sharp-3-data-services.mp4
```

Output:

```
{
    "ETag": "\"9c8b9f2a5e4d3c2b1a0f9e8d7c6b5a49\"",
    "ChecksumCRC64NVME": "bS5l2pLqN0A=",
    "ChecksumType": "FULL_OBJECT",
    "ServerSideEncryption": "AES256"
}
```

For more information, see Uploading objects in the *Amazon S3 User Guide*.

- For API details, see PutObject in *AWS CLI Command Reference*.

`put-public-access-block`

The following code example shows how to use `put-public-access-block`.

AWS CLI

To set the block public access configuration for a bucket

The following `put-public-access-block` example sets a restrictive block public access configuration for the specified bucket.

```
aws s3api put-public-access-block \
    --bucket amzn-s3-demo-bucket \
    --public-access-block-
configuration "BlockPublicAcls=true,IgnorePublicAcls=true,BlockPublicPolicy=true,RestrictPub
```

This command produces no output.

For more information, see Blocking public access to your Amazon S3 storage in the *Amazon S3 User Guide*.

- For API details, see PutPublicAccessBlock in *AWS CLI Command Reference*.

`rb`

The following code example shows how to use `rb`.

AWS CLI

Example 1: To delete a bucket

The following `rb` example removes a bucket. In this example, the user's bucket is `amzn-s3-demo-bucket`. Note that the bucket must be empty in order to remove it.

```
aws s3 rb s3://amzn-s3-demo-bucket
```

Output:

```
remove_bucket: amzn-s3-demo-bucket
```

Example 2: To force delete a bucket

The following `rb` example uses the `--force` parameter to first remove all of the objects in the bucket and then remove the bucket itself. In this example, the user's bucket is `amzn-s3-demo-bucket` and the objects in `amzn-s3-demo-bucket` are `test1.txt` and `test2.txt`.

```
aws s3 rb s3://amzn-s3-demo-bucket \
    --force
```

Output:

```
delete: s3://amzn-s3-demo-bucket/test1.txt
delete: s3://amzn-s3-demo-bucket/test2.txt
remove_bucket: amzn-s3-demo-bucket
```

For more information, see Using high-level (s3) commands in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see Rb in *AWS CLI Command Reference*.

`restore-object`

The following code example shows how to use `restore-object`.

AWS CLI

To create a restore request for an object

The following `restore-object` example restores the specified Amazon S3 Glacier object for the bucket `amzn-s3-demo-bucket` for 10 days.

```
aws s3api restore-object \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf \
    --restore-request Days=10
```

This command produces no output.

For more information, see Restoring an archived object in the *Amazon S3 User Guide*.

- For API details, see RestoreObject in *AWS CLI Command Reference*.

`rm`

The following code example shows how to use `rm`.

AWS CLI

Example 1: To delete an S3 object

The following `rm` example deletes a single S3 object.

```
aws s3 rm s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
delete: s3://amzn-s3-demo-bucket/test2.txt
```

Example 2: To delete all contents in a bucket

The following `rm` example recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive`. In this example, the bucket `amzn-s3-demo-bucket` contains the objects `test1.txt` and `test2.txt`.

```
aws s3 rm s3://amzn-s3-demo-bucket \
    --recursive
```

Output:

```
delete: s3://amzn-s3-demo-bucket/test1.txt
```

```
delete: s3://amzn-s3-demo-bucket/test2.txt
```

Example 3: To delete all contents in a bucket, except ``.jpg`` files

The following `rm` example recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive` while excluding some objects by using an `--exclude` parameter. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `test2.jpg`.

```
aws s3 rm s3://amzn-s3-demo-bucket/ \
    --recursive \
    --exclude "*.jpg"
```

Output:

```
delete: s3://amzn-s3-demo-bucket/test1.txt
```

Example 4: To delete all contents in a bucket, except objects under the specified prefix

The following `rm` example recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive` while excluding all objects under a particular prefix by using an `--exclude` parameter. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `another/test.txt`.

```
aws s3 rm s3://amzn-s3-demo-bucket/ \
    --recursive \
    --exclude "another/*"
```

Output:

```
delete: s3://amzn-s3-demo-bucket/test1.txt
```

Example 5: To delete an object from an S3 access point

The following `rm` example deletes a single object (`mykey`) from the access point (`myaccesspoint`).

```
aws s3 rm s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey
```

Output:

```
delete: s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey
```

For more information, see Using high-level (s3) commands in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see Rm in *AWS CLI Command Reference*.

`select-object-content`

The following code example shows how to use `select-object-content`.

AWS CLI

To filter the contents of an Amazon S3 object based on an SQL statement

The following `select-object-content` example filters the object `my-data-file.csv` with the specified SQL statement and sends output to a file.

```
aws s3api select-object-content \
    --bucket amzn-s3-demo-bucket \
    --key my-data-file.csv \
    --expression "select * from s3object limit 100" \
    --expression-type 'SQL' \
    --input-serialization '{"CSV": {}, "CompressionType": "NONE"}' \
    --output-serialization '{"CSV": {}}' "output.csv"
```

This command produces no output.

For more information, see Querying data in place with Amazon S3 Select in the *Amazon S3 User Guide*.

- For API details, see SelectObjectContent in *AWS CLI Command Reference*.

`sync`

The following code example shows how to use `sync`.

AWS CLI

Example 1: To sync all local objects to the specified bucket

The following sync example syncs objects from a local directory to the specified prefix and bucket by uploading the local files to S3. A local file will require uploading if the size of the local file is different than the size of the S3 object, the last modified time of the local file is newer than the last modified time of the S3 object, or the local file does not exist under the specified bucket and prefix. In this example, the user syncs the bucket amzn-s3-demo-bucket to the local current directory. The local current directory contains the files test.txt and test2.txt. The bucket amzn-s3-demo-bucket contains no objects.

```
aws s3 sync . s3://amzn-s3-demo-bucket
```

Output:

```
upload: test.txt to s3://amzn-s3-demo-bucket/test.txt
upload: test2.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 2: To sync all S3 objects from the specified S3 bucket to another bucket

The following sync example syncs objects under a specified prefix and bucket to objects under another specified prefix and bucket by copying S3 objects. An S3 object will require copying if the sizes of the two S3 objects differ, the last modified time of the source is newer than the last modified time of the destination, or the S3 object does not exist under the specified bucket and prefix destination.

In this example, the user syncs the bucket amzn-s3-demo-bucket to the bucket amzn-s3-demo-bucket2. The bucket amzn-s3-demo-bucket contains the objects test.txt and test2.txt. The bucket amzn-s3-demo-bucket2 contains no objects.

```
aws s3 sync s3://amzn-s3-demo-bucket s3://amzn-s3-demo-bucket2
```

Output:

```
copy: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket2/test.txt
copy: s3://amzn-s3-demo-bucket/test2.txt to s3://amzn-s3-demo-bucket2/test2.txt
```

Example 3: To sync all S3 objects from the specified S3 bucket to the local directory

The following sync example syncs files from the specified S3 bucket to the local directory by downloading S3 objects. An S3 object will require downloading if the size of the S3 object

differs from the size of the local file, the last modified time of the S3 object is newer than the last modified time of the local file, or the S3 object does not exist in the local directory. Take note that when objects are downloaded from S3, the last modified time of the local file is changed to the last modified time of the S3 object. In this example, the user syncs the bucket `amzn-s3-demo-bucket` to the current local directory. The bucket `amzn-s3-demo-bucket` contains the objects `test.txt` and `test2.txt`. The current local directory has no files.

```
aws s3 sync s3://amzn-s3-demo-bucket .
```

Output:

```
download: s3://amzn-s3-demo-bucket/test.txt to test.txt
download: s3://amzn-s3-demo-bucket/test2.txt to test2.txt
```

Example 4: To sync all local objects to the specified bucket and delete all files that do not match

The following `sync` example syncs objects under a specified prefix and bucket to files in a local directory by uploading the local files to S3. Because of the `--delete` parameter, any files existing under the specified prefix and bucket but not existing in the local directory will be deleted. In this example, the user syncs the bucket `amzn-s3-demo-bucket` to the local current directory. The local current directory contains the files `test.txt` and `test2.txt`. The bucket `amzn-s3-demo-bucket` contains the object `test3.txt`.

```
aws s3 sync . s3://amzn-s3-demo-bucket \
    --delete
```

Output:

```
upload: test.txt to s3://amzn-s3-demo-bucket/test.txt
upload: test2.txt to s3://amzn-s3-demo-bucket/test2.txt
delete: s3://amzn-s3-demo-bucket/test3.txt
```

Example 5: To sync all local objects to the specified bucket except ``.jpg`` files

The following `sync` example syncs objects under a specified prefix and bucket to files in a local directory by uploading the local files to S3. Because of the `--exclude` parameter, all files matching the pattern existing both in S3 and locally will be excluded from the sync. In this

example, the user syncs the bucket `amzn-s3-demo-bucket` to the local current directory. The local current directory contains the files `test.jpg` and `test2.txt`. The bucket `amzn-s3-demo-bucket` contains the object `test.jpg` of a different size than the local `test.jpg`.

```
aws s3 sync . s3://amzn-s3-demo-bucket \
    --exclude "*.jpg"
```

Output:

```
upload: test2.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 6: To sync all local objects to the specified bucket except specified directory files

The following `sync` example syncs files under a local directory to objects under a specified prefix and bucket by downloading S3 objects. This example uses the `--exclude` parameter flag to exclude a specified directory and S3 prefix from the `sync` command. In this example, the user syncs the local current directory to the bucket `amzn-s3-demo-bucket`. The local current directory contains the files `test.txt` and `another/test2.txt`. The bucket `amzn-s3-demo-bucket` contains the objects `another/test5.txt` and `test1.txt`.

```
aws s3 sync s3://amzn-s3-demo-bucket/ . \
    --exclude "*another/*"
```

Output:

```
download: s3://amzn-s3-demo-bucket/test1.txt to test1.txt
```

Example 7: To sync all objects between buckets in different regions

The following `sync` example syncs files between two buckets in different regions.

```
aws s3 sync s3://amzn-s3-demo-bucket1 s3://amzn-s3-demo-bucket2 \
    --source-region us-west-2 \
    --region us-east-1
```

Output:

```
download: s3://amzn-s3-demo-bucket1/test1.txt to s3://amzn-s3-demo-bucket2/test1.txt
```

Example 8: To sync to an S3 access point

The following `sync` example syncs the current directory to the access point (`myaccesspoint`).

```
aws s3 sync . s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
```

Output:

```
upload: test.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/test.txt
upload: test2.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/test2.txt
```

Example 9: To sync a local directory to a bucket with tags

The following `sync` example syncs the current directory to a specified bucket while setting two tags on each uploaded object. Specify `--tags` once per tag, separating the key and value with a space. Tags are set only on objects that are actually uploaded.

```
aws s3 sync . s3://amzn-s3-demo-bucket \
    --tags key1 value1 \
    --tags key2 value2
```

Output:

```
upload: test.txt to s3://amzn-s3-demo-bucket/test.txt
upload: test2.txt to s3://amzn-s3-demo-bucket/test2.txt
```

For more information, see Using high-level (s3) commands in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see Sync in *AWS CLI Command Reference*.

`upload-part-copy`

The following code example shows how to use `upload-part-copy`.

AWS CLI

To upload part of an object by copying data from an existing object as the data source

The following `upload-part-copy` example uploads a part by copying data from an existing object as a data source.

```
aws s3api upload-part-copy \
    --bucket amzn-s3-demo-bucket \
    --key "Map_Data_June.mp4" \
    --copy-source "amzn-s3-demo-bucket/copy_of_Map_Data_June.mp4" \
    --part-number 1 \
    --upload-
id "bq0tdE1CDpWQYRPLHuNG50xAT6pA5D.m_RiBy0ggOH6b13pVRY7QjvLlf75iFdJqp_2wztk5hvpUM2SesXgrzbeh
```

Output:

```
{
    "CopyPartResult": {
        "LastModified": "2019-12-13T23:16:03.000Z",
        "ETag": "\"711470fc377698c393d94aed6305e245\""
    }
}
```

For more information, see Copying an object using multipart upload in the *Amazon S3 User Guide*.

- For API details, see UploadPartCopy in *AWS CLI Command Reference*.

`upload-part`

The following code example shows how to use `upload-part`.

AWS CLI

To upload a part of a multipart upload

The following `upload-part` example uploads the first part in a multipart upload initiated with the `create-multipart-upload` command.

```
aws s3api upload-part \
    --bucket amzn-s3-demo-bucket \
    --key 'multipart/01' \
    --part-number 1 \
    --body part01 \
```

```
    --upload-
id "dfRtDYU0WWCCcH43C3WFbkR0NycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3U
```

The body option takes the name or path of a local file for upload (do not use the file:// prefix). The minimum part size is 5 MB. Upload ID is returned by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`. Bucket and key are specified when you create the multipart upload.

Output:

```
{
    "ETag": "\"e868e0f4719e394144ef36531ee6824c\""
}
```

Save the ETag value of each part for later. They are required to complete the multipart upload.

For more information, see Uploading and copying objects using multipart upload in Amazon S3 in the *Amazon S3 User Guide*.

- For API details, see UploadPart in *AWS CLI Command Reference*.

`website`

The following code example shows how to use `website`.

AWS CLI

To configure an S3 bucket as a static website

The following `website` example configures a bucket named `amzn-s3-demo-bucket` as a static website. The index document option specifies the file in `amzn-s3-demo-bucket` that visitors will be directed to when they navigate to the website URL. In this case, the bucket is in the us-west-2 region, so the site would appear at `http://amzn-s3-demo-bucket.s3-website-us-west-2.amazonaws.com`.

All files in the bucket that appear on the static site must be configured to allow visitors to open them. File permissions are configured separately from the bucket website configuration.

```
aws s3 website s3://amzn-s3-demo-bucket/ \
    --index-document index.html \
```

```
    --error-document error.html
```

This command produces no output.

For information on hosting a static website in Amazon S3, see Hosting a Static Website in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see Website in *AWS CLI Command Reference*.

Amazon S3 Control examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon S3 Control.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-access-point`

The following code example shows how to use `create-access-point`.

AWS CLI

To create an access point

The following `create-access-point` example creates an access point named `finance-ap` for the bucket `amzn-s3-demo-bucket` in account 123456789012. Before running this example, replace the access point name, bucket name, and account number with appropriate values for your use case.

```
aws s3control create-access-point \
```

```
    --account-id 123456789012 \
    --bucket amzn-s3-demo-bucket \
    --name finance-ap
```

This command produces no output.

For more information, see Creating Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see CreateAccessPoint in *AWS CLI Command Reference*.

`create-job`

The following code example shows how to use `create-job`.

AWS CLI

To create an Amazon S3 batch operations job

The following `create-job` example creates an Amazon S3 batch operations job to tag objects as `confidential` in the bucket `employee-records`.

```
aws s3control create-job \
    --account-id 123456789012 \
    --operation '{"S3PutObjectTagging": { "TagSet": [{"Key":"confidential",
 "Value":"true"}] }}' \
    --report '{"Bucket":"arn:aws:s3:::amzn-s3-demo-bucket2","Prefix":"batch-op-
create-job",
 "Format":"Report_CSV_20180820","Enabled":true,"ReportScope":"AllTasks"}' \
    --manifest '{"Spec":{"Format":"S3BatchOperations_CSV_20180820","Fields":
["Bucket","Key"]},"Location":{"ObjectArn":"arn:aws:s3:::amzn-s3-demo-bucket2/inv-
report/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222.csv","ETag":"69f52a4e9f797e987155d9c8f5880897"}}' \
    --priority 42 \
    --role-arn arn:aws:iam::123456789012:role/S3BatchJobRole
```

Output:

```
{
    "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Creating an S3 Batch Operations job in the *Amazon S3 User Guide*.

- For API details, see CreateJob in *AWS CLI Command Reference*.

`delete-access-point-policy`

The following code example shows how to use `delete-access-point-policy`.

AWS CLI

To delete an access point policy

The following `delete-access-point-policy` example deletes the access point policy from the access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control delete-access-point-policy \
    --account-id 123456789012 \
    --name finance-ap
```

This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see DeleteAccessPointPolicy in *AWS CLI Command Reference*.

`delete-access-point`

The following code example shows how to use `delete-access-point`.

AWS CLI

To delete an access point

The following `delete-access-point` example deletes an access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control delete-access-point \
    --account-id 123456789012 \
```

```
    --name finance-ap
```

This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see DeleteAccessPoint in *AWS CLI Command Reference*.

`delete-public-access-block`

The following code example shows how to use `delete-public-access-block`.

AWS CLI

To delete block public access settings for an account

The following `delete-public-access-block` example deletes block public access settings for the specified account.

```
aws s3control delete-public-access-block \
    --account-id 123456789012
```

This command produces no output.

For more information, see Configuring block public access settings for your account in the *Amazon S3 User Guide*.

- For API details, see DeletePublicAccessBlock in *AWS CLI Command Reference*.

`describe-job`

The following code example shows how to use `describe-job`.

AWS CLI

To describe an Amazon S3 batch operations job

The following `describe-job` example provides configuration parameters and status for the specified batch operations job.

```
aws s3control describe-job \
    --account-id 123456789012 \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Job": {
        "TerminationDate": "2019-10-03T21:49:53.944Z",
        "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "FailureReasons": [],
        "Manifest": {
            "Spec": {
                "Fields": [
                    "Bucket",
                    "Key"
                ],
                "Format": "S3BatchOperations_CSV_20180820"
            },
            "Location": {
                "ETag": "69f52a4e9f797e987155d9c8f5880897",
                "ObjectArn": "arn:aws:s3:::amzn-s3-demo-bucket/inv-report/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222.csv"
            }
        },
        "Operation": {
            "S3PutObjectTagging": {
                "TagSet": [
                    {
                        "Value": "true",
                        "Key": "confidential"
                    }
                ]
            }
        },
        "RoleArn": "arn:aws:iam::123456789012:role/S3BatchJobRole",
        "ProgressSummary": {
            "TotalNumberOfTasks": 8,
            "NumberOfTasksFailed": 0,
            "NumberOfTasksSucceeded": 8
        },
        "Priority": 42,
        "Report": {
```

```
            "ReportScope": "AllTasks",
            "Format": "Report_CSV_20180820",
            "Enabled": true,
            "Prefix": "batch-op-create-job",
            "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket"
        },
        "JobArn": "arn:aws:s3:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "CreationTime": "2019-10-03T21:48:48.048Z",
        "Status": "Complete"
    }
}
```

For more information, see Tracking job status and completion reports in the *Amazon S3 User Guide*.

- For API details, see DescribeJob in *AWS CLI Command Reference*.

`get-access-point-policy-status`

The following code example shows how to use `get-access-point-policy-status`.

AWS CLI

To retrieve the access point policy status

The following `get-access-point-policy-status` example retrieves the access point policy status for the access point named `finance-ap` in account 123456789012. The access point policy status indicates whether the access point's policy allows public access. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point-policy-status \
    --account-id 123456789012 \
    --name finance-ap
```

Output:

```
{
    "PolicyStatus": {
        "IsPublic": false
```

```
    }
}
```

For more information about when an access point policy is considered public, see The Meaning of "Public" in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see GetAccessPointPolicyStatus in *AWS CLI Command Reference*.

`get-access-point-policy`

The following code example shows how to use `get-access-point-policy`.

AWS CLI

To retrieve an access point policy

The following `get-access-point-policy` example retrieves the access point policy from the access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point-policy \
    --account-id 123456789012 \
    --name finance-ap
```

Output:

```
{
    "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:role/Admin\"},\"Action\":
\"s3:GetObject\",\"Resource\":\"arn:aws:s3:us-west-2:123456789012:accesspoint/
finance-ap/object/records/*\"}]}"
}
```

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see GetAccessPointPolicy in *AWS CLI Command Reference*.

`get-access-point`

The following code example shows how to use `get-access-point`.

AWS CLI

To retrieve access point configuration details

The following `get-access-point` example retrieves the configuration details for the access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point \
    --account-id 123456789012 \
    --name finance-ap
```

Output:

```
{
    "Name": "finance-ap",
    "Bucket": "amzn-s3-demo-bucket",
    "NetworkOrigin": "Internet",
    "PublicAccessBlockConfiguration": {
        "BlockPublicAcls": false,
        "IgnorePublicAcls": false,
        "BlockPublicPolicy": false,
        "RestrictPublicBuckets": false
    },
    "CreationDate": "2020-01-01T00:00:00Z"
}
```

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see GetAccessPoint in *AWS CLI Command Reference*.

`get-multi-region-access-point-routes`

The following code example shows how to use `get-multi-region-access-point-routes`.

AWS CLI

To query the current Multi-Region Access Point route configuration

The following `get-multi-region-access-point-routes` example returns the current routing configuration for the specified Multi-Region Access Point.

```
aws s3control get-multi-region-access-point-routes \
    --region Region \
    --account-id 123456789012 \
    --mrap MultiRegionAccessPoint_ARN
```

Output:

```
{
    "Mrap": "arn:aws:s3::123456789012:accesspoint/0000000000000.mrap",
    "Routes": [
        {
            "Bucket": "amzn-s3-demo-bucket1",
            "Region": "ap-southeast-2",
            "TrafficDialPercentage": 100
        },
        {
            "Bucket": "amzn-s3-demo-bucket2",
            "Region": "us-west-1",
            "TrafficDialPercentage": 0
        }
    ]
}
```

For more information, see Using Amazon S3 Multi-Region Access Point failover controls in the *Amazon S3 User Guide*.

- For API details, see GetMultiRegionAccessPointRoutes in *AWS CLI Command Reference*.

`get-public-access-block`

The following code example shows how to use `get-public-access-block`.

AWS CLI

To list public block access settings for an account

The following `get-public-access-block` example displays the block public access settings for the specified account.

```
aws s3control get-public-access-block \
    --account-id 123456789012
```

Output:

```
{
    "PublicAccessBlockConfiguration": {
        "BlockPublicPolicy": true,
        "RestrictPublicBuckets": true,
        "IgnorePublicAcls": true,
        "BlockPublicAcls": true
    }
}
```

For more information, see Configuring block public access settings for your account in the *Amazon S3 User Guide*.

- For API details, see GetPublicAccessBlock in *AWS CLI Command Reference*.

`list-access-points`

The following code example shows how to use `list-access-points`.

AWS CLI

Example 1: To retrieve a list of all access points for an account

The following `list-access-points` example displays a list of all access points attached to buckets owned by account 123456789012.

```
aws s3control list-access-points \
    --account-id 123456789012
```

Output:

```
{
    "AccessPointList": [
        {
            "Name": "finance-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "amzn-s3-demo-bucket1"
        },
        {
            "Name": "managers-ap",
            "NetworkOrigin": "Internet",
```

```
            "Bucket": "amzn-s3-demo-bucket1"
        },
        {
            "Name": "private-network-ap",
            "NetworkOrigin": "VPC",
            "VpcConfiguration": {
                "VpcId": "1a2b3c"
            },
            "Bucket": "amzn-s3-demo-bucket1"
        },
        {
            "Name": "customer-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "amzn-s3-demo-bucket2"
        },
        {
            "Name": "public-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "amzn-s3-demo-bucket2"
        }
    ]
}
```

Example 2: To retrieve a list of all access points for a bucket

The following `list-access-points` example retrieves a list of all access points attached to the bucket `amzn-s3-demo-bucket2` owned by account 123456789012.

```
aws s3control list-access-points \
    --account-id 123456789012 \
    --bucket amzn-s3-demo-bucket2
```

Output:

```
{
    "AccessPointList": [
        {
            "Name": "customer-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "amzn-s3-demo-bucket2"
        },
        {
            "Name": "public-ap",
```

```
            "NetworkOrigin": "Internet",
            "Bucket": "amzn-s3-demo-bucket2"
        }
    ]
}
```

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see ListAccessPoints in *AWS CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

AWS CLI

To list an accounts Amazon S3 batch operations jobs

The following `list-jobs` example lists all recent batch operations jobs for the specified account.

```
aws s3control list-jobs \
    --account-id 123456789012
```

Output:

```
{
    "Jobs": [
        {
            "Operation": "S3PutObjectTagging",
            "ProgressSummary": {
                "NumberOfTasksFailed": 0,
                "NumberOfTasksSucceeded": 8,
                "TotalNumberOfTasks": 8
            },
            "CreationTime": "2019-10-03T21:48:48.048Z",
            "Status": "Complete",
            "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Priority": 42
        },
        {
```

```
            "Operation": "S3PutObjectTagging",
            "ProgressSummary": {
                "NumberOfTasksFailed": 0,
                "NumberOfTasksSucceeded": 0,
                "TotalNumberOfTasks": 0
            },
            "CreationTime": "2019-10-03T21:46:07.084Z",
            "Status": "Failed",
            "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Priority": 42
        }
    ]
}
```

For more information, see Managing S3 Batch Operations jobs in the *Amazon S3 User Guide*.

- For API details, see ListJobs in *AWS CLI Command Reference*.

`put-access-point-policy`

The following code example shows how to use `put-access-point-policy`.

AWS CLI

To set an access point policy

The following `put-access-point-policy` example places the specified access point policy for the access point `finance-ap` in account 123456789012. If the access point `finance-ap` already has a policy, this command replaces the existing policy with the one specified in this command. Before running this example, replace the account number, access point name, and policy statements with appropriate values for your use case.

```
aws s3control put-access-point-policy \
    --account-id 123456789012 \
    --name finance-ap \
    --policy file://ap-policy.json
```

Contents of `ap-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
```

```
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:user/Alice"
            },
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:us-west-2:123456789012:accesspoint/finance-ap/
object/Alice/*"
        }
    ]
}
```

This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see PutAccessPointPolicy in *AWS CLI Command Reference*.

`put-public-access-block`

The following code example shows how to use `put-public-access-block`.

AWS CLI

To edit block public access settings for an account

The following `put-public-access-block` example toggles all block public access settings to `true` for the specified account.

```
aws s3control put-public-access-block \
    --account-id 123456789012 \
    --public-access-block-configuration '{"BlockPublicAcls": true,
 "IgnorePublicAcls": true, "BlockPublicPolicy": true, "RestrictPublicBuckets":
 true}'
```

This command produces no output.

For more information, see Configuring block public access settings for your account in the *Amazon S3 User Guide*.

- For API details, see PutPublicAccessBlock in *AWS CLI Command Reference*.

`submit-multi-region-access-point-routes`

The following code example shows how to use `submit-multi-region-access-point-routes`.

AWS CLI

To update your Multi-Region Access Point routing configuration

The following `submit-multi-region-access-point-routes` example updates the routing statuses of `amzn-s3-demo-bucket1` and `amzn-s3-demo-bucket2` in the `us-west-2` Region for your Multi-Region Access Point.

```
aws s3control submit-multi-region-access-point-routes \
    --region us-west-2 \
    --account-id 123456789012 \
    --mrap MultiRegionAccessPoint_ARN \
    --route-updates Bucket=amzn-s3-demo-
bucket1,TrafficDialPercentage=100 Bucket=amzn-s3-demo-
bucket2,TrafficDialPercentage=0
```

This command produces no output.

For more information, see Using Amazon S3 Multi-Region Access Point failover controls in the *Amazon S3 User Guide*.

- For API details, see SubmitMultiRegionAccessPointRoutes in *AWS CLI Command Reference*.

`update-job-priority`

The following code example shows how to use `update-job-priority`.

AWS CLI

To update the job priority of an Amazon S3 batch operations job

The following `update-job-priority` example updates the specified job to a new priority.

```
aws s3control update-job-priority \
    --account-id 123456789012 \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --priority 52
```

Output:

```
{
    "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Priority": 52
}
```

For more information, see Assigning job priority in the *Amazon S3 User Guide*.

- For API details, see UpdateJobPriority in *AWS CLI Command Reference*.

`update-job-status`

The following code example shows how to use `update-job-status`.

AWS CLI

To update the status of an Amazon S3 batch operations job

The following `update-job-status` example cancels the specified job which is awaiting approval.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --requested-job-status Cancelled
```

Output:

```
{
    "Status": "Cancelled",
    "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

The following `update-job-status` example confirms and runs the specified which is awaiting approval.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --requested-job-status Ready
```

Output:

```
{
    "Status": "Ready",
    "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

The following `update-job-status` example cancels the specified job which is running.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --requested-job-status Cancelled
```

Output:

```
{
    "Status": "Cancelling",
    "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Tracking job status and completion reports in the *Amazon S3 User Guide*.

- For API details, see UpdateJobStatus in *AWS CLI Command Reference*.

Secrets Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Secrets Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-get-secret-value`

The following code example shows how to use `batch-get-secret-value`.

AWS CLI

Example 1: To retrieve the secret value for a group of secrets listed by name

The following `batch-get-secret-value` example gets the secret value secrets for three secrets.

```
aws secretsmanager batch-get-secret-value \
    --secret-id-list MySecret1 MySecret2 MySecret3
```

Output:

```
{
    "SecretValues": [
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret1-
a1b2c3",
            "Name": "MySecret1",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "SecretString": "{\"username\":\"diego_ramirez\",\"password\":\"EXAMPLE-
PASSWORD\",\"engine\":\"mysql\",\"host\":\"secretsmanagertutorial.cluster.us-
west-2.rds.amazonaws.com\",\"port\":3306,\"dbClusterIdentifier\":
\"secretsmanagertutorial\"}",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1523477145.729"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret2-
a1b2c3",
            "Name": "MySecret2",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "SecretString": "{\"username\":\"akua_mansa\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
```

```
                "AWSCURRENT"
            ],
            "CreatedDate": "1673477781.275"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret3-
a1b2c3",
            "Name": "MySecret3",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "SecretString": "{\"username\":\"jie_liu\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1373477721.124"
        }
    ],
    "Errors": []
}
```

For more information, see Get a secret value using the AWS CLI in the *AWS Secrets Manager User Guide*.

Example 2: To retrieve the secret value for a group of secrets selected by filter

The following `batch-get-secret-value` example gets the secret value secrets in your account that have `MySecret` in the name. Filtering by name is case sensitive.

```
aws secretsmanager batch-get-secret-value \
    --filters Key="name",Values="MySecret"
```

Output:

```
{
    "SecretValues": [
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret1-
a1b2c3",
            "Name": "MySecret1",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "SecretString": "{\"username\":\"diego_ramirez\",\"password\":\"EXAMPLE-
PASSWORD\",\"engine\":\"mysql\",\"host\":\"secretsmanagertutorial.cluster.us-
```

```
west-2.rds.amazonaws.com\",\"port\":3306,\"dbClusterIdentifier\":
\"secretsmanagertutorial\"}",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1523477145.729"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret2-
a1b2c3",
            "Name": "MySecret2",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "SecretString": "{\"username\":\"akua_mansa\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1673477781.275"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret3-
a1b2c3",
            "Name": "MySecret3",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "SecretString": "{\"username\":\"jie_liu\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1373477721.124"
        }
    ],
    "Errors": []
}
```

For more information, see Get a secret value using the AWS CLI in the *AWS Secrets Manager User Guide*.

- For API details, see BatchGetSecretValue in *AWS CLI Command Reference*.

`cancel-rotate-secret`

The following code example shows how to use `cancel-rotate-secret`.

AWS CLI

To turn off automatic rotation for a secret

The following `cancel-rotate-secret` example turns off automatic rotation for a secret. To resume rotation, call `rotate-secret`.

```
aws secretsmanager cancel-rotate-secret \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Rotate a secret in the *Secrets Manager User Guide*.

- For API details, see CancelRotateSecret in *AWS CLI Command Reference*.

`create-secret`

The following code example shows how to use `create-secret`.

AWS CLI

Example 1: To create a secret from credentials in a JSON file

The following `create-secret` example creates a secret from credentials in a file. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager create-secret \
    --name MyTestSecret \
    --secret-string file://mycreds.json
```

Contents of `mycreds.json`:

```
{
    "engine": "mysql",
```

```
    "username": "saanvis",
    "password": "EXAMPLE-PASSWORD",
    "host": "my-database-endpoint.us-west-2.rds.amazonaws.com",
    "dbname": "myDatabase",
    "port": "3306"
}
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create a secret in the *Secrets Manager User Guide*.

Example 2: To create a secret

The following `create-secret` example creates a secret with two key-value pairs. When you enter commands in a command shell, there is a risk of the command history being accessed or utilities having access to your command parameters. This is a concern if the command includes the value of a secret. For more information, see Mitigate the risks of using command-line tools to store secrets in the *Secrets Manager User Guide*.

```
aws secretsmanager create-secret \
    --name MyTestSecret \
    --description "My test secret created with the CLI." \
    --secret-string "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}"
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Create a secret in the *Secrets Manager User Guide*.

- For API details, see CreateSecret in *AWS CLI Command Reference*.

`delete-resource-policy`

The following code example shows how to use `delete-resource-policy`.

AWS CLI

To delete the resource-based policy attached to a secret

The following `delete-resource-policy` example deletes the resource-based policy attached to a secret.

```
aws secretsmanager delete-resource-policy \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Authentication and access control in the *Secrets Manager User Guide*.

- For API details, see DeleteResourcePolicy in *AWS CLI Command Reference*.

`delete-secret`

The following code example shows how to use `delete-secret`.

AWS CLI

Example 1: To delete a secret

The following `delete-secret` example deletes a secret. You can recover the secret with `restore-secret` until the date and time in the `DeletionDate` response field. To delete a secret that is replicated to other regions, first remove its replicas with `remove-regions-from-replication`, and then call `delete-secret`.

```
aws secretsmanager delete-secret \
    --secret-id MyTestSecret \
    --recovery-window-in-days 7
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "DeletionDate": 1524085349.095
}
```

For more information, see Delete a secret in the *Secrets Manager User Guide*.

Example 2: To delete a secret immediately

The following `delete-secret` example deletes a secret immediately without a recovery window. You can't recover this secret.

```
aws secretsmanager delete-secret \
    --secret-id MyTestSecret \
    --force-delete-without-recovery
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "DeletionDate": 1508750180.309
}
```

For more information, see Delete a secret in the *Secrets Manager User Guide*.

- For API details, see DeleteSecret in *AWS CLI Command Reference*.

`describe-secret`

The following code example shows how to use `describe-secret`.

AWS CLI

To retrieve the details of a secret

The following `describe-secret` example shows the details of a secret.

```
aws secretsmanager describe-secret \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
Ca8JGt",
    "Name": "MyTestSecret",
    "Description": "My test secret",
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE44444",

            "Status": "InSync",
            "StatusMessage": "Replication succeeded"
        }
    ]
}
```

For more information, see What's in a Secrets Manager secret? in the *Secrets Manager User Guide*.

- For API details, see DescribeSecret in *AWS CLI Command Reference*.

`get-random-password`

The following code example shows how to use `get-random-password`.

AWS CLI

To generate a random password

The following `get-random-password` example generates a random password 20 characters long that includes at least one uppercase letter, lowercase letter, number, and punctuation.

```
aws secretsmanager get-random-password \
    --require-each-included-type \
    --password-length 20
```

Output:

```
{
    "RandomPassword": "EXAMPLE-PASSWORD"
```

```
}
```

For more information, see Create and manage secrets in the *Secrets Manager User Guide*.

- For API details, see GetRandomPassword in *AWS CLI Command Reference*.

`get-resource-policy`

The following code example shows how to use `get-resource-policy`.

AWS CLI

To retrieve the resource-based policy attached to a secret

The following `get-resource-policy` example retrieves the resource-based policy attached to a secret.

```
aws secretsmanager get-resource-policy \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "ResourcePolicy": "{\n\"Version\":\"2012-10-17\",\n\"Statement\":[{\n\"Effect
\":\"Allow\",\n\"Principal\":{\n\"AWS\":\"arn:aws:iam::123456789012:root\"\n},\n
\"Action\":\"secretsmanager:GetSecretValue\",\n\"Resource\":\"*\"\n}]\n}"
}
```

For more information, see Authentication and access control in the *Secrets Manager User Guide*.

- For API details, see GetResourcePolicy in *AWS CLI Command Reference*.

`get-secret-value`

The following code example shows how to use `get-secret-value`.

AWS CLI

Example 1: To retrieve the encrypted secret value of a secret

The following `get-secret-value` example gets the current secret value.

```
aws secretsmanager get-secret-value \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "SecretString": "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}",
    "VersionStages": [
        "AWSCURRENT"
    ],
    "CreatedDate": 1523477145.713
}
```

For more information, see Retrieve a secret in the *Secrets Manager User Guide*.

Example 2: To retrieve the previous secret value

The following `get-secret-value` example gets the previous secret value.

```
aws secretsmanager get-secret-value \
    --secret-id MyTestSecret \
    --version-stage AWSPREVIOUS
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "SecretString": "{\"user\":\"diegor\",\"password\":\"PREVIOUS-EXAMPLE-PASSWORD
\"}",
    "VersionStages": [
        "AWSPREVIOUS"
    ],
```

```
    "CreatedDate": 1523477145.713
}
```

For more information, see Retrieve a secret in the *Secrets Manager User Guide*.

- For API details, see GetSecretValue in *AWS CLI Command Reference*.

`list-secret-version-ids`

The following code example shows how to use `list-secret-version-ids`.

AWS CLI

To list all of the secret versions associated with a secret

The following `list-secret-version-ids` example gets a list of all of the versions of a secret.

```
aws secretsmanager list-secret-version-ids \
    --secret-id MyTestSecret
```

Output:

```
{
    "Versions": [
        {
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "VersionStages": [
                "AWSPREVIOUS"
            ],
            "LastAccessedDate": 1523477145.713,
            "CreatedDate": 1523477145.713
        },
        {
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "LastAccessedDate": 1523477145.713,
            "CreatedDate": 1523486221.391
        },
        {
```

```
            "CreatedDate": 1.51197446236E9,
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333;"
        }
    ],
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see What's in a Secrets Manager secret? in the *Secrets Manager User Guide*.

- For API details, see ListSecretVersionIds in *AWS CLI Command Reference*.

`list-secrets`

The following code example shows how to use `list-secrets`.

AWS CLI

Example 1: To list the secrets in your account

The following `list-secrets` example gets a list of the secrets in your account.

```
aws secretsmanager list-secrets
```

Output:

```
{
    "SecretList": [
        {
            "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-a1b2c3",
            "Name": "MyTestSecret",
            "LastChangedDate": 1523477145.729,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [
                    "AWSCURRENT"
                ]
            }
        },
        {
```

```
            "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:AnotherSecret-d4e5f6",
            "Name": "AnotherSecret",
            "LastChangedDate": 1523482025.685,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222": [
                    "AWSCURRENT"
                ]
            }
        }
    ]
}
```

For more information, see Find a secret in the *Secrets Manager User Guide*.

Example 2: To filter the list of secrets in your account

The following `list-secrets` example gets a list of the secrets in your account that have `Test` in the name. Filtering by name is case sensitive.

```
aws secretsmanager list-secrets \
    --filters Key="name",Values="Test"
```

Output:

```
{
    "SecretList": [
        {
            "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-a1b2c3",
            "Name": "MyTestSecret",
            "LastChangedDate": 1523477145.729,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [
                    "AWSCURRENT"
                ]
            }
        }
    ]
}
```

For more information, see Find a secret in the *Secrets Manager User Guide*.

Example 3: To list the secrets in your account managed by another service

The following `list-secrets` example returns the secrets in your account that are managed by Amazon RDS.

```
aws secretsmanager list-secrets \
    --filters Key="owning-service",Values="rds"
```

Output:

```
{
    "SecretList": [
        {
            "Name": "rds!cluster-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Tags": [
                {
                    "Value": "arn:aws:rds:us-
west-2:123456789012:cluster:database-1",
                    "Key": "aws:rds:primaryDBClusterArn"
                },
                {
                    "Value": "rds",
                    "Key": "aws:secretsmanager:owningService"
                }
            ],
            "RotationRules": {
                "AutomaticallyAfterDays": 1
            },
            "LastChangedDate": 1673477781.275,
            "LastRotatedDate": 1673477781.26,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333": [
                    "AWSPREVIOUS"
                ],
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444": [
                    "AWSCURRENT",
                    "AWSPENDING"
                ]
            },
            "OwningService": "rds",
            "RotationEnabled": true,
            "CreatedDate": 1673467300.7,
            "LastAccessedDate": 1673395200.0,
```

```
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:rds!
cluster-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111-a1b2c3",
            "Description": "Secret associated with primary RDS DB cluster:
 arn:aws:rds:us-west-2:123456789012:cluster:database-1"
        }
    ]
}
```

For more information, see Secrets managed by other services in the *Secrets Manager User Guide*.

- For API details, see ListSecrets in *AWS CLI Command Reference*.

`put-resource-policy`

The following code example shows how to use `put-resource-policy`.

AWS CLI

To add a resource-based policy to a secret

The following `put-resource-policy` example adds a permissions policy to a secret, checking first that the policy does not provide broad access to the secret. The policy is read from a file. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager put-resource-policy \
    --secret-id MyTestSecret \
    --resource-policy file://mypolicy.json \
    --block-public-policy
```

Contents of `mypolicy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:role/MyRole"
            },
            "Action": "secretsmanager:GetSecretValue",
            "Resource": "*"
        }
    ]
```

```
}
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Attach a permissions policy to a secret in the *Secrets Manager User Guide*.

- For API details, see PutResourcePolicy in *AWS CLI Command Reference*.

`put-secret-value`

The following code example shows how to use `put-secret-value`.

AWS CLI

Example 1: To store a new secret value in a secret

The following `put-secret-value` example creates a new version of a secret with two key-value pairs.

```
aws secretsmanager put-secret-value \
    --secret-id MyTestSecret \
    --secret-string "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}"
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-1a2b3c",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "VersionStages": [
        "AWSCURRENT"
    ]
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

Example 2: To store a new secret value from credentials in a JSON file

The following `put-secret-value` example creates a new version of a secret from credentials in a file. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager put-secret-value \
    --secret-id MyTestSecret \
    --secret-string file://mycreds.json
```

Contents of `mycreds.json`:

```
{
    "engine": "mysql",
    "username": "saanvis",
    "password": "EXAMPLE-PASSWORD",
    "host": "my-database-endpoint.us-west-2.rds.amazonaws.com",
    "dbname": "myDatabase",
    "port": "3306"
}
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "VersionStages": [
        "AWSCURRENT"
    ]
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

- For API details, see PutSecretValue in *AWS CLI Command Reference*.

`remove-regions-from-replication`

The following code example shows how to use `remove-regions-from-replication`.

AWS CLI

To delete a replica secret

The following `remove-regions-from-replication` example deletes a replica secret in eu-west-3. To delete a primary secret that is replicated to other regions, first delete the replicas and then call `delete-secret`.

```
aws secretsmanager remove-regions-from-replication \
    --secret-id MyTestSecret \
    --remove-replica-regions eu-west-3
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-1a2b3c",
    "ReplicationStatus": []
}
```

For more information, see Replicate AWS Secrets Manager secrets across Regions in the *Secrets Manager User Guide*.

- For API details, see RemoveRegionsFromReplication in *AWS CLI Command Reference*.

`replicate-secret-to-regions`

The following code example shows how to use `replicate-secret-to-regions`.

AWS CLI

To replicate a secret to another region

The following `replicate-secret-to-regions` example replicates a secret to eu-west-3. The replica is encrypted with the AWS managed key `aws/secretsmanager`.

```
aws secretsmanager replicate-secret-to-regions \
    --secret-id MyTestSecret \
    --add-replica-regions Region=eu-west-3
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-1a2b3c",
    "ReplicationStatus": [
        {
            "Region": "eu-west-3",
            "KmsKeyId": "alias/aws/secretsmanager",
            "Status": "InProgress"
        }
    ]
}
```

For more information, see Replicate a secret to another Region in the *Secrets Manager User Guide*.

- For API details, see ReplicateSecretToRegions in *AWS CLI Command Reference*.

`restore-secret`

The following code example shows how to use `restore-secret`.

AWS CLI

To restore a previously deleted secret

The following `restore-secret` example restores a secret that was previously scheduled for deletion.

```
aws secretsmanager restore-secret \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Delete a secret in the *Secrets Manager User Guide*.

- For API details, see RestoreSecret in *AWS CLI Command Reference*.

rotate-secret

The following code example shows how to use `rotate-secret`.

AWS CLI

Example 1: To configure and start automatic rotation for a secret

The following `rotate-secret` example configures and starts automatic rotation for a secret. Secrets Manager rotates the secret once immediately, and then every eight hours in a two hour window. The output shows the `VersionId` of the new secret version created by rotation.

```
aws secretsmanager rotate-secret \
    --secret-id MyTestDatabaseSecret \
    --rotation-lambda-arn arn:aws:lambda:us-
west-2:1234566789012:function:SecretsManagerTestRotationLambda \
    --rotation-rules "{\"ScheduleExpression\": \"cron(0 8/8 * * ? *)\", \"Duration
\": \"2h\"}"
```

Output:

```
{
    "ARN": "aws:arn:secretsmanager:us-
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
    "Name": "MyTestDatabaseSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Rotate secrets in the *Secrets Manager User Guide*.

Example 2: To configure and start automatic rotation on a rotation interval

The following `rotate-secret` example configures and starts automatic rotation for a secret. Secrets Manager rotates the secret once immediately, and then every 10 days. The output shows the `VersionId` of the new secret version created by rotation.

```
aws secretsmanager rotate-secret \
    --secret-id MyTestDatabaseSecret \
    --rotation-lambda-arn arn:aws:lambda:us-
west-2:1234566789012:function:SecretsManagerTestRotationLambda \
    --rotation-rules "{\"ScheduleExpression\": \"rate(10 days)\"}"
```

Output:

```
{
    "ARN": "aws:arn:secretsmanager:us-
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
    "Name": "MyTestDatabaseSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Rotate secrets in the *Secrets Manager User Guide*.

Example 3: To rotate a secret immediately

The following `rotate-secret` example starts an immediate rotation. The output shows the `VersionId` of the new secret version created by rotation. The secret must already have rotation configured.

```
aws secretsmanager rotate-secret \
    --secret-id MyTestDatabaseSecret
```

Output:

```
{
    "ARN": "aws:arn:secretsmanager:us-
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
    "Name": "MyTestDatabaseSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Rotate secrets in the *Secrets Manager User Guide*.

- For API details, see RotateSecret in *AWS CLI Command Reference*.

`stop-replication-to-replica`

The following code example shows how to use `stop-replication-to-replica`.

AWS CLI

To promote a replica secret to a primary

The following `stop-replication-to-replica` example removes the link between a replica secret to the primary. The replica secret is promoted to a primary secret in the replica region. You must call `stop-replication-to-replica` from within the replica region.

```
aws secretsmanager stop-replication-to-replica \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3"
}
```

For more information, see Promote a replica secret in the *Secrets Manager User Guide*.

- For API details, see StopReplicationToReplica in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To add a tag to a secret

The following `tag-resource` example attaches a tag to a secret by using shorthand syntax.

```
aws secretsmanager tag-resource \
    --secret-id MyTestSecret \
    --tags Key=FirstTag,Value=FirstValue
```

This command produces no output.

For more information, see Tag your secrets in the *Secrets Manager User Guide*.

Example 2: To add multiple tags to a secret

The following `tag-resource` example attaches two key-value tags to a secret.

```
aws secretsmanager tag-resource \
    --secret-id MyTestSecret \
```

```
    --tags '[{"Key": "FirstTag", "Value": "FirstValue"}, {"Key": "SecondTag",
"Value": "SecondValue"}]'
```

This command produces no output.

For more information, see Tag secrets in the *Secrets Manager User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a secret

The following `untag-resource` example removes two tags from a secret. For each tag, both key and value are removed.

```
aws secretsmanager untag-resource \
    --secret-id MyTestSecret \
    --tag-keys '[ "FirstTag", "SecondTag"]'
```

This command produces no output.

For more information, see Tag secrets in the *Secrets Manager User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-secret-version-stage`

The following code example shows how to use `update-secret-version-stage`.

AWS CLI

Example 1: To revert a secret to the previous version

The following `update-secret-version-stage` example moves the AWSCURRENT staging label to the previous version of a secret, which reverts the secret to the previous version. To find the ID for the previous version, use `list-secret-version-ids`. For this example, the version with the AWSCURRENT label is a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 and the version

with the AWSPREVIOUS label is a1b2c3d4-5678-90ab-cdef-EXAMPLE22222. In this example, you move the AWSCURRENT label from version 11111 to 22222. Because the AWSCURRENT label is removed from a version, `update-secret-version-stage` automatically moves the AWSPREVIOUS label to that version (11111). The effect is that the AWSCURRENT and AWSPREVIOUS versions are swapped.

```
aws secretsmanager update-secret-version-stage \
    --secret-id MyTestSecret \
    --version-stage AWSCURRENT \
    --move-to-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --remove-from-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see What's in a Secrets Manager secret? in the *Secrets Manager User Guide*.

Example 2: To add a staging label attached to a version of a secret

The following `update-secret-version-stage` example adds a staging label to a version of a secret. You can review the results by running `list-secret-version-ids` and viewing the `VersionStages` response field for the affected version.

```
aws secretsmanager update-secret-version-stage \
    --secret-id MyTestSecret \
    --version-stage STAGINGLABEL1 \
    --move-to-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
```

```
}
```

For more information, see What's in a Secrets Manager secret? in the *Secrets Manager User Guide*.

Example 3: To delete a staging label attached to a version of a secret

The following `update-secret-version-stage` example deletes a staging label that is attached to a version of a secret. You can review the results by running `list-secret-version-ids` and viewing the `VersionStages` response field for the affected version.

```
aws secretsmanager update-secret-version-stage \
    --secret-id MyTestSecret \
    --version-stage STAGINGLABEL1 \
    --remove-from-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see What's in a Secrets Manager secret? in the *Secrets Manager User Guide*.

- For API details, see UpdateSecretVersionStage in *AWS CLI Command Reference*.

`update-secret`

The following code example shows how to use `update-secret`.

AWS CLI

Example 1: To update the description of a secret

The following `update-secret` example updates the description of a secret.

```
aws secretsmanager update-secret \
    --secret-id MyTestSecret \
```

```
    --description "This is a new description for the secret."
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

Example 2: To update the encryption key associated with a secret

The following `update-secret` example updates the KMS key used to encrypt the secret value. The KMS key must be in the same region as the secret.

```
aws secretsmanager update-secret \
    --secret-id MyTestSecret \
    --kms-key-id arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

- For API details, see UpdateSecret in *AWS CLI Command Reference*.

`validate-resource-policy`

The following code example shows how to use `validate-resource-policy`.

AWS CLI

To validate a resource policy

The following `validate-resource-policy` example checks that a resource policy doesn't grant broad access to a secret. The policy is read from a file on disk. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager validate-resource-policy \
    --resource-policy file://mypolicy.json
```

Contents of `mypolicy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:role/MyRole"
            },
            "Action": "secretsmanager:GetSecretValue",
            "Resource": "*"
        }
    ]
}
```

Output:

```
{
    "PolicyValidationPassed": true,
    "ValidationErrors": []
}
```

For more information, see Resource-based policies in the *Secrets Manager User Guide*.

- For API details, see ValidateResourcePolicy in *AWS CLI Command Reference*.

Security Hub CSPM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Security Hub CSPM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-administrator-invitation`

The following code example shows how to use `accept-administrator-invitation`.

AWS CLI

To accept an invitation from an administrator account

The following `accept-administrator-invitation` example accepts the specified invitation from the specified administrator account.

```
aws securityhub accept-administrator-invitation \
    --administrator-id 123456789012 \
    --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see AcceptAdministratorInvitation in *AWS CLI Command Reference*.

`accept-invitation`

The following code example shows how to use `accept-invitation`.

AWS CLI

To accept an invitation from an administrator account

The following `accept-invitation` example accepts the specified invitation from the specified administrator account.

```
aws securityhub accept-invitation \
    --master-id 123456789012 \
    --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see AcceptInvitation in *AWS CLI Command Reference*.

`batch-delete-automation-rules`

The following code example shows how to use `batch-delete-automation-rules`.

AWS CLI

To delete automation rules

The following `batch-delete-automation-rules` example deletes the specified automation rule. You can delete one or more rules with a single command. Only the Security Hub administrator account can run this command.

```
aws securityhub batch-delete-automation-rules \
    --automation-rules-arns '["arn:aws:securityhub:us-
west-2:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]'
```

Output:

```
{
    "ProcessedAutomationRules": [
        "arn:aws:securityhub:us-west-2:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    ],
    "UnprocessedAutomationRules": []
}
```

For more information, see Deleting automation rules in the *AWS Security Hub User Guide*.

- For API details, see BatchDeleteAutomationRules in *AWS CLI Command Reference*.

batch-disable-standards

The following code example shows how to use `batch-disable-standards`.

AWS CLI

To disable a standard

The following `batch-disable-standards` example disables the standard associated with the specified subscription ARN.

```
aws securityhub batch-disable-standards \
    --standards-subscription-arns "arn:aws:securityhub:us-
west-2:123456789012:subscription/pci-dss/v/3.2.1"
```

Output:

```
{
    "StandardsSubscriptions": [
        {
            "StandardsArn": "arn:aws:securityhub:us-west-2::standards/pci-dss/
v/3.2.1",
            "StandardsInput": { },
            "StandardsStatus": "DELETING",
            "StandardsSubscriptionArn": "arn:aws:securityhub:us-
west-2:123456789012:subscription/pci-dss/v/3.2.1"
        }
    ]
}
```

For more information, see Disabling a security standard in the *AWS Security Hub User Guide*.

- For API details, see BatchDisableStandards in *AWS CLI Command Reference*.

batch-enable-standards

The following code example shows how to use `batch-enable-standards`.

AWS CLI

To enable a standard

The following `batch-enable-standards` example enables the PCI DSS standard for the requesting account.

```
aws securityhub batch-enable-standards \
    --standards-subscription-requests '{"StandardsArn":"arn:aws:securityhub:us-
west-2::standards/pci-dss/v/3.2.1"}'
```

Output:

```
{
    "StandardsSubscriptions": [
        {
            "StandardsArn": "arn:aws:securityhub:us-west-2::standards/pci-dss/
v/3.2.1",
            "StandardsInput": { },
            "StandardsStatus": "PENDING",
            "StandardsSubscriptionArn": "arn:aws:securityhub:us-
west-2:123456789012:subscription/pci-dss/v/3.2.1"
        }
    ]
}
```

For more information, see Enabling a security standard in the *AWS Security Hub User Guide*.

- For API details, see BatchEnableStandards in *AWS CLI Command Reference*.

`batch-get-automation-rules`

The following code example shows how to use `batch-get-automation-rules`.

AWS CLI

To get details for automation rules

The following `batch-get-automation-rules` example gets details for the specified automation rule. You can get details for one or more automation rules with a single command.

```
aws securityhub batch-get-automation-rules \
    --automation-rules-arns '["arn:aws:securityhub:us-
west-2:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]'
```

Output:

```
{
    "Rules": [
        {
            "RuleArn": "arn:aws:securityhub:us-west-2:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RuleStatus": "ENABLED",
            "RuleOrder": 1,
            "RuleName": "Suppress informational findings",
            "Description": "Suppress GuardDuty findings with Informational
 severity",
            "IsTerminal": false,
            "Criteria": {
                "ProductName": [
                    {
                        "Value": "GuardDuty",
                        "Comparison": "EQUALS"
                    }
                ],
                "SeverityLabel": [
                    {
                        "Value": "INFORMATIONAL",
                        "Comparison": "EQUALS"
                    }
                ],
                "WorkflowStatus": [
                    {
                        "Value": "NEW",
                        "Comparison": "EQUALS"
                    }
                ],
                "RecordState": [
                    {
                        "Value": "ACTIVE",
                        "Comparison": "EQUALS"
                    }
                ]
            },
            "Actions": [
                {
                    "Type": "FINDING_FIELDS_UPDATE",
                    "FindingFieldsUpdate": {
                        "Note": {
```

```
                            "Text": "Automatically suppress GuardDuty findings with
 Informational severity",
                            "UpdatedBy": "sechub-automation"
                        },
                        "Workflow": {
                            "Status": "SUPPRESSED"
                        }
                    }
                }
            ],
            "CreatedAt": "2023-05-31T17:56:14.837000+00:00",
            "UpdatedAt": "2023-05-31T17:59:38.466000+00:00",
            "CreatedBy": "arn:aws:iam::123456789012:role/Admin"
        }
    ],
    "UnprocessedAutomationRules": []
}
```

For more information, see Viewing automation rules in the *AWS Security Hub User Guide*.

- For API details, see BatchGetAutomationRules in *AWS CLI Command Reference*.

`batch-get-configuration-policy-associations`

The following code example shows how to use `batch-get-configuration-policy-associations`.

AWS CLI

To get configuration association details for a batch of targets

The following `batch-get-configuration-policy-associations` example retrieves association details for the specified targets. You can provide account IDs, organizational unit IDs, or the root ID for the target.

```
aws securityhub batch-get-configuration-policy-associations \
    --configuration-policy-association-identifiers '[{"Target":
 {"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}}]'
```

Output:

```
{
```

```
    "ConfigurationPolicyAssociations": [
        {
            "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "TargetId": "ou-6hi7-8j91kl2m",
            "TargetType": "ORGANIZATIONAL_UNIT",
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
            "AssociationStatus": "SUCCESS",
            "AssociationStatusMessage": "Association applied successfully on this
 target."
        }
    ]
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see BatchGetConfigurationPolicyAssociations in *AWS CLI Command Reference*.

`batch-get-security-controls`

The following code example shows how to use `batch-get-security-controls`.

AWS CLI

To get security control details

The following `batch-get-security-controls` example gets details for the security controls ACM.1 and IAM.1 in the current AWS account and AWS Region.

```
aws securityhub batch-get-security-controls \
    --security-control-ids '["ACM.1", "IAM.1"]'
```

Output:

```
{
    "SecurityControls": [
        {
            "SecurityControlId": "ACM.1",
            "SecurityControlArn": "arn:aws:securityhub:us-
west-2:123456789012:security-control/ACM.1",
            "Title": "Imported and ACM-issued certificates should be renewed after a
 specified time period",
```

```
            "Description": "This control checks whether an AWS Certificate Manager
 (ACM) certificate is renewed within the specified time period. It checks both
 imported certificates and certificates provided by ACM. The control fails if the
 certificate isn't renewed within the specified time period. Unless you provide a
 custom parameter value for the renewal period, Security Hub uses a default value of
 30 days.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
ACM.1/remediation",
            "SeverityRating": "MEDIUM",
            "SecurityControlStatus": "ENABLED",
            "UpdateStatus": "READY",
            "Parameters": {
                "daysToExpiration": {
                    "ValueType": "CUSTOM",
                    "Value": {
                        "Integer": 15
                    }
                }
            },
            "LastUpdateReason": "Updated control parameter"
        },
        {
            "SecurityControlId": "IAM.1",
            "SecurityControlArn": "arn:aws:securityhub:us-
west-2:123456789012:security-control/IAM.1",
            "Title": "IAM policies should not allow full \"*\" administrative
 privileges",
            "Description": "This AWS control checks whether the default version of
 AWS Identity and Access Management (IAM) policies (also known as customer managed
 policies) do not have administrator access with a statement that has \"Effect\":
 \"Allow\" with \"Action\": \"*\" over \"Resource\": \"*\". It only checks for
 the Customer Managed Policies that you created, but not inline and AWS Managed
 Policies.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
IAM.1/remediation",
            "SeverityRating": "HIGH",
            "SecurityControlStatus": "ENABLED",
            "UpdateStatus": "READY",
            "Parameters": {}
        }
    ]
}
```

For more information, see Viewing details for a control in the *AWS Security Hub User Guide*.

- For API details, see BatchGetSecurityControls in *AWS CLI Command Reference*.

`batch-get-standards-control-associations`

The following code example shows how to use `batch-get-standards-control-associations`.

AWS CLI

To get the enablement status of a control

The following `batch-get-standards-control-associations` example identifies whether the specified controls are enabled in the specified standards.

```
aws securityhub batch-get-standards-control-associations \
    --standards-control-association-ids '[{"SecurityControlId":
 "Config.1","StandardsArn": "arn:aws:securityhub:us-west-2:123456789012:ruleset/cis-
aws-foundations-benchmark/v/1.2.0"}, {"SecurityControlId": "IAM.6","StandardsArn":
 "arn:aws:securityhub:us-west-2:123456789012:standards/aws-foundational-security-
best-practices/v/1.0.0"}]'
```

Output:

```
{
    "StandardsControlAssociationDetails": [
        {
            "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-
benchmark/v/1.2.0",
            "SecurityControlId": "Config.1",
            "SecurityControlArn": "arn:aws:securityhub:us-
west-2:123456789012:security-control/Config.1",
            "AssociationStatus": "ENABLED",
            "RelatedRequirements": [
                "CIS AWS Foundations 2.5"
            ],
            "UpdatedAt": "2022-10-27T16:07:12.960000+00:00",
            "StandardsControlTitle": "Ensure AWS Config is enabled",
            "StandardsControlDescription": "AWS Config is a web service that
 performs configuration management of supported AWS resources within your account
 and delivers log files to you. The recorded information includes the configuration
```

```
 item (AWS resource), relationships between configuration items (AWS resources), and
 any configuration changes between resources. It is recommended to enable AWS Config
 in all regions.",
            "StandardsControlArns": [
                "arn:aws:securityhub:us-west-2:123456789012:control/cis-aws-
foundations-benchmark/v/1.2.0/2.5"
            ]
        },
        {
            "StandardsArn": "arn:aws:securityhub:us-west-2::standards/aws-
foundational-security-best-practices/v/1.0.0",
            "SecurityControlId": "IAM.6",

            ]
        }
    ]
}
```

For more information, see Enabling and disabling controls in specific standards in the *AWS Security Hub User Guide*.

- For API details, see BatchGetStandardsControlAssociations in *AWS CLI Command Reference*.

`batch-import-findings`

The following code example shows how to use `batch-import-findings`.

AWS CLI

To update a finding

The following `batch-import-findings` example updates a finding.

```
aws securityhub batch-import-findings \
    --findings '
        [{
            "AwsAccountId": "123456789012",
            "CreatedAt": "2020-05-27T17:05:54.832Z",
            "Description": "Vulnerability in a CloudTrail trail",
            "FindingProviderFields": {
                "Severity": {
                    "Label": "LOW",
                    "Original": "10"
                },
                "Types": [
                    "Software and Configuration Checks/Vulnerabilities/CVE"
                ]
            },
            "GeneratorId": "TestGeneratorId",
            "Id": "Id1",
            "ProductArn": "arn:aws:securityhub:us-
west-2:123456789012:product/123456789012/default",
            "Resources": [
                {
                    "Id": "arn:aws:cloudtrail:us-west-2:123456789012:trail/
TrailName",
                    "Partition": "aws",
                    "Region": "us-west-2",
                    "Type": "AwsCloudTrailTrail"
                }
            ],
            "SchemaVersion": "2018-10-08",
            "Title": "CloudTrail trail vulnerability",
            "UpdatedAt": "2020-06-02T16:05:54.832Z"
        }]'
```

Output:

```
{
    "FailedCount": 0,
    "SuccessCount": 1,
    "FailedFindings": []
}
```

For more information, see Using BatchImportFindings to create and update findings in the *AWS Security Hub User Guide*.

- For API details, see BatchImportFindings in *AWS CLI Command Reference*.

`batch-update-automation-rules`

The following code example shows how to use `batch-update-automation-rules`.

AWS CLI

To update automation rules

The following `batch-update-automation-rules` example updates the specified automation rule. You can update one or more rules with a single command. Only the Security Hub administrator account can run this command.

```
aws securityhub batch-update-automation-rules \
    --update-automation-rules-request-items '[
        {
            "Actions": [{
                "Type": "FINDING_FIELDS_UPDATE",
                "FindingFieldsUpdate": {
                    "Note": {
                        "Text": "Known issue that is a risk",
                        "UpdatedBy": "sechub-automation"
                    },
                    "Workflow": {
                        "Status": "NEW"
                    }
                }
            }],
            "Criteria": {
                "SeverityLabel": [{
                    "Value": "LOW",
                    "Comparison": "EQUALS"
                }]
            },
            "RuleArn": "arn:aws:securityhub:us-west-2:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RuleOrder": 1,
            "RuleStatus": "DISABLED"
        }
```

```
    ]'
```

Output:

```
{
    "ProcessedAutomationRules": [
        "arn:aws:securityhub:us-west-2:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    ],
    "UnprocessedAutomationRules": []
}
```

For more information, see Editing automation rules in the *AWS Security Hub User Guide*.

- For API details, see BatchUpdateAutomationRules in *AWS CLI Command Reference*.

`batch-update-findings`

The following code example shows how to use `batch-update-findings`.

AWS CLI

Example 1: To update a finding

The following `batch-update-findings` example updates two findings to add a note, change the severity label, and resolve it.

```
aws securityhub batch-update-findings \
    --finding-identifiers '[{"Id": "arn:aws:securityhub:us-
west-2:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111", "ProductArn": "arn:aws:securityhub:us-
west-2::product/aws/securityhub"}, {"Id": "arn:aws:securityhub:us-
west-2:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222", "ProductArn": "arn:aws:securityhub:us-
west-2::product/aws/securityhub"}]' \
    --note '{"Text": "Known issue that is not a risk.", "UpdatedBy": "user1"}' \
    --severity '{"Label": "LOW"}' \
    --workflow '{"Status": "RESOLVED"}'
```

Output:

```
{
```

```
    "ProcessedFindings": [
        {
            "Id": "arn:aws:securityhub:us-west-2:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ProductArn": "arn:aws:securityhub:us-west-2::product/aws/securityhub"
        },
        {
            "Id": "arn:aws:securityhub:us-west-2:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ProductArn": "arn:aws:securityhub:us-west-2::product/aws/securityhub"
        }
    ],
    "UnprocessedFindings": []
}
```

For more information, see Using BatchUpdateFindings to update a finding in the *AWS Security Hub User Guide*.

Example 2: To update a finding using shorthand syntax

The following `batch-update-findings` example updates two findings to add a note, change the severity label, and resolve it using shorthand syntax.

```
aws securityhub batch-update-findings \
    --finding-identifiers Id="arn:aws:securityhub:us-
west-2:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",ProductArn="arn:aws:securityhub:us-
west-2::product/aws/securityhub" Id="arn:aws:securityhub:us-
west-2:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",ProductArn="arn:aws:securityhub:us-
west-2::product/aws/securityhub" \
    --note Text="Known issue that is not a risk.",UpdatedBy="user1" \
    --severity Label="LOW" \
    --workflow Status="RESOLVED"
```

Output:

```
{
    "ProcessedFindings": [
        {
            "Id": "arn:aws:securityhub:us-west-2:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
            "ProductArn": "arn:aws:securityhub:us-west-2::product/aws/securityhub"
        },
        {
            "Id": "arn:aws:securityhub:us-west-2:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ProductArn": "arn:aws:securityhub:us-west-2::product/aws/securityhub"
        }
    ],
    "UnprocessedFindings": []
}
```

For more information, see Using BatchUpdateFindings to update a finding in the *AWS Security Hub User Guide*.

- For API details, see BatchUpdateFindings in *AWS CLI Command Reference*.

`batch-update-standards-control-associations`

The following code example shows how to use `batch-update-standards-control-associations`.

AWS CLI

To update the enablement status of a control in enabled standards

The following `batch-update-standards-control-associations` example disables CloudTrail.1 in the specified standards.

```
aws securityhub batch-update-standards-control-associations \
    --standards-control-association-updates '[{"SecurityControlId": "CloudTrail.1",
 "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0", "AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable
 to environment"}, {"SecurityControlId": "CloudTrail.1", "StandardsArn":
 "arn:aws:securityhub:::standards/cis-aws-foundations-benchmark/v/1.4.0",
 "AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable to
 environment"}]'
```

Output:

```
{
    "UnprocessedAssociationUpdates": []
}
```

For more information, see Enabling and disabling controls in specific standards and Enabling and disabling controls in all standards in the *AWS Security Hub User Guide*.

- For API details, see BatchUpdateStandardsControlAssociations in *AWS CLI Command Reference*.

`create-action-target`

The following code example shows how to use `create-action-target`.

AWS CLI

To create a custom action

The following `create-action-target` example creates a custom action. It provides the name, description, and identifier for the action.

```
aws securityhub create-action-target \
    --name "Send to remediation" \
    --description "Action to send the finding for remediation tracking" \
    --id "Remediation"
```

Output:

```
{
    "ActionTargetArn": "arn:aws:securityhub:us-west-2:123456789012:action/custom/
Remediation"
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see CreateActionTarget in *AWS CLI Command Reference*.

`create-automation-rule`

The following code example shows how to use `create-automation-rule`.

AWS CLI

To create an automation rule

The following `create-automation-rule` example creates an automation rule in the current AWS account and AWS Region. Security Hub filters your findings based on the specified criteria and applies the actions to matching findings. Only the Security Hub administrator account can run this command.

```
aws securityhub create-automation-rule \
    --actions '[{
        "Type": "FINDING_FIELDS_UPDATE",
        "FindingFieldsUpdate": {
            "Severity": {
                "Label": "HIGH"
            },
            "Note": {
                "Text": "Known issue that is a risk. Updated by automation rules",
                "UpdatedBy": "sechub-automation"
            }
        }
    }]' \
    --criteria '{
        "SeverityLabel": [{
            "Value": "INFORMATIONAL",
            "Comparison": "EQUALS"
        }]
    }' \
    --description "A sample rule" \
    --no-is-terminal \
    --rule-name "sample rule" \
    --rule-order 1 \
    --rule-status "ENABLED"
```

Output:

```
{
    "RuleArn": "arn:aws:securityhub:us-west-2:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Creating automation rules in the *AWS Security Hub User Guide*.

- For API details, see CreateAutomationRule in *AWS CLI Command Reference*.

`create-configuration-policy`

The following code example shows how to use `create-configuration-policy`.

AWS CLI

To create a configuration policy

The following `create-configuration-policy` example creates a configuration policy with the specified settings.

```
aws securityhub create-configuration-policy \
    --name "SampleConfigurationPolicy" \
    --description "SampleDescription" \
    --configuration-policy '{"SecurityHub": {"ServiceEnabled":
 true, "EnabledStandardIdentifiers": ["arn:aws:securityhub:us-
west-2::standards/aws-foundational-security-best-practices/
v/1.0.0","arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"],"SecurityControlsConfiguration":{"DisabledSecurityControlIdentifiers":
 ["CloudTrail.2"], "SecurityControlCustomParameters": [{"SecurityControlId":
 "ACM.1", "Parameters": {"daysToExpiration": {"ValueType": "CUSTOM", "Value":
 {"Integer": 15}}}}]}}}' \
    --tags '{"Environment": "Prod"}'
```

Output:

```
{
    "Arn": "arn:aws:securityhub:us-west-2:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Name": "SampleConfigurationPolicy",
    "Description": "SampleDescription",
    "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
    "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
    "ConfigurationPolicy": {
        "SecurityHub": {
            "ServiceEnabled": true,
            "EnabledStandardIdentifiers": [
                "arn:aws:securityhub:us-west-2::standards/aws-foundational-security-
best-practices/v/1.0.0",
                "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
            ],
```

```
            "SecurityControlsConfiguration": {
                "DisabledSecurityControlIdentifiers": [
                    "CloudTrail.2"
                ],
                "SecurityControlCustomParameters": [
                    {
                        "SecurityControlId": "ACM.1",
                        "Parameters": {
                            "daysToExpiration": {
                                "ValueType": "CUSTOM",
                                "Value": {
                                    "Integer": 15
                                }
                            }
                        }
                    }
                ]
            }
        }
    }
}
```

For more information, see Creating and associating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see CreateConfigurationPolicy in *AWS CLI Command Reference*.

`create-finding-aggregator`

The following code example shows how to use `create-finding-aggregator`.

AWS CLI

To enable finding aggregation

The following `create-finding-aggregator` example configures finding aggregation. It is run from US East (Virginia), which designates US East (Virginia) as the aggregation Region. It indicates to only link specified Regions, and to not automatically link new Regions. It selects US West (N. California) and US West (Oregon) as the linked Regions.

```
aws securityhub create-finding-aggregator \
    --region us-east-1 \
```

```
    --region-linking-mode SPECIFIED_REGIONS \
    --regions us-west-1,us-west-2
```

Output:

```
{
    "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:123456789012:finding-
aggregator/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "FindingAggregationRegion": "us-east-1",
    "RegionLinkingMode": "SPECIFIED_REGIONS",
    "Regions": [
        "us-west-1",
        "us-west-2"
    ]
}
```

For more information, see Enabling finding aggregation in the *AWS Security Hub User Guide*.

- For API details, see CreateFindingAggregator in *AWS CLI Command Reference*.

`create-insight`

The following code example shows how to use `create-insight`.

AWS CLI

To create a custom insight

The following `create-insight` example creates a custom insight named Critical role findings that returns critical findings that are related to AWS roles.

```
aws securityhub create-insight \
    --filters '{"ResourceType": [{ "Comparison": "EQUALS", "Value": "AwsIamRole"}],
 "SeverityLabel": [{"Comparison": "EQUALS", "Value": "CRITICAL"}]}' \
    --group-by-attribute "ResourceId" \
    --name "Critical role findings"
```

Output:

```
{
    "InsightArn": "arn:aws:securityhub:us-west-2:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

```
}
```

For more information, see Managing custom insights in the *AWS Security Hub User Guide*.

- For API details, see CreateInsight in *AWS CLI Command Reference*.

`create-members`

The following code example shows how to use `create-members`.

AWS CLI

To add accounts as member accounts

The following `create-members` example adds two accounts as member accounts to the requesting administrator account.

```
aws securityhub create-members \
    --account-details '[{"AccountId": "123456789111"}, {"AccountId":
 "123456789222"}]'
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see CreateMembers in *AWS CLI Command Reference*.

`decline-invitations`

The following code example shows how to use `decline-invitations`.

AWS CLI

To decline an invitation to be a member account

The following `decline-invitations` example declines an invitation to be a member account of the specified administrator account. The member account is the requesting account.

```
aws securityhub decline-invitations \
    --account-ids "123456789012"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DeclineInvitations in *AWS CLI Command Reference*.

`delete-action-target`

The following code example shows how to use `delete-action-target`.

AWS CLI

To delete a custom action

The following `delete-action-target` example deletes the custom action identified by the specified ARN.

```
aws securityhub delete-action-target \
    --action-target-arn "arn:aws:securityhub:us-west-2:123456789012:action/custom/
Remediation"
```

Output:

```
{
    "ActionTargetArn": "arn:aws:securityhub:us-west-2:123456789012:action/custom/
Remediation"
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see DeleteActionTarget in *AWS CLI Command Reference*.

`delete-configuration-policy`

The following code example shows how to use `delete-configuration-policy`.

AWS CLI

To delete a configuration policy

The following `delete-configuration-policy` example deletes the specified configuration policy.

```
aws securityhub delete-configuration-policy \
    --identifier "arn:aws:securityhub:us-west-2:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Deleting and disassociating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see DeleteConfigurationPolicy in *AWS CLI Command Reference*.

`delete-finding-aggregator`

The following code example shows how to use `delete-finding-aggregator`.

AWS CLI

To stop finding aggregation

The following `delete-finding-aggregator` example stops finding aggregation. It is run from US East (Virginia), which is the aggregation Region.

```
aws securityhub delete-finding-aggregator \
    --region us-west-2 \
    --finding-aggregator-arn arn:aws:securityhub:us-west-2:123456789012:finding-
aggregator/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Stopping finding aggregation in the *AWS Security Hub User Guide*.

- For API details, see DeleteFindingAggregator in *AWS CLI Command Reference*.

`delete-insight`

The following code example shows how to use `delete-insight`.

AWS CLI

To delete a custom insight

The following `delete-insight` example deletes the custom insight with the specified ARN.

```
aws securityhub delete-insight \
    --insight-arn "arn:aws:securityhub:us-west-2:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "InsightArn": "arn:aws:securityhub:us-west-2:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Managing custom insights in the *AWS Security Hub User Guide*.

- For API details, see DeleteInsight in *AWS CLI Command Reference*.

`delete-invitations`

The following code example shows how to use `delete-invitations`.

AWS CLI

To delete an invitation to be a member account

The following `delete-invitations` example deletes an invitation to be a member account for the specified administrator account. The member account is the requesting account.

```
aws securityhub delete-invitations \
    --account-ids "123456789012"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DeleteInvitations in *AWS CLI Command Reference*.

`delete-members`

The following code example shows how to use `delete-members`.

AWS CLI

To delete member accounts

The following `delete-members` example deletes the specified member accounts from the requesting administrator account.

```
aws securityhub delete-members \
    --account-ids "123456789111" "123456789222"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DeleteMembers in *AWS CLI Command Reference*.

`describe-action-targets`

The following code example shows how to use `describe-action-targets`.

AWS CLI

To retrieve details about custom actions

The following `describe-action-targets` example retrieves information about the custom action identified by the specified ARN.

```
aws securityhub describe-action-targets \
    --action-target-arns "arn:aws:securityhub:us-west-2:123456789012:action/custom/
Remediation"
```

Output:

```
{
    "ActionTargets": [
        {
            "ActionTargetArn": "arn:aws:securityhub:us-west-2:123456789012:action/
custom/Remediation",
            "Description": "Action to send the finding for remediation tracking",
            "Name": "Send to remediation"
        }
    ]
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see DescribeActionTargets in *AWS CLI Command Reference*.

`describe-hub`

The following code example shows how to use `describe-hub`.

AWS CLI

To get information about a hub resource

The following `describe-hub` example returns the subscription date and other configuration settings for the specified hub resource. The hub resource is identified by its ARN.

```
aws securityhub describe-hub \
```

```
    --hub-arn "arn:aws:securityhub:us-west-2:123456789012:hub/default"
```

Output:

```
{
    "HubArn": "arn:aws:securityhub:us-west-2:123456789012:hub/default",
    "SubscribedAt": "2019-11-19T23:15:10.046Z",
    "AutoEnableControls": true,
    "ControlFindingGenerator": "SECURITY_CONTROL"
}
```

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see DescribeHub in *AWS CLI Command Reference*.

`describe-organization-configuration`

The following code example shows how to use `describe-organization-configuration`.

AWS CLI

To view how Security Hub is configured for an organization

The following `describe-organization-configuration` example returns information about the way an organization is configured in Security Hub. In this example, the organization uses central configuration. Only the Security Hub administrator account can run this command.

```
aws securityhub describe-organization-configuration
```

Output:

```
{
    "AutoEnable": false,
    "MemberAccountLimitReached": false,
    "AutoEnableStandards": "NONE",
    "OrganizationConfiguration": {
        "ConfigurationType": "LOCAL",
        "Status": "ENABLED",
        "StatusMessage": "Central configuration has been enabled successfully"
    }
```

```
}
```

For more information, see Managing accounts with AWS Organizations in the *AWS Security Hub User Guide*.

- For API details, see DescribeOrganizationConfiguration in *AWS CLI Command Reference*.

`describe-products`

The following code example shows how to use `describe-products`.

AWS CLI

To return information about available product integrations

The following `describe-products` example returns the available product integrations one at a time.

```
aws securityhub describe-products \
    --max-results 1
```

Output:

```
{
    "NextToken": "U2FsdGVkX18vvPlOqb7RDrWRWVFBJI46MOIAb+nZmRJmR15NoRi2gm13sdQEn3O/

        }
    ]
}
```

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see DescribeProducts in *AWS CLI Command Reference*.

`describe-standards-controls`

The following code example shows how to use `describe-standards-controls`.

AWS CLI

To request the list of controls in an enabled standard

The following `describe-standards-controls` example requests the list of controls in the requester account's subscription to the PCI DSS standard. The request returns two controls at a time.

```
aws securityhub describe-standards-controls \
    --standards-subscription-arn "arn:aws:securityhub:us-
west-2:123456789012:subscription/pci-dss/v/3.2.1" \
    --max-results 2
```

Output:

```
{
    "Controls": [
        {
            "StandardsControlArn": "arn:aws:securityhub:us-
west-2:123456789012:control/pci-dss/v/3.2.1/PCI.AutoScaling.1",

```

For more information, see Viewing details for controls in the *AWS Security Hub User Guide*.

- For API details, see DescribeStandardsControls in *AWS CLI Command Reference*.

`describe-standards`

The following code example shows how to use `describe-standards`.

AWS CLI

To return a list of available standards

The following `describe-standards` example returns the list of available standards.

```
aws securityhub describe-standards
```

Output:

```
{
    "Standards": [
        {
            "StandardsArn": "arn:aws:securityhub:us-west-2::standards/aws-
foundational-security-best-practices/v/1.0.0",
            "Name": "AWS Foundational Security Best Practices v1.0.0",
            "Description": "The AWS Foundational Security Best Practices standard
 is a set of automated security checks that detect when AWS accounts and deployed
 resources do not align to security best practices. The standard is defined by AWS
 security experts. This curated set of controls helps improve your security posture
 in AWS, and cover AWS's most popular and foundational services.",
            "EnabledByDefault": true
        },
        {
            "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-
benchmark/v/1.2.0",
            "Name": "CIS AWS Foundations Benchmark v1.2.0",
```

```
            "Description": "The Center for Internet Security (CIS) AWS Foundations
 Benchmark v1.2.0 is a set of security configuration best practices for AWS. This
 Security Hub standard automatically checks for your compliance readiness against a
 subset of CIS requirements.",
            "EnabledByDefault": true
        },
        {
            "StandardsArn": "arn:aws:securityhub:us-west-2::standards/pci-dss/
v/3.2.1",
            "Name": "PCI DSS v3.2.1",
            "Description": "The Payment Card Industry Data Security Standard (PCI
 DSS) v3.2.1 is an information security standard for entities that store, process,
 and/or transmit cardholder data. This Security Hub standard automatically checks
 for your compliance readiness against a subset of PCI DSS requirements.",
            "EnabledByDefault": false
        }
    ]
}
```

For more information, see Security standards in AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see DescribeStandards in *AWS CLI Command Reference*.

`disable-import-findings-for-product`

The following code example shows how to use `disable-import-findings-for-product`.

AWS CLI

To stop receiving findings from a product integration

The following `disable-import-findings-for-product` example disables the flow of findings for the specified subscription to a product integration.

```
aws securityhub disable-import-findings-for-product \
    --product-subscription-arn "arn:aws:securityhub:us-west-2:123456789012:product-
subscription/crowdstrike/crowdstrike-falcon"
```

This command produces no output.

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see DisableImportFindingsForProduct in *AWS CLI Command Reference*.

`disable-organization-admin-account`

The following code example shows how to use `disable-organization-admin-account`.

AWS CLI

To remove a Security Hub administrator account

The following `disable-organization-admin-account` example revokes the specified account's assignment as a Security Hub administrator account for AWS Organizations.

```
aws securityhub disable-organization-admin-account \
    --admin-account-id 123456789012
```

This command produces no output.

For more information, see Designating a Security Hub administrator account in the *AWS Security Hub User Guide*.

- For API details, see DisableOrganizationAdminAccount in *AWS CLI Command Reference*.

`disable-security-hub`

The following code example shows how to use `disable-security-hub`.

AWS CLI

To disable AWS Security Hub

The following `disable-security-hub` example disables AWS Security Hub for the requesting account.

```
aws securityhub disable-security-hub
```

This command produces no output.

For more information, see Disabling AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see DisableSecurityHub in *AWS CLI Command Reference*.

`disassociate-from-administrator-account`

The following code example shows how to use `disassociate-from-administrator-account`.

AWS CLI

To disassociate from an administrator account

The following `disassociate-from-administrator-account` example disassociates the requesting account from its current administrator account.

```
aws securityhub disassociate-from-administrator-account
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DisassociateFromAdministratorAccount in *AWS CLI Command Reference*.

`disassociate-from-master-account`

The following code example shows how to use `disassociate-from-master-account`.

AWS CLI

To disassociate from an administrator account

The following `disassociate-from-master-account` example disassociates the requesting account from its current administrator account.

```
aws securityhub disassociate-from-master-account
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DisassociateFromMasterAccount in *AWS CLI Command Reference*.

`disassociate-members`

The following code example shows how to use `disassociate-members`.

AWS CLI

To disassociate member accounts

The following `disassociate-members` example disassociates the specified member accounts from the requesting administrator account.

```
aws securityhub disassociate-members  \
    --account-ids "123456789111" "123456789222"
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DisassociateMembers in *AWS CLI Command Reference*.

`enable-import-findings-for-product`

The following code example shows how to use `enable-import-findings-for-product`.

AWS CLI

To start receiving findings from a product integration

The following `enable-import-findings-for-product` example enables the flow of findings from the specified product integration.

```
aws securityhub enable-import-findings-for-product \
    --product-arn "arn:aws:securityhub:us-west-2:123456789333:product/crowdstrike/
crowdstrike-falcon"
```

Output:

```
{
    "ProductSubscriptionArn": "arn:aws:securityhub:us-west-2:123456789012:product-
subscription/crowdstrike/crowdstrike-falcon"
```

```
}
```

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see EnableImportFindingsForProduct in *AWS CLI Command Reference*.

`enable-organization-admin-account`

The following code example shows how to use `enable-organization-admin-account`.

AWS CLI

To designate an organization account as a Security Hub administrator account

The following `enable-organization-admin-account` example designates the specified account as a Security Hub administrator account.

```
aws securityhub enable-organization-admin-account \
    --admin-account-id 123456789012
```

This command produces no output.

For more information, see Designating a Security Hub administrator account in the *AWS Security Hub User Guide*.

- For API details, see EnableOrganizationAdminAccount in *AWS CLI Command Reference*.

`enable-security-hub`

The following code example shows how to use `enable-security-hub`.

AWS CLI

To enable AWS Security Hub

The following `enable-security-hub` example enables AWS Security Hub for the requesting account. It configures Security Hub to enable the default standards. For the hub resource, it assigns the value `Security` to the tag `Department`.

```
aws securityhub enable-security-hub \
```

```
    --enable-default-standards \
    --tags '{"Department": "Security"}'
```

This command produces no output.

For more information, see Enabling Security Hub in the *AWS Security Hub User Guide*.

- For API details, see EnableSecurityHub in *AWS CLI Command Reference*.

`get-administrator-account`

The following code example shows how to use `get-administrator-account`.

AWS CLI

To retrieve information about an administrator account

The following `get-administrator-account` example retrieves information about the administrator account for the requesting account.

```
aws securityhub get-administrator-account
```

Output:

```
{
    "Administrator": {
        "AccountId": "123456789012",
        "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
        "InvitedAt": "2020-06-01T20:21:18.042000+00:00",
        "MemberStatus": "ASSOCIATED"
    }
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetAdministratorAccount in *AWS CLI Command Reference*.

`get-configuration-policy-association`

The following code example shows how to use `get-configuration-policy-association`.

AWS CLI

To get configuration association details for a target

The following `get-configuration-policy-association` example retrieves association details for the specified target. You can provide an account ID, organizational unit ID, or the root ID for the target.

```
aws securityhub get-configuration-policy-association \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```
{
    "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "TargetId": "ou-6hi7-8j91kl2m",
    "TargetType": "ORGANIZATIONAL_UNIT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
    "AssociationStatus": "SUCCESS",
    "AssociationStatusMessage": "Association applied successfully on this target."
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see GetConfigurationPolicyAssociation in *AWS CLI Command Reference*.

`get-configuration-policy`

The following code example shows how to use `get-configuration-policy`.

AWS CLI

To view configuration policy details

The following `get-configuration-policy` example retrieves details about the specified configuration policy.

```
aws securityhub get-configuration-policy \
    --identifier "arn:aws:securityhub:us-west-2:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Arn": "arn:aws:securityhub:us-west-2:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Name": "SampleConfigurationPolicy",
    "Description": "SampleDescription",
    "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
    "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
    "ConfigurationPolicy": {
        "SecurityHub": {
            "ServiceEnabled": true,
            "EnabledStandardIdentifiers": [
                "arn:aws:securityhub:us-west-2::standards/aws-foundational-security-
best-practices/v/1.0.0",
                "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
            ],
            "SecurityControlsConfiguration": {
                "DisabledSecurityControlIdentifiers": [
                    "CloudTrail.2"
                ],
                "SecurityControlCustomParameters": [
                    {
                        "SecurityControlId": "ACM.1",
                        "Parameters": {
                            "daysToExpiration": {
                                "ValueType": "CUSTOM",
                                "Value": {
                                    "Integer": 15
                                }
                            }
                        }
                    }
                ]
            }
        }
    }
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see GetConfigurationPolicy in *AWS CLI Command Reference*.

`get-enabled-standards`

The following code example shows how to use `get-enabled-standards`.

AWS CLI

To retrieve information about an enabled standard

The following `get-enabled-standards` example retrieves information about the PCI DSS standard.

```
aws securityhub get-enabled-standards \
    --standards-subscription-arns "arn:aws:securityhub:us-
west-2:123456789012:subscription/pci-dss/v/3.2.1"
```

Output:

```
{
    "StandardsSubscriptions": [
        {
            "StandardsArn": "arn:aws:securityhub:us-west-2::standards/pci-dss/
v/3.2.1",
            "StandardsInput": { },
            "StandardsStatus": "READY",
            "StandardsSubscriptionArn": "arn:aws:securityhub:us-
west-2:123456789012:subscription/pci-dss/v/3.2.1"
        }
    ]
}
```

For more information, see Security standards in AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see GetEnabledStandards in *AWS CLI Command Reference*.

`get-finding-aggregator`

The following code example shows how to use `get-finding-aggregator`.

AWS CLI

To retrieve the current finding aggregation configuration

The following `get-finding-aggregator` example retrieves the current finding aggregation configuration.

```
aws securityhub get-finding-aggregator \
    --finding-aggregator-arn arn:aws:securityhub:us-east-1:123456789012:finding-aggregator/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:123456789012:finding-aggregator/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "FindingAggregationRegion": "us-east-1",
    "RegionLinkingMode": "SPECIFIED_REGIONS",
    "Regions": [
        "us-west-1",
        "us-west-2"
    ]
}
```

For more information, see Viewing the current finding aggregation configuration in the *AWS Security Hub User Guide*.

- For API details, see GetFindingAggregator in *AWS CLI Command Reference*.

`get-finding-history`

The following code example shows how to use `get-finding-history`.

AWS CLI

To get finding history

The following `get-finding-history` example gets up to the last 90 days of history for the specified finding. In this example, the results are limited to two records of finding history.

```
aws securityhub get-finding-history \
```

```
    --finding-identifier Id="arn:aws:securityhub:us-
west-2:123456789012:security-control/S3.17/finding/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",ProductArn="arn:aws:securityhub:us-west-2::product/aws/securityhub"
```

Output:

```
{
    "Records": [
        {
            "FindingIdentifier": {
                "Id": "arn:aws:securityhub:us-west-2:123456789012:security-control/

        }
    ]
}
```

For more information, see Reviewing finding details and history in Security Hub CSPM in the *AWS Security Hub User Guide*.

- For API details, see GetFindingHistory in *AWS CLI Command Reference*.

`get-findings`

The following code example shows how to use `get-findings`.

AWS CLI

Example 1: To return findings generated for a specific standard

The following `get-findings` example returns findings for the PCI DSS standard.

```
aws securityhub get-findings \
    --filters '{"GeneratorId":[{"Value": "pci-dss","Comparison":"PREFIX"}]}' \
    --max-items 1
```

Output:

```
{
    "Findings": [
        {
            "SchemaVersion": "2018-10-08",
            "Id": "arn:aws:securityhub:us-west-2:123456789012:subscription/pci-dss/

For more information, see Filtering findings in Security Hub CSPM in the *AWS Security Hub User Guide*.

- For API details, see GetFindings in *AWS CLI Command Reference*.

`get-insight-results`

The following code example shows how to use `get-insight-results`.

AWS CLI

To retrieve the results for an insight

The following `get-insight-results` example returns the list of insight results for the insight with the specified ARN.

```
aws securityhub get-insight-results \
    --insight-arn "arn:aws:securityhub:us-west-2:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
```

```
    "InsightResults": {
        "GroupByAttribute": "ResourceId",
        "InsightArn": "arn:aws:securityhub:us-
west-2:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "ResultValues": [
            {
                "Count": 10,
                "GroupByAttributeValue": "AWS::::Account:123456789111"
            },
            {
                "Count": 3,
                "GroupByAttributeValue": "AWS::::Account:123456789222"
            }
        ]
    }
}
```

For more information, see Viewing and taking action on insight results and findings in the *AWS Security Hub User Guide*.

- For API details, see GetInsightResults in *AWS CLI Command Reference*.

`get-insights`

The following code example shows how to use `get-insights`.

AWS CLI

To retrieve details about an insight

The following `get-insights` example retrieves the configuration details for the insight with the specified ARN.

```
aws securityhub get-insights \
    --insight-arns "arn:aws:securityhub:us-west-2:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Insights": [
```

```
        {
            "Filters": {
                "ResourceType": [
                    {
                        "Comparison": "EQUALS",
                        "Value": "AwsIamRole"
                    }
                ],
                "SeverityLabel": [
                    {
                        "Comparison": "EQUALS",
                        "Value": "CRITICAL"
                    }
                ]
            },
            "GroupByAttribute": "ResourceId",
            "InsightArn": "arn:aws:securityhub:us-
west-2:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
            "Name": "Critical role findings"
        }
    ]
}
```

For more information, see Insights in AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see GetInsights in *AWS CLI Command Reference*.

`get-invitations-count`

The following code example shows how to use `get-invitations-count`.

AWS CLI

To retrieve the number of invitations that were not accepted

The following `get-invitations-count` example retrieves the number of invitations that the requesting account declined or did not respond to.

```
aws securityhub get-invitations-count
```

Output:

```
{
    "InvitationsCount": 3
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetInvitationsCount in *AWS CLI Command Reference*.

`get-master-account`

The following code example shows how to use `get-master-account`.

AWS CLI

To retrieve information about an administrator account

The following `get-master-account` example retrieves information about the administrator account for the requesting account.

```
aws securityhub get-master-account
```

Output:

```
{
    "Master": {
        "AccountId": "123456789012",
        "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
        "InvitedAt": "2020-06-01T20:21:18.042000+00:00",
        "MemberStatus": "ASSOCIATED"
    }
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetMasterAccount in *AWS CLI Command Reference*.

`get-members`

The following code example shows how to use `get-members`.

AWS CLI

To retrieve information about selected member accounts

The following `get-members` example retrieves information about the specified member accounts.

```
aws securityhub get-members \
    --account-ids "123456789111" "123456789222"
```

Output:

```
{
    "Members": [
        {
            "AccountId": "123456789111",
            "AdministratorId": "123456789012",
            "InvitedAt": "2020-06-01T20:15:15.289000+00:00",
            "MasterId": "123456789012",
            "MemberStatus": "ASSOCIATED",
            "UpdatedAt": "2020-06-01T20:15:15.289000+00:00"
        },
        {
            "AccountId": "123456789222",
            "AdministratorId": "123456789012",
            "InvitedAt": "2020-06-01T20:15:15.289000+00:00",
            "MasterId": "123456789012",
            "MemberStatus": "ASSOCIATED",
            "UpdatedAt": "2020-06-01T20:15:15.289000+00:00"
        }
    ],
    "UnprocessedAccounts": [ ]
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetMembers in *AWS CLI Command Reference*.

`get-security-control-definition`

The following code example shows how to use `get-security-control-definition`.

AWS CLI

To get security control definition details

The following `get-security-control-definition` example retrieves definition details for a Security Hub security control. Details include the control title, description, Region availability, parameters, and other information.

```
aws securityhub get-security-control-definition \
    --security-control-id ACM.1
```

Output:

```
{
    "SecurityControlDefinition": {
        "SecurityControlId": "ACM.1",
        "Title": "Imported and ACM-issued certificates should be renewed after a
 specified time period",
        "Description": "This control checks whether an AWS Certificate Manager
 (ACM) certificate is renewed within the specified time period. It checks both
 imported certificates and certificates provided by ACM. The control fails if the
 certificate isn't renewed within the specified time period. Unless you provide a
 custom parameter value for the renewal period, Security Hub uses a default value of
 30 days.",
        "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/ACM.1/
remediation",
        "SeverityRating": "MEDIUM",
        "CurrentRegionAvailability": "AVAILABLE",
        "ParameterDefinitions": {
            "daysToExpiration": {
                "Description": "Number of days within which the ACM certificate must
 be renewed",
                "ConfigurationOptions": {
                    "Integer": {
                        "DefaultValue": 30,
                        "Min": 14,
                        "Max": 365
                    }
                }
            }
        }
    }
```

```
}
```

For more information, see Custom control parameters in the *AWS Security Hub User Guide*.

- For API details, see GetSecurityControlDefinition in *AWS CLI Command Reference*.

`invite-members`

The following code example shows how to use `invite-members`.

AWS CLI

To send invitations to member accounts

The following `invite-members` example sends invitations to the specified member accounts.

```
aws securityhub invite-members \
    --account-ids "123456789111" "123456789222"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see InviteMembers in *AWS CLI Command Reference*.

`list-automation-rules`

The following code example shows how to use `list-automation-rules`.

AWS CLI

To view a list of automation rules

The following `list-automation-rules` example lists the automation rules for an AWS account. Only the Security Hub administrator account can run this command.

```
aws securityhub list-automation-rules \
    --max-results 3 \
    --next-token NULL
```

Output:

```
{
    "AutomationRulesMetadata": [
        {
            "RuleArn": "arn:aws:securityhub:us-west-2:123456789012:automation-rule/

            "UpdatedAt": "2023-07-15T23:45:25.126000+00:00",
```

```
            "CreatedBy": "arn:aws:iam::123456789012:role/Admin"
        }
    ]
}
```

For more information, see Viewing automation rules in the *AWS Security Hub User Guide*.

- For API details, see ListAutomationRules in *AWS CLI Command Reference*.

`list-configuration-policies`

The following code example shows how to use `list-configuration-policies`.

AWS CLI

To list configuration policy summaries

The following `list-configuration-policies` example lists a summary of configuration policies for the organization.

```
aws securityhub list-configuration-policies \
    --max-items 3
```

Output:

```
{
    "ConfigurationPolicySummaries": [
        {
            "Arn": "arn:aws:securityhub:us-west-2:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "SampleConfigurationPolicy1",
            "Description": "SampleDescription1",
            "UpdatedAt": "2023-09-26T21:08:36.214000+00:00",
            "ServiceEnabled": true
        },
        {
            "Arn": "arn:aws:securityhub:us-west-2:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Name": "SampleConfigurationPolicy2",
            "Description": "SampleDescription2",
```

```
            "UpdatedAt": "2023-11-28T19:26:25.207000+00:00",
            "ServiceEnabled": true
        },
        {
            "Arn": "arn:aws:securityhub:us-west-2:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Name": "SampleConfigurationPolicy3",
            "Description": "SampleDescription3",
            "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
            "ServiceEnabled": true
        }
    ]
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see ListConfigurationPolicies in *AWS CLI Command Reference*.

`list-configuration-policy-associations`

The following code example shows how to use `list-configuration-policy-associations`.

AWS CLI

To list configuration associations

The following `list-configuration-policy-associations` example lists a summary of configuration associations for the organization. The response include associations with configuration policies and self-managed behavior.

```
aws securityhub list-configuration-policy-associations \
    --filters '{"AssociationType": "APPLIED"}' \
    --max-items 4
```

Output:

```
{
    "ConfigurationPolicyAssociationSummaries": [
        {
```

```
            "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TargetId": "r-1ab2",
            "TargetType": "ROOT",
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-11-28T19:26:49.417000+00:00",
            "AssociationStatus": "FAILED",
            "AssociationStatusMessage": "Policy association failed because 2
 organizational units or accounts under this root failed."
        },
        {
            "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "TargetId": "ou-1ab2-c3de4f5g",
            "TargetType": "ORGANIZATIONAL_UNIT",
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-09-26T21:14:05.283000+00:00",
            "AssociationStatus": "FAILED",
            "AssociationStatusMessage": "One or more children under this target
 failed association."
        },
        {
            "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "TargetId": "ou-6hi7-8j91kl2m",
            "TargetType": "ORGANIZATIONAL_UNIT",
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
            "AssociationStatus": "SUCCESS",
            "AssociationStatusMessage": "Association applied successfully on this
 target."
        },
        {
            "ConfigurationPolicyId": "SELF_MANAGED_SECURITY_HUB",
            "TargetId": "123456789012",
            "TargetType": "ACCOUNT",
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-11-28T22:01:26.409000+00:00",
            "AssociationStatus": "SUCCESS"
        }
    ]
}
```

For more information, see Viewing configuration policy status and details in the *AWS Security Hub User Guide*.

- For API details, see ListConfigurationPolicyAssociations in *AWS CLI Command Reference*.

`list-enabled-products-for-import`

The following code example shows how to use `list-enabled-products-for-import`.

AWS CLI

To return the list of enabled product integrations

The following `list-enabled-products-for-import` example returns the list of subscription ARNS for the currently enabled product integrations.

```
aws securityhub list-enabled-products-for-import
```

Output:

```
{
    "ProductSubscriptions": [ "arn:aws:securityhub:us-west-2:123456789012:product-subscription/crowdstrike/crowdstrike-falcon", "arn:aws:securityhub:us-west-2:123456789012:product-subscription/aws/securityhub" ]
}
```

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see ListEnabledProductsForImport in *AWS CLI Command Reference*.

`list-finding-aggregators`

The following code example shows how to use `list-finding-aggregators`.

AWS CLI

To list the available widgets

The following `list-finding-aggregators` example returns the ARN of the finding aggregation configuration.

```
aws securityhub list-finding-aggregators
```

Output:

```
{
```

```
    "FindingAggregators": [
        {
            "FindingAggregatorArn": "arn:aws:securityhub:us-
west-2:123456789012:finding-aggregator/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Viewing the current finding aggregation configuration in the *AWS Security Hub User Guide*.

- For API details, see ListFindingAggregators in *AWS CLI Command Reference*.

`list-invitations`

The following code example shows how to use `list-invitations`.

AWS CLI

To display a list of invitations

The following `list-invitations` example retrieves the list of invitations sent to the requesting account.

```
aws securityhub list-invitations
```

Output:

```
{
    "Invitations": [
        {
            "AccountId": "123456789012",
            "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
            "InvitedAt": "2020-06-01T20:21:18.042000+00:00",
            "MemberStatus": "ASSOCIATED"
        }
    ]
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see ListInvitations in *AWS CLI Command Reference*.

`list-members`

The following code example shows how to use `list-members`.

AWS CLI

To retrieve a list of member accounts

The following `list-members` example returns the list of member accounts for the requesting administrator account.

```
aws securityhub list-members
```

Output:

```
{
    "Members": [
        {
            "AccountId": "123456789111",
            "AdministratorId": "123456789012",
            "InvitedAt": "2020-06-01T20:15:15.289000+00:00",
            "MasterId": "123456789012",
            "MemberStatus": "ASSOCIATED",
            "UpdatedAt": "2020-06-01T20:15:15.289000+00:00"
        },
        {
            "AccountId": "123456789222",
            "AdministratorId": "123456789012",
            "InvitedAt": "2020-06-01T20:15:15.289000+00:00",
            "MasterId": "123456789012",
            "MemberStatus": "ASSOCIATED",
            "UpdatedAt": "2020-06-01T20:15:15.289000+00:00"
        }
    ]
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see ListMembers in *AWS CLI Command Reference*.

`list-organization-admin-accounts`

The following code example shows how to use `list-organization-admin-accounts`.

AWS CLI

To list the designated Security Hub administrator accounts

The following `list-organization-admin-accounts` example lists the Security Hub administrator accounts for an organization.

```
aws securityhub list-organization-admin-accounts
```

Output:

```
{
    "AdminAccounts": [
        {
            "AccountId": "123456789012",
            "Status": "ENABLED"
        }
    ]
}
```

For more information, see Designating a Security Hub administrator account in the *AWS Security Hub User Guide*.

- For API details, see ListOrganizationAdminAccounts in *AWS CLI Command Reference*.

`list-security-control-definitions`

The following code example shows how to use `list-security-control-definitions`.

AWS CLI

Example 1: To list all available security controls

The following `list-security-control-definitions` example lists the available security controls across all Security Hub standards. This example limits the results to three controls.

```
aws securityhub list-security-control-definitions \
```

```
    --max-items 3
```

Output:

```
{
    "SecurityControlDefinitions": [
        {
            "SecurityControlId": "ACM.1",
            "Title": "Imported and ACM-issued certificates should be renewed after a
 specified time period",
            "Description": "This control checks whether an AWS Certificate Manager
 (ACM) certificate is renewed within the specified time period. It checks both
 imported certificates and certificates provided by ACM. The control fails if the
 certificate isn't renewed within the specified time period. Unless you provide a
 custom parameter value for the renewal period, Security Hub uses a default value of
 30 days.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
ACM.1/remediation",
            "SeverityRating": "MEDIUM",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": [
                "Parameters"
            ]
        },
        {
            "SecurityControlId": "ACM.2",
            "Title": "RSA certificates managed by ACM should use a key length of at
 least 2,048 bits",
            "Description": "This control checks whether RSA certificates managed by
 AWS Certificate Manager use a key length of at least 2,048 bits. The control fails
 if the key length is smaller than 2,048 bits.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
ACM.2/remediation",
            "SeverityRating": "HIGH",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": []
        },
        {
            "SecurityControlId": "APIGateway.1",
            "Title": "API Gateway REST and WebSocket API execution logging should be
 enabled",
            "Description": "This control checks whether all stages of an Amazon
 API Gateway REST or WebSocket API have logging enabled. The control fails if
```

```
 the 'loggingLevel' isn't 'ERROR' or 'INFO' for all stages of the API. Unless you
 provide custom parameter values to indicate that a specific log type should be
 enabled, Security Hub produces a passed finding if the logging level is either
 'ERROR' or 'INFO'.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
APIGateway.1/remediation",
            "SeverityRating": "MEDIUM",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": [
                "Parameters"
            ]
        }
    ],
    "NextToken": "U2FsdGVkX1/UprCPzxVbkDeHikDXbDxfgJZ1w2RG1XWsFPTMTIQPVE0m/

+NYawjocVBeos6xzn/8qnbF9IuwGg=="
}
```

For more information, see Viewing details for a standard in the *AWS Security Hub User Guide*.

Example 2: To list available security controls for a specific standard

The following `list-security-control-definitions` example lists the available security controls for the CIS AWS Foundations Benchmark v1.4.0. This example limits the results to three controls.

```
aws securityhub list-security-control-definitions \
    --standards-arn "arn:aws:securityhub:us-west-2::standards/cis-aws-foundations-
benchmark/v/1.4.0" \
    --max-items 3
```

Output:

```
{
    "SecurityControlDefinitions": [
        {
            "SecurityControlId": "CloudTrail.1",
            "Title": "CloudTrail should be enabled and configured with at least one
 multi-Region trail that includes read and write management events",
            "Description": "This AWS control checks that there is at least one
 multi-region AWS CloudTrail trail includes read and write management events.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
CloudTrail.1/remediation",
```

```
            "SeverityRating": "HIGH",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": []
        },
        {

For more information, see Viewing details for a standard in the *AWS Security Hub User Guide*.

- For API details, see ListSecurityControlDefinitions in *AWS CLI Command Reference*.

`list-standards-control-associations`

The following code example shows how to use `list-standards-control-associations`.

AWS CLI

To get the enablement status of a control in each enabled standard

The following `list-standards-control-associations` example lists the enablement status of CloudTrail.1 in each enabled standard.

```
aws securityhub list-standards-control-associations \
    --security-control-id CloudTrail.1
```

Output:

```
{
    "StandardsControlAssociationSummaries": [

For more information, see Enabling and disabling controls in specific standards in the *AWS Security Hub User Guide*.

- For API details, see ListStandardsControlAssociations in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve the tags assigned to a resource

The following `list-tags-for-resource` example returns the tags assigned to the specified hub resource.

```
aws securityhub list-tags-for-resource \
    --resource-arn "arn:aws:securityhub:us-west-2:123456789012:hub/default"
```

Output:

```
{
    "Tags": {
        "Department" : "Operations",
        "Area" : "USMidwest"
    }
}
```

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-configuration-policy-association`

The following code example shows how to use `start-configuration-policy-association`.

AWS CLI

Example 1: To associate a configuration policy

The following `start-configuration-policy-association` example associates the specified configuration policy with the specified organizational unit. A configuration may be associated with a target account, organizational unit, or the root.

```
aws securityhub start-configuration-policy-association \
    --configuration-policy-identifier "arn:aws:securityhub:us-
west-2:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333" \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```
{
    "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "TargetId": "ou-6hi7-8j91kl2m",
    "TargetType": "ORGANIZATIONAL_UNIT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-11-29T17:40:52.468000+00:00",
    "AssociationStatus": "PENDING"
}
```

For more information, see Creating and associating Security Hub configuration policies in the *AWS Security Hub User Guide*.

Example 2: To associate a self-managed configuration

The following `start-configuration-policy-association` example associates a self-managed configuration with the specified account.

```
aws securityhub start-configuration-policy-association \
    --configuration-policy-identifier "SELF_MANAGED_SECURITY_HUB" \
```

```
    --target '{"OrganizationalUnitId": "123456789012"}'
```

Output:

```
{
    "ConfigurationPolicyId": "SELF_MANAGED_SECURITY_HUB",
    "TargetId": "123456789012",
    "TargetType": "ACCOUNT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-11-29T17:40:52.468000+00:00",
    "AssociationStatus": "PENDING"
}
```

For more information, see Creating and associating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see StartConfigurationPolicyAssociation in *AWS CLI Command Reference*.

`start-configuration-policy-disassociation`

The following code example shows how to use `start-configuration-policy-disassociation`.

AWS CLI

Example 1: To disassociate a configuration policy

The following `start-configuration-policy-disassociation` example disassociates a configuration policy from the specified organizational unit. A configuration may be disassociated from a target account, organizational unit, or the root.

```
aws securityhub start-configuration-policy-disassociation \
    --configuration-policy-identifier "arn:aws:securityhub:us-
west-2:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333" \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

This command produces no output.

For more information, see Disassociating a configuration from accounts and OUs in the *AWS Security Hub User Guide*.

Example 2: To disassociate a self-managed configuration

The following `start-configuration-policy-disassociation` example disassociates a self-managed configuration from the specified account.

```
aws securityhub start-configuration-policy-disassociation \
    --configuration-policy-identifier "SELF_MANAGED_SECURITY_HUB" \
    --target '{"AccountId": "123456789012"}'
```

This command produces no output.

For more information, see Disassociating a configuration from accounts and OUs in the *AWS Security Hub User Guide*.

- For API details, see StartConfigurationPolicyDisassociation in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To assign a tag to a resource

The following `tag-resource` example assigns values for the Department and Area tags to the specified hub resource.

```
aws securityhub tag-resource \
    --resource-arn "arn:aws:securityhub:us-west-2:123456789012:hub/default" \
    --tags '{"Department":"Operations", "Area":"USMidwest"}'
```

This command produces no output.

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag value from a resource

The following `untag-resource` example removes the Department tag from the specified hub resource.

```
aws securityhub untag-resource \
    --resource-arn "arn:aws:securityhub:us-west-2:123456789012:hub/default" \
    --tag-keys "Department"
```

This command produces no output.

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-action-target`

The following code example shows how to use `update-action-target`.

AWS CLI

To update a custom action

The following `update-action-target` example updates the name of the custom action identified by the specified ARN.

```
aws securityhub update-action-target \
    --action-target-arn "arn:aws:securityhub:us-west-2:123456789012:action/custom/
Remediation" \
    --name "Send to remediation"
```

This command produces no output.

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see UpdateActionTarget in *AWS CLI Command Reference*.

`update-configuration-policy`

The following code example shows how to use `update-configuration-policy`.

AWS CLI

To update a configuration policy

The following `update-configuration-policy` example updates an existing configuration policy to use the specified settings.

```
aws securityhub update-configuration-policy \
    --identifier "arn:aws:securityhub:us-west-2:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name "SampleConfigurationPolicyUpdated" \
    --description "SampleDescriptionUpdated" \
    --configuration-policy '{"SecurityHub": {"ServiceEnabled":
 true, "EnabledStandardIdentifiers": ["arn:aws:securityhub:us-
west-2::standards/aws-foundational-security-best-practices/
v/1.0.0","arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"],"SecurityControlsConfiguration":{"DisabledSecurityControlIdentifiers":
 ["CloudWatch.1"], "SecurityControlCustomParameters": [{"SecurityControlId":
 "ACM.1", "Parameters": {"daysToExpiration": {"ValueType": "CUSTOM", "Value":
 {"Integer": 21}}}}]}}}' \
    --updated-reason "Disabling CloudWatch.1 and changing parameter value"
```

Output:

```
{
    "Arn": "arn:aws:securityhub:us-west-2:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Name": "SampleConfigurationPolicyUpdated",
    "Description": "SampleDescriptionUpdated",

    "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
    "ConfigurationPolicy": {
        "SecurityHub": {
            "ServiceEnabled": true,
            "EnabledStandardIdentifiers": [
                "arn:aws:securityhub:us-west-2::standards/aws-foundational-security-
best-practices/v/1.0.0",
                "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
            ],
            "SecurityControlsConfiguration": {
                "DisabledSecurityControlIdentifiers": [
                    "CloudWatch.1"
                ],
                "SecurityControlCustomParameters": [
                    {
```

```
                        "SecurityControlId": "ACM.1",
                        "Parameters": {
                            "daysToExpiration": {
                                "ValueType": "CUSTOM",
                                "Value": {
                                    "Integer": 21
                                }
                            }
                        }
                    }
                ]
            }
        }
    }
}
```

For more information, see Updating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see UpdateConfigurationPolicy in *AWS CLI Command Reference*.

`update-finding-aggregator`

The following code example shows how to use `update-finding-aggregator`.

AWS CLI

To update the current finding aggregation configuration

The following `update-finding-aggregator` example changes the finding aggregation configuration to link from selected Regions. It is run from US East (Virginia), which is the aggregation Region. It selects US West (N. California) and US West (Oregon) as the linked Regions.

```
aws securityhub update-finding-aggregator \
    --region us-east-1 \
    --finding-aggregator-arn arn:aws:securityhub:us-east-1:123456789012:finding-aggregator/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --region-linking-mode SPECIFIED_REGIONS \
    --regions us-west-1,us-west-2
```

This command produces no output.

For more information, see Updating the finding aggregation configuration in the *AWS Security Hub User Guide*.

- For API details, see UpdateFindingAggregator in *AWS CLI Command Reference*.

`update-insight`

The following code example shows how to use `update-insight`.

AWS CLI

Example 1: To change the filter for a custom insight

The following `update-insight` example changes the filters for a custom insight. The updated insight looks for findings with a high severity that are related to AWS roles.

```
aws securityhub update-insight \
    --insight-arn "arn:aws:securityhub:us-west-2:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --filters '{"ResourceType": [{ "Comparison": "EQUALS", "Value": "AwsIamRole"}],
 "SeverityLabel": [{"Comparison": "EQUALS", "Value": "HIGH"}]}' \
    --name "High severity role findings"
```

This command produces no output.

Example 2: To change the grouping attribute for a custom insight

The following `update-insight` example changes the grouping attribute for the custom insight with the specified ARN. The new grouping attribute is the resource ID.

```
aws securityhub update-insight \
    --insight-arn "arn:aws:securityhub:us-west-2:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --group-by-attribute "ResourceId" \
    --name "Critical role findings"
```

This command produces no output.

For more information, see Managing custom insights in the *AWS Security Hub User Guide*.

- For API details, see UpdateInsight in *AWS CLI Command Reference*.

update-organization-configuration

The following code example shows how to use update-organization-configuration.

AWS CLI

To update how Security Hub is configured for an organization

The following update-organization-configuration example specifies that Security Hub should use central configuration to configure an organization. After running this command, the delegated Security Hub administrator can create and manage configuration policies to configure the organization. The delegated administrator can also use this command to switch from central to local configuration. If local configuration is the configuration type, the delegated administrator can choose whether to automatically enable Security Hub and default security standards in new organization accounts.

```
aws securityhub update-organization-configuration \
    --no-auto-enable \
    --organization-configuration '{"ConfigurationType": "CENTRAL"}'
```

This command produces no output.

For more information, see Managing accounts with AWS Organizations in the *AWS Security Hub User Guide*.

- For API details, see UpdateOrganizationConfiguration in *AWS CLI Command Reference*.

update-security-control

The following code example shows how to use update-security-control.

AWS CLI

To update security control properties

The following update-security-control example specifies custom values for a Security Hub security control parameter.

```
aws securityhub update-security-control \
    --security-control-id ACM.1 \
    --parameters '{"daysToExpiration": {"ValueType": "CUSTOM", "Value": {"Integer":
 15}}}' \
```

```
    --last-update-reason "Internal compliance requirement"
```

This command produces no output.

For more information, see Custom control parameters in the *AWS Security Hub User Guide*.

- For API details, see UpdateSecurityControl in *AWS CLI Command Reference*.

`update-security-hub-configuration`

The following code example shows how to use `update-security-hub-configuration`.

AWS CLI

To update Security Hub configuration

The following `update-security-hub-configuration` example configures Security Hub to automatically enable new controls for enabled standards.

```
aws securityhub update-security-hub-configuration \
    --auto-enable-controls
```

This command produces no output.

For more information, see Enabling new controls in enabled standards automatically in the *AWS Security Hub User Guide*.

- For API details, see UpdateSecurityHubConfiguration in *AWS CLI Command Reference*.

`update-standards-control`

The following code example shows how to use `update-standards-control`.

AWS CLI

Example 1: To disable a control

The following `update-standards-control` example disables the PCI.AutoScaling.1 control.

```
aws securityhub update-standards-control \
    --standards-control-arn "arn:aws:securityhub:us-west-2:123456789012:control/pci-dss/v/3.2.1/PCI.AutoScaling.1" \
```

```
    --control-status "DISABLED" \
    --disabled-reason "Not applicable for my service"
```

This command produces no output.

Example 2: To enable a control

The following `update-standards-control` example enables the PCI.AutoScaling.1 control.

```
aws securityhub update-standards-control \
    --standards-control-arn "arn:aws:securityhub:us-west-2:123456789012:control/pci-dss/v/3.2.1/PCI.AutoScaling.1" \
    --control-status "ENABLED"
```

This command produces no output.

For more information, see Disabling and enabling individual controls in the *AWS Security Hub User Guide*.

- For API details, see UpdateStandardsControl in *AWS CLI Command Reference*.

Security Lake examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Security Lake.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-aws-log-source`

The following code example shows how to use `create-aws-log-source`.

AWS CLI

To add a natively supported Amazon Web Service as an Amazon Security Lake source

The following `create-aws-log-source` example adds VPC Flow Logs as a Security Lake source in the designated accounts and Regions.

```
aws securitylake create-aws-log-source \
    --sources '[{"regions": ["us-west-2"], "accounts": ["123456789012"],
 "sourceName": "SH_FINDINGS", "sourceVersion": "2.0"}]'
```

Output:

```
{
    "failed": [
        "123456789012"
    ]
}
```

For more information, see Adding an AWS service as a source in the *Amazon Security Lake User Guide*.

- For API details, see CreateAwsLogSource in *AWS CLI Command Reference*.

`create-custom-log-source`

The following code example shows how to use `create-custom-log-source`.

AWS CLI

To add a custom source as an Amazon Security Lake source

The following `create-custom-log-source` example adds a custom source as a Security Lake source in the designated log provider account and the designated Region.

```
aws securitylake create-custom-log-source \
    --source-name "VPC_FLOW" \
    --event-classes '["DNS_ACTIVITY", "NETWORK_ACTIVITY"]' \
    --configuration '{"crawlerConfiguration": {"roleArn": "arn:aws:glue:us-
west-2:123456789012:crawler/E1WG1ZNPRXT0D4"},"providerIdentity": {"principal":
 "123456789111","externalId": "123456789012"}}'
```

Output:

```
{
    "source": {
        "attributes": {
            "crawlerArn": "arn:aws:glue:us-west-2:123456789012:crawler/
E1WG1ZNPRXT0D4",
            "databaseArn": "arn:aws:glue:us-west-2:123456789012:database/
E1WG1ZNPRXT0D4",
            "tableArn": "arn:aws:glue:us-west-2:123456789012:table/E1WG1ZNPRXT0D4"
        },
        "provider": {
            "location": "amzn-s3-demo-bucket--usw2-az1--x-s3",
            "roleArn": "arn:aws:iam::123456789012:role/AmazonSecurityLake-Provider-
testCustom2-eu-west-2"
        },
        "sourceName": "testCustom2",
        "sourceVersion": "2.0"
    }
}
```

For more information, see Adding a custom source in the *Amazon Security Lake User Guide*.

- For API details, see CreateCustomLogSource in *AWS CLI Command Reference*.

`create-data-lake-exception-subscription`

The following code example shows how to use `create-data-lake-exception-subscription`.

AWS CLI

To send notifications of Security Lake exceptions

The following `create-data-lake-exception-subscription` example sends notifications of Security Lake exceptions to the specified account through SMS delivery. The exception message remains for the specified time period.

```
aws securitylake create-data-lake-exception-subscription \
    --notification-endpoint "123456789012" \
    --exception-time-to-live 30 \
    --subscription-protocol "sms"
```

This command produces no output.

For more information, see Troubleshooting Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see CreateDataLakeExceptionSubscription in *AWS CLI Command Reference*.

`create-data-lake-organization-configuration`

The following code example shows how to use `create-data-lake-organization-configuration`.

AWS CLI

To configure Security Lake in new organization accounts

The following `create-data-lake-organization-configuration` example enables Security Lake and the collection of the specified source events and logs in new organization accounts.

```
aws securitylake create-data-lake-organization-configuration \
    --auto-enable-new-account '[{"region":"us-west-2","sources":
[{"sourceName":"SH_FINDINGS","sourceVersion": "1.0"}]}]'
```

This command produces no output.

For more information, see Managing multiple accounts with AWS Organizations in the *Amazon Security Lake User Guide*.

- For API details, see CreateDataLakeOrganizationConfiguration in *AWS CLI Command Reference*.

`create-data-lake`

The following code example shows how to use `create-data-lake`.

AWS CLI

Example 1: To configure your data lake in multiple Regions

The following `create-data-lake` example enables Amazon Security Lake in multiple AWS Regions and configures your data lake.

```
aws securitylake create-data-lake \
    --configurations '[{"encryptionConfiguration":
 {"kmsKeyId":"S3_MANAGED_KEY"},"region":"us-east-1","lifecycleConfiguration":
 {"expiration":{"days":365},"transitions":
[{"days":60,"storageClass":"ONEZONE_IA"}]}}, {"encryptionConfiguration":
 {"kmsKeyId":"S3_MANAGED_KEY"},"region":"us-east-2","lifecycleConfiguration":
 {"expiration":{"days":365},"transitions":
[{"days":60,"storageClass":"ONEZONE_IA"}]}}]' \
    --meta-store-manager-role-arn "arn:aws:iam:us-east-1:123456789012:role/service-
role/AmazonSecurityLakeMetaStoreManager"
```

Output:

```
{
    "dataLakes": [
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-1:123456789012:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "S3_MANAGED_KEY"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 365
                },
                "transitions": [
                    {
                        "days": 60,
                        "storageClass": "ONEZONE_IA"
                    }
                ]
            },
            "region": "us-east-1",
            "replicationConfiguration": {
                "regions": [

default",
            "encryptionConfiguration": {
                "kmsKeyId": "S3_MANAGED_KEY"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 365
                },
                "transitions": [
                    {
                        "days": 60,
                        "storageClass": "ONEZONE_IA"
                    }
                ]
            },
            "region": "us-east-2",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:123456789012:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-2-
cehuifzl5rwmhm6m62h7zhvtseogr9",
            "updateStatus": {
                "exception": {},
                "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "status": "INITIALIZED"
            }
        }
    ]
}
```

For more information, see Getting started with Amazon Security Lake in the *Amazon Security Lake User Guide*.

Example 2: To configure your data lake in a single Region

The following `create-data-lake` example enables Amazon Security Lake in a single AWS Region and configures your data lake.

```
aws securitylake create-data-lake \
    --configurations '[{"encryptionConfiguration": {"kmsKeyId":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"},"region":"us-east-2","lifecycleConfiguration": {"expiration": {"days":500},"transitions":[{"days":30,"storageClass":"GLACIER"}]}}]' \
    --meta-store-manager-role-arn "arn:aws:iam:us-east-1:123456789012:role/service-role/AmazonSecurityLakeMetaStoreManager"
```

Output:

```
{
    "dataLakes": [
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-2:123456789012:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 500
                },
                "transitions": [
                    {
                        "days": 30,
                        "storageClass": "GLACIER"
                    }
                ]
            },
            "region": "us-east-2",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
```

```
                "roleArn": "arn:aws:securitylake:ap-northeast-3:123456789012:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-2-
cehuifzl5rwmhm6m62h7zhvtseogr9",
            "updateStatus": {
                "exception": {},
                "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
                "status": "INITIALIZED"
            }
        }
    ]
}
```

For more information, see Getting started with Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see CreateDataLake in *AWS CLI Command Reference*.

`create-subscriber-notification`

The following code example shows how to use `create-subscriber-notification`.

AWS CLI

To create a subscriber notification

The following `create-subscriber-notification` example shows how to specify subscriber notification to create a notification when new data is written to the data lake.

```
aws securitylake create-subscriber-notification \
    --subscriber-id "12345ab8-1a34-1c34-1bd4-12345ab9012" \
    --configuration '{"httpsNotificationConfiguration":
 {"targetRoleArn":"arn:aws:iam::XXX:role/service-role/RoleName",
 "endpoint":"https://account-management.$3.$2.securitylake.aws.dev/v1/datalake"}}'
```

Output:

```
{
    "subscriberEndpoint": "https://account-management.$3.$2.securitylake.aws.dev/v1/
datalake"
}
```

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see CreateSubscriberNotification in *AWS CLI Command Reference*.

`create-subscriber`

The following code example shows how to use `create-subscriber`.

AWS CLI

Example 1: To create a subscriber with data access

The following `create-subscriber` example creates a subscriber in Security Lake with access to data in the current AWS Region for the specified subscriber identity for an AWS source.

```
aws securitylake create-subscriber \
    --access-types "S3" \
    --sources '[{"awsLogSource": {"sourceName": "VPC_FLOW","sourceVersion":
 "2.0"}}]' \
    --subscriber-name 'opensearch-s3' \
    --subscriber-identity '{"principal": "123456789111","externalId":
 "123456789012"}'
```

Output:

```
{
    "subscriber": {
        "accessTypes": [
            "S3"
        ],
        "createdAt": "2024-07-17T19:08:26.787000+00:00",
        "roleArn": "arn:aws:iam::123456789012:role/AmazonSecurityLake-896f218b-
cfba-40be-a255-8b49a65d0407",
        "s3BucketArn": "arn:aws:s3:::amzn-s3-demo-bucket",
        "sources": [
            {
                "awsLogSource": {
                    "sourceName": "VPC_FLOW",
                    "sourceVersion": "2.0"
                }
            }
        ],
```

```
        "subscriberArn": "arn:aws:securitylake:us-west-2:123456789012:subscriber/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "subscriberId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "subscriberIdentity": {
            "externalId": "123456789012",
            "principal": "123456789111"
        },
        "subscriberName": "opensearch-s3",
        "subscriberStatus": "ACTIVE",
        "updatedAt": "2024-07-17T19:08:27.133000+00:00"
    }
}
```

For more information, see Creating a subscriber with data access in the *Amazon Security Lake User Guide*.

Example 2: To create a subscriber with query access

The following `create-subscriber` example creates a subscriber in Security Lake with query access in the current AWS Region for the specified subscriber identity.

```
aws securitylake create-subscriber \
    --access-types "LAKEFORMATION" \
    --sources '[{"awsLogSource": {"sourceName": "VPC_FLOW","sourceVersion":
 "2.0"}}]' \
    --subscriber-name 'opensearch-s3' \
    --subscriber-identity '{"principal": "123456789111","externalId":
 "123456789012"}'
```

Output:

```
{
    "subscriber": {
        "accessTypes": [
            "LAKEFORMATION"
        ],
        "createdAt": "2024-07-18T01:05:55.853000+00:00",
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "resourceShareName": "LakeFormation-V2-NAMENAMENA-123456789012",
        "sources": [
            {
                "awsLogSource": {
```

```
                    "sourceName": "VPC_FLOW",
                    "sourceVersion": "2.0"
                }
            }
        ],
        "subscriberArn": "arn:aws:securitylake:us-west-2:123456789012:subscriber/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "subscriberId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "subscriberIdentity": {
            "externalId": "123456789012",
            "principal": "123456789111"
        },
        "subscriberName": "opensearch-s3",
        "subscriberStatus": "ACTIVE",
        "updatedAt": "2024-07-18T01:05:58.393000+00:00"
    }
}
```

For more information, see Creating a subscriber with query access in the *Amazon Security Lake User Guide*.

- For API details, see CreateSubscriber in *AWS CLI Command Reference*.

`delete-aws-log-source`

The following code example shows how to use `delete-aws-log-source`.

AWS CLI

To remove a natively-supported AWS service.

The following `delete-aws-log-source` example deletes VPC Flow Logs as a Security Lake source in the designated accounts and Regions.

```
aws securitylake delete-aws-log-source \
    --sources '[{"regions": ["us-west-2"], "accounts": ["123456789012"],
 "sourceName": "SH_FINDINGS", "sourceVersion": "2.0"}]'
```

Output:

```
{
    "failed": [
```

```
        "123456789012"
    ]
}
```

For more information, see Removing an AWS service as a source in the *Amazon Security Lake User Guide*.

- For API details, see DeleteAwsLogSource in *AWS CLI Command Reference*.

`delete-custom-log-source`

The following code example shows how to use `delete-custom-log-source`.

AWS CLI

To remove a custom source.

The following `delete-custom-log-source` example deletes a custom source in the designated log provider account in the designated Region.

```
aws securitylake delete-custom-log-source \
    --source-name "CustomSourceName"
```

This command produces no output.

For more information, see Deleting a custom source in the *Amazon Security Lake User Guide*.

- For API details, see DeleteCustomLogSource in *AWS CLI Command Reference*.

`delete-data-lake-organization-configuration`

The following code example shows how to use `delete-data-lake-organization-configuration`.

AWS CLI

To stop automatic source collection in member accounts

The following `delete-data-lake-organization-configuration` example stops the automatic collection of AWS Security Hub findings from new member accounts that join the organization. Only the delegated Security Lake administrator can run this command. It prevents new member accounts from automatically contributing data to the data lake.

```
aws securitylake delete-data-lake-organization-configuration \
    --auto-enable-new-account '[{"region":"us-west-2","sources":
[{"sourceName":"SH_FINDINGS"}]}]'
```

This command produces no output.

For more information, see Managing multiple accounts with AWS Organizations in the *Amazon Security Lake User Guide*.

- For API details, see DeleteDataLakeOrganizationConfiguration in *AWS CLI Command Reference*.

`delete-data-lake`

The following code example shows how to use `delete-data-lake`.

AWS CLI

To disable your data lake

The following `delete-data-lake` example disables your data lake in the specified AWS Regions. In the specified Regions, sources no longer contribute data to the data lake. For a Security Lake deployment utilizing AWS Organizations, only the delegated Security Lake administrator for the organization can disable Security Lake for accounts in the organization.

```
aws securitylake delete-data-lake \
    --regions "ap-northeast-1" "eu-central-1"
```

This command produces no output.

For more information, see Disabling Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see DeleteDataLake in *AWS CLI Command Reference*.

`delete-subscriber-notification`

The following code example shows how to use `delete-subscriber-notification`.

AWS CLI

To delete a subscriber notification

The following `delete-subscriber-notification` example shows how to delete the subscriber notification for specific Security Lake subscriber.

```
aws securitylake delete-subscriber-notification \
    --subscriber-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see DeleteSubscriberNotification in *AWS CLI Command Reference*.

`delete-subscriber`

The following code example shows how to use `delete-subscriber`.

AWS CLI

To delete a subscriber

The following `delete-subscriber` example shows how to remove a subscriber if you no longer want a subscriber to consume data from Security Lake.

```
aws securitylake delete-subscriber \
    --subscriber-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see DeleteSubscriber in *AWS CLI Command Reference*.

`get-data-lake-exception-subscription`

The following code example shows how to use `get-data-lake-exception-subscription`.

AWS CLI

To get details about an exception subscription

The following `get-data-lake-exception-subscription` example provides details about a Security Lake exception subscription. In this example, the user of the specified AWS account is notified of errors through SMS delivery. The exception message remains in the account for

the specified time period. An exception subscription notifies a Security Lake user about an error through the requester's preferred protocol.

```
aws securitylake get-data-lake-exception-subscription
```

Output:

```
{
    "exceptionTimeToLive": 30,
    "notificationEndpoint": "123456789012",
    "subscriptionProtocol": "sms"
}
```

For more information, see Troubleshooting data lake status in the *Amazon Security Lake User Guide*.

- For API details, see GetDataLakeExceptionSubscription in *AWS CLI Command Reference*.

`get-data-lake-organization-configuration`

The following code example shows how to use `get-data-lake-organization-configuration`.

AWS CLI

To get details about the configuration for new organization accounts

The following `get-data-lake-organization-configuration` example retrieves details about the source logs that new organization accounts will send after onboarding to Amazon Security Lake.

```
aws securitylake get-data-lake-organization-configuration
```

Output:

```
{
    "autoEnableNewAccount": [
        {
            "region": "us-west-2",
            "sources": [
                {
```

```
                    "sourceName": "VPC_FLOW",
                    "sourceVersion": "1.0"
                },
                {
                    "sourceName": "ROUTE53",
                    "sourceVersion": "1.0"
                },
                {
                    "sourceName": "SH_FINDINGS",
                    "sourceVersion": "1.0"
                }
            ]
        }
    ]
}
```

For more information, see Managing multiple accounts with AWS Organizations in the *Amazon Security Lake User Guide*.

- For API details, see GetDataLakeOrganizationConfiguration in *AWS CLI Command Reference*.

`get-data-lake-sources`

The following code example shows how to use `get-data-lake-sources`.

AWS CLI

To get the status of log collection

The following `get-data-lake-sources` example gets a snapshot of log collection for the specified account in the current AWS Region. The account has Amazon Security Lake enabled.

```
aws securitylake get-data-lake-sources \
    --accounts "123456789012"
```

Output:

```
{
    "dataLakeSources": [
        {
            "account": "123456789012",
            "sourceName": "SH_FINDINGS",
            "sourceStatuses": [
```

```
                {
                    "resource": "vpc-1234567890abcdef0",
                    "status": "COLLECTING"
                }
            ]
        },
        {
            "account": "123456789012",

For more information, see Collecting data from AWS services in the *Amazon Security Lake User Guide*.

- For API details, see GetDataLakeSources in *AWS CLI Command Reference*.

`get-subscriber`

The following code example shows how to use `get-subscriber`.

AWS CLI

To retrieve the subscription information

The following `get-subscriber` example retrieves the subscription information for the specified Security Lake subscriber.

```
aws securitylake get-subscriber \
    --subscriber-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "subscriber": {
        "accessTypes": [
            "LAKEFORMATION"
        ],
        "createdAt": "2024-04-19T15:19:44.421803+00:00",
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/

- For API details, see GetSubscriber in *AWS CLI Command Reference*.

`list-data-lake-exceptions`

The following code example shows how to use `list-data-lake-exceptions`.

AWS CLI

To list the issues affecting your data lake

The following `list-data-lake-exceptions` example lists the issues that are affecting your data lake in the last 14 days in the specified AWS Regions.

```
aws securitylake list-data-lake-exceptions \
    --regions "us-east-1" "eu-west-3"
```

Output:

```
{
    "exceptions": [
        {
            "exception": "The account does not have the required role permissions.
 Update your role permissions to use the new data source version.",
            "region": "us-east-1",
            "timestamp": "2024-02-29T12:24:15.641725+00:00"
        },
        {
            "exception": "The account does not have the required role permissions.
 Update your role permissions to use the new data source version.",
            "region": "eu-west-3",
            "timestamp": "2024-02-29T12:24:15.641725+00:00"
        }
    ]
}
```

For more information, see Troubleshooting Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see ListDataLakeExceptions in *AWS CLI Command Reference*.

`list-data-lakes`

The following code example shows how to use `list-data-lakes`.

AWS CLI

To list the Security Lake configuration object

The following `list-data-lakes` example lists the Amazon Security Lake configuration object for the specified AWS Region. You can use this command to determine whether Security Lake is enabled in a specified Region or Regions.

```
aws securitylake list-data-lakes \
    --regions "us-east-1"
```

Output:

```
{
    "dataLakes": [
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-1:123456789012:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "S3_MANAGED_KEY"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 365
                },
                "transitions": [
                    {
                        "days": 60,
                        "storageClass": "ONEZONE_IA"
                    }
                ]
            },
            "region": "us-east-1",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:123456789012:data-
lake/default"
            },

east-1-1234567890abcdef0",
            "updateStatus": {
                "exception": {
                    "code": "software.amazon.awssdk.services.s3.model.S3Exception",
                    "reason": ""
                },
                "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "status": "FAILED"
            }
```

```
        }
    ]
}
```

For more information, see Checking Region status in the *Amazon Security Lake User Guide*.

- For API details, see ListDataLakes in *AWS CLI Command Reference*.

`list-log-sources`

The following code example shows how to use `list-log-sources`.

AWS CLI

To retrieve the Amazon Security Lake log sources

The following `list-log-sources` example lists the Amazon Security Lake log sources in a specified account.

```
aws securitylake list-log-sources \
    --accounts "123456789012"
```

Output:

```
{
    "sources": [
        {
            "account": "123456789012",
            "region": "xy-region-1",
            "sources": [
                {
                    "awsLogSource": {
                        "sourceName": "VPC_FLOW",
                        "sourceVersion": "2.0"
                    }
                },
                {
                    "awsLogSource": {
                        "sourceName": "SH_FINDINGS",
                        "sourceVersion": "2.0"
                    }
                }
```

```
            ]
        }
    ]
}
```

For more information, see Source management in the *Amazon Security Lake User Guide*.

- For API details, see ListLogSources in *AWS CLI Command Reference*.

`list-subscribers`

The following code example shows how to use `list-subscribers`.

AWS CLI

To retrieve the Amazon Security Lake subscribers

The following `list-subscribers` example lists all the Amazon Security Lake subscribers in a specific account.

```
aws securitylake list-subscribers
```

Output:

```
{
    "subscribers": [
        {
            "accessTypes": [
                "S3"
            ],
            "createdAt": "2024-06-04T15:02:28.921000+00:00",
            "roleArn": "arn:aws:iam::123456789012:role/AmazonSecurityLake-
E1WG1ZNPRXT0D4",
            "s3BucketArn": "amzn-s3-demo-bucket--usw2-az1--x-s3",
            "sources": [
                {
                    "awsLogSource": {
                        "sourceName": "CLOUD_TRAIL_MGMT",
                        "sourceVersion": "2.0"
                    }
                },
                {
```

```
                    "awsLogSource": {
                        "sourceName": "LAMBDA_EXECUTION",
                        "sourceVersion": "1.0"
                    }
                },
                {
                    "customLogSource": {
                        "attributes": {
                            "crawlerArn": "arn:aws:glue:us-
west-2:123456789012:crawler/E1WG1ZNPRXT0D4",
                            "databaseArn": "arn:aws:glue:us-
west-2:123456789012:database/E1WG1ZNPRXT0D4",
                            "tableArn": "arn:aws:glue:us-west-2:123456789012:table/
E1WG1ZNPRXT0D4"

west-2:123456789012:AmazonSecurityLake-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111-Main-
Queue",
            "subscriberId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "subscriberIdentity": {
                "externalId": "ext123456789012",
                "principal": "123456789012"
            },
            "subscriberName": "Test",
            "subscriberStatus": "ACTIVE",
            "updatedAt": "2024-06-04T15:02:35.617000+00:00"
        }
    ]
}
```

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see ListSubscribers in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for an existing resource

The following `list-tags-for-resource` example lists tags for the specified Amazon Security Lake subscriber. In this example, the Owner tag key doesn't have an associated tag value. You can use this operation to list tags for other existing Security Lake resources as well.

```
aws securitylake list-tags-for-resource \
    --resource-arn "arn:aws:securitylake:us-west-2:123456789012:subscriber/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "tags": [
        {
            "key": "Environment",
            "value": "Cloud"
        },
        {
            "key": "CostCenter",
            "value": "12345"
        },
        {
            "key": "Owner",
            "value": ""
        }
    ]
}
```

For more information, see Tagging Amazon Security Lake resources in the *Amazon Security Lake User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`register-data-lake-delegated-administrator`

The following code example shows how to use `register-data-lake-delegated-administrator`.

AWS CLI

To designate the delegated administratore

The following `register-data-lake-delegated-administrator` example designates the specified AWS account as the delegated Amazon Security Lake administrator.

```
aws securitylake register-data-lake-delegated-administrator \
    --account-id 123456789012
```

This command produces no output.

For more information, see Managing multiple accounts with AWS Organizations in the *Amazon Security Lake User Guide*.

- For API details, see RegisterDataLakeDelegatedAdministrator in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to an existing resource

The following `tag-resource` example add tags to an existing subscriber resource. To create a new resource and add one or more tags to it, don't use this operation. Instead, use the appropriate Create operation for the the type of resource that you want to create.

```
aws securitylake tag-resource \
    --resource-arn "arn:aws:securitylake:us-west-2:123456789012:subscriber/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --tags key=Environment,value=Cloud
```

This command produces no output.

For more information, see Tagging Amazon Security Lake resources in the *Amazon Security Lake User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from an existing resource

The following `untag-resource` example removes the specified tags from an existing subscriber resource.

```
aws securitylake untag-resource \
    --resource-arn "arn:aws:securitylake:us-west-2:123456789012:subscriber/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --tag-keys Environment Owner
```

This command produces no output.

For more information, see Tagging Amazon Security Lake resources in the *Amazon Security Lake User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-data-lake-exception-subscription`

The following code example shows how to use `update-data-lake-exception-subscription`.

AWS CLI

To update notification subscription for Security Lake exceptions

The following `update-data-lake-exception-subscription` example updates the notification subscription that notifies users of Security Lake exceptions.

```
aws securitylake update-data-lake-exception-subscription \
    --notification-endpoint "123456789012" \
    --exception-time-to-live 30 \
```

```
    --subscription-protocol "email"
```

This command produces no output.

For more information, see Troubleshooting Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see UpdateDataLakeExceptionSubscription in *AWS CLI Command Reference*.

`update-data-lake`

The following code example shows how to use `update-data-lake`.

AWS CLI

Example 1: To update your data lake settings

The following `update-data-lake` example updates the settings of your Amazon Security Lake data lake. You can use this operation to specify data encryption, storage, and rollup Region settings.

```
aws securitylake update-data-lake \
    --configurations '[{"encryptionConfiguration":
 {"kmsKeyId":"S3_MANAGED_KEY"},"region":"us-east-1","lifecycleConfiguration":
 {"expiration":{"days":365},"transitions":
[{"days":60,"storageClass":"ONEZONE_IA"}]}}, {"encryptionConfiguration":
 {"kmsKeyId":"S3_MANAGED_KEY"},"region":"us-east-2","lifecycleConfiguration":
 {"expiration":{"days":365},"transitions":
[{"days":60,"storageClass":"ONEZONE_IA"}]}}]' \
    --meta-store-manager-role-arn "arn:aws:iam:us-east-1:123456789012:role/service-
role/AmazonSecurityLakeMetaStoreManager"
```

Output:

```
{
    "dataLakes": [
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-1:123456789012:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "S3_MANAGED_KEY"
            },
```

```
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 365
                },
                "transitions": [
                    {
                        "days": 60,
                        "storageClass": "ONEZONE_IA"
                    }
                ]
            },
            "region": "us-east-1",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:123456789012:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-1-
gnevt6s8z7bzby8oi3uiaysbr8v2ml",
            "updateStatus": {
                "exception": {},
                "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "status": "INITIALIZED"
            }
        },
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-2:123456789012:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "S3_MANAGED_KEY"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 365
                },
                "transitions": [
                    {
                        "days": 60,
                        "storageClass": "ONEZONE_IA"
                    }
                ]
```

```
            },
            "region": "us-east-2",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:123456789012:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-2-
cehuifzl5rwmhm6m62h7zhvtseogr9",
            "updateStatus": {
                "exception": {},
                "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "status": "INITIALIZED"
            }
        }
    ]
}
```

For more information, see Getting started with Amazon Security Lake in the *Amazon Security Lake User Guide*.

Example 2: To configure your data lake in a single Region

The following `update-data-lake` example configures your Amazon Security Lake data lake in a single AWS Region.

```
aws securitylake update-data-lake \
    --configurations '[{"encryptionConfiguration": {"kmsKeyId":"a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"},"region":"us-east-2","lifecycleConfiguration": {"expiration":
{"days":500},"transitions":[{"days":30,"storageClass":"GLACIER"}]}}]' \
    --meta-store-manager-role-arn "arn:aws:iam:us-east-1:123456789012:role/service-
role/AmazonSecurityLakeMetaStoreManager"
```

Output:

```
{
    "dataLakes": [
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-2:123456789012:data-lake/
default",
```

```
            "encryptionConfiguration": {
                "kmsKeyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 500
                },
                "transitions": [
                    {
                        "days": 30,
                        "storageClass": "GLACIER"
                    }
                ]
            },
            "region": "us-east-2",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:123456789012:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-2-
cehuifzl5rwmhm6m62h7zhvtseogr9",
            "updateStatus": {
                "exception": {},
                "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
                "status": "INITIALIZED"
            }
        }
    ]
}
```

For more information, see Getting started with Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see UpdateDataLake in *AWS CLI Command Reference*.

`update-subscriber-notification`

The following code example shows how to use `update-subscriber-notification`.

AWS CLI

To update a subscriber notification

The following `update-subscriber-notification` example shows how you can update the notification method for a subscriber.

```
aws securitylake update-subscriber-notification \
    --subscriber-id "12345ab8-1a34-1c34-1bd4-12345ab9012" \
    --configuration '{"httpsNotificationConfiguration":
 {"targetRoleArn":"arn:aws:iam::XXX:role/service-role/RoleName",
 "endpoint":"https://account-management.$3.$2.securitylake.aws.dev/v1/datalake"}}'
```

Output:

```
{
    "subscriberEndpoint": "https://account-management.$3.$2.securitylake.aws.dev/v1/
datalake"
}
```

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see UpdateSubscriberNotification in *AWS CLI Command Reference*.

`update-subscriber`

The following code example shows how to use `update-subscriber`.

AWS CLI

To update an Amazon Security Lake subscriber.

The following `update-subscriber` example updates the security lake data access sources for a specific Security Lake subscriber.

```
aws securitylake update-subscriber \
    --subscriber-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "subscriber": {
```

```
        "accessTypes": [
            "LAKEFORMATION"
        ],
        "createdAt": "2024-04-19T15:19:44.421803+00:00",

    }
}
```

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see UpdateSubscriber in *AWS CLI Command Reference*.

AWS Serverless Application Repository examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Serverless Application Repository.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`put-application-policy`

The following code example shows how to use `put-application-policy`.

AWS CLI

Example 1: To share an application publicly

The following `put-application-policy` example shares an application publicly, so anyone can find and deploy your application in the AWS Serverless Application Repository.

```
aws serverlessrepo put-application-policy \
    --application-id arn:aws:serverlessrepo:us-west-2:123456789012:applications/my-test-application \
    --statements Principals='*',Actions=Deploy
```

Output:

```
{
    "Statements": [
        {
            "Actions": [
                "Deploy"
            ],
            "Principals": [
                ""
            ],
            "StatementId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

Example 2: To share an application privately

The following `put-application-policy` example shares an application privately, so only specific AWS accounts can find and deploy your application in the AWS Serverless Application Repository.

```
aws serverlessrepo put-application-policy \
    --application-id arn:aws:serverlessrepo:us-west-2:123456789012:applications/my-test-application \
    --statements Principals=123456789111,123456789222,Actions=Deploy
```

Output:

```
{
    "Statements": [
        {
            "Actions": [
                "Deploy"
            ],
            "Principals": [
                "123456789111",
                "123456789222"
            ],
            "StatementId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Sharing an Application Through the AWS CLI in the *AWS Serverless Application Repository Developer Guide*.

- For API details, see PutApplicationPolicy in *AWS CLI Command Reference*.

Service Catalog examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Service Catalog.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-portfolio-share`

The following code example shows how to use `accept-portfolio-share`.

AWS CLI

To accept a portfolio share

The following `accept-portfolio-share` example accepts an offer, made by another user, to share the specified portfolio.

```
aws servicecatalog accept-portfolio-share \
    --portfolio-id port-2s6wuabcdefghijk
```

This command produces no output.

For more information, see Sharing and Importing Portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see AcceptPortfolioShare in *AWS CLI Command Reference*.

`associate-principal-with-portfolio`

The following code example shows how to use `associate-principal-with-portfolio`.

AWS CLI

To associate a principal with a portfolio

The following `associate-principal-with-portfolio` example associates a user with the specified portfolio.

```
aws servicecatalog associate-principal-with-portfolio \
    --portfolio-id port-2s6abcdefwdh4 \
    --principal-arn arn:aws:iam::123456789012:user/usertest \
    --principal-type IAM
```

This command produces no output.

For more information, see Granting Access to Users in the *AWS Service Catalog Administrator Guide*.

- For API details, see AssociatePrincipalWithPortfolio in *AWS CLI Command Reference*.

`associate-product-with-portfolio`

The following code example shows how to use `associate-product-with-portfolio`.

AWS CLI

To associate a product with a portfolio

The following `associate-product-with-portfolio` example associates the given product with the specified portfolio.

```
aws servicecatalog associate-product-with-portfolio \
    --product-id prod-3p5abcdef3oyk \
    --portfolio-id port-2s6abcdef5wdh4
```

This command produces no output.

For more information, see Adding products to portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see AssociateProductWithPortfolio in *AWS CLI Command Reference*.

`associate-tag-option-with-resource`

The following code example shows how to use `associate-tag-option-with-resource`.

AWS CLI

To associate a TagOption with a resource

The following `associate-tag-option-with-resource` example associates the specified TagOption with the specified resource.

```
aws servicecatalog associate-tag-option-with-resource \
    --resource-id port-2s6abcdq5wdh4 \
    --tag-option-id tag-p3abc2pkpz5qc
```

This command produces no output.

For more information, see AWS Service Catalog TagOption Library in the *AWS Service Catalog Administrator Guide*.

- For API details, see AssociateTagOptionWithResource in *AWS CLI Command Reference*.

`copy-product`

The following code example shows how to use `copy-product`.

AWS CLI

To copy a product

The following `copy-product` example makes a copy of the specified product, using a JSON file to pass parameters.

```
aws servicecatalog copy-product \
    --cli-input-json file://copy-product-input.json
```

Contents of `copy-product-input.json`:

```
{
    "SourceProductArn": "arn:aws:catalog:us-west-2:123456789012:product/prod-
tcabcd3syn2xy",
    "TargetProductName": "copy-of-myproduct",
    "CopyOptions": [
        "CopyTags"
    ]
}
```

Output:

```
{
    "CopyProductToken": "copyproduct-abc5defgjkdji"
}
```

For more information, see Managing Products in the *AWS Service Catalog Administrator Guide*.

- For API details, see CopyProduct in *AWS CLI Command Reference*.

`create-constraint`

The following code example shows how to use `create-constraint`.

AWS CLI

To create a constraints

The following `create-constraint` example creates a constraint.

```
aws servicecatalog create-constraint \
    --portfolio-id port-y3fnkesxxxxx \
    --product-id prod-cfrfxmraxxxxx \
    --type LAUNCH \
    --parameters '{"RoleArn" : "arn:aws:iam::123456789012:role/LaunchRole"}'
```

Output:

```
{
    "ConstraintDetail": {
        "ConstraintId": "cons-7tr6gei4bxxxx",
        "Type": "LAUNCH",
        "Owner": "123456789012",
        "ProductId": "prod-cfrfxmra3xxxx",
        "PortfolioId": "port-y3fnkeslpxxxx"
    },
    "ConstraintParameters": "{\"RoleArn\" : \"arn:aws:iam::123456789012:role/
LaunchRole\"}",
    "Status": "CREATING"
}
```

For more information, see Using AWS Service Catalog Constraints in the *AWS Service Catalog User Guide*.

- For API details, see CreateConstraint in *AWS CLI Command Reference*.

`create-portfolio-share`

The following code example shows how to use `create-portfolio-share`.

AWS CLI

To share a portfolio with an account

The following `create-portfolio-share` example shares the specified portfolio with the specified account.

```
aws servicecatalog create-portfolio-share \
    --portfolio-id port-2s6abcdef5wdh4 \
    --account-id 123456789012
```

This command produces no output.

For more information, see Sharing a Portfolio in the *AWS Service Catalog Administrator Guide*.

- For API details, see CreatePortfolioShare in *AWS CLI Command Reference*.

`create-portfolio`

The following code example shows how to use `create-portfolio`.

AWS CLI

To create a portfolio

The following `create-portfolio` example creates a portfolio.

```
aws servicecatalog create-portfolio  \
    --provider-name my-provider \
    --display-name my-portfolio
```

Output:

```
{
    "PortfolioDetail": {
        "ProviderName": "my-provider",
        "DisplayName": "my-portfolio",
        "CreatedTime": 1571337221.555,
        "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-2s6xmplq5wdh4",
        "Id": "port-2s6xmplq5wdh4"
    }
}
```

For more information, see Creating and Deleting Portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see CreatePortfolio in *AWS CLI Command Reference*.

`create-product`

The following code example shows how to use `create-product`.

AWS CLI

To create a product

The following `create-product` example creates a product, using a JSON file to pass parameters.

```
aws servicecatalog create-product \
    --cli-input-json file://create-product-input.json
```

Contents of `create-product-input.json`:

```
{
    "AcceptLanguage": "en",
    "Name": "test-product",
    "Owner": "test-owner",
    "Description": "test-description",
    "Distributor": "test-distributor",
    "SupportDescription": "test-support",
    "SupportEmail": "test@amazon.com",
    "SupportUrl": "https://aws.amazon.com",
    "ProductType": "CLOUD_FORMATION_TEMPLATE",
    "Tags": [
        {
            "Key": "region",
            "Value": "us-west-2"
        }
    ],
    "ProvisioningArtifactParameters": {
        "Name": "test-version-name",
        "Description": "test-version-description",
        "Info": {
            "LoadTemplateFromURL": "https://s3-us-west-1.amazonaws.com/
cloudformation-templates-us-west-1/my-cfn-template.template"
        },
        "Type": "CLOUD_FORMATION_TEMPLATE"
```

```
    }
}
```

Output:

```
{
    "Tags": [
        {
            "Key": "region",
            "Value": "us-west-2"
        }
    ],
    "ProductViewDetail": {
        "CreatedTime": 1576025036.0,
        "ProductARN": "arn:aws:catalog:us-west-2:1234568542028:product/
prod-3p5abcdef3oyk",
        "Status": "CREATED",
        "ProductViewSummary": {
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "Distributor": "test-distributor",

            "SupportEmail": "test@amazon.com",
            "Id": "prodview-abcd42wvx45um",
            "SupportDescription": "test-support",
            "ShortDescription": "test-description",
            "Owner": "test-owner",
            "Name": "test-product2",
            "HasDefaultPath": false,
            "ProductId": "prod-3p5abcdef3oyk"
        }
    },
    "ProvisioningArtifactDetail": {
        "CreatedTime": 1576025036.0,
        "Active": true,
        "Id": "pa-pq3p5lil12a34",
        "Description": "test-version-description",
        "Name": "test-version-name",
        "Type": "CLOUD_FORMATION_TEMPLATE"
    }
}
```

For more information, see Creating Products in the *AWS Service Catalog Administrator Guide*.

- For API details, see CreateProduct in *AWS CLI Command Reference*.

`create-provisioned-product-plan`

The following code example shows how to use `create-provisioned-product-plan`.

AWS CLI

To create a plan

The following `create-provisioned-product-plan` example creates a plan.

```
aws servicecatalog create-provisioned-product-plan \
    --plan-name test-plan \
    --plan-type CLOUDFORMATION \
    --product-id prod-cfrfxmraxxxxx \
    --provisioned-product-name test-pp \
    --provisioning-artifact-id pa-7wz4cu5cxxxxx
```

Output:

```
{
    "PlanName": "test-plan",
    "PlanId": "plan-cuxae3z6gxxxx",
    "ProvisionProductId": "pp-7kh7wbc4xxxxx",
    "ProvisionedProductName": "test-pp",
    "ProvisioningArtifactId": "pa-7wz4cu5cxxxxx"
}
```

For more information, see Creating a launch plan in the *AWS Service Catalog User Guide*.

- For API details, see CreateProvisionedProductPlan in *AWS CLI Command Reference*.

`create-provisioning-artifact`

The following code example shows how to use `create-provisioning-artifact`.

AWS CLI

To create a provisioning artifact

The following `create-provisioning-artifact` example creates a provisioning artifact, using a JSON file to pass parameters.

```
aws servicecatalog create-provisioning-artifact \
```

```
    --cli-input-json file://create-provisioning-artifact-input.json
```

Contents of `create-provisioning-artifact-input.json`:

```
{
    "ProductId": "prod-nfi2abcdefghi",
    "Parameters": {
        "Name": "test-provisioning-artifact",
        "Description": "test description",
        "Info": {
            "LoadTemplateFromURL": "https://s3-us-west-1.amazonaws.com/
cloudformation-templates-us-west-1/my-cfn-template.template"
        },
        "Type": "CLOUD_FORMATION_TEMPLATE"
    }
}
```

Output:

```
{
    "Info": {
        "TemplateUrl": "https://s3-us-west-1.amazonaws.com/cloudformation-templates-
us-west-1/my-cfn-template.template"
    },
    "Status": "CREATING",
    "ProvisioningArtifactDetail": {
        "Id": "pa-bb4abcdefwnaio",
        "Name": "test-provisioning-artifact",
        "Description": "test description",
        "Active": true,
        "Type": "CLOUD_FORMATION_TEMPLATE",
        "CreatedTime": 1576022545.0
    }
}
```

For more information, see Managing Versions in the *AWS Service Catalog Administrator Guide*.

- For API details, see CreateProvisioningArtifact in *AWS CLI Command Reference*.

`create-tag-option`

The following code example shows how to use `create-tag-option`.

AWS CLI

To create a TagOption

The following `create-tag-option` example creates a TagOption.

```
aws servicecatalog create-tag-option \
    --key 1234 \
    --value name
```

Output:

```
{
    "TagOptionDetail": {
    "Id": "tag-iabcdn4fzjjms",
    "Value": "name",
    "Active": true,
    "Key": "1234"
    }
}
```

For more information, see AWS Service Catalog TagOption Library in the *AWS Service Catalog Administrator Guide*.

- For API details, see CreateTagOption in *AWS CLI Command Reference*.

`delete-constraint`

The following code example shows how to use `delete-constraint`.

AWS CLI

To delete a constraint

The following `delete-constraint` example deletes a constraint.

```
aws servicecatalog delete-constraint \
    --id cons-7tr6gei4bxxxx
```

This command produces no output.

For more information, see Using AWS Service Catalog Constraints in the *AWS Service Catalog User Guide*.

- For API details, see DeleteConstraint in *AWS CLI Command Reference*.

`delete-portfolio-share`

The following code example shows how to use `delete-portfolio-share`.

AWS CLI

To stop sharing a portfolio with an account

The following `delete-portfolio-share` example stops sharing the portfolio with the specified account.

```
aws servicecatalog delete-portfolio-share \
    --portfolio-id port-2s6abcdq5wdh4 \
    --account-id 123456789012
```

This command produces no output.

For more information, see Sharing and Importing Portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see DeletePortfolioShare in *AWS CLI Command Reference*.

`delete-portfolio`

The following code example shows how to use `delete-portfolio`.

AWS CLI

To delete a portfolio

The following `delete-portfolio` example deletes the specified portfolio.

```
aws servicecatalog delete-portfolio \
    --id port-abcdlx4gox4do
```

This command produces no output.

For more information, see Creating and Deleting Portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see DeletePortfolio in *AWS CLI Command Reference*.

`delete-product`

The following code example shows how to use `delete-product`.

AWS CLI

To delete a product

The following `delete-product` example deletes the specified product.

```
aws servicecatalog delete-product \
    --id prod-abcdcek6yhbxi
```

This command produces no output.

For more information, see Deleting products in the *AWS Service Catalog Administrator Guide*.

- For API details, see DeleteProduct in *AWS CLI Command Reference*.

`delete-provisioned-product-plan`

The following code example shows how to use `delete-provisioned-product-plan`.

AWS CLI

To delete a provisioned product plan

The following `delete-provisioned-product-plan` example deletes a provisioned product plan.

```
aws servicecatalog delete-provisioned-product-plan \
    --plan-id plan-cuxae3z6gxxxx
```

This command produces no output.

For more information, see Creating a launch plan in the *AWS Service Catalog User Guide*.

- For API details, see DeleteProvisionedProductPlan in *AWS CLI Command Reference*.

`delete-provisioning-artifact`

The following code example shows how to use `delete-provisioning-artifact`.

AWS CLI

To delete a provisioning artifact

The following `delete-provisioning-artifact` example deletes the specified provisioning artifact.

```
aws servicecatalog delete-provisioning-artifact \
    --product-id prod-abc2uebuplcpw \
    --provisioning-artifact-id pa-pqabcddii7ouc
```

This command produces no output.

For more information, see Managing Versions in the *AWS Service Catalog Administrator Guide*.

- For API details, see DeleteProvisioningArtifact in *AWS CLI Command Reference*.

`delete-tag-option`

The following code example shows how to use `delete-tag-option`.

AWS CLI

To delete a TagOption

The following `delete-tag-option` example deletes the specified TagOption.

```
aws servicecatalog delete-tag-option \
    --id tag-iabcdn4fzjjms
```

This command produces no output.

For more information, see AWS Service Catalog TagOption Library in the *AWS Service Catalog Administrator Guide*.

- For API details, see DeleteTagOption in *AWS CLI Command Reference*.

`describe-constraint`

The following code example shows how to use `describe-constraint`.

AWS CLI

To describe a constraint

The following `describe-constraint` example describes a constraint.

```
aws servicecatalog describe-constraint \
    --id "cons-oqp52evr4bxxxx"
```

Output:

```
{
    "ConstraintDetail": {
        "ConstraintId": "cons-7tr6gei4bxxxx",
        "Type": "LAUNCH",
        "Owner": "123456789012",
        "ProductId": "prod-cfrfxmra3xxxx",
        "PortfolioId": "port-y3fnkeslpxxxx"
    },
    "ConstraintParameters": "{\"RoleArn\" : \"arn:aws:iam::123456789012:role/
LaunchRole\"}",
    "Status": "AVAILABLE"
}
```

For more information, see Using AWS Service Catalog Constraints in the *AWS Service Catalog User Guide*.

- For API details, see DescribeConstraint in *AWS CLI Command Reference*.

`describe-copy-product-status`

The following code example shows how to use `describe-copy-product-status`.

AWS CLI

To describe the status of the copy product operation

The following `describe-copy-product-status` example displays the current status of the specified asynchronous copy product operation.

```
aws servicecatalog describe-copy-product-status \
    --copy-product-token copyproduct-znn5tf5abcd3w
```

Output:

```
{
    "CopyProductStatus": "SUCCEEDED",
    "TargetProductId": "prod-os6hog7abcdt2"
}
```

For more information, see Managing Products in the *AWS Service Catalog Administrator Guide*.

- For API details, see DescribeCopyProductStatus in *AWS CLI Command Reference*.

`describe-portfolio-share-status`

The following code example shows how to use `describe-portfolio-share-status`.

AWS CLI

To describe portfolio share status

The following `describe-portfolio-share-status` example describes portfolio share status.

```
aws servicecatalog describe-portfolio-share-status \
    --portfolio-share-token "share-agngcybu4xxxx"
```

Output:

```
{
    "PortfolioShareToken": "share-agngcybu4xxxx",
    "PortfolioId": "port-y3fnkeslxxxxx",
    "OrganizationNodeValue": "123456789012",
    "Status": "COMPLETED",
    "ShareDetails": {
        "SuccessfulShares": [
            "123456789111"
        ],
        "ShareErrors": []
    }
```

```
}
```

For more information, see Sharing a Portfolio in the *AWS Service Catalog User Guide*.

- For API details, see DescribePortfolioShareStatus in *AWS CLI Command Reference*.

`describe-portfolio-shares`

The following code example shows how to use `describe-portfolio-shares`.

AWS CLI

To describe portfolio shares

The following `describe-portfolio-shares` example describes portfolio shares.

```
aws servicecatalog describe-portfolio-shares \
    --portfolio-id port-y3fnkeslxxxxx \
    --type ACCOUNT
```

Output:

```
{
    "PortfolioShareDetails": [
        {
            "PrincipalId": "123456789012",
            "Type": "ACCOUNT",
            "Accepted": true,
            "ShareTagOptions": false,
            "SharePrincipals": false
        },
        {
            "PrincipalId": "123456789012",
            "Type": "ACCOUNT",
            "Accepted": false,
            "ShareTagOptions": false,
            "SharePrincipals": false
        }
    ]
}
```

For more information, see Sharing a Portfolio in the *AWS Service Catalog User Guide*.

- For API details, see DescribePortfolioShares in *AWS CLI Command Reference*.

`describe-portfolio`

The following code example shows how to use `describe-portfolio`.

AWS CLI

To describe a portfolio

The following `describe-portfolio` example displays details for the specified portfolio.

```
aws servicecatalog describe-portfolio \
    --id port-2s6abcdq5wdh4
```

Output:

```
{
    "TagOptions": [],
    "PortfolioDetail": {
        "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-2s6abcdq5wdh4",
        "Id": "port-2s6wuzyq5wdh4",
        "CreatedTime": 1571337221.555,
        "DisplayName": "my-portfolio",
        "ProviderName": "my-provider"
    },
    "Tags": []
}
```

For more information, see Managing Portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see DescribePortfolio in *AWS CLI Command Reference*.

`describe-product-as-admin`

The following code example shows how to use `describe-product-as-admin`.

AWS CLI

To describe a product as an administrator

The following `describe-product-as-admin` example displays details for the specified product using administrator privileges.

```
aws servicecatalog describe-product-as-admin \
    --id prod-abcdcek6yhbxi
```

Output:

```
{
    "TagOptions": [],
    "ProductViewDetail": {
        "ProductARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
abcdcek6yhbxi",
        "ProductViewSummary": {
            "SupportEmail": "test@amazon.com",
            "Type": "CLOUD_FORMATION_TEMPLATE",

        }
    ]
}
```

For more information, see Managing Products in the *AWS Service Catalog User Guide*.

- For API details, see DescribeProduct in *AWS CLI Command Reference*.

`describe-provisioned-product-plan`

The following code example shows how to use `describe-provisioned-product-plan`.

AWS CLI

To describe a provisioned product plan

The following `describe-provisioned-product-plan` example describes a provisioned product plan.

```
aws servicecatalog describe-provisioned-product-plan \
    --plan-id "plan-g7iwsaf3mxxxx"
```

Output:

```
{
    "ProvisionedProductPlanDetails": {
        "CreatedTime": "2025-11-09T18:09:37.808000-06:00",
        "PathId": "lpv3-y3fnkeslpxxxx",
        "ProductId": "prod-cfrfxmraxxxxx",
        "PlanName": "test-plan",
        "PlanId": "plan-g7iwsaf3mxxxx",
        "ProvisionProductId": "pp-mkbnbztzxxxxx",
        "ProvisionProductName": "test-pp",
        "PlanType": "CLOUDFORMATION",
        "ProvisioningArtifactId": "pa-7wz4cu5cxxxxx",
        "Status": "CREATE_SUCCESS",
        "UpdatedTime": "2025-11-09T18:09:46.524000-06:00",
        "Tags": []
    }
}
```

For more information, see Creating a launch plan in the *AWS Service Catalog User Guide*.

- For API details, see DescribeProvisionedProductPlan in *AWS CLI Command Reference*.

`describe-provisioned-product`

The following code example shows how to use `describe-provisioned-product`.

AWS CLI

To describe a provisioned product

The following `describe-provisioned-product` example displays details for the specified provisioned product.

```
aws servicecatalog describe-provisioned-product \
    --id pp-dpom27bm4abcd
```

Output:

```
{
    "ProvisionedProductDetail": {
        "Status": "ERROR",
        "CreatedTime": 1577222793.358,
```

```
        "Arn": "arn:aws:servicecatalog:us-west-2:123456789012:stack/mytestppname3/
pp-dpom27bm4abcd",
        "Id": "pp-dpom27bm4abcd",
        "StatusMessage": "AmazonCloudFormationException  Parameters: [KeyName]
 must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code:

        "LastRecordId": "rec-tfuawdjovzxge",
        "Type": "CFN_STACK",
        "Name": "mytestppname3"
    },
    "CloudWatchDashboards": []
}
```

For more information, see Managing Provisioned Products in the *AWS Service Catalog Administrator Guide*.

- For API details, see DescribeProvisionedProduct in *AWS CLI Command Reference*.

`describe-provisioning-artifact`

The following code example shows how to use `describe-provisioning-artifact`.

AWS CLI

To describe a provisioning artifact

The following `describe-provisioning-artifact` example displays details for the specified provisioning artifact.

```
aws servicecatalog describe-provisioning-artifact \
    --provisioning-artifact-id pa-pcz347abcdcfm \
    --product-id prod-abcdfz3syn2rg
```

Output:

```
{
    "Info": {
        "TemplateUrl": "https://awsdocs.s3.amazonaws.com/servicecatalog/
myexampledevelopment-environment.template"
    },
    "ProvisioningArtifactDetail": {
        "Id": "pa-pcz347abcdcfm",
```

```
        "Active": true,
        "Type": "CLOUD_FORMATION_TEMPLATE",
        "Description": "updated description",
        "CreatedTime": 1562097906.0,
        "Name": "updated name"
    },
    "Status": "AVAILABLE"
}
```

For more information, see Managing Versions in the *AWS Service Catalog Administrator Guide*.

- For API details, see DescribeProvisioningArtifact in *AWS CLI Command Reference*.

`describe-provisioning-parameters`

The following code example shows how to use `describe-provisioning-parameters`.

AWS CLI

To describe provisioning parameters

The following `describe-provisioning-parameters` example describes provisioning parameters.

```
aws servicecatalog describe-provisioning-parameters \
    --product-id prod-cfrfxmraxxxxx \
    --provisioning-artifact-id pa-7wz4cu5cxxxxx \
    --path-id lpv3-y3fnkeslpxxxx
```

Output:

```
{
    "ProvisioningArtifactParameters": [
        {
            "ParameterKey": "Size",
            "ParameterType": "String",
            "IsNoEcho": false,
            "ParameterConstraints": {
                "AllowedValues": []

For more information, see Launching a product in the *AWS Service Catalog User Guide*.

- For API details, see DescribeProvisioningParameters in *AWS CLI Command Reference*.

describe-tag-option

The following code example shows how to use `describe-tag-option`.

AWS CLI

To describe a TagOption

The following `describe-tag-option` example displays details for the specified TagOption.

```
aws servicecatalog describe-tag-option \
    --id tag-p3tej2abcd5qc
```

Output:

```
{
    "TagOptionDetail": {
        "Active": true,
        "Id": "tag-p3tej2abcd5qc",
        "Value": "value-3",
        "Key": "1234"
    }
}
```

For more information, see AWS Service Catalog TagOption Library in the *AWS Service Catalog Administrator Guide*.

- For API details, see DescribeTagOption in *AWS CLI Command Reference*.

disassociate-principal-from-portfolio

The following code example shows how to use `disassociate-principal-from-portfolio`.

AWS CLI

To disassociate a principal from a portfolio

The following `disassociate-principal-from-portfolio` example disassociates the specified principal from the portfolio.

```
aws servicecatalog disassociate-principal-from-portfolio \
    --portfolio-id port-2s6abcdq5wdh4 \
```

```
    --principal-arn arn:aws:iam::123456789012:group/myendusers
```

This command produces no output.

For more information, see Granting Access to Users in the *AWS Service Catalog Administrator Guide*.

- For API details, see DisassociatePrincipalFromPortfolio in *AWS CLI Command Reference*.

`disassociate-product-from-portfolio`

The following code example shows how to use `disassociate-product-from-portfolio`.

AWS CLI

To disassociate a product from a portfolio

The following `disassociate-product-from-portfolio` example disassociates the specified product from the portfolio.

```
aws servicecatalog disassociate-product-from-portfolio \
    --product-id prod-3p5abcdmu3oyk \
    --portfolio-id port-2s6abcdq5wdh4
```

This command produces no output.

For more information, see Adding products to portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see DisassociateProductFromPortfolio in *AWS CLI Command Reference*.

`disassociate-tag-option-from-resource`

The following code example shows how to use `disassociate-tag-option-from-resource`.

AWS CLI

To disassociate a TagOption from a resource

The following `disassociate-tag-option-from-resource` example disassociates the specified `TagOption` from the resource.

```
aws servicecatalog disassociate-tag-option-from-resource \
```

```
    --resource-id port-2s6abcdq5wdh4 \
    --tag-option-id tag-p3abc2pkpz5qc
```

This command produces no output.

For more information, see AWS Service Catalog TagOption Library in the *AWS Service Catalog Administrator Guide*.

- For API details, see DisassociateTagOptionFromResource in *AWS CLI Command Reference*.

`list-accepted-portfolio-shares`

The following code example shows how to use `list-accepted-portfolio-shares`.

AWS CLI

To list accepted portfolio shares

The following `list-accepted-portfolio-shares` example lists all portfolios for which sharing was accepted by this account, including only the default Service Catalog portfolios.

```
aws servicecatalog list-accepted-portfolio-shares \
    --portfolio-share-type "AWS_SERVICECATALOG"
```

Output:

```
{
    "PortfolioDetails": [
        {
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/port-
d2abcd5dpkuma",
            "Description": "AWS Service Catalog Reference blueprints for often-used
 AWS services such as EC2, S3, RDS, VPC and EMR.",
            "CreatedTime": 1574456190.687,
            "ProviderName": "AWS Service Catalog",
            "DisplayName": "Reference Architectures",
            "Id": "port-d2abcd5dpkuma"
        },
        {
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/port-
abcdefaua7zpu",
            "Description": "AWS well-architected blueprints for high reliability
 applications.",
```

```
            "CreatedTime": 1574461496.092,
            "ProviderName": "AWS Service Catalog",
            "DisplayName": "High Reliability Architectures",
            "Id": "port-abcdefaua7zpu"
        }
    ]
}
```

For more information, see Sharing and Importing Portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see ListAcceptedPortfolioShares in *AWS CLI Command Reference*.

`list-constraints-for-portfolio`

The following code example shows how to use `list-constraints-for-portfolio`.

AWS CLI

Example 1: To list all constraints for a portfolio

The following `list-constraints-for-portfolio` example lists all constraints for a portfolio.

```
aws servicecatalog list-constraints-for-portfolio \
    --portfolio-id port-y3fnkeslpxxxx
```

Output:

```
{
    "ConstraintDetails": [
        {
            "ConstraintId": "cons-dgdyqdqrxxxxx",
            "Type": "LAUNCH",
            "Description": "Launch as local role TestLaunchRole",
            "Owner": "123456789012",
            "ProductId": "prod-j6pd3hf6xxxxx",
            "PortfolioId": "port-y3fnkeslxxxxx"
        },
        {
            "ConstraintId": "cons-tzxjnj4l6xxxx",
            "Type": "RESOURCE_UPDATE",
            "Owner": "123456789012",
```

```
            "ProductId": "prod-sphewkokxxxxx",
            "PortfolioId": "port-y3fnkeslxxxxx"
        }
    ]
}
```

Example 2: To list constraints on a product

The following `list-constraints-for-portfolio` example lists constraints on a product.

```
aws servicecatalog list-constraints-for-portfolio \
    --portfolio-id port-y3fnkeslxxxxx \
    --product-id prod-j6pd3hf6xxxxx
```

Output:

```
{
    "ConstraintDetails": [
        {
            "ConstraintId": "cons-dgdyqdqrxxxxx",
            "Type": "LAUNCH",
            "Description": "Launch as local role TestLaunchRole",
            "Owner": "123456789012",
            "ProductId": "prod-j6pd3hf6xxxxx",
            "PortfolioId": "port-y3fnkeslxxxxx"
        }
    ]
}
```

For more information, see Using AWS Service Catalog Constraints in the *AWS Service Catalog User Guide*.

- For API details, see ListConstraintsForPortfolio in *AWS CLI Command Reference*.

`list-launch-paths`

The following code example shows how to use `list-launch-paths`.

AWS CLI

To list launch paths

The following `list-launch-paths` example lists launch paths for a portfolio.

```
aws servicecatalog list-launch-paths \
    --product-id prod-cfrfxmraxxxxx
```

Output:

```
{
    "LaunchPathSummaries": [
        {
            "Id": "lpv3-y3fnkeslpxxxx",
            "ConstraintSummaries": [
                {
                    "Type": "LAUNCH"
                }
            ],
            "Tags": [],
            "Name": "TestPort"
        }
    ]
}
```

For more information, see Granting Access to Users in the *AWS Service Catalog User Guide*.

- For API details, see ListLaunchPaths in *AWS CLI Command Reference*.

`list-portfolio-access`

The following code example shows how to use `list-portfolio-access`.

AWS CLI

To list accounts with access to a portfolio

The following `list-portfolio-access` example lists the AWS accounts that have access to the specified portfolio.

```
aws servicecatalog list-portfolio-access \
    --portfolio-id port-2s6abcdq5wdh4
```

Output:

```
{
```

```
    "AccountIds": [
        "123456789012"
    ]
}
```

For more information, see Sharing a Portfolio in the *AWS Service Catalog Administrator Guide*.

- For API details, see ListPortfolioAccess in *AWS CLI Command Reference*.

`list-portfolios-for-product`

The following code example shows how to use `list-portfolios-for-product`.

AWS CLI

To list portfolios associated with a product

The following `list-portfolios-for-product` example lists the portfolios associated with the specified product.

```
aws servicecatalog list-portfolios-for-product \
    --product-id prod-abcdfz3syn2rg
```

Output:

```
{
    "PortfolioDetails": [
        {
            "CreatedTime": 1571337221.555,
            "Id": "port-2s6abcdq5wdh4",
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-2s6abcdq5wdh4",
            "DisplayName": "my-portfolio",
            "ProviderName": "my-provider"
        },
        {
            "CreatedTime": 1559665256.348,
            "Id": "port-5abcd3e5st4ei",
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-5abcd3e5st4ei",
            "DisplayName": "test",
            "ProviderName": "provider-name"
        }
```

```
    ]
}
```

For more information, see Managing Portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see ListPortfoliosForProduct in *AWS CLI Command Reference*.

`list-portfolios`

The following code example shows how to use `list-portfolios`.

AWS CLI

To list portfolios

The following `list-portfolios` example lists the Service Catalog portfolios in the current Region.

```
aws servicecatalog list-portfolios
```

Output:

```
{
    "PortfolioDetails": [
        {
            "CreatedTime": 1559665256.348,
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-5pzcxmplst4ei",
            "DisplayName": "my-portfolio",
            "Id": "port-5pzcxmplst4ei",
            "ProviderName": "my-user"
        }
    ]
}
```

For more information, see Managing Portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see ListPortfolios in *AWS CLI Command Reference*.

`list-principals-for-portfolio`

The following code example shows how to use `list-principals-for-portfolio`.

AWS CLI

To list all principals for a portfolio

The following `list-principals-for-portfolio` example lists all principals for the specified portfolio.

```
aws servicecatalog list-principals-for-portfolio \
    --portfolio-id port-2s6abcdq5wdh4
```

Output:

```
{
    "Principals": [
        {
            "PrincipalARN": "arn:aws:iam::123456789012:user/usertest",
            "PrincipalType": "IAM"
        }
    ]
}
```

For more information, see Granting Access to Users in the *AWS Service Catalog Administrator Guide*.

- For API details, see ListPrincipalsForPortfolio in *AWS CLI Command Reference*.

`list-provisioning-artifacts`

The following code example shows how to use `list-provisioning-artifacts`.

AWS CLI

To list all provisioning artifacts for a product

The following `list-provisioning-artifacts` example lists all provisioning artifacts for the specified product.

```
aws servicecatalog list-provisioning-artifacts \
    --product-id prod-nfi2abcdefgcpw
```

Output:

```
{
    "ProvisioningArtifactDetails": [
        {
            "Id": "pa-abcdef54ipm6z",
            "Description": "test-version-description",
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "CreatedTime": 1576021147.0,
            "Active": true,
            "Name": "test-version-name"
        },
        {
            "Id": "pa-bb4zyxwwnaio",
            "Description": "test description",
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "CreatedTime": 1576022545.0,
            "Active": true,
            "Name": "test-provisioning-artifact-2"
        }
    ]
}
```

For more information, see Managing Versions in the *AWS Service Catalog Administrator Guide*.

- For API details, see ListProvisioningArtifacts in *AWS CLI Command Reference*.

`list-resources-for-tag-option`

The following code example shows how to use `list-resources-for-tag-option`.

AWS CLI

To list resources associated to a TagOption

The following `list-resources-for-tag-option` example lists the resources associated with the specified `TagOption`.

```
aws servicecatalog list-resources-for-tag-option \
    --tag-option-id tag-p3tej2abcd5qc
```

Output:

```
{
```

```
    "ResourceDetails": [
        {
            "ARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
abcdfz3syn2rg",
            "Name": "my product",
            "Description": "description",
            "CreatedTime": 1562097906.0,
            "Id": "prod-abcdfz3syn2rg"
        }
    ]
}
```

For more information, see AWS Service Catalog TagOption Library in the *AWS Service Catalog Administrator Guide*.

- For API details, see ListResourcesForTagOption in *AWS CLI Command Reference*.

`list-tag-options`

The following code example shows how to use `list-tag-options`.

AWS CLI

To list all TagOptions

The following `list-tag-options` example lists all values for `TagOptions`.

```
aws servicecatalog list-tag-options
```

Output:

```
{
    "TagOptionDetails": [
        {
            "Value": "newvalue",
            "Active": true,
            "Id": "tag-iabcdn4fzjjms",
            "Key": "1234"
        },
        {
            "Value": "value1",
            "Active": true,
            "Id": "tag-e3abcdvmwvrzy",
```

```
            "Key": "key"
        }
    ]
}
```

For more information, see AWS Service Catalog TagOption Library in the *AWS Service Catalog Administrator Guide*.

- For API details, see ListTagOptions in *AWS CLI Command Reference*.

`provision-product`

The following code example shows how to use `provision-product`.

AWS CLI

To provision a product

The following `provision-product` example provisions the specified product using the specified provisioning artifact.

```
aws servicecatalog provision-product \
    --product-id prod-abcdfz3syn2rg \
    --provisioning-artifact-id pa-abc347pcsccfm \
    --provisioned-product-name "mytestppname3"
```

Output:

```
{
    "RecordDetail": {
        "RecordId": "rec-tfuawdabcdege",
        "CreatedTime": 1577222793.362,
        "ProvisionedProductId": "pp-abcd27bm4mldq",
        "PathId": "lpv2-abcdg3jp6t5k6",
        "RecordErrors": [],
        "ProductId": "prod-abcdfz3syn2rg",
        "UpdatedTime": 1577222793.362,
        "RecordType": "PROVISION_PRODUCT",
        "ProvisionedProductName": "mytestppname3",
        "ProvisioningArtifactId": "pa-pcz347abcdcfm",
        "RecordTags": [],
        "Status": "CREATED",
```

```
        "ProvisionedProductType": "CFN_STACK"
    }
}
```

For more information, see Launching a product in the *AWS Service Catalog User Guide*.

- For API details, see ProvisionProduct in *AWS CLI Command Reference*.

`reject-portfolio-share`

The following code example shows how to use `reject-portfolio-share`.

AWS CLI

To reject a portfolio share

The following `reject-portfolio-share` example rejects the portfolio share for the given portfolio.

```
aws servicecatalog reject-portfolio-share \
    --portfolio-id port-2s6wuabcdefghijk
```

This command produces no output.

For more information, see Sharing and Importing Portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see RejectPortfolioShare in *AWS CLI Command Reference*.

`scan-provisioned-products`

The following code example shows how to use `scan-provisioned-products`.

AWS CLI

To list all available provisioned products

The following `scan-provisioned-products` example lists available provisioned products.

```
aws servicecatalog scan-provisioned-products
```

Output:

```
{
    "ProvisionedProducts": [
        {
            "Status": "ERROR",
            "Arn": "arn:aws:servicecatalog:us-west-2:123456789012:stack/
mytestppname3/pp-abcd27bm4mldq",
            "StatusMessage": "AmazonCloudFormationException  Parameters: [KeyName]
 must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code:
 ValidationError; Request ID: a1b2c3d4-5678-90ab-cdef-EXAMPLE11111)",
            "Id": "pp-abcd27bm4mldq",
            "Type": "CFN_STACK",
            "IdempotencyToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreatedTime": 1577222793.358,
            "Name": "mytestppname3",
            "LastRecordId": "rec-tfuawdabcdxge"
        }
    ]
}
```

For more information, see Managing Provisioned Products in the *AWS Service Catalog Administrator Guide*.

- For API details, see ScanProvisionedProducts in *AWS CLI Command Reference*.

`search-products-as-admin`

The following code example shows how to use `search-products-as-admin`.

AWS CLI

To search products with administrator privileges

The following `search-products-as-admin` example searches for products with admin privileges, using a portfolio ID as a filter.

```
aws servicecatalog search-products-as-admin \
    --portfolio-id port-5abcd3e5st4ei
```

Output:

```
{
    "ProductViewDetails": [
```

```
        {
            "ProductViewSummary": {
                "Name": "my product",
                "Owner": "owner name",
                "Type": "CLOUD_FORMATION_TEMPLATE",
                "ProductId": "prod-abcdfz3syn2rg",
                "HasDefaultPath": false,
                "Id": "prodview-abcdmyuzv2dlu",
                "ShortDescription": "description"
            },
            "ProductARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
abcdfz3syn2rg",
            "CreatedTime": 1562097906.0,
            "Status": "CREATED"
        }
    ]
}
```

For more information, see Managing Products in the *AWS Service Catalog Administrator Guide*.

- For API details, see SearchProductsAsAdmin in *AWS CLI Command Reference*.

`search-products`

The following code example shows how to use `search-products`.

AWS CLI

To get information about the products to which the caller has access

The following `search-products` example gets all the products the caller has access to.

```
aws servicecatalog search-products
```

Output:

```
{
    "ProductViewSummaries": [
        {
            "Id": "prodview-5uksdh4xxxxxx",
            "ProductId": "prod-j6fu3hxxxxxxxx",
            "Name": "TestSC",
            "Owner": "test",
```

```
            "ShortDescription": "",
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "Distributor": "",
            "HasDefaultPath": false,
            "SupportEmail": "",
            "SupportDescription": "",
            "SupportUrl": ""
        },
        {
            "Id": "prodview-3kfoaabxxxxxx",
            "ProductId": "prod-j6pd3xxxxxxxx",
            "Name": "TestProduct",
            "Owner": "test_owner",
            "ShortDescription": "",
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "Distributor": "",
            "HasDefaultPath": false,
            "SupportEmail": "",
            "SupportDescription": "",
            "SupportUrl": ""
        }
    ]
}
```

For more information, see Managing Products in the *AWS Service Catalog User Guide*.

- For API details, see SearchProducts in *AWS CLI Command Reference*.

`search-provisioned-products`

The following code example shows how to use `search-provisioned-products`.

AWS CLI

To search provisioned products

The following `search-provisioned-products` example searches for provisioned products matching the specified product ID, using a JSON file to pass parameters.

```
aws servicecatalog search-provisioned-products \
    --cli-input-json file://search-provisioned-products-input.json
```

Contents of `search-provisioned-products-input.json`:

```
{
    "Filters": {
        "SearchQuery": [
            "prod-tcjvfz3syn2rg"
        ]
    }
}
```

Output:

```
{
    "ProvisionedProducts": [
        {
            "ProvisioningArtifactId": "pa-pcz347abcdcfm",
            "Name": "mytestppname3",
            "CreatedTime": 1577222793.358,

    "TotalResultsCount": 1
}
```

For more information, see Managing Provisioned Products in the *AWS Service Catalog Administrator Guide*.

- For API details, see SearchProvisionedProducts in *AWS CLI Command Reference*.

`terminate-provisioned-product`

The following code example shows how to use `terminate-provisioned-product`.

AWS CLI

To terminate a provisioned product

The following `terminate-provisioned-product` example terminates a provisioned product.

```
aws servicecatalog terminate-provisioned-product \
    --provisioned-product-id pp-7z4t3k4hxxxxx
```

Output:

```
{
    "RecordDetail": {
```

```
        "RecordId": "rec-sbwnhzld3xxxx",
        "ProvisionedProductName": "test2",
        "Status": "CREATED",
        "CreatedTime": "2025-12-31T15:23:55.051000-06:00",
        "UpdatedTime": "2025-12-31T15:23:55.051000-06:00",
        "ProvisionedProductType": "CFN_STACK",
        "RecordType": "TERMINATE_PROVISIONED_PRODUCT",
        "ProvisionedProductId": "pp-7z4t3k4hxxxxx",
        "ProductId": "prod-j6pd3hf6xxxxx",
        "ProvisioningArtifactId": "pa-sbhovlh7wxxxx",
        "PathId": "lpv3-y3fnkeslpxxxx",
        "RecordErrors": [],
        "RecordTags": [],
        "LaunchRoleArn": "arn:aws:iam::123456789012:role/TestLaunchRole"
    }
}
```

For more information, see Managing Provisioned Products in the *AWS Service Catalog User Guide*.

- For API details, see TerminateProvisionedProduct in *AWS CLI Command Reference*.

`update-constraint`

The following code example shows how to use `update-constraint`.

AWS CLI

To update a constraint

The following `update-constraint` example updates a constraint.

```
aws servicecatalog update-constraint \
    --id cons-dgdyqdqrxxxxx \
    --parameters '{"LocalRoleName": "TestLaunchRole"}'
```

Output:

```
{
    "ConstraintDetail": {
        "ConstraintId": "cons-dgdyqdqrxxxxx",
        "Type": "LAUNCH",
        "Description": "Launch as local role TestLaunchRole",
```

```
        "Owner": "123456789012",
        "ProductId": "prod-j6pd3hf6xxxxx",
        "PortfolioId": "port-y3fnkeslxxxxx"
    },
    "ConstraintParameters": "{\"LocalRoleName\": \"TestLaunchRole\"}",
    "Status": "CREATING"
}
```

For more information, see Using AWS Service Catalog Constraints in the *AWS Service Catalog User Guide*.

- For API details, see UpdateConstraint in *AWS CLI Command Reference*.

`update-portfolio`

The following code example shows how to use `update-portfolio`.

AWS CLI

To update a portfolio

The following `update-portfolio` example updates the name of the specified portfolio.

```
aws servicecatalog update-portfolio \
    --id port-5abcd3e5st4ei \
    --display-name "New portfolio name"
```

Output:

```
{
    "PortfolioDetail": {
        "DisplayName": "New portfolio name",
        "ProviderName": "provider",
        "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-5abcd3e5st4ei",
        "Id": "port-5abcd3e5st4ei",
        "CreatedTime": 1559665256.348
    },
    "Tags": []
}
```

For more information, see Managing Portfolios in the *AWS Service Catalog Administrator Guide*.

- For API details, see UpdatePortfolio in *AWS CLI Command Reference*.

`update-product`

The following code example shows how to use `update-product`.

AWS CLI

To update a product

The following `update-product` example updates the name and owner of the specified product.

```
aws servicecatalog update-product \
    --id prod-os6abc7drqlt2 \
    --name "New product name" \
    --owner "Updated product owner"
```

Output:

```
{
    "Tags": [
        {
            "Value": "iad",
            "Key": "region"
        }
    ],
    "ProductViewDetail": {
        "ProductViewSummary": {
            "Owner": "Updated product owner",
            "ProductId": "prod-os6abc7drqlt2",
            "Distributor": "test-distributor",
            "SupportUrl": "https://aws.amazon.com",
            "Name": "New product name",
            "ShortDescription": "test-description",
            "HasDefaultPath": false,
            "Id": "prodview-6abcdgrfhvidy",
            "SupportDescription": "test-support",
            "SupportEmail": "test@amazon.com",
            "Type": "CLOUD_FORMATION_TEMPLATE"
        },
        "Status": "CREATED",
```

```
        "ProductARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
os6abc7drqlt2",
        "CreatedTime": 1577136255.0
    }
}
```

For more information, see Updating products in the *AWS Service Catalog Administrator Guide*.

- For API details, see UpdateProduct in *AWS CLI Command Reference*.

`update-provisioning-artifact`

The following code example shows how to use `update-provisioning-artifact`.

AWS CLI

To update a provisioning artifact

The following `update-provisioning-artifact` example updates the name and description of the specified provisioning artifact, using a JSON file to pass parameters.

```
aws servicecatalog update-provisioning-artifact \
    --cli-input-json file://update-provisioning-artifact-input.json
```

Contents of `update-provisioning-artifact-input.json`:

```
{
    "ProductId": "prod-abcdfz3syn2rg",
    "ProvisioningArtifactId": "pa-pcz347abcdcfm",
    "Name": "updated name",
    "Description": "updated description"
}
```

Output:

```
{
    "Info": {
        "TemplateUrl": "https://awsdocs.s3.amazonaws.com/servicecatalog/
myexampledevelopment-environment.template"
    },
    "Status": "AVAILABLE",
    "ProvisioningArtifactDetail": {
```

```
        "Active": true,
        "Description": "updated description",
        "Id": "pa-pcz347abcdcfm",
        "Name": "updated name",
        "Type": "CLOUD_FORMATION_TEMPLATE",
        "CreatedTime": 1562097906.0
    }
}
```

For more information, see Managing Versions in the *AWS Service Catalog Administrator Guide*.

- For API details, see UpdateProvisioningArtifact in *AWS CLI Command Reference*.

`update-tag-option`

The following code example shows how to use `update-tag-option`.

AWS CLI

To update a TagOption

The following `update-tag-option` example updates the value of a `TagOption`, using the specified JSON file.

```
aws servicecatalog update-tag-option \
    --cli-input-json file://update-tag-option-input.json
```

Contents of `update-tag-option-input.json`:

```
{
    "Id": "tag-iabcdn4fzjjms",
    "Value": "newvalue",
    "Active": true
}
```

Output:

```
{
    "TagOptionDetail": {
        "Value": "newvalue",
        "Key": "1234",
        "Active": true,
```

```
        "Id": "tag-iabcdn4fzjjms"
    }
}
```

For more information, see AWS Service Catalog TagOption Library in the *AWS Service Catalog Administrator Guide*.

- For API details, see UpdateTagOption in *AWS CLI Command Reference*.

Service Quotas examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Service Quotas.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`get-aws-default-service-quota`

The following code example shows how to use `get-aws-default-service-quota`.

AWS CLI

To describe a default service quota

The following `get-aws-default-service-quota` example displays details for the specified quota.

```
aws service-quotas get-aws-default-service-quota \
    --service-code ec2 \
    --quota-code L-1216C47A
```

Output:

```
{
    "Quota": {
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaArn": "arn:aws:servicequotas:us-west-2::ec2/L-1216C47A",
        "QuotaCode": "L-1216C47A",
        "QuotaName": "Running On-Demand Standard (A, C, D, H, I, M, R, T, Z)
 instances",
        "Value": 5.0,
        "Unit": "None",
        "Adjustable": true,
        "GlobalQuota": false,
        "UsageMetric": {
            "MetricNamespace": "AWS/Usage",
            "MetricName": "ResourceCount",
            "MetricDimensions": {
                "Class": "Standard/OnDemand",
                "Resource": "vCPU",
                "Service": "EC2",
                "Type": "Resource"
            },
            "MetricStatisticRecommendation": "Maximum"
        }
    }
}
```

For more information, see Viewing service quotas in the *Service Quotas User Guide*.

- For API details, see GetAwsDefaultServiceQuota in *AWS CLI Command Reference*.

`get-requested-service-quota-change`

The following code example shows how to use `get-requested-service-quota-change`.

AWS CLI

To describe a service quota increase request

The following `get-requested-service-quota-change` example describes the specified quota increase request.

```
aws service-quotas get-requested-service-quota-change \
```

```
    --request-id d187537d15254312a9609aa51bbf7624u7W49tP0
```

Output:

```
{
    "RequestedQuota": {
        "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
        "CaseId": "6780195351",
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaCode": "L-20F13EBD",
        "QuotaName": "Running Dedicated c5n Hosts",
        "DesiredValue": 2.0,
        "Status": "CASE_OPENED",
        "Created": 1580446904.067,
        "LastUpdated": 1580446953.265,
        "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
        "QuotaArn": "arn:aws:servicequotas:us-west-2:123456789012:ec2/L-20F13EBD",
        "GlobalQuota": false,
        "Unit": "None"
    }
}
```

For more information, see Requesting a quota increase in the *Service Quotas User Guide*.

- For API details, see GetRequestedServiceQuotaChange in *AWS CLI Command Reference*.

`get-service-quota`

The following code example shows how to use `get-service-quota`.

AWS CLI

To describe a service quota

The following `get-service-quota` example displays details about the specified quota.

```
aws service-quotas get-service-quota \
    --service-code ec2 \
    --quota-code L-1216C47A
```

Output:

```
{
    "Quota": {
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaArn": "arn:aws:servicequotas:us-west-2:123456789012:ec2/L-1216C47A",
        "QuotaCode": "L-1216C47A",
        "QuotaName": "Running On-Demand Standard (A, C, D, H, I, M, R, T, Z)
 instances",
        "Value": 1920.0,
        "Unit": "None",
        "Adjustable": true,
        "GlobalQuota": false,
        "UsageMetric": {
            "MetricNamespace": "AWS/Usage",
            "MetricName": "ResourceCount",
            "MetricDimensions": {
                "Class": "Standard/OnDemand",
                "Resource": "vCPU",
                "Service": "EC2",
                "Type": "Resource"
            },
            "MetricStatisticRecommendation": "Maximum"
        }
    }
}
```

For more information, see Viewing service quotas in the *Service Quotas User Guide*.

- For API details, see GetServiceQuota in *AWS CLI Command Reference*.

`list-aws-default-service-quotas`

The following code example shows how to use `list-aws-default-service-quotas`.

AWS CLI

To list the default quotas for a service

The following `list-aws-default-service-quotas` example lists the default values for the quotas for the specified service.

```
aws service-quotas list-aws-default-service-quotas \
```

```
    --service-code xray
```

Output:

```
{
    "Quotas": [
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-C6B6F05D",
            "QuotaCode": "L-C6B6F05D",
            "QuotaName": "Indexed annotations per trace",
            "Value": 50.0,
            "Unit": "None",
            "Adjustable": false,
            "GlobalQuota": false
        },
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-D781C0FD",
            "QuotaCode": "L-D781C0FD",
            "QuotaName": "Segment document size",
            "Value": 64.0,
            "Unit": "Kilobytes",
            "Adjustable": false,
            "GlobalQuota": false
        },
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-998BFF16",
            "QuotaCode": "L-998BFF16",
            "QuotaName": "Trace and service graph retention in days",
            "Value": 30.0,
            "Unit": "None",
            "Adjustable": false,
            "GlobalQuota": false
        }
    ]
}
```

For more information, see Viewing service quotas in the *Service Quotas User Guide*.

- For API details, see ListAwsDefaultServiceQuotas in *AWS CLI Command Reference*.

`list-requested-service-quota-change-history-by-quota`

The following code example shows how to use `list-requested-service-quota-change-history-by-quota`.

AWS CLI

To list your quota increase requests

The following `list-requested-service-quota-change-history-by-quota` example lists the quota increase requests for the specified quota.

```
aws service-quotas list-requested-service-quota-change-history-by-quota \
    --service-code ec2 \
    --quota-code L-20F13EBD
```

Output:

```
{
    "RequestedQuotas": [
        {
            "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
            "CaseId": "6780195351",
            "ServiceCode": "ec2",
            "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
            "QuotaCode": "L-20F13EBD",
            "QuotaName": "Running Dedicated c5n Hosts",
            "DesiredValue": 2.0,
            "Status": "CASE_OPENED",
            "Created": 1580446904.067,
            "LastUpdated": 1580446953.265,
            "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
            "QuotaArn": "arn:aws:servicequotas:us-west-2:123456789012:ec2/
L-20F13EBD",
            "GlobalQuota": false,
            "Unit": "None"
        }
    ]
}
```

For more information, see Requesting a quota increase in the *Service Quotas User Guide*.

- For API details, see ListRequestedServiceQuotaChangeHistoryByQuota in *AWS CLI Command Reference*.

`list-requested-service-quota-change-history`

The following code example shows how to use `list-requested-service-quota-change-history`.

AWS CLI

To list your quota increase requests

The following `list-requested-service-quota-change-history` example lists the quota increase requests for the specified service.

```
aws service-quotas list-requested-service-quota-change-history \
    --service-code ec2
```

Output:

```
{
    "RequestedQuotas": [
        {
            "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
            "CaseId": "6780195351",
            "ServiceCode": "ec2",
            "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
            "QuotaCode": "L-20F13EBD",
            "QuotaName": "Running Dedicated c5n Hosts",
            "DesiredValue": 2.0,
            "Status": "CASE_OPENED",
            "Created": 1580446904.067,
            "LastUpdated": 1580446953.265,
            "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
            "QuotaArn": "arn:aws:servicequotas:us-west-2:123456789012:ec2/
L-20F13EBD",
            "GlobalQuota": false,
            "Unit": "None"
        }
    ]
```

```
}
```

For more information, see Requesting a quota increase in the *Service Quotas User Guide*.

- For API details, see ListRequestedServiceQuotaChangeHistory in *AWS CLI Command Reference*.

`list-service-quotas`

The following code example shows how to use `list-service-quotas`.

AWS CLI

To list the quotas for a service

The following `list-service-quotas` example displays details about the quotas for AWS CloudFormation.

```
aws service-quotas list-service-quotas \
    --service-code cloudformation
```

Output:

```
{
    "Quotas": [
        {
            "ServiceCode": "cloudformation",
            "ServiceName": "AWS CloudFormation",
            "QuotaArn": "arn:aws:servicequotas:us-
west-2:123456789012:cloudformation/L-87D14FB7",
            "QuotaCode": "L-87D14FB7",
            "QuotaName": "Output count in CloudFormation template",
            "Value": 60.0,
            "Unit": "None",
            "Adjustable": false,
            "GlobalQuota": false
        },
        {
            "ServiceCode": "cloudformation",
            "ServiceName": "AWS CloudFormation",
            "QuotaArn": "arn:aws:servicequotas:us-
west-2:123456789012:cloudformation/L-0485CB21",
```

```
            "QuotaCode": "L-0485CB21",
            "QuotaName": "Stack count",
            "Value": 200.0,
            "Unit": "None",
            "Adjustable": true,
            "GlobalQuota": false
        }
    ]
}
```

For more information, see Viewing service quotas in the *Service Quotas User Guide*.

- For API details, see ListServiceQuotas in *AWS CLI Command Reference*.

`list-services`

The following code example shows how to use `list-services`.

AWS CLI

To list the available services

The following `list-services` example lists the services that are available in Service Quotas.

```
aws service-quotas list-services
```

Output:

```
{
    "Services": [
        {
            "ServiceCode": "AWSCloudMap",
            "ServiceName": "AWS Cloud Map"
        },
        {
            "ServiceCode": "access-analyzer",
            "ServiceName": "Access Analyzer"
        },
        {
            "ServiceCode": "acm",
            "ServiceName": "AWS Certificate Manager (ACM)"
        },
        {
```

```
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray"
        }
    ]
}
```

You can add the `--query` parameter to filter the display to the information that you are interested in. The following example displays only the service codes.

```
aws service-quotas list-services \
    --query Services[*].ServiceCode
```

Output:

```
[
    "AWSCloudMap",
    "access-analyzer",
    "acm",
    "acm-pca",
    "amplify",
    "apigateway",
    "application-autoscaling",
    "xray"
]
```

For more information, see Viewing service quotas in the *Service Quotas User Guide*.

- For API details, see ListServices in *AWS CLI Command Reference*.

`request-service-quota-increase`

The following code example shows how to use `request-service-quota-increase`.

AWS CLI

To request a service quota increase

The following `request-service-quota-increase` example requests an increase in the specified service quota.

```
aws service-quotas request-service-quota-increase \
```

```
    --service-code ec2 \
    --quota-code L-20F13EBD \
    --desired-value 2
```

Output:

```
{
    "RequestedQuota": {
        "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaCode": "L-20F13EBD",
        "QuotaName": "Running Dedicated c5n Hosts",
        "DesiredValue": 2.0,
        "Status": "PENDING",
        "Created": 1580446904.067,
        "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
        "QuotaArn": "arn:aws:servicequotas:us-west-2:123456789012:ec2/L-20F13EBD",
        "GlobalQuota": false,
        "Unit": "None"
    }
}
```

For more information, see Requesting a quota increase in the *Service Quotas User Guide*.

- For API details, see RequestServiceQuotaIncrease in *AWS CLI Command Reference*.

Amazon SES examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SES.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-identity`

The following code example shows how to use `delete-identity`.

AWS CLI

To delete an identity

The following `delete-identity` example deletes an identity from the list of identities verified with Amazon SES.

```
aws ses delete-identity \
    --identity user@example.com
```

This command produces no output.

For more information, see Verified identities in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see DeleteIdentity in *AWS CLI Command Reference*.

`get-identity-dkim-attributes`

The following code example shows how to use `get-identity-dkim-attributes`.

AWS CLI

To get the Amazon SES Easy DKIM attributes for a list of identities

The following `get-identity-dkim-attributes` example retrieves the Amazon SES Easy DKIM attributes for a list of identities.

```
aws ses get-identity-dkim-attributes \
    --identities "example.com" "user@example.com"
```

Output:

```
{
    "DkimAttributes": {
        "example.com": {
            "DkimTokens": [
```

```
                "EXAMPLEjcs5xoyqytjsotsijas7236gr",
                "EXAMPLEjr76cvoc6mysspnioorxsn6ep",
                "EXAMPLEkbmkqkhlm2lyz77ppkulerm4k"
            ],
            "DkimEnabled": true,
            "DkimVerificationStatus": "Success"
        },
        "user@example.com": {
            "DkimEnabled": false,
            "DkimVerificationStatus": "NotStarted"
        }
    }
}
```

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetIdentityDkimAttributes in *AWS CLI Command Reference*.

`get-identity-notification-attributes`

The following code example shows how to use `get-identity-notification-attributes`.

AWS CLI

To get the Amazon SES notification attributes for a list of identities

The following `get-identity-notification-attributes` example retrieves the Amazon SES notification attributes for a list of identities.

```
aws ses get-identity-notification-attributes \
    --identities "user1@example.com" "user2@example.com"
```

Output:

```
{
    "NotificationAttributes": {
        "user1@example.com": {
            "ForwardingEnabled": false,
```

```
            "ComplaintTopic": "arn:aws:sns:us-west-2:EXAMPLE65304:MyTopic",
            "BounceTopic": "arn:aws:sns:us-west-2:EXAMPLE65304:MyTopic",
            "DeliveryTopic": "arn:aws:sns:us-west-2:EXAMPLE65304:MyTopic"
        },
        "user2@example.com": {
            "ForwardingEnabled": true
        }
    }
}
```

This command returns the status of email feedback forwarding and, if applicable, the Amazon Resource Names (ARNs) of the Amazon SNS topics that bounce, complaint, and delivery notifications are sent to.

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information, see Setting up event notifications for Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetIdentityNotificationAttributes in *AWS CLI Command Reference*.

`get-identity-verification-attributes`

The following code example shows how to use `get-identity-verification-attributes`.

AWS CLI

To get the Amazon SES verification status for a list of identities

The following `get-identity-verification-attributes` example retrieves the Amazon SES verification status for a list of identities.

```
aws ses get-identity-verification-attributes \
    --identities "user1@example.com" "user2@example.com"
```

Output:

```
{
    "VerificationAttributes": {
        "user1@example.com": {
            "VerificationStatus": "Success"
```

```
        },
        "user2@example.com": {
            "VerificationStatus": "Pending"
        }
    }
}
```

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information, see Verified identities in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetIdentityVerificationAttributes in *AWS CLI Command Reference*.

`get-send-quota`

The following code example shows how to use `get-send-quota`.

AWS CLI

To get your Amazon SES sending limits

The following `get-send-quota` example returns your Amazon SES sending limits.

```
aws ses get-send-quota
```

Output:

```
{
    "Max24HourSend": 200.0,
    "SentLast24Hours": 1.0,
    "MaxSendRate": 1.0
}
```

Max24HourSend is your sending quota, which is the maximum number of emails that you can send in a 24-hour period. The sending quota reflects a rolling time period. Every time you try to send an email, Amazon SES checks how many emails you sent in the previous 24 hours. As long as the total number of emails that you have sent is less than your quota, your send request will be accepted and your email will be sent.

SentLast24Hours is the number of emails that you have sent in the previous 24 hours.

MaxSendRate is the maximum number of emails that you can send per second.

Note that sending limits are based on recipients rather than on messages. For example, an email that has 10 recipients counts as 10 against your sending quota.

For more information, see Managing your Amazon SES sending limits in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetSendQuota in *AWS CLI Command Reference*.

`get-send-statistics`

The following code example shows how to use `get-send-statistics`.

AWS CLI

To get your Amazon SES sending statistics

The following `get-send-statistics` example returns your Amazon SES sending statistics.

```
aws ses get-send-statistics
```

Output:

```
{
    "SendDataPoints": [
        {
            "Complaints": 0,
            "Timestamp": "2013-06-12T19:32:00Z",
            "DeliveryAttempts": 2,
            "Bounces": 0,
            "Rejects": 0
        },
        {
            "Complaints": 0,
            "Timestamp": "2013-06-12T00:47:00Z",
            "DeliveryAttempts": 1,
            "Bounces": 0,
            "Rejects": 0
        }
    ]
}
```

The result is a list of data points, representing the last two weeks of sending activity. Each data point in the list contains statistics for a 15-minute interval.

In this example, there are only two data points because the only emails that the user sent in the last two weeks fell within two 15-minute intervals.

For more information, see Monitoring your Amazon SES sending activity in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetSendStatistics in *AWS CLI Command Reference*.

`list-identities`

The following code example shows how to use `list-identities`.

AWS CLI

To list all identities (email addresses and domains) for a specific AWS account

The following `list-identities` example lists all identities that have been submitted for verification with Amazon SES.

```
aws ses list-identities
```

Output:

```
{
    "Identities": [
        "user@example.com",
        "example.com"
    ]
}
```

The list that is returned contains all identities regardless of verification status (verified, pending verification, failure, etc.).

In this example, email addresses *and* domains are returned because we did not specify the identity-type parameter.

For more information, see Verified identities in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see ListIdentities in *AWS CLI Command Reference*.

`send-email`

The following code example shows how to use `send-email`.

AWS CLI

To send a formatted email using Amazon SES

The following `send-email` example sends a formatted email.

```
aws ses send-email \
    --from sender@example.com \
    --destination file://destination.json \
    --message file://message.json
```

The destination and the message are JSON data structures saved in .json files in the current directory.

Contents of `destination.json`:

```
{
    "ToAddresses": [
        "recipient1@example.com",
        "recipient2@example.com"
    ],
    "CcAddresses": [
        "recipient3@example.com"
    ],
    "BccAddresses": []
}
```

Contents of `message.json`:

```
{
    "Subject": {
        "Data": "Test email sent using the AWS CLI",
        "Charset": "UTF-8"
    },
    "Body": {
```

```
        "Text": {
            "Data": "This is the message body in text format.",
            "Charset": "UTF-8"
        },
        "Html": {
            "Data": "This message body contains HTML formatting. It can,
 for example, contain links like this one: <a class=\"ulink\" href=\"http://
docs.aws.amazon.com/ses/latest/DeveloperGuide\" target=\"_blank\">Amazon SES
 Developer Guide</a>.",
            "Charset": "UTF-8"
        }
    }
}
```

Output:

```
{
    "MessageId": "EXAMPLEf3a5efcd1-51adec81-d2a4-4e3f-9fe2-5d85c1b23783-000000"
}
```

Replace the sender and recipient email addresses with the ones you want to use. Note that the sender's email address must be verified with Amazon SES. Until you are granted production access to Amazon SES, you must also verify the email address of each recipient unless the recipient is the Amazon SES mailbox simulator. For more information on verification, see Verified identities in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

The Message ID in the output indicates that the call to send-email was successful.

If you don't receive the email, check your Junk box.

For more information, see Sending formatted email using the Amazon SES API in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SendEmail in *AWS CLI Command Reference*.

`send-raw-email`

The following code example shows how to use `send-raw-email`.

AWS CLI

To send a raw email using Amazon SES

The following `send-raw-email` example sends an email with a TXT attachment.

```
aws ses send-raw-email \
    --cli-binary-format raw-in-base64-out \
    --raw-message file://message.json
```

The raw message is a JSON data structure saved in a file named `message.json` in the current directory.

Contents of `message.json`:

```
{
    "Data": "From: sender@example.com\nTo: recipient@example.com\nSubject: Test
 email sent using the AWS CLI (contains an attachment)\nMIME-Version: 1.0\nContent-
type: Multipart/Mixed; boundary=\"NextPart\"\n\n--NextPart\nContent-Type: text/plain
\n\nThis is the message body.\n\n--NextPart\nContent-Type: text/plain;\nContent-
Disposition: attachment; filename=\"attachment.txt\"\n\nThis is the text in the
 attachment.\n\n--NextPart--"
}
```

As you can see, "Data" is one long string that contains the entire raw email content in MIME format, including an attachment called attachment.txt.

Output:

```
{
    "MessageId": "EXAMPLEf3f73d99b-c63fb06f-d263-41f8-a0fb-d0dc67d56c07-000000"
}
```

Replace sender@example.com and recipient@example.com with the addresses you want to use. Note that the sender's email address must be verified with Amazon SES. Until you are granted production access to Amazon SES, you must also verify the email address of the recipient unless the recipient is the Amazon SES mailbox simulator. For more information on verification, see Verified identities in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

The Message ID in the output indicates that the call to send-raw-email was successful.

If you don't receive the email, check your Junk box.

For more information, see Sending raw email using the Amazon SES API v2 in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SendRawEmail in *AWS CLI Command Reference*.

`set-identity-dkim-enabled`

The following code example shows how to use `set-identity-dkim-enabled`.

AWS CLI

To enable or disable Easy DKIM for an Amazon SES verified identity

The following `set-identity-dkim-enabled` example disables DKIM for a verified email address.

```
aws ses set-identity-dkim-enabled \
    --identity user@example.com \
    --no-dkim-enabled
```

This command produces no output.

For more information, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SetIdentityDkimEnabled in *AWS CLI Command Reference*.

`set-identity-feedback-forwarding-enabled`

The following code example shows how to use `set-identity-feedback-forwarding-enabled`.

AWS CLI

To enable or disable bounce and complaint email feedback forwarding for an Amazon SES verified identity

The following `set-identity-feedback-forwarding-enabled` example enables a verified email address to receive bounce and complaint notifications by email.

```
aws ses set-identity-feedback-forwarding-enabled \
    --identity user@example.com \
    --forwarding-enabled
```

This command produces no output.

You are required to receive bounce and complaint notifications via either Amazon SNS or email feedback forwarding, so you can only disable email feedback forwarding if you select an Amazon SNS topic for both bounce and complaint notifications.

For more information, see Receiving Amazon SES notifications through email in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SetIdentityFeedbackForwardingEnabled in *AWS CLI Command Reference*.

`set-identity-notification-topic`

The following code example shows how to use `set-identity-notification-topic`.

AWS CLI

To set the Amazon SNS topic to which Amazon SES will publish bounce, complaint, and/or delivery notifications for a verified identity

The following `set-identity-notification-topic` example specifies the Amazon SNS topic to which a verified email address will receive bounce notifications.

```
aws ses set-identity-notification-topic \
    --identity user@example.com \
    --notification-type Bounce \
    --sns-topic arn:aws:sns:us-west-2:EXAMPLE65304:MyTopic
```

This command produces no output.

For more information, see Configuring Amazon SNS notifications for Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SetIdentityNotificationTopic in *AWS CLI Command Reference*.

`verify-domain-dkim`

The following code example shows how to use `verify-domain-dkim`.

AWS CLI

To generate a verified domain's DKIM tokens for DKIM signing with Amazon SES

The following `verify-domain-dkim` example generates DKIM tokens for a domain that has been verified with Amazon SES.

```
aws ses verify-domain-dkim \
    --domain example.com
```

Output:

```
{
    "DkimTokens": [
        "EXAMPLEq76owjnks3lnluwg65scbemvw",
        "EXAMPLEi3dnsj67hstzaj673klariwx2",
        "EXAMPLEwfbtcukvimehexktmdtaz6naj"
    ]
}
```

To set up DKIM, you must use the returned DKIM tokens to update your domain's DNS settings with CNAME records that point to DKIM public keys hosted by Amazon SES. For more information, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyDomainDkim in *AWS CLI Command Reference*.

`verify-domain-identity`

The following code example shows how to use `verify-domain-identity`.

AWS CLI

To verify a domain with Amazon SES

The following `verify-domain-identity` example verifies a domain.

```
aws ses verify-domain-identity \
    --domain example.com
```

Output:

```
{
    "VerificationToken": "eoEmxw+YaYhb3h3iVJHuXMJXqeu1q1/wwmvjuEXAMPLE"
}
```

To complete domain verification, you must add a TXT record with the returned verification token to your domain's DNS settings. For more information, see Creating and verifying identities in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyDomainIdentity in *AWS CLI Command Reference*.

`verify-email-identity`

The following code example shows how to use `verify-email-identity`.

AWS CLI

To verify an email address with Amazon SES

The following `verify-email-identity` example verifies an email address.

```
aws ses verify-email-identity \
    --email-address user@example.com
```

This command produces no output.

Before you can send an email using Amazon SES, you must verify the address or domain that you are sending the email from to prove that you own it. If you do not have production access yet, you also need to verify any email addresses that you send emails to except for email addresses provided by the Amazon SES mailbox simulator.

After verify-email-identity is called, the email address will receive a verification email. The user must click on the link in the email to complete the verification process.

For more information, see Creating and verifying identities in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyEmailIdentity in *AWS CLI Command Reference*.

Shield examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Shield.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-drt-log-bucket`

The following code example shows how to use `associate-drt-log-bucket`.

AWS CLI

To authorize the DRT to access an Amazon S3 bucket

The following `associate-drt-log-bucket` example creates an association between the DRT and the specified S3 bucket. This permits the DRT to access the bucket on behalf of the account.

```
aws shield associate-drt-log-bucket \
    --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see AssociateDrtLogBucket in *AWS CLI Command Reference*.

`associate-drt-role`

The following code example shows how to use `associate-drt-role`.

AWS CLI

To authorize the DRT to mitigate potential attacks on your behalf

The following `associate-drt-role` example creates an association between the DRT and the specified role. The DRT can use the role to access and manage the account.

```
aws shield associate-drt-role \
    --role-arn arn:aws:iam::123456789012:role/service-role/DrtRole
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see AssociateDrtRole in *AWS CLI Command Reference*.

`create-protection`

The following code example shows how to use `create-protection`.

AWS CLI

To enable AWS Shield Advanced protection for a single AWS resource

The following `create-protection` example enables Shield Advanced protection for the specified AWS CloudFront distribution.

```
aws shield create-protection \
    --name "Protection for CloudFront distribution" \
    --resource-arn arn:aws:cloudfront::123456789012:distribution/E198WC25FXOWY8
```

Output:

```
{
    "ProtectionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Specify Your Resources to Protect in the *AWS Shield Advanced Developer Guide*.

- For API details, see CreateProtection in *AWS CLI Command Reference*.

`create-subscription`

The following code example shows how to use `create-subscription`.

AWS CLI

To enable AWS Shield Advanced protection for an account

The following `create-subscription` example enables Shield Advanced protection for the account.

```
aws shield create-subscription
```

This command produces no output.

For more information, see Getting Started with AWS Shield Advanced in the *AWS Shield Advanced Developer Guide*.

- For API details, see CreateSubscription in *AWS CLI Command Reference*.

`delete-protection`

The following code example shows how to use `delete-protection`.

AWS CLI

To remove AWS Shield Advanced protection from an AWS resource

The following `delete-protection` example removes the specified AWS Shield Advanced protection.

```
aws shield delete-protection \
    --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Removing AWS Shield Advanced from an AWS Resource in the *AWS Shield Advanced Developer Guide*.

- For API details, see DeleteProtection in *AWS CLI Command Reference*.

`describe-attack`

The following code example shows how to use `describe-attack`.

AWS CLI

To retrieve a detailed description of an attack

The following `describe-attack` example displays details about the DDoS attack with the specified attack ID. You can obtain attack IDs by running the `list-attacks` command.

```
aws shield describe-attack \
    --attack-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "Attack": {
        "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "ResourceArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/testElb",

`describe-drt-access`

The following code example shows how to use `describe-drt-access`.

AWS CLI

To retrieve a description of the authorizations the DRT has to mitigate attacks on your behalf

The following `describe-drt-access` example retrieves the role and S3 bucket authorizations that the DRT has, which allow it to respond to potential attacks on your behalf.

```
aws shield describe-drt-access
```

Output:

```
{
    "RoleArn": "arn:aws:iam::123456789012:role/service-role/DrtRole",
    "LogBucketList": [
        "flow-logs-for-website-lb"
    ]
}
```

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeDrtAccess in *AWS CLI Command Reference*.

`describe-emergency-contact-settings`

The following code example shows how to use `describe-emergency-contact-settings`.

AWS CLI

To retrieve emergency e-mail addresses that you have on file with the DRT

The following `describe-emergency-contact-settings` example retrieves the e-mail addresses that are on file with the DRT for the account. These are the addresses the DRT should contact when it's responding to a suspected attack.

```
aws shield describe-emergency-contact-settings
```

Output:

```
{
    "EmergencyContactList": [
        {
            "EmailAddress": "ops@example.com"
        },
        {
            "EmailAddress": "ddos-notifications@example.com"
        }
    ]
}
```

For more information, see How AWS Shield and Shield Advanced work in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeEmergencyContactSettings in *AWS CLI Command Reference*.

`describe-protection`

The following code example shows how to use `describe-protection`.

AWS CLI

To retrieve the details for an AWS Shield Advanced protection

The following `describe-protection` example displays details about the Shield Advanced protection with the specified ID. You can obtain protection IDs by running the `list-protections` command.

```
aws shield describe-protection \
    --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Protection": {
        "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Name": "1.2.3.4",
        "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:eip-allocation/
eipalloc-0ac1537af40742a6d"
    }
}
```

For more information, see Specify Your Resources to Protect in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeProtection in *AWS CLI Command Reference*.

`describe-subscription`

The following code example shows how to use `describe-subscription`.

AWS CLI

To retrieve the details of the AWS Shield Advanced protection for the account

The following `describe-subscription` example displays details about the Shield Advanced protection provided for the account.

```
aws shield describe-subscription
```

Output:

```
{
    "Subscription": {
        "StartTime": 1534368978.0,
        "EndTime": 1597613778.0,
        "TimeCommitmentInSeconds": 63244800,
        "AutoRenew": "ENABLED",
        "Limits": [
            {
                "Type": "GLOBAL_ACCELERATOR",
                "Max": 1000
            },
```

```
            {
                "Type": "ROUTE53_HOSTED_ZONE",
                "Max": 1000
            },
            {
                "Type": "CF_DISTRIBUTION",
                "Max": 1000
            },
            {
                "Type": "ELB_LOAD_BALANCER",
                "Max": 1000
            },
            {
                "Type": "EC2_ELASTIC_IP_ALLOCATION",
                "Max": 1000
            }
        ]
    }
}
```

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeSubscription in *AWS CLI Command Reference*.

`disassociate-drt-log-bucket`

The following code example shows how to use `disassociate-drt-log-bucket`.

AWS CLI

To remove the authorization for DRT to access an Amazon S3 bucket on your behalf

The following `disassociate-drt-log-bucket` example removes the association between the DRT and the specified S3 bucket. After this command completes, the DRT can no longer access the bucket on behalf of the account.

```
aws shield disassociate-drt-log-bucket \
    --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateDrtLogBucket in *AWS CLI Command Reference*.

`disassociate-drt-role`

The following code example shows how to use `disassociate-drt-role`.

AWS CLI

To remove the authorization for DRT to mitigate potential attacks on your behalf

The following `disassociate-drt-role` example removes the association between the DRT and the account. After this call, the DRT can no longer access or manage your account.

```
aws shield disassociate-drt-role
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateDrtRole in *AWS CLI Command Reference*.

`get-subscription-state`

The following code example shows how to use `get-subscription-state`.

AWS CLI

To retrieve the current state of the account's AWS Shield Advanced subscription

The following `get-subscription-state` example retrieves the state of the Shield Advanced protection for the account.

```
aws shield get-subscription-state
```

Output:

```
{
    "SubscriptionState": "ACTIVE"
}
```

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see GetSubscriptionState in *AWS CLI Command Reference*.

`list-attacks`

The following code example shows how to use `list-attacks`.

AWS CLI

To retrieve attack summaries from AWS Shield Advanced

The following `list-attacks` example retrieves summaries of attacks for the specified AWS CloudFront distribution during the specified time period. The response includes attack IDs that you can provide to the `describe-attack` command for detailed information on an attack.

```
aws shield list-attacks \
    --resource-arns arn:aws:cloudfront::12345678910:distribution/E1PXMP22ZVFAOR \
    --start-time FromInclusive=1529280000,ToExclusive=1529300000
```

Output:

```
{
    "AttackSummaries": [
        {
            "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/
E1PXMP22ZVFAOR",
            "StartTime": 1529280000.0,
            "EndTime": 1529449200.0,
            "AttackVectors": [
                {
                    "VectorType": "SYN_FLOOD"
                }
            ]
        }
    ]
}
```

For more information, see Reviewing DDoS Incidents in the *AWS Shield Advanced Developer Guide*.

- For API details, see ListAttacks in *AWS CLI Command Reference*.

`list-protections`

The following code example shows how to use `list-protections`.

AWS CLI

To retrieve protection summaries from AWS Shield Advanced

The following `list-protections` example retrieves summaries of the protections that are enabled for the account.

```
aws shield list-protections
```

Output:

```
{
    "Protections": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "Protection for CloudFront distribution",
            "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/
E198WC25FXOWY8"
        }
    ]
}
```

For more information, see Specify Your Resources to Protect in the *AWS Shield Advanced Developer Guide*.

- For API details, see ListProtections in *AWS CLI Command Reference*.

`update-emergency-contact-settings`

The following code example shows how to use `update-emergency-contact-settings`.

AWS CLI

To define the emergency e-mail addresses that are on file with the DRT

The following `update-emergency-contact-settings` example defines two e-mail addresses that the DRT should contact when it's responding to a suspected attack.

```
aws shield update-emergency-contact-settings \
```

```
    --emergency-contact-list EmailAddress=ops@example.com EmailAddress=ddos-
notifications@example.com
```

This command produces no output.

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see UpdateEmergencyContactSettings in *AWS CLI Command Reference*.

`update-subscription`

The following code example shows how to use `update-subscription`.

AWS CLI

To modify the account's AWS Shield Advanced subscription

The following `update-subscription` example enables auto-renewal of the AWS Shield Advanced subscription for the account.

```
aws shield update-subscription \
    --auto-renew ENABLED
```

This command produces no output.

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see UpdateSubscription in *AWS CLI Command Reference*.

Signer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Signer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`cancel-signing-profile`

The following code example shows how to use `cancel-signing-profile`.

AWS CLI

To delete a signing profile

The following `cancel-signing-profile` example removes an existing signing profile from AWS Signer.

```
aws signer cancel-signing-profile \
    --profile-name MyProfile1
```

This command produces no output.

For more information, see Create a Signer signing profile in the *AWS Signer Developer Guide*.

- For API details, see CancelSigningProfile in *AWS CLI Command Reference*.

`describe-signing-job`

The following code example shows how to use `describe-signing-job`.

AWS CLI

To display details about a signing job

The following `describe-signing-job` example displays details about the specified signing job.

```
aws signer describe-signing-job \
    --job-id 2065c468-73e2-4385-a6c9-0123456789abc
```

Output:

```
{
    "status": "Succeeded",
    "completedAt": 1568412037,
    "platformId": "AmazonFreeRTOS-Default",
```

```
    "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
    },
    "statusReason": "Signing Succeeded",
    "jobId": "2065c468-73e2-4385-a6c9-0123456789abc",
    "source": {
        "s3": {
            "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4",
            "bucketName": "signer-source",
            "key": "MyCode.rb"
        }
    },
    "profileName": "MyProfile2",
    "signedObject": {
        "s3": {
            "bucketName": "signer-destination",

}
```

For more information, see Create a signing job for IoT in AWS Signer in the *AWS Signer Developer Guide*.

- For API details, see DescribeSigningJob in *AWS CLI Command Reference*.

`get-signing-platform`

The following code example shows how to use `get-signing-platform`.

AWS CLI

To display details about a signing platform

The following `get-signing-platform` example displays details about the specified signing platform.

```
aws signer get-signing-platform \
    --platform-id AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
{
    "category": "AWS",
    "displayName": "Amazon FreeRTOS SHA1-RSA CC3220SF-Format",
    "target": "SHA1-RSA-TISHA1",
    "platformId": "AmazonFreeRTOS-TI-CC3220SF",
    "signingConfiguration": {
        "encryptionAlgorithmOptions": {
            "defaultValue": "RSA",
            "allowedValues": [
                "RSA"
            ]
        },
        "hashAlgorithmOptions": {
            "defaultValue": "SHA1",
            "allowedValues": [
                "SHA1"
            ]
        }
    },
    "maxSizeInMB": 16,
    "partner": "AmazonFreeRTOS",
    "signingImageFormat": {
        "defaultFormat": "JSONEmbedded",
        "supportedFormats": [
            "JSONEmbedded"
        ]
    }
}
```

For more information, see Sign Internet of Things (IoT) objects in the *AWS Signer Developer Guide*.

- For API details, see GetSigningPlatform in *AWS CLI Command Reference*.

`get-signing-profile`

The following code example shows how to use `get-signing-profile`.

AWS CLI

To display details about a signing profile

The following `get-signing-profile` example displays details about the specified signing profile.

```
aws signer get-signing-profile \
    --profile-name MyProfile3
```

Output:

```
{
    "platformId": "AmazonFreeRTOS-TI-CC3220SF",
    "profileName": "MyProfile3",
    "status": "Active",
    "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
    }
}
```

For more information, see Create a Signer signing profile in the *AWS Signer Developer Guide*.

- For API details, see GetSigningProfile in *AWS CLI Command Reference*.

`list-signing-jobs`

The following code example shows how to use `list-signing-jobs`.

AWS CLI

To list all signing jobs

The following `list-signing-jobs` example displays details about all signing jobs for the account. In this example, two jobs are returned, one successful, and one failed.

```
aws signer list-signing-jobs
```

Output:

```
{
    "jobs": [
        {
```

```
            "status": "Succeeded",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            },
            "jobId": "2065c468-73e2-4385-a6c9-0123456789abc",
            "source": {
                "s3": {
                    "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4",
                    "bucketName": "signer-source",
                    "key": "MyCode.rb"
                }
            },
            "signedObject": {
                "s3": {
                    "bucketName": "signer-destination",
                    "key": "signed-2065c468-73e2-4385-a6c9-0123456789abc"
                }
            },
            "createdAt": 1568412036
        },
        {
            "status": "Failed",
            "source": {
                "s3": {
                    "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4",
                    "bucketName": "signer-source",
                    "key": "MyOtherCode.rb"
                }
            },
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            },
            "createdAt": 1568402690,
            "jobId": "74d9825e-22fc-4a0d-b962-0123456789abc"
        }
    ]
}
```

For more information, see Create a signing job for IoT in AWS Signer in the *AWS Signer Developer Guide*.

- For API details, see ListSigningJobs in *AWS CLI Command Reference*.

`list-signing-platforms`

The following code example shows how to use `list-signing-platforms`.

AWS CLI

To list all signing platforms

The following `list-signing-platforms` example displays details about all available signing platforms.

```
aws signer list-signing-platforms
```

Output:

```
{
    "platforms": [
        {
            "category": "AWS",
            "displayName": "AWS IoT Device Management SHA256-ECDSA ",
            "target": "SHA256-ECDSA",
            "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "ECDSA",
                    "allowedValues": [
                        "ECDSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA256",
                    "allowedValues": [
                        "SHA256"
                    ]
                }
            },
            "maxSizeInMB": 2048,
            "partner": "AWSIoTDeviceManagement",
            "signingImageFormat": {
                "defaultFormat": "JSONDetached",
                "supportedFormats": [
                    "JSONDetached"
                ]
```

```
            }
        },
        {
            "category": "AWS",
            "displayName": "Amazon FreeRTOS SHA1-RSA CC3220SF-Format",
            "target": "SHA1-RSA-TISHA1",
            "platformId": "AmazonFreeRTOS-TI-CC3220SF",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "RSA",

                        "RSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA1",
                    "allowedValues": [
                        "SHA1"
                    ]
                }
            },
            "maxSizeInMB": 16,
            "partner": "AmazonFreeRTOS",
            "signingImageFormat": {
                "defaultFormat": "JSONEmbedded",
                "supportedFormats": [
                    "JSONEmbedded"
                ]
            }
        },
        {
            "category": "AWS",
            "displayName": "Amazon FreeRTOS SHA256-ECDSA",
            "target": "SHA256-ECDSA",
            "platformId": "AmazonFreeRTOS-Default",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "ECDSA",
                    "allowedValues": [
                        "ECDSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA256",
```

```
                    "allowedValues": [
                        "SHA256"
                    ]
                }
            },
            "maxSizeInMB": 16,
            "partner": "AmazonFreeRTOS",
            "signingImageFormat": {
                "defaultFormat": "JSONEmbedded",
                "supportedFormats": [
                    "JSONEmbedded"
                ]
            }
        }
    ]
}
```

For more information, see Code signing workflows in Signer in the *AWS Signer Developer Guide*.

- For API details, see ListSigningPlatforms in *AWS CLI Command Reference*.

`list-signing-profiles`

The following code example shows how to use `list-signing-profiles`.

AWS CLI

To list all signing profiles

The following `list-signing-profiles` example displays details about all signing profiles for the account.

```
aws signer list-signing-profiles
```

Output:

```
{
    "profiles": [
        {
            "platformId": "AmazonFreeRTOS-TI-CC3220SF",
            "profileName": "MyProfile4",
            "status": "Active",
            "signingMaterial": {
```

```
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            }
        },
        {
            "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",
            "profileName": "MyProfile5",
            "status": "Active",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            }
        }
    ]
}
```

For more information, see Create a Signer signing profile in the *AWS Signer Developer Guide*.

- For API details, see ListSigningProfiles in *AWS CLI Command Reference*.

`put-signing-profile`

The following code example shows how to use `put-signing-profile`.

AWS CLI

To create a signing profile

The following `put-signing-profile` example creates a signing profile using the specified certificate and platform.

```
aws signer put-signing-profile \
    --profile-name MyProfile6 \
    --signing-material certificateArn=arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc \
    --platform-id AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
{
    "arn": "arn:aws:signer:us-west-2:123456789012:/signing-profiles/MyProfile6"
}
```

For more information, see Create a Signer signing profile in the *AWS Signer Developer Guide*.

- For API details, see PutSigningProfile in *AWS CLI Command Reference*.

`start-signing-job`

The following code example shows how to use `start-signing-job`.

AWS CLI

To start a signing job

The following `start-signing-job` example starts a signing job on the code found at the specified source. It uses the specified profile to do the signing and places the signed code in the specified destination. The output is the ID of the signing job.

```
aws signer start-signing-job \
    --source 's3={bucketName=signer-
source,key=MyCode.rb,version=PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4}' \
    --destination 's3={bucketName=signer-destination,prefix=signed-}' \
    --profile-name MyProfile7
```

Output:

```
{
    "jobId": "2065c468-73e2-4385-a6c9-0123456789abc"
}
```

For more information, see Create a signing job for IoT in AWS Signer in the *AWS Signer Developer Guide*.

- For API details, see StartSigningJob in *AWS CLI Command Reference*.

Snowball Edge examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Snowball Edge.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`get-snowball-usage`

The following code example shows how to use `get-snowball-usage`.

AWS CLI

To get information about the Snowball service limit for your account

The following `get-snowball-usage` example displays information about the Snowball service limit for your account, and also the number of Snowballs your account has in use.

```
aws snowball get-snowball-usage
```

Output:

```
{
    "SnowballLimit": 1,
    "SnowballsInUse": 0
}
```

FOR more information, see AWS Snowball Edge Limits in the *AWS Snowball Developer Guide*.

- For API details, see GetSnowballUsage in *AWS CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

AWS CLI

To list the current Snowball jobs in your account

The following `list-jobs` example displays an array of `JobListEntry` objects. In this example, a single job is listed.

```
aws snowball list-jobs
```

Output:

```
{
    "JobListEntries": [
        {
            "CreationDate": "2016-09-27T14:50:00+00:00",
            "Description": "Important Photos 2016-08-11",
            "IsMaster": true,
            "JobId": "ABCd1e324fe-022f-488e-a98b-3b0566063db1",
            "JobState": "Complete",
            "JobType": "IMPORT",
            "SnowballType": "EDGE"
        }
    ]
}
```

For more information, see Jobs for AWS Snowball Edge devices in the *AWS Snowball Developer Guide*.

- For API details, see ListJobs in *AWS CLI Command Reference*.

Amazon SNS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SNS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`add-permission`

The following code example shows how to use `add-permission`.

AWS CLI

To add a permission to a topic

The following `add-permission` example adds the permission for AWS account `123456789111` to use the `Publish` action with the specified topic under AWS account `123456789012`.

```
aws sns add-permission \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --label Publish-Permission \
    --aws-account-id 123456789111 \
    --action-name Publish
```

This command produces no output.

For more information, see Example cases for Amazon SNS access control in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see AddPermission in *AWS CLI Command Reference*.

`check-if-phone-number-is-opted-out`

The following code example shows how to use `check-if-phone-number-is-opted-out`.

AWS CLI

To check SMS message opt-out for a phone number

The following `check-if-phone-number-is-opted-out` example checks whether the specified phone number is opted out of receiving SMS messages from the current AWS account.

```
aws sns check-if-phone-number-is-opted-out \
```

```
    --phone-number +1555550100
```

Output:

```
{
    "isOptedOut": false
}
```

For more information, see Managing Amazon SNS phone numbers and subscriptions in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see CheckIfPhoneNumberIsOptedOut in *AWS CLI Command Reference*.

`confirm-subscription`

The following code example shows how to use `confirm-subscription`.

AWS CLI

To confirm a subscription

The following `confirm-subscription` example completes the confirmation process started when you subscribed to an SNS topic named `my-topic`. The --token parameter comes from the confirmation message sent to the notification endpoint specified in the subscribe call.

```
aws sns confirm-subscription \
    --topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \
    --
token 2336412f37fb687f5d51e6e241d7700ae02f7124d8268910b858cb4db727ceeb2474bb937929d3bdd7ce5d
```

Output:

```
{
    "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Creating a subscription to an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see ConfirmSubscription in *AWS CLI Command Reference*.

`create-platform-application`

The following code example shows how to use `create-platform-application`.

AWS CLI

To create a platform application

The following `create-platform-application` example creates a Google Firebase platform application using the specified platform credential.

```
aws sns create-platform-application \
    --name MyApplication \
    --platform GCM \
    --attributes PlatformCredential=EXAMPLEabcd12345jklm67890stuv12345bcdef
```

Output:

```
{
    "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication"
}
```

For more information, see Creating an Amazon SNS platform application in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see CreatePlatformApplication in *AWS CLI Command Reference*.

`create-topic`

The following code example shows how to use `create-topic`.

AWS CLI

To create an SNS topic

The following `create-topic` example creates an SNS topic named `my-topic`.

```
aws sns create-topic \
    --name my-topic
```

Output:

```
{
    "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
}
```

For more information, see Using the AWS Command Line Interface with Amazon SQS and Amazon SNS in the *AWS Command Line Interface User Guide*.

- For API details, see CreateTopic in *AWS CLI Command Reference*.

`delete-endpoint`

The following code example shows how to use `delete-endpoint`.

AWS CLI

To delete a platform application endpoint

The following `delete-endpoint` example deletes the specified platform application endpoint.

```
aws sns delete-endpoint \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/MyApplication/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Setting up an Amazon SNS platform endpoint for mobile notifications in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see DeleteEndpoint in *AWS CLI Command Reference*.

`delete-platform-application`

The following code example shows how to use `delete-platform-application`.

AWS CLI

To delete a platform application

The following `delete-platform-application` example deletes the specified platform application.

```
aws sns delete-platform-application \
```

```
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/ADM/
MyApplication
```

This command produces no output.

For more information, see Creating an Amazon SNS platform application in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see DeletePlatformApplication in *AWS CLI Command Reference*.

`delete-topic`

The following code example shows how to use `delete-topic`.

AWS CLI

To delete an SNS topic

The following `delete-topic` example deletes the specified SNS topic.

```
aws sns delete-topic \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

This command produces no output.

For more information, see Deleting an Amazon SNS topic and subscription in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see DeleteTopic in *AWS CLI Command Reference*.

`get-endpoint-attributes`

The following code example shows how to use `get-endpoint-attributes`.

AWS CLI

To list platform application endpoint attributes

The following `get-endpoint-attributes` example lists the attributes for the specified platform application endpoint.

```
aws sns get-endpoint-attributes \
```

```
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/MyApplication/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Attributes": {
        "Enabled": "true",
        "Token": "EXAMPLE12345..."
    }
}
```

For more information, see Setting up an Amazon SNS platform endpoint for mobile notifications in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see GetEndpointAttributes in *AWS CLI Command Reference*.

`get-platform-application-attributes`

The following code example shows how to use `get-platform-application-attributes`.

AWS CLI

To list the platform application attributes

The following `get-platform-application-attributes` example lists the attributes for the specified platform application.

```
aws sns get-platform-application-attributes \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/MPNS/
MyApplication
```

Output:

```
{
    "Attributes": {
        "Enabled": "true",
        "SuccessFeedbackSampleRate": "100"
    }
}
```

For more information, see Amazon SNS mobile app attributes in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see GetPlatformApplicationAttributes in *AWS CLI Command Reference*.

`get-sms-attributes`

The following code example shows how to use `get-sms-attributes`.

AWS CLI

To list the default SMS message attributes

The following `get-sms-attributes` example lists the default attributes for sending SMS messages.

```
aws sns get-sms-attributes
```

Output:

```
{
    "attributes": {
        "DefaultSenderID": "MyName"
    }
}
```

For more information, see Setting SMS messaging preferences in Amazon SNS in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see GetSMSAttributes in *AWS CLI Command Reference*.

`get-subscription-attributes`

The following code example shows how to use `get-subscription-attributes`.

AWS CLI

To retrieve subscription attributes for a topic

The following `get-subscription-attributes` example displays the attributes of the specified subscription. You can get the `subscription-arn` from the output of the `list-subscriptions` command.

```
aws sns get-subscription-attributes \
    --subscription-arn "arn:aws:sns:us-west-2:123456789012:my-
topic:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Attributes": {
        "Endpoint": "my-email@example.com",
        "Protocol": "email",
        "RawMessageDelivery": "false",
        "ConfirmationWasAuthenticated": "false",
        "Owner": "123456789012",
        "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
    }
}
```

For more information, see Creating a subscription to an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see GetSubscriptionAttributes in *AWS CLI Command Reference*.

`get-topic-attributes`

The following code example shows how to use `get-topic-attributes`.

AWS CLI

To retrieve the attributes of a topic

The following `get-topic-attributes` example displays the attributes for the specified topic.

```
aws sns get-topic-attributes \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

Output:

```
{
```

```
    "Attributes": {
        "SubscriptionsConfirmed": "1",
        "DisplayName": "my-topic",
        "SubscriptionsDeleted": "0",
        "EffectiveDeliveryPolicy": "{\"http\":{\"defaultHealthyRetryPolicy\":
{\"minDelayTarget\":20,\"maxDelayTarget\":20,\"numRetries\":3,\"numMaxDelayRetries
\":0,\"numNoDelayRetries\":0,\"numMinDelayRetries\":0,\"backoffFunction\":\"linear
\"},\"disableSubscriptionOverrides\":false}}",
        "Owner": "123456789012",
        "Policy": "{\"Version\":\"2008-10-17\",\"Id\":\"__default_policy_ID\",
\"Statement\":[{\"Sid\":\"__default_statement_ID\",\"Effect\":\"Allow\",\"Principal
\":{\"AWS\":\"*\"},\"Action\":[\"SNS:Subscribe\",\"SNS:ListSubscriptionsByTopic
\",\"SNS:DeleteTopic\",\"SNS:GetTopicAttributes\",\"SNS:Publish\",
\"SNS:RemovePermission\",\"SNS:AddPermission\",\"SNS:SetTopicAttributes\"],
\"Resource\":\"arn:aws:sns:us-west-2:123456789012:my-topic\",\"Condition\":
{\"StringEquals\":{\"AWS:SourceOwner\":\"0123456789012\"}}}]}",
        "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
        "SubscriptionsPending": "0"
    }
}
```

For more information, see Creating an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see GetTopicAttributes in *AWS CLI Command Reference*.

`list-endpoints-by-platform-application`

The following code example shows how to use `list-endpoints-by-platform-application`.

AWS CLI

To list the endpoints for a platform application

The following `list-endpoints-by-platform-application` example lists the endpoints and endpoint attributes for the specified platform application.

```
aws sns list-endpoints-by-platform-application \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication
```

Output:

```
{
    "Endpoints": [
        {
            "Attributes": {
                "Token": "EXAMPLE12345",
                "Enabled": "true"
            },
            "EndpointArn": "arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Setting up an Amazon SNS platform endpoint for mobile notifications in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see ListEndpointsByPlatformApplication in *AWS CLI Command Reference*.

`list-phone-numbers-opted-out`

The following code example shows how to use `list-phone-numbers-opted-out`.

AWS CLI

To list SMS message opt-outs

The following `list-phone-numbers-opted-out` example lists the phone numbers opted out of receiving SMS messages.

```
aws sns list-phone-numbers-opted-out
```

Output:

```
{
    "phoneNumbers": [
        "+15555550100"
    ]
}
```

For more information, see Managing Amazon SNS phone numbers and subscriptions in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see ListPhoneNumbersOptedOut in *AWS CLI Command Reference*.

`list-platform-applications`

The following code example shows how to use `list-platform-applications`.

AWS CLI

To list platform applications

The following `list-platform-applications` example lists the platform applications for ADM and MPNS.

```
aws sns list-platform-applications
```

Output:

```
{
    "PlatformApplications": [
        {
            "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/ADM/
MyApplication",
            "Attributes": {
                "SuccessFeedbackSampleRate": "100",
                "Enabled": "true"
            }
        },
        {
            "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/MPNS/
MyOtherApplication",
            "Attributes": {
                "SuccessFeedbackSampleRate": "100",
                "Enabled": "true"
            }
        }
    ]
}
```

For more information, see Sending mobile push notifications with Amazon SNS in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see ListPlatformApplications in *AWS CLI Command Reference*.

`list-subscriptions-by-topic`

The following code example shows how to use `list-subscriptions-by-topic`.

AWS CLI

To list the subscriptions associated with a topic

The following `list-subscriptions-by-topic` example retrieves a list of SNS subscriptions associated with the specified topic.

```
aws sns list-subscriptions-by-topic \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

Output:

```
{
    "Subscriptions": [
        {
            "Owner": "123456789012",
            "Endpoint": "my-email@example.com",
            "Protocol": "email",
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
            "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Creating a subscription to an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see ListSubscriptionsByTopic in *AWS CLI Command Reference*.

`list-subscriptions`

The following code example shows how to use `list-subscriptions`.

AWS CLI

To list your SNS subscriptions

The following `list-subscriptions` example displays a list of the SNS subscriptions in your AWS account.

```
aws sns list-subscriptions
```

Output:

```
{
    "Subscriptions": [
        {
            "Owner": "123456789012",
            "Endpoint": "my-email@example.com",
            "Protocol": "email",
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
            "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Creating a subscription to an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see ListSubscriptions in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a topic

The following `list-tags-for-resource` example lists the tags for the specified Amazon SNS topic.

```
aws sns list-tags-for-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic
```

Output:

```
{
    "Tags": [
        {
            "Key": "Team",
            "Value": "Alpha"
        }
    ]
}
```

For more information, see Amazon SNS topic tagging in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-topics`

The following code example shows how to use `list-topics`.

AWS CLI

To list your SNS topics

The following `list-topics` example lists all of SNS topics in your AWS account.

```
aws sns list-topics
```

Output:

```
{
    "Topics": [
        {
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
        }
    ]
}
```

For more information, see Creating an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see ListTopics in *AWS CLI Command Reference*.

`opt-in-phone-number`

The following code example shows how to use `opt-in-phone-number`.

AWS CLI

To opt-in for SMS messages

The following `opt-in-phone-number` example opts the specified phone number into receiving SMS messages.

```
aws sns opt-in-phone-number \
    --phone-number +15555550100
```

This command produces no output.

For more information, see Managing Amazon SNS phone numbers and subscriptions in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see OptInPhoneNumber in *AWS CLI Command Reference*.

`publish`

The following code example shows how to use `publish`.

AWS CLI

Example 1: To publish a message to a topic

The following `publish` example publishes the specified message to the specified SNS topic. The message comes from a text file, which enables you to include line breaks.

```
aws sns publish \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic" \
    --message file://message.txt
```

Contents of `message.txt`:

```
Hello World
Second Line
```

Output:

```
{
    "MessageId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Publishing an Amazon SNS message in the *Amazon Simple Notification Service Developer Guide*.

Example 2: To publish an SMS message to a phone number

The following `publish` example publishes the message `Hello world!` to the phone number `+1-555-555-0100`.

```
aws sns publish \
    --message "Hello world!" \
    --phone-number +1-555-555-0100
```

Output:

```
{
    "MessageId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Sending SMS messages using Amazon SNS in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see Publish in *AWS CLI Command Reference*.

`put-data-protection-policy`

The following code example shows how to use `put-data-protection-policy`.

AWS CLI

Example 1: To deny publishers from publishing messages with CreditCardNumber

The following `put-data-protection-policy` example denies publishers from publishing messages with CreditCardNumber.

```
aws sns put-data-protection-policy \
    --resource-arn arn:aws:sns:us-west-2:123456789012:mytopic \
    --data-protection-policy "{\"Name\":\"data_protection_policy\",\"Description
\":\"Example data protection policy\",\"Version\":\"2021-06-01\",\"Statement
\":[{\"DataDirection\":\"Inbound\",\"Principal\":[\"*\"],\"DataIdentifier\":
[\"arn:aws:dataprotection::aws:data-identifier/CreditCardNumber\"],\"Operation\":
{\"Deny\":{}}}]}"
```

This command produces no output.

For more information, see Understanding Amazon SNS data protection policies in the *Amazon Simple Notification Service Developer Guide*.

Example 2: To load parameters from a file

The following `put-data-protection-policy` example loads parameters from a file.

```
aws sns put-data-protection-policy \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --data-protection-policy file://policy.json
```

Contents of `policy.json`:

```
{
    "Name": "data_protection_policy",
    "Description": "Example data protection policy",
    "Version": "2021-06-01",
    "Statement": [
        {
            "DataDirection": "Inbound",
            "Principal": [
                "*"
            ],
            "DataIdentifier": [
                "arn:aws:dataprotection::aws:data-identifier/CreditCardNumber"
            ],
            "Operation": {
                "Deny": {}
            }
        }
    ]
```

```
}
```

This command produces no output.

For more information, see Understanding Amazon SNS data protection policies in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see PutDataProtectionPolicy in *AWS CLI Command Reference*.

`remove-permission`

The following code example shows how to use `remove-permission`.

AWS CLI

To remove a permission from a topic

The following `remove-permission` example removes the permission `Publish-Permission` from the specified topic.

```
aws sns remove-permission \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --label Publish-Permission
```

This command produces no output.

For more information, see Example cases for Amazon SNS access control in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see RemovePermission in *AWS CLI Command Reference*.

`set-endpoint-attributes`

The following code example shows how to use `set-endpoint-attributes`.

AWS CLI

To set endpoint attributes

The following `set-endpoint-attributes` example disables the specified platform application endpoint.

```
aws sns set-endpoint-attributes \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/MyApplication/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --attributes Enabled=false
```

This command produces no output.

For more information, see Setting up an Amazon SNS platform endpoint for mobile notifications in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see SetEndpointAttributes in *AWS CLI Command Reference*.

`set-platform-application-attributes`

The following code example shows how to use `set-platform-application-attributes`.

AWS CLI

To set platform application attributes

The following `set-platform-application-attributes` example sets the `EventDeliveryFailure` attribute for the specified platform application to the ARN of the specified Amazon SNS topic.

```
aws sns set-platform-application-attributes \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication \
    --attributes EventDeliveryFailure=arn:aws:sns:us-
west-2:123456789012:AnotherTopic
```

This command produces no output.

For more information, see Amazon SNS mobile app attributes in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see SetPlatformApplicationAttributes in *AWS CLI Command Reference*.

`set-sms-attributes`

The following code example shows how to use `set-sms-attributes`.

AWS CLI

To set SMS message attributes

The following `set-sms-attributes` example sets the default sender ID for SMS messages to `MyName`.

```
aws sns set-sms-attributes \
    --attributes DefaultSenderID=MyName
```

This command produces no output.

For more information, see Setting SMS messaging preferences in Amazon SNS in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see SetSMSAttributes in *AWS CLI Command Reference*.

`set-subscription-attributes`

The following code example shows how to use `set-subscription-attributes`.

AWS CLI

To set subscription attributes

The following `set-subscription-attributes` example sets the `RawMessageDelivery` attribute to an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
west-2:123456789012:mytopic:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --attribute-name RawMessageDelivery \
    --attribute-value true
```

This command produces no output.

For more information, see Amazon SNS raw message delivery in the *Amazon Simple Notification Service Developer Guide*.

The following `set-subscription-attributes` example sets a `FilterPolicy` attribute to an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
west-2:123456789012:mytopic:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --attribute-name FilterPolicy \
    --attribute-value "{ \"anyMandatoryKey\": [\"any\", \"of\", \"these\"] }"
```

This command produces no output.

For more information, see Amazon SNS subscription filter policies in the *Amazon Simple Notification Service Developer Guide*.

The following `set-subscription-attributes` example removes the `FilterPolicy` attribute from an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
west-2:123456789012:mytopic:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --attribute-name FilterPolicy \
    --attribute-value "{}"
```

This command produces no output.

For more information, see Amazon SNS subscription filter policies in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see SetSubscriptionAttributes in *AWS CLI Command Reference*.

`set-topic-attributes`

The following code example shows how to use `set-topic-attributes`.

AWS CLI

To set an attribute for a topic

The following `set-topic-attributes` example sets the `DisplayName` attribute for the specified topic.

```
aws sns set-topic-attributes \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --attribute-name DisplayName \
```

```
    --attribute-value MyTopicDisplayName
```

This command produces no output.

For more information, see Creating an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see SetTopicAttributes in *AWS CLI Command Reference*.

`subscribe`

The following code example shows how to use `subscribe`.

AWS CLI

To subscribe to a topic

The following `subscribe` example subscribes an email address to the specified topic.

```
aws sns subscribe \
    --topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \
    --protocol email \
    --notification-endpoint my-email@example.com
```

Output:

```
{
    "SubscriptionArn": "pending confirmation"
}
```

For more information, see Amazon SNS email subscription setup and management in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see Subscribe in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a topic

The following `tag-resource` example adds a metadata tag to the specified Amazon SNS topic.

```
aws sns tag-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --tags Key=Team,Value=Alpha
```

This command produces no output.

For more information, see Amazon SNS topic tagging in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`unsubscribe`

The following code example shows how to use `unsubscribe`.

AWS CLI

To unsubscribe from a topic

The following `unsubscribe` example deletes the specified subscription from a topic.

```
aws sns unsubscribe \
    --subscription-arn arn:aws:sns:us-west-2:0123456789012:my-
topic:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Deleting an Amazon SNS topic and subscription in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see Unsubscribe in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a topic

The following `untag-resource` example removes any tags with the specified keys from the specified Amazon SNS topic.

```
aws sns untag-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --tag-keys Team
```

This command produces no output.

For more information, see Amazon SNS topic tagging in the *Amazon Simple Notification Service Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Scenarios

Create a platform endpoint for push notifications

The following code example shows how to create a platform endpoint for Amazon SNS push notifications.

AWS CLI

To create a platform application endpoint

The following `create-platform-endpoint` example creates an endpoint for the specified platform application using the specified token.

```
aws sns create-platform-endpoint \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication \
    --token EXAMPLE12345...
```

Output:

```
{
    "EndpointArn": "arn:aws:sns:us-west-2:1234567890:endpoint/GCM/MyApplication/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting up an Amazon SNS platform endpoint for mobile notifications in the *Amazon Simple Notification Service Developer Guide*.

Amazon SQS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SQS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-permission`

The following code example shows how to use `add-permission`.

AWS CLI

To add a permission to a queue

The following `add-permission` example enables the specified AWS account to send messages to the specified queue.

```
aws sqs add-permission \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
    --label SendMessagesFromMyQueue \
    --aws-account-ids 12345EXAMPLE \
    --actions SendMessage
```

This command produces no output.

For more information, see Overview of managing access in Amazon SQS in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see AddPermission in *AWS CLI Command Reference*.

`cancel-message-move-task`

The following code example shows how to use `cancel-message-move-task`.

AWS CLI

To cancel a message move task

The following `cancel-message-move-task` example cancels the specified message move task.

```
aws sqs cancel-message-move-task \
    --task-handle AQEB6nR4...HzlvZQ==
```

Output:

```
{
    "ApproximateNumberOfMessagesMoved": 102
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see CancelMessageMoveTask in *AWS CLI Command Reference*.

`change-message-visibility-batch`

The following code example shows how to use `change-message-visibility-batch`.

AWS CLI

To change multiple messages' timeout visibilities as a batch

The following `change-message-visibility-batch` example changes the 2 specified messages' timeout visibilities to 10 hours (10 hours * 60 minutes * 60 seconds).

```
aws sqs change-message-visibility-batch \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
```

```
    --entries file://change-message-visibility-batch.json
```

Contents of `change-message-visibility-batch.json`:

```
[
    {
        "Id": "FirstMessage",
        "ReceiptHandle": "AQEBhz2q...Jf3kaw==",
        "VisibilityTimeout": 36000
    },
    {
        "Id": "SecondMessage",
        "ReceiptHandle": "AQEBkTUH...HifSnw==",
        "VisibilityTimeout": 36000
    }
]
```

Output:

```
{
    "Successful": [
        {
            "Id": "SecondMessage"
        },
        {
            "Id": "FirstMessage"
        }
    ]
}
```

For more information, see Amazon SQS visibility timeout in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see ChangeMessageVisibilityBatch in *AWS CLI Command Reference*.

`change-message-visibility`

The following code example shows how to use `change-message-visibility`.

AWS CLI

To change a message's timeout visibility

The following `change-message-visibility` example changes the specified message's timeout visibility to 10 hours (10 hours * 60 minutes * 60 seconds).

```
aws sqs change-message-visibility \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
    --receipt-handle AQEBTpyI...t6HyQg== \
    --visibility-timeout 36000
```

This command produces no output.

For more information, see Amazon SQS visibility timeout in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see ChangeMessageVisibility in *AWS CLI Command Reference*.

`create-queue`

The following code example shows how to use `create-queue`.

AWS CLI

To create a queue

The following `create-queue` example creates a queue with the specified name, sets the message retention period to 3 days (3 days * 24 hours * 60 minutes * 60 seconds), and sets the queue's dead letter queue to the specified queue with a maximum receive count of 1,000 messages.

```
aws sqs create-queue \
    --queue-name MyQueue \
    --attributes file://create-queue.json
```

Contents of `create-queue.json`:

```
{
    "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
west-2:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":\"1000\"}",
    "MessageRetentionPeriod": "259200"
}
```

Output:

```
{
    "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

For more information, see Using dead-letter queues in Amazon SQS in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see CreateQueue in *AWS CLI Command Reference*.

`delete-message-batch`

The following code example shows how to use `delete-message-batch`.

AWS CLI

To delete multiple messages as a batch

The following `delete-message-batch` example deletes the specified messages.

```
aws sqs delete-message-batch \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
    --entries file://delete-message-batch.json
```

Contents of `delete-message-batch.json`:

```
[
    {
        "Id": "FirstMessage",
        "ReceiptHandle": "AQEB1mgl...Z4GuLw=="
    },
    {
        "Id": "SecondMessage",
        "ReceiptHandle": "AQEBLsYM...VQubAA=="
    }
]
```

Output:

```
{
    "Successful": [
        {
```

```
            "Id": "FirstMessage"
        },
        {
            "Id": "SecondMessage"
        }
    ]
}
```

For more information, see Amazon SQS batch actions in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see DeleteMessageBatch in *AWS CLI Command Reference*.

`delete-message`

The following code example shows how to use `delete-message`.

AWS CLI

To delete a message

The following `delete-message` example deletes the specified message.

```
aws sqs delete-message \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
    --receipt-handle AQEBRXTo...q2doVA==
```

This command produces no output.

For more information, see Receiving and deleting a message in Amazon SQS in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see DeleteMessage in *AWS CLI Command Reference*.

`delete-queue`

The following code example shows how to use `delete-queue`.

AWS CLI

To delete a queue

The following `delete-queue` example deletes the specified queue.

```
aws sqs delete-queue \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyNewerQueue
```

This command produces no output.

For more information, see Deleting an Amazon SQS queue in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see DeleteQueue in *AWS CLI Command Reference*.

`get-queue-attributes`

The following code example shows how to use `get-queue-attributes`.

AWS CLI

To get a queue's attributes

The following `get-queue-attributes` example gets all of the specified queue's attributes.

```
aws sqs get-queue-attributes \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
    --attribute-names All
```

Output:

```
{
    "Attributes": {
        "ApproximateNumberOfMessagesNotVisible": "0",
        "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
west-2:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":1000}",
        "MessageRetentionPeriod": "345600",
        "ApproximateNumberOfMessagesDelayed": "0",
        "MaximumMessageSize": "262144",
        "CreatedTimestamp": "1442426968",
        "ApproximateNumberOfMessages": "0",
        "ReceiveMessageWaitTimeSeconds": "0",
        "DelaySeconds": "0",
        "VisibilityTimeout": "30",
```

```
        "LastModifiedTimestamp": "1442426968",
        "QueueArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyNewQueue"
    }
}
```

For more information, see Configuring queue parameters using the Amazon SQS console in the *Amazon Simple Queue Service Developer Guide*.

The following `get-queue-attributes` example gets only the specified queue's maximum message size and visibility timeout attributes.

```
aws sqs get-queue-attributes \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyNewQueue \
    --attribute-names MaximumMessageSize VisibilityTimeout
```

Output:

```
{
    "Attributes": {
        "VisibilityTimeout": "30",
        "MaximumMessageSize": "262144"
    }
}
```

For more information, see Configuring queue parameters using the Amazon SQS console in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see GetQueueAttributes in *AWS CLI Command Reference*.

`get-queue-url`

The following code example shows how to use `get-queue-url`.

AWS CLI

To get a queue URL

The following `get-queue-url` example gets the specified queue's URL.

```
aws sqs get-queue-url \
```

```
    --queue-name MyQueue
```

Output:

```
{
    "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

For more information, see Amazon SQS queue and message identifiers in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see GetQueueUrl in *AWS CLI Command Reference*.

`list-dead-letter-source-queues`

The following code example shows how to use `list-dead-letter-source-queues`.

AWS CLI

To list dead letter source queues

The following `list-dead-letter-source-queues` example lists the queues that are associated with the specified dead letter source queue.

```
aws sqs list-dead-letter-source-queues \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue
```

Output:

```
{
    "queueUrls": [
        "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
        "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
    ]
}
```

For more information, see Using dead-letter queues in Amazon SQS in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see ListDeadLetterSourceQueues in *AWS CLI Command Reference*.

`list-message-move-tasks`

The following code example shows how to use `list-message-move-tasks`.

AWS CLI

To list the message move tasks

The following `list-message-move-tasks` example lists the 2 most recent message move tasks in the specified queue.

```
aws sqs list-message-move-tasks \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue \
    --max-results 2
```

Output:

```
{
    "Results": [
        {
            "TaskHandle": "AQEB6nR4...HzlvZQ==",
            "Status": "RUNNING",
            "SourceArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1",
            "DestinationArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2",
            "MaxNumberOfMessagesPerSecond": 50,
            "ApproximateNumberOfMessagesMoved": 203,
            "ApproximateNumberOfMessagesToMove": 30,
            "StartedTimestamp": 1442428276921
        },

        {
            "Status": "COMPLETED",
            "SourceArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1",
            "DestinationArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2",
            "ApproximateNumberOfMessagesMoved": 29,
            "ApproximateNumberOfMessagesToMove": 0,
            "StartedTimestamp": 1342428272093
        }
    ]
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see ListMessageMoveTasks in *AWS CLI Command Reference*.

`list-queue-tags`

The following code example shows how to use `list-queue-tags`.

AWS CLI

To list all cost allocation tags for a queue

The following `list-queue-tags` example displays all of the cost allocation tags associated with the specified queue.

```
aws sqs list-queue-tags \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue
```

Output:

```
{
    "Tags": {
        "Team": "Alpha"
    }
}
```

For more information, see Listing Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see ListQueueTags in *AWS CLI Command Reference*.

`list-queues`

The following code example shows how to use `list-queues`.

AWS CLI

To list queues

The following `list-queues` example lists all queues.

```
aws sqs list-queues
```

Output:

```
{
    "QueueUrls": [
        "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
        "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
        "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue",
        "https://queue.amazonaws.com/80398EXAMPLE/TestQueue1",
        "https://queue.amazonaws.com/80398EXAMPLE/TestQueue2"
    ]
}
```

For more information, see Amazon SQS list queue pagination in the *Amazon Simple Queue Service Developer Guide*.

The following `list-queues` example lists only queues that start with "My".

```
aws sqs list-queues \
    --queue-name-prefix My
```

Output:

```
{
    "QueueUrls": [
        "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
        "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
        "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
    ]
}
```

For more information, see Amazon SQS list queue pagination in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see ListQueues in *AWS CLI Command Reference*.

`purge-queue`

The following code example shows how to use `purge-queue`.

AWS CLI

To purge a queue

The following `purge-queue` example deletes all messages in the specified queue.

```
aws sqs purge-queue \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyNewQueue
```

This command produces no output.

For more information, see Purging messages from an queue using the Amazon SQS console in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see PurgeQueue in *AWS CLI Command Reference*.

`receive-message`

The following code example shows how to use `receive-message`.

AWS CLI

To receive a message

The following `receive-message` example receives up to 10 available messages, returning all available attributes.

```
aws sqs receive-message \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
    --attribute-names All \
    --message-attribute-names All \
    --max-number-of-messages 10
```

Output:

```
{
    "Messages": [
        {
            "Body": "My first message.",
            "ReceiptHandle": "AQEBzbVv...fqNzFw==",
            "MD5OfBody": "1000f835...a35411fa",
            "MD5OfMessageAttributes": "9424c491...26bc3ae7",
            "MessageId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Attributes": {
                "ApproximateFirstReceiveTimestamp": "1442428276921",
```

```
                "SenderId": "AIDAIAZKMSNQ7TEXAMPLE",
                "ApproximateReceiveCount": "5",
                "SentTimestamp": "1442428276921"
            },
            "MessageAttributes": {
                "PostalCode": {
                    "DataType": "String",
                    "StringValue": "ABC123"
                },
                "City": {
                    "DataType": "String",
                    "StringValue": "Any City"
                }
            }
        }
    ]
}
```

The following `receive-message` example receives the next available message, returning only the SenderId and SentTimestamp attributes as well as the PostalCode message attribute.

```
aws sqs receive-message \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
    --attribute-names SenderId SentTimestamp \
    --message-attribute-names PostalCode
```

Output:

```
{
    "Messages": [
        {
            "Body": "My first message.",
            "ReceiptHandle": "AQEB6nR4...HzlvZQ==",
            "MD5OfBody": "1000f835...a35411fa",
            "MD5OfMessageAttributes": "b8e89563...e088e74f",
            "MessageId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Attributes": {
                "SenderId": "AIDAIAZKMSNQ7TEXAMPLE",
                "SentTimestamp": "1442428276921"
            },
            "MessageAttributes": {
                "PostalCode": {
                    "DataType": "String",
```

```
                    "StringValue": "ABC123"
                }
            }
        }
    ]
}
```

For more information, see Receiving and deleting a message in Amazon SQS in the *Amazon Simple Queue Service Developer Guide*.

For more information, see Receiving and deleting a message in Amazon SQS in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see ReceiveMessage in *AWS CLI Command Reference*.

`remove-permission`

The following code example shows how to use `remove-permission`.

AWS CLI

To remove a permission

The following `remove-permission` example removes the permission with the specified label from the specified queue.

```
aws sqs remove-permission \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
    --label SendMessagesFromMyQueue
```

This command produces no output.

For more information, see Overview of managing access in Amazon SQS in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see RemovePermission in *AWS CLI Command Reference*.

`send-message-batch`

The following code example shows how to use `send-message-batch`.

AWS CLI

To send multiple messages as a batch

The following `send-message-batch` example sends 2 messages with the specified message bodies, delay periods, and message attributes, to the specified queue.

```
aws sqs send-message-batch \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
    --entries file://send-message-batch.json
```

Contents of `send-message-batch.json`:

```
[
    {
        "Id": "FuelReport-0001-2015-09-16T140731Z",
        "MessageBody": "Fuel report for account 0001 on 2015-09-16 at 02:07:31 PM.",
        "DelaySeconds": 10,
        "MessageAttributes": {
            "SellerName": {
                "DataType": "String",
                "StringValue": "Example Store"
            },
            "City": {
                "DataType": "String",
                "StringValue": "Any City"
            },
            "Region": {
                "DataType": "String",

}
```

For more information, see Amazon SQS batch actions in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see SendMessageBatch in *AWS CLI Command Reference*.

`send-message`

The following code example shows how to use `send-message`.

AWS CLI

To send a message

The following `send-message` example sends a message with the specified message body, delay period, and message attributes, to the specified queue. The `--cli-binary-format raw-in-base64-out` option lets you pass the binary `Greeting` attribute as plain text instead of base64.

```
aws sqs send-message \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyQueue \
    --message-body "Information about the largest city in Any Region." \
    --delay-seconds 10 \
    --message-attributes file://send-message.json \
    --cli-binary-format raw-in-base64-out
```

Contents of `send-message.json`:

```
{
    "City": {
        "DataType": "String",
        "StringValue": "Any City"
    },
    "Greeting": {
        "DataType": "Binary",
        "BinaryValue": "Hello, World!"
    },
    "Population": {
        "DataType": "Number",
        "StringValue": "1250800"
```

```
    }
}
```

Output:

```
{
    "MD5OfMessageBody": "51b0a325...39163aa0",
    "MD5OfMessageAttributes": "00484c68...59e48f06",
    "MessageId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Sending a message with attributes using Amazon SQS in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see SendMessage in *AWS CLI Command Reference*.

`set-queue-attributes`

The following code example shows how to use `set-queue-attributes`.

AWS CLI

To set queue attributes

The following `set-queue-attributes` example sets the specified queue to a delivery delay of 10 seconds, a maximum message size of 128 KB (128 KB * 1,024 bytes), a message retention period of 3 days (3 days * 24 hours * 60 minutes * 60 seconds), a receive message wait time of 20 seconds, and a default visibility timeout of 60 seconds. This example also associates the specified dead letter queue with a maximum receive count of 1,000 messages.

```
aws sqs set-queue-attributes \
    --queue-url https://sqs.us-west-2.amazonaws.com/80398EXAMPLE/MyNewQueue \
    --attributes file://set-queue-attributes.json
```

Contents of `set-queue-attributes.json`:

```
{
    "DelaySeconds": "10",
    "MaximumMessageSize": "131072",
    "MessageRetentionPeriod": "259200",
```

```
    "ReceiveMessageWaitTimeSeconds": "20",
    "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
west-2:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":\"1000\"}",
    "VisibilityTimeout": "60"
}
```

This command produces no output.

For more information, see Configuring queue parameters using the Amazon SQS console in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see SetQueueAttributes in *AWS CLI Command Reference*.

`start-message-move-task`

The following code example shows how to use `start-message-move-task`.

AWS CLI

Example 1: To start a message move task

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the source queue.

```
aws sqs start-message-move-task \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue
```

Output:

```
{
    "TaskHandle": "AQEB6nR4...HzlvZQ=="
}
```

For more information, see Learn how to configure a dead-letter queue redrive in Amazon SQS in the *Amazon SQS Developer Guide*.

Example 2: To start a message move task with a maximum rate

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the specified destination queue at a maximum rate of 50 messages per second.

```
aws sqs start-message-move-task \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1 \
    --destination-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2 \
    --max-number-of-messages-per-second 50
```

Output:

```
{
    "TaskHandle": "AQEB6nR4...HzlvZQ=="
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see StartMessageMoveTask in *AWS CLI Command Reference*.

`tag-queue`

The following code example shows how to use `tag-queue`.

AWS CLI

To add cost allocation tags to a queue

The following `tag-queue` example adds a cost allocation tag to the specified Amazon SQS queue.

```
aws sqs tag-queue \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \
    --tags Priority=Highest
```

This command produces no output.

For more information, see Adding Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see TagQueue in *AWS CLI Command Reference*.

`untag-queue`

The following code example shows how to use `untag-queue`.

AWS CLI

To remove cost allocation tags from a queue

The following `untag-queue` example removes a cost allocation tag from the specified Amazon SQS queue.

```
aws sqs untag-queue \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \
    --tag-keys "Priority"
```

This command produces no output.

For more information, see Adding Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see UntagQueue in *AWS CLI Command Reference*.

Storage Gateway examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Storage Gateway.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`describe-gateway-information`

The following code example shows how to use `describe-gateway-information`.

AWS CLI

To describe a gateway

The following `describe-gateway-information` example returns metadata about the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This example specifies a gateway with the id `sgw-12A3456B` in account `123456789012`.

```
aws storagegateway describe-gateway-information \
    --gateway-arn "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-12A3456B"
```

This command outputs a JSON block that contains metadata about about the gateway such as its name, network interfaces, configured time zone, and the state (whether the gateway is running or not).

Output:

```
{
    "GatewayARN": "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-12A3456B",
    "GatewayId": "sgw-12A3456B",
    "GatewayName": "my-gateway",
    "GatewayTimezone": "GMT-8:00",
    "GatewayState": "RUNNING",
    "GatewayNetworkInterfaces": [
        {
            "Ipv4Address": "10.0.0.25"
        }
    ],
    "GatewayType": "STORED",
    "Tags": [],
    "HostEnvironment": "VMWARE",
    "EndpointType": "STANDARD"
}
```

For more information, see Managing Your Volume Gateway in the *AWS Storage Gateway Volume Gateway User Guide*.

- For API details, see DescribeGatewayInformation in *AWS CLI Command Reference*.

`list-file-shares`

The following code example shows how to use `list-file-shares`.

AWS CLI

To list file shares

The following `list-file-shares` example lists the file shares for the specified gateway.

```
aws storagegateway list-file-shares \
    --gateway-arn arn:aws:storagegateway:us-west-2:123456789012:gateway/sgw-FB02E292
```

Output:

```
{
    "FileShareInfoList": [
        {
            "FileShareType": "NFS",
            "FileShareARN": "arn:aws:storagegateway:us-west-2:123456789012:share/
share-2FA12345",
            "FileShareId": "share-2FA12345",
            "FileShareStatus": "AVAILABLE",
            "GatewayARN": "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-FB0AAAAA"
        }
    ],
    "Marker": null
}
```

For more information, see Managing your Amazon S3 File Gateway in the *Amazon S3 File Gateway User Guide*.

- For API details, see ListFileShares in *AWS CLI Command Reference*.

`list-gateways`

The following code example shows how to use `list-gateways`.

AWS CLI

To list gateways for an account

The following `list-gateways` example lists all the gateways defined for an account.

```
aws storagegateway list-gateways
```

This command outputs a JSON block that contains a list of gateway Amazon Resource Names (ARNs).

Output:

```
{
    "Gateways": [
        {
            "GatewayId": "sgw-12A3456B",
            "GatewayARN": "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-12A3456B",
            "GatewayType": "STORED",
            "GatewayOperationalState": "ACTIVE",
            "GatewayName": "my-gateway",
            "HostEnvironment": "VMWARE"
        },
        {
            "GatewayId": "sgw-23B4567C",
            "GatewayARN": "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-23B4567C",
            "GatewayType": "CACHED",
            "GatewayOperationalState": "ACTIVE",
            "GatewayName": "my-cached-gateway",
            "HostEnvironment": "VMWARE"
        }
    ]
}
```

For more information, see Understanding Storage Gateway Resources and Resource IDs in the *AWS Storage Gateway Volume Gateway User Guide*.

- For API details, see ListGateways in *AWS CLI Command Reference*.

`list-volumes`

The following code example shows how to use `list-volumes`.

AWS CLI

To list the volumes configured for a gateway

The following `list-volumes` example returns a list of volumes configured for the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This example specifies a gateway with the id `sgw-12A3456B` in account `123456789012`.

```
aws storagegateway list-volumes \
    --gateway-arn "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-12A3456B"
```

This command outputs a JSON block that a list of volumes that includes the type and ARN for each volume.

Output:

```
{
    "GatewayARN": "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-12A3456B",
    "VolumeInfos": [
        {
            "VolumeARN": "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-12A3456B/volume/vol-1122AABB",
            "VolumeId": "vol-1122AABB",
            "GatewayARN": "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-12A3456B",
            "GatewayId": "sgw-12A3456B",
            "VolumeType": "STORED",
            "VolumeSizeInBytes": 10737418240,
            "VolumeAttachmentStatus": "ATTACHED"
        },
        {
            "VolumeARN": "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-12A3456B/volume/vol-3344CCDD",
            "VolumeId": "vol-3344CCDD",
            "GatewayARN": "arn:aws:storagegateway:us-west-2:123456789012:gateway/
sgw-12A3456B",
            "GatewayId": "sgw-12A3456B",
            "VolumeType": "STORED",
            "VolumeSizeInBytes": 10737418240,
            "VolumeAttachmentStatus": "ATTACHED"
        }
    ]
```

```
}
```

For more information, see Managing Your Volume Gateway in the *AWS Storage Gateway Volume Gateway User Guide*.

- For API details, see ListVolumes in *AWS CLI Command Reference*.

`refresh-cache`

The following code example shows how to use `refresh-cache`.

AWS CLI

To refresh the file share cache

The following `refresh-cache` example refreshes the cache for the specified file share.

```
aws storagegateway refresh-cache \
    --file-share-arn arn:aws:storagegateway:us-west-2:123456789012:share/
share-2FA12345
```

Output:

```
{
    "FileShareARN": "arn:aws:storagegateway:us-west-2:123456789012:share/
share-2FA12345",
    "NotificationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Refreshing Amazon S3 bucket object cache in the *Amazon S3 File Gateway User Guide*.

- For API details, see RefreshCache in *AWS CLI Command Reference*.

AWS STS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS STS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`assume-role-with-saml`

The following code example shows how to use `assume-role-with-saml`.

AWS CLI

To get short-term credentials for a role authenticated with SAML

The following `assume-role-with-saml` example retrieves a set of short-term credentials for the IAM role `TestSaml`. The request in this example is authenticated by using the SAML assertion supplied by your identity provider when you authenticate to it.

```
aws sts assume-role-with-saml \
    --role-arn arn:aws:iam::123456789012:role/TestSaml \
    --principal-arn arn:aws:iam::123456789012:saml-provider/SAML-test \
    --saml-
assertion "VERYLONGENCODEDASSERTIONEXAMPLExzYW1sOkF1ZGllbmNlPmJsYW5rPC9zYW1sOkF1ZGllbmNlPjwv

For more information, see Requesting Temporary Security Credentials in the *AWS IAM User Guide*.

- For API details, see AssumeRoleWithSaml in *AWS CLI Command Reference*.

`assume-role-with-web-identity`

The following code example shows how to use `assume-role-with-web-identity`.

AWS CLI

To get short-term credentials for a role authenticated with Web Identity (OAuth 2."0)

The following `assume-role-with-web-identity` example retrieves a set of short-term credentials for the IAM role app1. The request is authenticated by using the web identity token supplied by the specified web identity provider. Two additional policies are applied to the session to further restrict what the user can do. The returned credentials expire one hour after they are generated.

```
aws sts assume-role-with-web-identity \
    --duration-seconds 3600 \
    --role-session-name "app1" \
    --provider-id "www.amazon.com" \
    --policy-arns arn=arn:aws:iam::123456789012:policy/
webidentitydemopolicy1 arn=arn:aws:iam::123456789012:policy/webidentitydemopolicy2 \

        "AccessKeyId": "ASIAJEXAMPLEXEG2JICEA"
    }
}
```

The output of the command contains an access key, secret key, and session token that you can use to authenticate to AWS.

For AWS CLI use, you can set up a named profile associated with a role. When you use the profile, the AWS CLI will call assume-role and manage credentials for you. For more information, see Use an IAM role in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see AssumeRole in *AWS CLI Command Reference*.

`assume-root`

The following code example shows how to use `assume-root`.

AWS CLI

To launch a privileged session

The following `assume-root` example retrieves a set of short-term credentials you can use to remove a misconfigured Amazon S3 bucket policy for a member account in your organization.

```
aws sts assume-root \
```

```
    --duration-seconds 900 \
    --target-principal 123456789012 \
    --task-policy-arn arn=arn:aws:iam::aws:policy/root-task/S3UnlockBucketPolicy
```

Output:

```
{
    "Credentials": {
        "SecretAccessKey": "9drTJvcXLB89EXAMPLELB8923FB892xMFI",
        "SessionToken": "AQoXdzELDDY//////////

        "Expiration": "2024-11-15T00:05:07Z",
        "AccessKeyId": "ASIAJEXAMPLEXEG2JICEA"
    },
    "SourceIdentity": "Alice"
}
```

The output of the command contains an access key, secret key, and session token that you can use to to perform privileged actions in the member account. For more information, see Perform a privileged task on an AWS Organizations member account in the *AWS IAM User Guide*.

- For API details, see AssumeRoot in *AWS CLI Command Reference*.

`decode-authorization-message`

The following code example shows how to use `decode-authorization-message`.

AWS CLI

To decode an encoded authorization message returned in response to a request

The following `decode-authorization-message` example decodes additional information about the authorization status of a request from an encoded message returned in response to an Amazon Web Services request.

```
aws sts decode-authorization-message \
```

```
    --encoded-message EXAMPLEWodyRNrtlQARDip-
eTA6i6DrlUhHhPQrLWB_lAbl5pAKxl9mPDLexYcGBreyIKQC1BGBIpBKr3dFDkwqeO7e2NMk5j_hmzAiChJN-8oy3Ewi

}
```

For more information, see Policy evaluation logic in the *AWS IAM User Guide*.

- For API details, see DecodeAuthorizationMessage in *AWS CLI Command Reference*.

`get-caller-identity`

The following code example shows how to use `get-caller-identity`.

AWS CLI

To get details about the current IAM identity

The following `get-caller-identity` example displays information about the IAM identity used to authenticate the request. The caller is an IAM user.

```
aws sts get-caller-identity
```

Output:

```
{
    "UserId": "AIDASAMPLEUSERID",
    "Account": "123456789012",
    "Arn": "arn:aws:iam::123456789012:user/DevAdmin"
}
```

For more information, see View AWS account identifiers in the *AWS Account Management Reference Guide*.

- For API details, see GetCallerIdentity in *AWS CLI Command Reference*.

`get-federation-token`

The following code example shows how to use `get-federation-token`.

AWS CLI

To return a set of temporary security credentials using IAM user access key credentials

The following `get-federation-token` example returns a set of temporary security credentials (consisting of an access key ID, a secret access key, and a security token) for a user. You must call the `GetFederationToken` operation using the long-term security credentials of an IAM user.

```
aws sts get-federation-token \
```

```
    --name Bob \
    --policy file://myfile.json \
    --policy-arns arn=arn:aws:iam::aws:policy/AmazonS3ReadOnlyAccess \
    --duration-seconds 900
```

Contents of `myfile.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:Describe*",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "elasticloadbalancing:Describe*",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:ListMetrics",
                "cloudwatch:GetMetricStatistics",
                "cloudwatch:Describe*"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "autoscaling:Describe*",
            "Resource": "*"
        }
    ]
}
```

Output:

```
{
    "Credentials": {
        "AccessKeyId": "ASIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",

    },
    "PackedPolicySize": 36
}
```

For more information, see Requesting Temporary Security Credentials in the *AWS IAM User Guide*.

- For API details, see GetFederationToken in *AWS CLI Command Reference*.

`get-session-token`

The following code example shows how to use `get-session-token`.

AWS CLI

To get a set of short term credentials for an IAM identity

The following `get-session-token` example retrieves a set of short-term credentials for the IAM identity making the call. The resulting credentials can be used for requests where multi-factor authentication (MFA) is required by policy. The credentials expire 15 minutes after they are generated.

```
aws sts get-session-token \
    --duration-seconds 900 \
    --serial-number "YourMFADeviceSerialNumber" \
    --token-code 123456
```

Output:

```
{
    "Credentials": {
        "AccessKeyId": "ASIAIOSFODNN7EXAMPLE",
```

```
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
        "SessionToken": "AQoEXAMPLEH4aoAH0gNCAPyJxz4BlCFFxWNE1OPTgk5TthT

        "Expiration": "2020-05-19T18:06:10+00:00"
    }
}
```

For more information, see Requesting Temporary Security Credentials in the *AWS IAM User Guide*.

- For API details, see GetSessionToken in *AWS CLI Command Reference*.

Support examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Support.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-attachments-to-set`

The following code example shows how to use `add-attachments-to-set`.

AWS CLI

To add an attachment to a set

The following `add-attachments-to-set` example adds an image to a set that you can then specify for a support case in your AWS account. The `data` value is the base64-encoded contents of the image.

```
aws support add-attachments-to-set \
    --attachment-set-id "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-
G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE" \
    --attachments fileName=troubleshoot-
screenshot.png,data=iVBORw0KGgoAAAANSUhEUgAAAAEAAAABCAYAAAAfFcSJAAAADUlEQVR42mNk
+M9QDwADhgGAWjR9awAAAABJRU5ErkJggg==
```

Output:

```
{
    "attachmentSetId": "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-
G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE",
    "expiryTime": "2020-05-14T17:04:40.790+0000"
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see AddAttachmentsToSet in *AWS CLI Command Reference*.

`add-communication-to-case`

The following code example shows how to use `add-communication-to-case`.

AWS CLI

To add communication to a case

The following `add-communication-to-case` example adds communications to a support case in your AWS account.

```
aws support add-communication-to-case \
    --case-id "case-12345678910-2013-c4c1d2bf33c5cf47" \
    --communication-body "I'm attaching a set of images to this case." \
    --cc-email-addresses "myemail@example.com" \
    --attachment-set-id "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-
G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE"
```

Output:

```
{
    "result": true
```

```
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see AddCommunicationToCase in *AWS CLI Command Reference*.

`create-case`

The following code example shows how to use `create-case`.

AWS CLI

To create a case

The following `create-case` example creates a support case for your AWS account.

```
aws support create-case \
    --category-code "using-aws" \
    --cc-email-addresses "myemail@example.com" \
    --communication-body "I want to learn more about an AWS service." \
    --issue-type "technical" \
    --language "en" \
    --service-code "general-info" \
    --severity-code "low" \
    --subject "Question about my account"
```

Output:

```
{
    "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47"
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see CreateCase in *AWS CLI Command Reference*.

`describe-attachment`

The following code example shows how to use `describe-attachment`.

AWS CLI

To describe an attachment

The following `describe-attachment` example returns information about the attachment with the specified ID.

```
aws support describe-attachment \
    --attachment-id "attachment-KBnjRNrePd9D6Jx0-Mm00xZuDEaL2JAj_0-gJv9qqDooTipsz3V1Nb19rCfkZneeQeDPgp8X1iVJyHH7UuhZDdNeqGoduZsPrAhyMakqlc60-iJjL5HqyYGiT1FG8EXAMPLE"
```

Output:

```
{
    "attachment": {
        "fileName": "troubleshoot-screenshot.png",
        "data": "base64-blob"
    }
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see DescribeAttachment in *AWS CLI Command Reference*.

`describe-cases`

The following code example shows how to use `describe-cases`.

AWS CLI

To describe a case

The following `describe-cases` example returns information about the specified support case in your AWS account.

```
aws support describe-cases \
    --display-id "1234567890" \
    --after-time "2020-03-23T21:31:47.774Z" \
    --include-resolved-cases \
    --language "en" \
    --no-include-communications \
    --max-items 1
```

Output:

```
{
    "cases": [
        {
            "status": "resolved",
            "ccEmailAddresses": [],
            "timeCreated": "2020-03-23T21:31:47.774Z",
            "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47",
            "severityCode": "low",
            "language": "en",
            "categoryCode": "using-aws",
            "serviceCode": "general-info",
            "submittedBy": "myemail@example.com",
            "displayId": "1234567890",
            "subject": "Question about my account"
        }
    ]
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see DescribeCases in *AWS CLI Command Reference*.

`describe-communications`

The following code example shows how to use `describe-communications`.

AWS CLI

To describe the latest communication for a case

The following `describe-communications` example returns the latest communication for the specified support case in your AWS account.

```
aws support describe-communications \
    --case-id "case-12345678910-2013-c4c1d2bf33c5cf47" \
    --after-time "2020-03-23T21:31:47.774Z" \
    --max-items 1
```

Output:

```
{
    "communications": [
```

```
        {
            "body": "I want to learn more about an AWS service.",
            "attachmentSet": [],
            "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47",
            "timeCreated": "2020-05-12T23:12:35.000Z",
            "submittedBy": "Amazon Web Services"
        }
    ],
    "NextToken": "eyJuZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQEXAMPLE=="
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see DescribeCommunications in *AWS CLI Command Reference*.

`describe-services`

The following code example shows how to use `describe-services`.

AWS CLI

To list AWS services and service categories

The following `describe-services` example lists the available service categories for requesting general information.

```
aws support describe-services \
    --service-code-list "general-info"
```

Output:

```
{
    "services": [
        {
            "code": "general-info",
            "name": "General Info and Getting Started",
            "categories": [
                {
                    "code": "charges",
                    "name": "How Will I Be Charged?"
                },
                {
```

```
                    "code": "gdpr-queries",
                    "name": "Data Privacy Query"
                },
                {
                    "code": "reserved-instances",
                    "name": "Reserved Instances"
                },
                {
                    "code": "resource",
                    "name": "Where is my Resource?"
                },
                {
                    "code": "using-aws",
                    "name": "Using AWS & Services"
                },
                {
                    "code": "free-tier",
                    "name": "Free Tier"
                },
                {
                    "code": "security-and-compliance",
                    "name": "Security & Compliance"
                },
                {
                    "code": "account-structure",
                    "name": "Account Structure"
                }
            ]
        }
    ]
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see DescribeServices in *AWS CLI Command Reference*.

`describe-severity-levels`

The following code example shows how to use `describe-severity-levels`.

AWS CLI

To list the available severity levels

The following `describe-severity-levels` example lists the available severity levels for a support case.

```
aws support describe-severity-levels
```

Output:

```
{
    "severityLevels": [
        {
            "code": "low",
            "name": "Low"
        },
        {
            "code": "normal",
            "name": "Normal"
        },
        {
            "code": "high",
            "name": "High"
        },
        {
            "code": "urgent",
            "name": "Urgent"
        },
        {
            "code": "critical",
            "name": "Critical"
        }
    ]
}
```

For more information, see Choosing a severity in the *AWS Support User Guide*.

- For API details, see DescribeSeverityLevels in *AWS CLI Command Reference*.

`describe-trusted-advisor-check-refresh-statuses`

The following code example shows how to use `describe-trusted-advisor-check-refresh-statuses`.

AWS CLI

To list the refresh statuses of AWS Trusted Advisor checks

The following `describe-trusted-advisor-check-refresh-statuses` example lists the refresh statuses for two Trusted Advisor checks: Amazon S3 Bucket Permissions and IAM Use.

```
aws support describe-trusted-advisor-check-refresh-statuses \
    --check-ids "Pfx0RwqBli" "zXCkfM1nI3"
```

Output:

```
{
    "statuses": [
        {
            "checkId": "Pfx0RwqBli",
            "status": "none",
            "millisUntilNextRefreshable": 0
        },
        {
            "checkId": "zXCkfM1nI3",
            "status": "none",
            "millisUntilNextRefreshable": 0
        }
    ]
}
```

For more information, see AWS Trusted Advisor in the *AWS Support User Guide*.

- For API details, see DescribeTrustedAdvisorCheckRefreshStatuses in *AWS CLI Command Reference*.

`describe-trusted-advisor-check-result`

The following code example shows how to use `describe-trusted-advisor-check-result`.

AWS CLI

To list the results of an AWS Trusted Advisor check

The following `describe-trusted-advisor-check-result` example lists the results of the IAM Use check.

```
aws support describe-trusted-advisor-check-result \
    --check-id "zXCkfM1nI3"
```

Output:

```
{
    "result": {
        "checkId": "zXCkfM1nI3",
        "timestamp": "2020-05-13T21:38:05Z",
        "status": "ok",
        "resourcesSummary": {
            "resourcesProcessed": 1,
            "resourcesFlagged": 0,
            "resourcesIgnored": 0,
            "resourcesSuppressed": 0
        },
        "categorySpecificSummary": {
            "costOptimizing": {
                "estimatedMonthlySavings": 0.0,
                "estimatedPercentMonthlySavings": 0.0
            }
        },
        "flaggedResources": [
            {
                "status": "ok",
                "resourceId": "47DEQpj8HBSa-_TImW-5JCeuQeRkm5NMpJWZEXAMPLE",
                "isSuppressed": false
            }
        ]
    }
}
```

For more information, see AWS Trusted Advisor in the *AWS Support User Guide*.

- For API details, see DescribeTrustedAdvisorCheckResult in *AWS CLI Command Reference*.

`describe-trusted-advisor-check-summaries`

The following code example shows how to use `describe-trusted-advisor-check-summaries`.

AWS CLI

To list the summaries of AWS Trusted Advisor checks

The following `describe-trusted-advisor-check-summaries` example lists the results for two Trusted Advisor checks: Amazon S3 Bucket Permissions and IAM Use.

```
aws support describe-trusted-advisor-check-summaries \
    --check-ids "Pfx0RwqBli" "zXCkfM1nI3"
```

Output:

```
{
    "summaries": [
        {
            "checkId": "Pfx0RwqBli",
            "timestamp": "2020-05-13T21:38:12Z",
            "status": "ok",
            "hasFlaggedResources": true,
            "resourcesSummary": {
                "resourcesProcessed": 44,
                "resourcesFlagged": 0,
                "resourcesIgnored": 0,
                "resourcesSuppressed": 0
            },
            "categorySpecificSummary": {
                "costOptimizing": {
                    "estimatedMonthlySavings": 0.0,
                    "estimatedPercentMonthlySavings": 0.0
                }
            }
        },
        {
            "checkId": "zXCkfM1nI3",
            "timestamp": "2020-05-13T21:38:05Z",
            "status": "ok",
            "hasFlaggedResources": true,
            "resourcesSummary": {
                "resourcesProcessed": 1,
                "resourcesFlagged": 0,
                "resourcesIgnored": 0,
                "resourcesSuppressed": 0
            },
```

```
            "categorySpecificSummary": {
                "costOptimizing": {
                    "estimatedMonthlySavings": 0.0,
                    "estimatedPercentMonthlySavings": 0.0
                }
            }
        }
    ]
}
```

For more information, see AWS Trusted Advisor in the *AWS Support User Guide*.

- For API details, see DescribeTrustedAdvisorCheckSummaries in *AWS CLI Command Reference*.

`describe-trusted-advisor-checks`

The following code example shows how to use `describe-trusted-advisor-checks`.

AWS CLI

To list the available AWS Trusted Advisor checks

The following `describe-trusted-advisor-checks` example lists the available Trusted Advisor checks in your AWS account. This information includes the check name, ID, description, category, and metadata. Note that the output is shortened for readability.

```
aws support describe-trusted-advisor-checks \
    --language "en"
```

Output:

```
{
    "checks": [
        {
            "id": "zXCkfM1nI3",
            "name": "IAM Use",
            "description": "Checks for your use of AWS Identity and Access
 Management (IAM). You can use IAM to create users, groups, and roles in AWS, and
 you can use permissions to control access to AWS resources. \n<br>\n<br>\n<b>Alert
 Criteria</b><br>\nYellow: No IAM users have been created for this account.\n<br>
\n<br>\n<b>Recommended Action</b><br>\nCreate one or more IAM users and groups in
```

```
 your account. You can then create additional users whose permissions are limited
 to perform specific tasks in your AWS environment. For more information, see <a
 href=\"https://docs.aws.amazon.com/IAM/latest/UserGuide/IAMGettingStarted.html\"
 target=\"_blank\">Getting Started</a>. \n<br><br>\n<b>Additional Resources</b><br>
\n<a href=\"https://docs.aws.amazon.com/IAM/latest/UserGuide/IAM_Introduction.html\"
 target=\"_blank\">What Is IAM?</a>",
            "category": "security",
            "metadata": []
        }
    ]
}
```

For more information, see AWS Trusted Advisor in the *AWS Support User Guide*.

- For API details, see DescribeTrustedAdvisorChecks in *AWS CLI Command Reference*.

`refresh-trusted-advisor-check`

The following code example shows how to use `refresh-trusted-advisor-check`.

AWS CLI

To refresh an AWS Trusted Advisor check

The following `refresh-trusted-advisor-check` example refreshes the Amazon S3 Bucket Permissions Trusted Advisor check in your AWS account.

```
aws support refresh-trusted-advisor-check \
    --check-id "Pfx0RwqBli"
```

Output:

```
{
    "status": {
        "checkId": "Pfx0RwqBli",
        "status": "enqueued",
        "millisUntilNextRefreshable": 3599992
    }
}
```

For more information, see AWS Trusted Advisor in the *AWS Support User Guide*.

- For API details, see RefreshTrustedAdvisorCheck in *AWS CLI Command Reference*.

`resolve-case`

The following code example shows how to use `resolve-case`.

AWS CLI

To resolve a support case

The following `resolve-case` example resolves a support case in your AWS account.

```
aws support resolve-case \
    --case-id "case-12345678910-2013-c4c1d2bf33c5cf47"
```

Output:

```
{
    "finalCaseStatus": "resolved",
    "initialCaseStatus": "work-in-progress"
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see ResolveCase in *AWS CLI Command Reference*.

Amazon SWF examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SWF.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`count-closed-workflow-executions`

The following code example shows how to use `count-closed-workflow-executions`.

AWS CLI

To count closed workflow executions

The following `count-closed-workflow-executions` example retrieves the number of closed workflow executions for a given domain. You can specify filters to count specific classes of executions.

The `--domain` and *either* `--close-time-filter` or `--start-time-filter` arguments are required. All other arguments are optional.

```
aws swf count-closed-workflow-executions \
    --domain DataFrobtzz \
    --close-time-filter "{ \"latestDate\" : 1377129600, \"oldestDate\" :
 1370044800 }"
```

Output:

```
{
    "count": 2,
    "truncated": false
}
```

If "truncated" is `true`, then "count" represents the maximum number that can be returned by Amazon SWF. Any further results are truncated.

To reduce the number of results returned, you can:

modify the `--close-time-filter` or `--start-time-filter` values to narrow the time range that is searched. Eachof these is mutually exclusive: You can specify *only one of these* in a request.use the `--close-status-filter`, `--execution-filter`, `--tag-filter` or `--type-filter` arguments to furtherfilter the results. However, these arguments are also mutually exclusive.

For more information, see Workflow execution closure in Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

- For API details, see CountClosedWorkflowExecutions in *AWS CLI Command Reference*.

`count-open-workflow-executions`

The following code example shows how to use `count-open-workflow-executions`.

AWS CLI

To count open workflow executions

The following `count-open-workflow-executions` example retrieves the number of open workflow executions for a given domain. You can specify filters to count specific classes of executions.

The `--domain` and `--start-time-filter` arguments are required. All other arguments are optional.

```
aws swf count-open-workflow-executions \
    --domain DataFrobtzz \
    --start-time-filter "{ \"latestDate\" : 1377129600, \"oldestDate\" :
 1370044800 }"
```

Output:

```
{
    "count": 4,
    "truncated": false
}
```

If "truncated" is `true`, then "count" represents the maximum number that can be returned by Amazon SWF. Any further results are truncated.

To reduce the number of results returned, you can:

modify the `--start-time-filter` values to narrow the time range that is searched.use the `--close-status-filter`, `--execution-filter`, `--tag-filter` or `--type-filter` arguments to furtherfilter the results. Each of these is mutually exclusive: You can specify *only one of these* in a request.

For more information, see Life cycle of a Amazon SWF workflow in the *Amazon Simple Workflow Service Developer Guide*.

- For API details, see CountOpenWorkflowExecutions in *AWS CLI Command Reference*.

`deprecate-domain`

The following code example shows how to use `deprecate-domain`.

AWS CLI

To deprecate a domain

The following `deprecate-domain` example deprecates a domain. You can still see a deprecated domain, but cannot create new workflow executions or register types on it. The command has a sole required parameter, `--name`, which takes the name of the domain to deprecate.

```
aws swf deprecate-domain \
    --name MyNeatNewDomain
```

This command produces no output.

As with `register-domain`, no output is returned. If you use `list-domains` to view the registered domains, however, you will see that the domain has been deprecated and no longer appears in the returned data.

```
aws swf list-domains \
    --registration-status REGISTERED
```

Output:

```
{
    "domainInfos": [
        {
            "status": "REGISTERED",
            "name": "DataFrobotz"
        },
        {
            "status": "REGISTERED",
            "name": "erontest"
        }
    ]
```

```
}
```

If you use `--registration-status DEPRECATED` with `list-domains`, you will see your deprecated domain.

```
aws swf list-domains \
    --registration-status DEPRECATED
```

Output:

```
{
    "domainInfos": [
        {
            "status": "DEPRECATED",
            "name": "MyNeatNewDomain"
        }
    ]
}
```

You can still use `describe-domain` to get information about a deprecated domain.

```
aws swf describe-domain \
    --name MyNeatNewDomain
```

Output:

```
{
    "domainInfo": {
        "status": "DEPRECATED",
        "name": "MyNeatNewDomain"
    },
    "configuration": {
        "workflowExecutionRetentionPeriodInDays": "0"
    }
}
```

For more information, see Domains in Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

- For API details, see DeprecateDomain in *AWS CLI Command Reference*.

describe-domain

The following code example shows how to use `describe-domain`.

AWS CLI

To get information about a domain

The following `describe-domain` example gets detailed information about a particular domain. There is one required parameter: `--name`, which takes the name of the domain you want information about.

```
aws swf describe-domain \
    --name DataFrobotz
```

Output:

```
{
    "domainInfo": {
        "status": "REGISTERED",
        "name": "DataFrobotz"
    },
    "configuration": {
        "workflowExecutionRetentionPeriodInDays": "1"
    }
}
```

You can also use `describe-domain` to get information about deprecated domains.

```
aws swf describe-domain \
    --name MyNeatNewDomain
```

Output:

```
{
    "domainInfo": {
        "status": "DEPRECATED",
        "name": "MyNeatNewDomain"
    },
    "configuration": {
        "workflowExecutionRetentionPeriodInDays": "0"
```

```
    }
}
```

For more information, see Domains in Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

- For API details, see DescribeDomain in *AWS CLI Command Reference*.

`list-activity-types`

The following code example shows how to use `list-activity-types`.

AWS CLI

To list activity types

The following `list-activity-types` example gets a list of the activity types for a domain. The `--domain` and `--registration-status` arguments are required.

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED
```

Output:

```
{
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.451,
            "activityType": {
                "version": "1",
                "name": "confirm-user-email"
            },
            "description": "subscribe confirm-user-email activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.709,
            "activityType": {
                "version": "1",
                "name": "confirm-user-phone"
```

```
            },
            "description": "subscribe confirm-user-phone activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454149.871,
            "activityType": {
                "version": "1",
                "name": "get-subscription-info"
            },
            "description": "subscribe get-subscription-info activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.085,
            "activityType": {
                "version": "1",
                "name": "subscribe-user-sns"
            },
            "description": "subscribe subscribe-user-sns activity"
        }
    ]
}
```

You can use the `--name` argument to select only activity types with a particular name.

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --name "send-subscription-success"
```

Output:

```
{
```

```
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        }
    ]
}
```

To retrieve results in pages, you can set the `--maximum-page-size` argument. If more results are returned than will fit in a page of results, a "nextPageToken" will be returned in the result set.

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --maximum-page-size 2
```

Output:

```
{
    "nextPageToken": "AAAAKgAAAAEAAAAAAAAAA1Gp1BelJq
+PmHvAnDxJYbup8+0R4LVtbXLDl7QNY7C3OpHo9Sz06D/GuFz1OyC73umBQ1tOPJ/gC/
aYpzDMqUIWIA1T9W0s2DryyZX4OC/6Lhk9/
o5kdsuWMSBkHhgaZjgwp3WJINIFJFdaSMxY2vYAX7AtRtpcqJuBDDRE9RaRqDGYqIYUMltarkiqpSY1ZVveBasBvlvyU
WGAaqehiDz7/JzLT/wWNNUMOd+Nhe",
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.451,
            "activityType": {
                "version": "1",
                "name": "confirm-user-email"
            },
            "description": "subscribe confirm-user-email activity"
        },
        {
            "status": "REGISTERED",
```

```
            "creationDate": 1371454150.709,
            "activityType": {
                "version": "1",
                "name": "confirm-user-phone"
            },
            "description": "subscribe confirm-user-phone activity"
        }
    ]
}
```

You can pass the nextPageToken value to the next call to `list-activity-types` in the `--next-page-token` argument, retrieving the next page of results.

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --maximum-page-size 2 \
    --next-page-token "AAAAKgAAAAEAAAAAAAAAA1Gp1BelJq
+PmHvAnDxJYbup8+0R4LVtbXLDl7QNY7C3OpHo9Sz06D/GuFz1OyC73umBQ1tOPJ/gC/
aYpzDMqUIWIA1T9W0s2DryyZX4OC/6Lhk9/
o5kdsuWMSBkHhgaZjgwp3WJINIFJFdaSMxY2vYAX7AtRtpcqJuBDDRE9RaRqDGYqIYUMltarkiqpSY1ZVveBasBvlvyU
WGAaqehiDz7/JzLT/wWNNUMOd+Nhe"
```

Output:

```
{
    "nextPageToken": "AAAAKgAAAAEAAAAAAAAAw+7LZ4GRZPzTqBHsp2wBxWB8m1sgLCclgCuq3J+h/
m3+vOfFqtkcjLwV5cc4OjNAzTCuq/
XcylPumGwkjbajtqpZpbqOcVNfjFxGoi0LB2Olbvv0krbUISBvlpFPmSWpDSZJsxg5UxCcweteSlFn1PNSZ/
MoinBZo8OTkjMuzcsTuKOzH9wCaR8ITcALJ3SaqHU3pyIRS5hPmFA3OLIc8zaAepjlaujo6hntNSCruB4",
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454149.871,
            "activityType": {
                "version": "1",
                "name": "get-subscription-info"
            },
            "description": "subscribe get-subscription-info activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
```

```
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        }
    ]
}
```

If there are still more results to return, "nextPageToken" will be returned with the results. When there are no more pages of results to return, "nextPageToken" will *not* be returned in the result set.

You can use the `--reverse-order` argument to reverse the order of the returned results. This also affects paged results.

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --maximum-page-size 2 \
    --reverse-order
```

Output:

```
{
    "nextPageToken": "AAAAKgAAAAEAAAAAAAAAAwXcpu5ePSyQkrC
+8WMbmSrenuZC2ZkIXQYBPB/b9xIOVkj+bMEFhGj0KmmJ4rF7iddhjf7UMYCsfGkEn7mk

cwioBbXlkz1fQzmDeU3M5oYGMPQIrUqkPq7pMEW0q0lK5eDN97NzFYdZZ/rlcLDWPZhUjY",
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.085,
            "activityType": {
                "version": "1",
                "name": "subscribe-user-sns"
            },
            "description": "subscribe subscribe-user-sns activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
```

```
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        }
    ]
}
```

For more information, see Registering an Activity Type with Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

- For API details, see ListActivityTypes in *AWS CLI Command Reference*.

`list-domains`

The following code example shows how to use `list-domains`.

AWS CLI

Example 1: To list your registered domains

The following `list-domains` example lists the `REGISTERED` SWF domains that you have registered for your account.

```
aws swf list-domains \
    --registration-status REGISTERED
```

Output:

```
{
    "domainInfos": [
        {
            "status": "REGISTERED",
            "name": "DataFrobotz"
        },
        {
            "status": "REGISTERED",
            "name": "erontest"
        }
    ]
}
```

For more information, see Domains in Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

Example 2: To list your deprecated domains

The following `list-domains` example lists the `DEPRECATED` SWF domains that you have registered for your account. Deprecated domains are domains that can not register new workflows or activities, but that can still be queried.

```
aws swf list-domains \
    --registration-status DEPRECATED
```

Output:

```
{
    "domainInfos": [
        {
            "status": "DEPRECATED",
            "name": "MyNeatNewDomain"
        }
    ]
}
```

For more information, see Domains in Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

Example 3: To list the first page of registered domains

The following `list-domains` example lists the first page `REGISTERED` SWF domains that you have registered for your account using the `--maximum-page-size` option.

```
aws swf list-domains \
    --registration-status REGISTERED \
    --maximum-page-size 1
```

Output:

```
{
    "domainInfos": [
        {
            "status": "REGISTERED",
```

```
            "name": "DataFrobotz"
        }
    ],
    "nextPageToken": "AAAAKgAAAAEAAAAAAAAAA2QJKNtidVgd49TTeNwYcpD
+QKT2ynuEbibcQWe2QKrslMGe63gpS0MgZGpcpoKttL4OCXRFn98Xif557it
+wSZUsvUDtImjDLvguyuyyFdIZtvIxIKEOPm3k2r4OjAGaFsGOuVbrKljvla7wdU7FYH3OlkNCP8b7PBj9SBkUyGoiAg
}
```

For more information, see Domains in Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

Example 4: To list the specified single page of registered domains

The following `list-domains` example lists the first page `REGISTERED` SWF domains that you have registered for your account using the `--maximum-page-size` option.

When you make the call again, this time supplying the value of `nextPageToken` in the `--next-page-token` argument, you'll get another page of results.

```
aws swf list-domains \
    --registration-status REGISTERED \
    --maximum-page-size 1 \
    --next-page-token "AAAAKgAAAAEAAAAAAAAAA2QJKNtidVgd49TTeNwYcpD
+QKT2ynuEbibcQWe2QKrslMGe63gpS0MgZGpcpoKttL4OCXRFn98Xif557it
+wSZUsvUDtImjDLvguyuyyFdIZtvIxIKEOPm3k2r4OjAGaFsGOuVbrKljvla7wdU7FYH3OlkNCP8b7PBj9SBkUyGoiAg
```

Output:

```
{
    "domainInfos": [
        {
            "status": "REGISTERED",
            "name": "erontest"
        }
    ]
}
```

When there are no further pages of results to retrieve, `nextPageToken` will not be returned in the results.

For more information, see Domains in Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

- For API details, see ListDomains in *AWS CLI Command Reference*.

`list-workflow-types`

The following code example shows how to use `list-workflow-types`.

AWS CLI

To list workflow types

The following `list-workflow-types` example gets a list of the workflow types for a domain. The `--domain` and `--registration-status` arguments are required.

```
aws swf list-workflow-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED
```

Output:

```
{
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454149.598,
            "description": "DataFrobtzz subscribe workflow",
            "workflowType": {
                "version": "v3",
                "name": "subscribe"
            }
        }
    ]
}
```

As with `list-activity-types`, you can use the `--name` argument to select only workflow types with a particular name, and use the `--maximum-page-size` argument in coordination with `--next-page-token` to page results. To reverse the order in which results are returned, use `--reverse-order`.

For more information, see Basic workflow concepts in Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

- For API details, see ListWorkflowTypes in *AWS CLI Command Reference*.

`register-domain`

The following code example shows how to use `register-domain`.

AWS CLI

To register a domain

The following `register-domain` example registers a new domain. There are two required parameters, `--name`, which takes the domain name, and `--workflow-execution-retention-period-in-days`, which takes an integer to specify the number of days to retain workflow execution data on this domain, up to a maximum period of 90 days (for more information, see the SWF FAQ <https://aws.amazon.com/swf/faqs/#retain_limit>). Workflow execution data will not be retained after the specified number of days have passed.

```
aws swf register-domain \
    --name MyNeatNewDomain \
    --workflow-execution-retention-period-in-days 0
```

This command produces no output.

When you register a domain, nothing is returned, but you can use `swf list-domains` or `swf describe-domain` to see the new domain.

```
aws swf list-domains \
    --registration-status REGISTERED
```

Output:

```
{
    "domainInfos": [
        {
            "status": "REGISTERED",
            "name": "DataFrobotz"
        },
        {
            "status": "REGISTERED",
            "name": "MyNeatNewDomain"
```

```
        },
        {
            "status": "REGISTERED",
            "name": "erontest"
        }
    ]
}
```

The following example uses `swf describe-domain` to see the new domain.

```
aws swf describe-domain \
    --name MyNeatNewDomain
```

Output:

```
{
    "domainInfo": {
        "status": "REGISTERED",
        "name": "MyNeatNewDomain"
    },
    "configuration": {
        "workflowExecutionRetentionPeriodInDays": "0"
    }
}
```

For more information, see Domains in Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

- For API details, see RegisterDomain in *AWS CLI Command Reference*.

`register-workflow-type`

The following code example shows how to use `register-workflow-type`.

AWS CLI

To register a workflow type

The following `register-workflow-type` example registers a workflow type.

```
aws swf register-workflow-type \
    --domain DataFrobtzz \
```

```
    --name "MySimpleWorkflow" \
    --workflow-version "v1"
```

This command produces no output.

On an error (for example, if you try to register the same workflow typetwice, or specify a domain that doesn't exist) you will get a response in JSON.

```
{
    "message": "WorkflowType=[name=MySimpleWorkflow, version=v1]",
    "__type": "com.amazonaws.swf.base.model#TypeAlreadyExistsFault"
}
```

The `--domain`, `--name` and `--workflow-version` are required. You can also set the workflow description, timeouts, and child workflow policy.

For more information, see Basic workflow concepts in Amazon SWF in the *Amazon Simple Workflow Service Developer Guide*.

- For API details, see RegisterWorkflowType in *AWS CLI Command Reference*.

Systems Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Systems Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

Example 1: To add tags to a maintenance window

The following `add-tags-to-resource` example adds a tag to the specified maintenance window.

```
aws ssm add-tags-to-resource \
    --resource-type "MaintenanceWindow" \
    --resource-id "mw-03eb9db428EXAMPLE" \
    --tags "Key=Stack,Value=Production"
```

This command produces no output.

Example 2: To add tags to a parameter

The following `add-tags-to-resource` example adds two tags to to the specified parameter.

```
aws ssm add-tags-to-resource \
    --resource-type "Parameter" \
    --resource-id "My-Parameter" \
    --tags '[{"Key":"Region","Value":"East"},{"Key":"Environment",
 "Value":"Production"}]'
```

This command produces no output.

Example 3: To add tags to an SSM document

The following `add-tags-to-resource` example adds a tag to to the specified document.

```
aws ssm add-tags-to-resource \
    --resource-type "Document" \
    --resource-id "My-Document" \
    --tags "Key=Quarter,Value=Q322"
```

This command produces no output.

For more information, see Managing tags with Tag Editor in the *AWS Systems Manager User Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

`associate-ops-item-related-item`

The following code example shows how to use `associate-ops-item-related-item`.

AWS CLI

To associate a related item

The following `associate-ops-item-related-item` example associates a related item to the OpsItem.

```
aws ssm associate-ops-item-related-item \
    --ops-item-id "oi-649fExample" \
    --association-type "RelatesTo" \
    --resource-type "AWS::SSMIncidents::IncidentRecord" \
    --resource-uri "arn:aws:ssm-incidents::123456789012:incident-record/Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Creating an incident for an OpsItem in the *AWS Systems Manager User Guide*.

- For API details, see AssociateOpsItemRelatedItem in *AWS CLI Command Reference*.

`cancel-command`

The following code example shows how to use `cancel-command`.

AWS CLI

Example 1: To cancel a command for all instances

The following `cancel-command` example attempts to cancel the specified command that is already running for all instances.

```
aws ssm cancel-command \
    --command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

Example 2: To cancel a command for specific instances

The following `cancel-command` example attempts to cancel a command for the specified instance only.

```
aws ssm cancel-command \
    --command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --instance-ids "i-02573cafcfEXAMPLE"
```

This command produces no output.

For more information, see Canceling a command in the *AWS Systems Manager User Guide*.

- For API details, see CancelCommand in *AWS CLI Command Reference*.

`cancel-maintenance-window-execution`

The following code example shows how to use `cancel-maintenance-window-execution`.

AWS CLI

To cancel a maintenance window execution

The following `cancel-maintenance-window-execution` example stops the specified maintenance window execution that is already in progress.

```
aws ssm cancel-maintenance-window-execution \
    --window-execution-id j2l8d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE
```

Output:

```
{
    "WindowExecutionId": "j2l8d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE"
}
```

For more information, see Systems Manager Maintenance Windows Tutorials (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see CancelMaintenanceWindowExecution in *AWS CLI Command Reference*.

`create-activation`

The following code example shows how to use `create-activation`.

AWS CLI

To create a managed instance activation

The following `create-activation` example creates a managed instance activation.

```
aws ssm create-activation \
    --default-instance-name "HybridWebServers" \
    --iam-role "HybridWebServersRole" \
    --registration-limit 5
```

Output:

```
{
    "ActivationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "ActivationCode": "dRmgnYaFv567vEXAMPLE"
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the *AWS Systems Manager User Guide*.

- For API details, see CreateActivation in *AWS CLI Command Reference*.

`create-association-batch`

The following code example shows how to use `create-association-batch`.

AWS CLI

To create multiple associations

The following `create-association-batch` example associates a configuration document with multiple instances. The output returns a list of successful and failed operations, if applicable.

```
aws ssm create-association-batch \
    --entries "Name=AWS-UpdateSSMAgent,InstanceId=i-1234567890abcdef0" "Name=AWS-
UpdateSSMAgent,InstanceId=i-9876543210abcdef0"
```

Output:

```
{
    "Successful": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationVersion": "1",
            "Date": 1550504725.007,
            "LastUpdateAssociationDate": 1550504725.007,
            "Status": {
                "Date": 1550504725.007,
                "Name": "Associated",
                "Message": "Associated with AWS-UpdateSSMAgent"
            },
            "Overview": {
                "Status": "Pending",
                "DetailedStatus": "Creating"
            },
            "DocumentVersion": "$DEFAULT",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ]
        },
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-9876543210abcdef0",
            "AssociationVersion": "1",
            "Date": 1550504725.057,
            "LastUpdateAssociationDate": 1550504725.057,
            "Status": {
                "Date": 1550504725.057,
                "Name": "Associated",
                "Message": "Associated with AWS-UpdateSSMAgent"
            },
            "Overview": {
                "Status": "Pending",
                "DetailedStatus": "Creating"
```

```
            },
            "DocumentVersion": "$DEFAULT",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-9876543210abcdef0"
                    ]
                }
            ]
        }
    ],
    "Failed": []
}
```

For more information, see Creating associations in the *AWS Systems Manager User Guide*.

- For API details, see CreateAssociationBatch in *AWS CLI Command Reference*.

`create-association`

The following code example shows how to use `create-association`.

AWS CLI

Example 1: To associate a document using instance IDs

The following `create-association` example associates a configuration document with an instance, using instance IDs.

```
aws ssm create-association \
    --instance-id "i-0cb2b964d3e14fd9f" \
    --name "AWS-UpdateSSMAgent"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
```

```
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see Creating associations in the *AWS Systems Manager User Guide*.

Example 2: To associate a document using targets

The following `create-association` example associates a configuration document with an instance, using targets.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
```

```
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see Creating associations in the *AWS Systems Manager User Guide*.

Example 3: To create an association that runs only once

The following `create-association` example creates a new association that only runs once on the specified date and time. Associations created with a date in the past or present (by the time it is processed the date is in the past) run immediately.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f" \
    --schedule-expression "at(2020-05-14T15:55:00)"  \
    --apply-only-at-cron-interval
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
```

```
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see Creating associations and Reference: Cron and rate expressions for Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see CreateAssociation in *AWS CLI Command Reference*.

`create-document`

The following code example shows how to use `create-document`.

AWS CLI

To create a document

The following `create-document` example creates a Systems Manager document.

```
aws ssm create-document \
    --content file://exampleDocument.yml \
    --name "Example" \
    --document-type "Automation" \
    --document-format YAML
```

Contents of `exampleDocument.yml`:

```
description: Document Example
schemaVersion: '0.3'
assumeRole: '{{ AutomationAssumeRole }}'
parameters:
    AutomationAssumeRole:
        type: String
        description: (Required) The ARN of the role that allows Automation to
 perform the actions on your behalf. If no role is specified, Systems Manager
 Automation uses your IAM permissions to execute this document.
        default: ''
    InstanceId:
        type: String
        description: (Required) The ID of the Amazon EC2 instance.
        default: ''
mainSteps:
    - name: rebootInstance
      action: 'aws:executeAwsApi'
      inputs:
          Service: ec2
          Api: RebootInstances
          InstanceIds:
              - '{{ InstanceId }}'
```

Output:

```
{
    "DocumentDescription": {
        "Hash": "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
        "HashType": "Sha256",
        "Name": "Example",
        "Owner": "29884EXAMPLE",
        "CreatedDate": 1583256349.452,
        "Status": "Creating",
        "DocumentVersion": "1",
        "Description": "Document Example",
        "Parameters": [
            {
                "Name": "AutomationAssumeRole",
                "Type": "String",
                "Description": "(Required) The ARN of the role that allows
 Automation to perform the actions on your behalf. If no role is specified, Systems
 Manager Automation uses your IAM permissions to execute this document.",
                "DefaultValue": ""
```

```
            },
            {
                "Name": "InstanceId",
                "Type": "String",
                "Description": "(Required) The ID of the Amazon EC2 instance.",
                "DefaultValue": ""
            }
        ],
        "PlatformTypes": [
            "Windows",
            "Linux"
        ],
        "DocumentType": "Automation",
        "SchemaVersion": "0.3",
        "LatestVersion": "1",
        "DefaultVersion": "1",
        "DocumentFormat": "YAML",
        "Tags": []
    }
}
```

For more information, see Creating Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see CreateDocument in *AWS CLI Command Reference*.

`create-maintenance-window`

The following code example shows how to use `create-maintenance-window`.

AWS CLI

Example 1: To create a maintenance window

The following `create-maintenance-window` example creates a new maintenance window that every five minutes for up to two hours (as needed), prevents new tasks from starting within one hour of the end of the maintenance window execution, allows unassociated targets (instances that you haven't registered with the maintenance window), and indicates through the use of custom tags that its creator intends to use it in a tutorial.

```
aws ssm create-maintenance-window \
    --name "My-Tutorial-Maintenance-Window" \
    --schedule "rate(5 minutes)" \
```

```
    --duration 2 \
    --cutoff 1 \
    --allow-unassociated-targets \
    --tags "Key=Purpose,Value=Tutorial"
```

Output:

```
{
    "WindowId": "mw-0c50858d01EXAMPLE"
}
```

For more information, see Tutorial: Create and configure a maintenance window using the AWS CLI in the *AWS Systems Manager User Guide*.

Example 2: To create a maintenance window that runs only once

The following `create-maintenance-window` example creates a new maintenance window that only runs one time on the specified date and time.

```
aws ssm create-maintenance-window \
    --name My-One-Time-Maintenance-Window \
    --schedule "at(2020-05-14T15:55:00)" \
    --duration 5 \
    --cutoff 2 \
    --allow-unassociated-targets \
    --tags "Key=Environment,Value=Production"
```

Output:

```
{
    "WindowId": "mw-01234567890abcdef"
}
```

For more information, see AWS Systems Manager Maintenance Windows in the *AWS Systems Manager User Guide*.

- For API details, see CreateMaintenanceWindow in *AWS CLI Command Reference*.

`create-ops-item`

The following code example shows how to use `create-ops-item`.

AWS CLI

To create an OpsItems

The following `create-ops-item` example uses the /aws/resources key in OperationalData to create an OpsItem with an Amazon DynamoDB related resource.

```
aws ssm create-ops-item \
    --title "EC2 instance disk full" \
    --description "Log clean up may have failed which caused the disk to be full" \
    --priority 2 \
    --source ec2 \
    --operational-data '{"/aws/resources":{"Value":"[{\"arn
\": \"arn:aws:dynamodb:us-west-2:12345678:table/OpsItems
\"}]","Type":"SearchableString"}}' \
    --notifications Arn="arn:aws:sns:us-west-2:12345678:TestUser"
```

Output:

```
{
    "OpsItemId": "oi-1a2b3c4d5e6f"
}
```

For more information, see Creating OpsItems manually (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see CreateOpsItem in *AWS CLI Command Reference*.

`create-patch-baseline`

The following code example shows how to use `create-patch-baseline`.

AWS CLI

Example 1: To create a patch baseline with auto-approval

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves patches for a production environment seven days after they are released by Microsoft.

```
aws ssm create-patch-baseline \
```

```
    --name "Windows-Production-Baseline-AutoApproval" \
    --operating-system "WINDOWS" \
    --approval-
rules "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,Impo
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},Approv
 \
    --description "Baseline containing all updates approved for Windows Server
 production systems"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 2: To create a patch baseline with an approval cutoff date

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves all patches for a production environment that are released on or before July 7, 2020.

```
aws ssm create-patch-baseline \
    --name "Windows-Production-Baseline-AutoApproval" \
    --operating-system "WINDOWS" \
    --approval-
rules "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,Impo
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},Approv
 \
    --description "Baseline containing all updates approved for Windows Server
 production systems"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 3: To create a patch baseline with approval rules stored in a JSON file

The following `create-patch-baseline` example creates a patch baseline for Amazon Linux 2017.09 that approves patches for a production environment seven days after they are

released, specifies approval rules for the patch baseline, and specifies a custom repository for patches.

```
aws ssm create-patch-baseline \
    --cli-input-json file://my-amazon-linux-approval-rules-and-repo.json
```

Contents of `my-amazon-linux-approval-rules-and-repo.json`:

```
{
    "Name": "Amazon-Linux-2017.09-Production-Baseline",
    "Description": "My approval rules patch baseline for Amazon Linux 2017.09
 instances",
    "OperatingSystem": "AMAZON_LINUX",
    "Tags": [
        {
            "Key": "Environment",
            "Value": "Production"
        }
    ],
    "ApprovalRules": {
        "PatchRules": [
            {
                "ApproveAfterDays": 7,
                "EnableNonSecurity": true,
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "SEVERITY",
                            "Values": [
                                "Important",
                                "Critical"
                            ]
                        },
                        {
                            "Key": "CLASSIFICATION",
                            "Values": [
                                "Security",
                                "Bugfix"
                            ]
                        },
                        {
                            "Key": "PRODUCT",
                            "Values": [
```

```
                                "AmazonLinux2017.09"
                            ]
                        }
                    ]
                }
            }
        ]
    },
    "Sources": [
        {
            "Name": "My-AL2017.09",
            "Products": [
                "AmazonLinux2017.09"
            ],
            "Configuration": "[amzn-main] \nname=amzn-main-Base
\nmirrorlist=http://repo./$awsregion./$awsdomain//$releasever/main/mirror.list //
nmirrorlist_expire=300//nmetadata_expire=300 \npriority=10 \nfailovermethod=priority
 \nfastestmirror_enabled=0 \ngpgcheck=1 \ngpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-
KEY-amazon-ga \nenabled=1 \nretries=3 \ntimeout=5\nreport_instanceid=yes"
        }
    ]
}
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 4: To create a patch baseline that specifies approved and rejected patches

The following `create-patch-baseline` example explicitly specifies patches to approve and reject as exception to the default approval rules.

```
aws ssm create-patch-baseline \
    --name "Amazon-Linux-2017.09-Alpha-Baseline" \
    --description "My custom approve/reject patch baseline for Amazon Linux 2017.09
 instances" \
    --operating-system "AMAZON_LINUX" \
    --approved-patches "CVE-2018-1234567,example-pkg-EE-2018*.amzn1.noarch" \
    --approved-patches-compliance-level "HIGH" \
    --approved-patches-enable-non-security \
```

```
    --tags "Key=Environment,Value=Alpha"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

For more information, see Create a Custom Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see CreatePatchBaseline in *AWS CLI Command Reference*.

`create-resource-data-sync`

The following code example shows how to use `create-resource-data-sync`.

AWS CLI

To create a resource data sync

The following `create-resource-data-sync` example creates a resource data sync.

```
aws ssm create-resource-data-sync \
    --sync-name "ssm-resource-data-sync" \
    --s3-destination "BucketName=ssm-
bucket,Prefix=inventory,SyncFormat=JsonSerDe,Region=us-west-2"
```

This command produces no output.

For more information, see Creating a resource data sync for Inventory in the *AWS Systems Manager User Guide*.

- For API details, see CreateResourceDataSync in *AWS CLI Command Reference*.

`delete-activation`

The following code example shows how to use `delete-activation`.

AWS CLI

To delete a managed instance activation

The following `delete-activation` example deletes a managed instance activation.

```
aws ssm delete-activation \
    --activation-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Setting Up AWS Systems Manager for Hybrid Environments in the *AWS Systems Manager User Guide*.

- For API details, see DeleteActivation in *AWS CLI Command Reference*.

`delete-association`

The following code example shows how to use `delete-association`.

AWS CLI

Example 1: To delete an association using the association ID

The following `delete-association` example deletes the association for the specified association ID. There is no output if the command succeeds.

```
aws ssm delete-association \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

Example 2: To delete an association

The following `delete-association` example deletes the association between an instance and a document. There is no output if the command succeeds.

```
aws ssm delete-association \
    --instance-id "i-1234567890abcdef0" \
    --name "AWS-UpdateSSMAgent"
```

This command produces no output.

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see DeleteAssociation in *AWS CLI Command Reference*.

`delete-document`

The following code example shows how to use `delete-document`.

AWS CLI

To delete a document

The following `delete-document` example deletes a Systems Manager document.

```
aws ssm delete-document \
    --name "Example"
```

This command produces no output.

For more information, see Creating Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see DeleteDocument in *AWS CLI Command Reference*.

`delete-inventory`

The following code example shows how to use `delete-inventory`.

AWS CLI

Example 1: To delete a custom inventory type

The following `delete-inventory` example deletes a custom inventory schema.

```
aws ssm delete-inventory \
    --type-name "Custom:RackInfo" \
    --schema-delete-option "DeleteSchema"
```

Output:

```
{
```

```
    "DeletionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "TypeName": "Custom:RackInfo",
    "DeletionSummary": {
        "TotalCount": 1,
        "RemainingCount": 1,
        "SummaryItems": [
            {
                "Version": "1.0",
                "Count": 1,
                "RemainingCount": 1
            }
        ]
    }
}
```

For more information, see Working with custom inventory in the *AWS Systems Manager User Guide*.

Example 2: To disable a custom inventory type

The following `delete-inventory` example disables a custom inventory schema.

```
aws ssm delete-inventory \
    --type-name "Custom:RackInfo" \
    --schema-delete-option "DisableSchema"
```

Output:

```
{
    "DeletionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "TypeName": "Custom:RackInformation",
    "DeletionSummary": {
        "TotalCount": 0,
        "RemainingCount": 0,
        "SummaryItems": []
    }
}
```

For more information, see Working with custom inventory in the *AWS Systems Manager User Guide*.

- For API details, see DeleteInventory in *AWS CLI Command Reference*.

`delete-maintenance-window`

The following code example shows how to use `delete-maintenance-window`.

AWS CLI

To delete a maintenance window

The following `delete-maintenance-window` example removes the specified maintenance window.

```
aws ssm delete-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9"
```

Output:

```
{
    "WindowId":"mw-1a2b3c4d5e6f7g8h9"
}
```

For more information, see Delete a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DeleteMaintenanceWindow in *AWS CLI Command Reference*.

`delete-parameter`

The following code example shows how to use `delete-parameter`.

AWS CLI

To delete a parameter

The following `delete-parameter` example deletes the specified single parameter.

```
aws ssm delete-parameter \
    --name "MyParameter"
```

This command produces no output.

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

- For API details, see DeleteParameter in *AWS CLI Command Reference*.

`delete-parameters`

The following code example shows how to use `delete-parameters`.

AWS CLI

To delete a list of parameters

The following `delete-parameters` example deletes the specified parameters.

```
aws ssm delete-parameters \
    --names "MyFirstParameter" "MySecondParameter" "MyInvalidParameterName"
```

Output:

```
{
    "DeletedParameters": [
        "MyFirstParameter",
        "MySecondParameter"
    ],
    "InvalidParameters": [
        "MyInvalidParameterName"
    ]
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

- For API details, see DeleteParameters in *AWS CLI Command Reference*.

`delete-patch-baseline`

The following code example shows how to use `delete-patch-baseline`.

AWS CLI

To delete a patch baseline

The following `delete-patch-baseline` example deletes the specified patch baseline.

```
aws ssm delete-patch-baseline \
    --baseline-id "pb-045f10b4f382baeda"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f382baeda"
}
```

For more information, see Update or Delete a Patch Baseline (Console) in the *AWS Systems Manager User Guide*.

- For API details, see DeletePatchBaseline in *AWS CLI Command Reference*.

`delete-resource-data-sync`

The following code example shows how to use `delete-resource-data-sync`.

AWS CLI

To delete a resource data sync

The following `delete-resource-data-sync` example deletes a resource data sync.

```
aws ssm delete-resource-data-sync \
    --sync-name "ssm-resource-data-sync"
```

This command produces no output.

For more information, see Creating a resource data sync for Inventory in the *AWS Systems Manager User Guide*.

- For API details, see DeleteResourceDataSync in *AWS CLI Command Reference*.

`deregister-managed-instance`

The following code example shows how to use `deregister-managed-instance`.

AWS CLI

To deregister a managed instance

The following `deregister-managed-instance` example deregisters the specified managed instance.

```
aws ssm deregister-managed-instance \
    --instance-id 'mi-08ab247cdfEXAMPLE'
```

This command produces no output.

For more information, see Deregistering managed nodes in a hybrid and multicloud environment in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterManagedInstance in *AWS CLI Command Reference*.

`deregister-patch-baseline-for-patch-group`

The following code example shows how to use `deregister-patch-baseline-for-patch-group`.

AWS CLI

To deregister a patch group from a patch baseline

The following `deregister-patch-baseline-for-patch-group` example deregisters the specified patch group from the specified patch baseline.

```
aws ssm deregister-patch-baseline-for-patch-group \
    --patch-group "Production" \
    --baseline-id "pb-0ca44a362fEXAMPLE"
```

Output:

```
{
    "PatchGroup":"Production",
    "BaselineId":"pb-0ca44a362fEXAMPLE"
}
```

For more information, see Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterPatchBaselineForPatchGroup in *AWS CLI Command Reference*.

deregister-target-from-maintenance-window

The following code example shows how to use `deregister-target-from-maintenance-window`.

AWS CLI

To remove a target from a maintenance window

The following `deregister-target-from-maintenance-window` example removes the specified target from the specified maintenance window.

```
aws ssm deregister-target-from-maintenance-window \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --window-target-id "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
```

Output:

```
{
    "WindowId":"mw-ab12cd34efEXAMPLE",
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Update a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterTargetFromMaintenanceWindow in *AWS CLI Command Reference*.

deregister-task-from-maintenance-window

The following code example shows how to use `deregister-task-from-maintenance-window`.

AWS CLI

To remove a task from a maintenance window

The following `deregister-task-from-maintenance-window` example removes the specified task from the specified maintenance window.

```
aws ssm deregister-task-from-maintenance-window \
    --window-id "mw-ab12cd34efEXAMPLE" \
```

```
    --window-task-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "WindowTaskId":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "WindowId":"mw-ab12cd34efEXAMPLE"
}
```

For more information, see Systems Manager Maintenance Windows Tutorials (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterTaskFromMaintenanceWindow in *AWS CLI Command Reference*.

`describe-activations`

The following code example shows how to use `describe-activations`.

AWS CLI

To describe activations

The following `describe-activations` example lists details about the activations in your AWS account.

```
aws ssm describe-activations
```

Output:

```
{
    "ActivationList": [
        {
            "ActivationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description": "Example1",
            "IamRole": "HybridWebServersRole",
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1584316800.0,
            "Expired": false,
            "CreatedDate": 1581954699.792
        },
        {
```

```
            "ActivationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Description": "Example2",
            "IamRole": "HybridDatabaseServersRole",
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1580515200.0,
            "Expired": true,
            "CreatedDate": 1578064132.002
        }
    ]
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the *AWS Systems Manager User Guide*.

- For API details, see DescribeActivations in *AWS CLI Command Reference*.

`describe-association-execution-targets`

The following code example shows how to use `describe-association-execution-targets`.

AWS CLI

To get details of an association execution

The following `describe-association-execution-targets` example describes the specified association execution.

```
aws ssm describe-association-execution-targets \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "AssociationExecutionTargets": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

`describe-association-executions`

The following code example shows how to use `describe-association-executions`.

AWS CLI

Example 1: To get details of all executions for an association

The following `describe-association-executions` example describes all executions of the specified association.

```
aws ssm describe-association-executions \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
            "AssociationVersion": "1",
            "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505536.843,
            "ResourceCountByStatus": "{Success=1}"
        }
    ]
}
```

For more information, see Viewing association histories in the *AWS Systems Manager User Guide*.

Example 2: To get details of all executions for an association after a specific date and time

The following `describe-association-executions` example describes all executions of an association after the specified date and time.

```
aws ssm describe-association-executions \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --filters "Key=CreatedTime,Value=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505536.843,
            "ResourceCountByStatus": "{Success=1}"
        }
```

```
    ]
}
```

For more information, see Viewing association histories in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAssociationExecutions in *AWS CLI Command Reference*.

`describe-association`

The following code example shows how to use `describe-association`.

AWS CLI

Example 1: To get details of an association

The following `describe-association` example describes the association for the specified association ID.

```
aws ssm describe-association \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-GatherSoftwareInventory",
        "AssociationVersion": "1",

    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

Example 2: To get details of an association for a specific instance and document

The following `describe-association` example describes the association between an instance and a document.

```
aws ssm describe-association \
    --instance-id "i-1234567890abcdef0" \
    --name "AWS-UpdateSSMAgent"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487876122.564,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-1234567890abcdef0",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Associated",
            "AssociationStatusAggregatedCount": {
                "Pending": 1
            }
        },
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487876122.564,
        "Date": 1487876122.564,
        "Targets": [
            {
                "Values": [
                    "i-1234567890abcdef0"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAssociation in *AWS CLI Command Reference*.

`describe-automation-executions`

The following code example shows how to use `describe-automation-executions`.

AWS CLI

To describe an automation execution

The following `describe-automation-executions` example displays details about an Automation execution.

```
aws ssm describe-automation-executions \
    --filters Key=ExecutionId,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "AutomationExecutionMetadataList": [
        {
            "AutomationExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DocumentName": "AWS-StartEC2Instance",
            "DocumentVersion": "1",
            "AutomationExecutionStatus": "Success",
            "ExecutionStartTime": 1583737233.748,
            "ExecutionEndTime": 1583737234.719,
            "ExecutedBy": "arn:aws:sts::29884EXAMPLE:assumed-role/mw_service_role/
OrchestrationService",
            "LogFile": "",
            "Outputs": {},
            "Mode": "Auto",
            "Targets": [],
            "ResolvedTargets": {
                "ParameterValues": [],
                "Truncated": false
            },
            "AutomationType": "Local"
        }
```

```
    ]
}
```

For more information, see Running a Simple Automation Workflow in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAutomationExecutions in *AWS CLI Command Reference*.

`describe-automation-step-executions`

The following code example shows how to use `describe-automation-step-executions`.

AWS CLI

Example 1: To describe all steps for an automation execution

The following `describe-automation-step-executions` example displays details about the steps of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "StepExecutions": [
        {
            "StepName": "startInstances",
            "Action": "aws:changeInstanceState",
            "ExecutionStartTime": 1583737234.134,
            "ExecutionEndTime": 1583737234.672,
            "StepStatus": "Success",
            "Inputs": {
                "DesiredState": "\"running\"",
                "InstanceIds": "[\"i-0cb99161f6EXAMPLE\"]"
            },
            "Outputs": {
                "InstanceStates": [
                    "running"
                ]
            },
```

```
            "StepExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "OverriddenParameters": {}
        }
    ]
}
```

Example 2: To describe a specific step for an automation execution

The following `describe-automation-step-executions` example displays details about a specific step of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --filters Key=StepExecutionId,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "StepExecutions": [
        {
            "StepName": "startInstances",
            "Action": "aws:changeInstanceState",
            "ExecutionStartTime": 1583737234.134,
            "ExecutionEndTime": 1583737234.672,
            "StepStatus": "Success",
            "Inputs": {
                "DesiredState": "\"running\"",
                "InstanceIds": "[\"i-0cb99161f6EXAMPLE\"]"
            },
            "Outputs": {
                "InstanceStates": [
                    "running"
                ]
            },
            "StepExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "OverriddenParameters": {}
        }
    ]
}
```

For more information, see Running an Automation Workflow Step by Step (Command Line) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAutomationStepExecutions in *AWS CLI Command Reference*.

`describe-available-patches`

The following code example shows how to use `describe-available-patches`.

AWS CLI

Example 1: To get available patches

The following `describe-available-patches` example retrieves details about all available patches for Windows Server 2019 that have a MSRC severity of Critical.

```
aws ssm describe-available-patches \
    --
filters "Key=PRODUCT,Values=WindowsServer2019" "Key=MSRC_SEVERITY,Values=Critical"
```

Output:

```
{
    "Patches": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ReleaseDate": 1544047205.0,
            "Title": "2018-11 Update for Windows Server 2019 for x64-based Systems
 (KB4470788)",
            "Description": "Install this update to resolve issues in Windows. For a
 complete listing of the issues that are included in this update, see the associated
 Microsoft Knowledge Base article for more information. After you install this item,
 you may have to restart your computer.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",

            "Vendor": "Microsoft",
            "ProductFamily": "Windows",
            "Product": "WindowsServer2016",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4480979",
            "MsrcNumber": "",
            "Language": "All"
        }
    ]
}
```

For more information, see How Patch Manager Operations Work in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAvailablePatches in *AWS CLI Command Reference*.

`describe-document-permission`

The following code example shows how to use `describe-document-permission`.

AWS CLI

To describe document permissions

The following `describe-document-permission` example displays permission details about a Systems Manager document that is shared publicly.

```
aws ssm describe-document-permission \
    --name "Example" \
    --permission-type "Share"
```

Output:

```
{
    "AccountIds": [
        "all"
    ],
    "AccountSharingInfoList": [
        {
```

```
            "AccountId": "all",
            "SharedDocumentVersion": "$DEFAULT"
        }
    ]
}
```

For more information, see Share a Systems Manager Document in the *AWS Systems Manager User Guide*.

- For API details, see DescribeDocumentPermission in *AWS CLI Command Reference*.

`describe-document`

The following code example shows how to use `describe-document`.

AWS CLI

To display details of a document

The following `describe-document` example displays details about a Systems Manager document in your AWS account.

```
aws ssm describe-document \
    --name "Example"
```

Output:

```
{
    "Document": {
        "Hash": "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",

    }
}
```

For more information, see Creating Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see DescribeDocument in *AWS CLI Command Reference*.

`describe-effective-instance-associations`

The following code example shows how to use `describe-effective-instance-associations`.

AWS CLI

To get details of the effective associations for an instance

The following `describe-effective-instance-associations` example retrieves details about the effective associations for an instance.

```
aws ssm describe-effective-instance-associations \
```

```
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "Associations": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "InstanceId": "i-1234567890abcdef0",
            "Content": "{\n    \"schemaVersion\": \"1.2\",\n    \"description\":
 \"Update the Amazon SSM Agent to the latest version or specified version.\",\n
   \"parameters\": {\n        \"version\": {\n            \"default\": \"\",\n
         \"description\": \"(Optional) A specific version of the Amazon SSM Agent
 to install. If not specified, the agent will be updated to the latest version.\",
\n            \"type\": \"String\"\n        },\n        \"allowDowngrade\": {\n
           \"default\": \"false\",\n            \"description\": \"(Optional)
 Allow the Amazon SSM Agent service to be downgraded to an earlier version. If
 set to false, the service can be upgraded to newer versions only (default). If
 set to true, specify the earlier version.\",\n            \"type\": \"String\",
\n            \"allowedValues\": [\n                \"true\",\n
 \"false\"\n            ]\n        }\n    },\n    \"runtimeConfig\": {\n
 \"aws:updateSsmAgent\": {\n            \"properties\": [\n                {\n
              \"agentName\": \"amazon-ssm-agent\",\n                \"source\":
 \"https://s3.{Region}.amazonaws.com/amazon-ssm-{Region}/ssm-agent-manifest.json\",
\n                \"allowDowngrade\": \"{{ allowDowngrade }}\",\n
 \"targetVersion\": \"{{ version }}\"\n                }\n            ]\n        }\n
    }\n}\n",
            "AssociationVersion": "1"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see DescribeEffectiveInstanceAssociations in *AWS CLI Command Reference*.

`describe-effective-patches-for-patch-baseline`

The following code example shows how to use `describe-effective-patches-for-patch-baseline`.

AWS CLI

Example 1: To get all patches defined by a custom patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by a custom patch baseline in the current AWS account. Note that for a custom baseline, only the ID is required for `--baseline-id`.

```
aws ssm describe-effective-patches-for-patch-baseline \
    --baseline-id "pb-08b654cf9b9681f04"
```

Output:

```
{
    "EffectivePatches": [
        {
            "Patch": {
                "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
                "ReleaseDate": 1544047205.0,
                "Title": "2018-11 Update for Windows Server 2019 for x64-based
 Systems (KB4470788)",
                "Description": "Install this update to resolve issues in Windows.
 For a complete listing of the issues that are included in this update, see the
 associated Microsoft Knowledge Base article for more information. After you install
 this item, you may have to restart your computer.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Critical",
                "KbNumber": "KB4470788",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
                "ComplianceLevel": "CRITICAL",
                "ApprovalDate": 1544047205.0
            }
        },
        {
            "Patch": {
```

```
                "Id": "915a6b1a-f556-4d83-8f50-b2e75a9a7e58",
                "ReleaseDate": 1549994400.0,
                "Title": "2019-02 Cumulative Update for .NET Framework 3.5 and 4.7.2
 for Windows Server 2019 for x64 (KB4483452)",
                "Description": "A security issue has been identified in a Microsoft
 software product that could affect your system. You can help protect your system by
 installing this update from Microsoft. For a complete listing of the issues that
 are included in this update, see the associated Microsoft Knowledge Base article.
 After you install this update, you may have to restart your system.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4483452",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Important",
                "KbNumber": "KB4483452",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
                "ComplianceLevel": "CRITICAL",
                "ApprovalDate": 1549994400.0
            }
        }
    ],
    "NextToken": "--token string truncated--"
}
```

Example 2: To get all patches defined by an AWS managed patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by an AWS managed patch baseline. Note that for an AWS managed baseline, the complete baseline ARN is required for `--baseline-id`.

```
aws ssm describe-effective-patches-for-patch-baseline \
    --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed"
```

Output:

```
{
    "EffectivePatches": [
```

```
        {
            "Patch": {
                "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
                "ReleaseDate": 1544047205.0,
                "Title": "2018-11 Update for Windows Server 2019 for x64-based
 Systems (KB4470788)",
                "Description": "Install this update to resolve issues in Windows.
 For a complete listing of the issues that are included in this update, see the
 associated Microsoft Knowledge Base article for more information. After you install
 this item, you may have to restart your computer.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Critical",
                "KbNumber": "KB4470788",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
                "ComplianceLevel": "UNSPECIFIED",
                "ApprovalDate": 1544652005.0
            }
        }
    ],
    "NextToken": "--token string truncated--"
}
```

- For API details, see DescribeEffectivePatchesForPatchBaseline in *AWS CLI Command Reference*.

`describe-instance-associations-status`

The following code example shows how to use `describe-instance-associations-status`.

AWS CLI

To describe the status of an instance's associations

The following `describe-instance-associations-status` example shows details of the associations for an instance.

```
aws ssm describe-instance-associations-status \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "InstanceAssociationStatusInfos": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "AWS-GatherSoftwareInventory",
            "DocumentVersion": "1",
            "AssociationVersion": "1",
            "InstanceId": "i-1234567890abcdef0",
            "ExecutionDate": 1550501886.0,
            "Status": "Success",
            "ExecutionSummary": "1 out of 1 plugin processed, 1 success, 0 failed, 0
 timedout, 0 skipped. ",
            "AssociationName": "Inventory-Association"
        },
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Name": "AWS-UpdateSSMAgent",
            "DocumentVersion": "1",
            "AssociationVersion": "1",
            "InstanceId": "i-1234567890abcdef0",
            "ExecutionDate": 1550505828.548,
            "Status": "Success",
            "DetailedStatus": "Success",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see DescribeInstanceAssociationsStatus in *AWS CLI Command Reference*.

describe-instance-information

The following code example shows how to use `describe-instance-information`.

AWS CLI

Example 1: To describe managed instance information

The following `describe-instance-information` example retrieves details of each of your managed instances.

```
aws ssm describe-instance-information
```

Output:

```
{
    "InstanceInformationList": [
        {
            "InstanceId": "i-028ea792daEXAMPLE",
            "PingStatus": "Online",
            "LastPingDateTime": 1582221233.421,
            "AgentVersion": "2.3.842.0",
            "IsLatestVersion": true,
            "PlatformType": "Linux",
            "PlatformName": "SLES",
            "PlatformVersion": "15.1",
            "ResourceType": "EC2Instance",
            "IPAddress": "192.0.2.0",
            "ComputerName": "ip-198.51.100.0.us-west-2.compute.internal",
            "AssociationStatus": "Success",
            "LastAssociationExecutionDate": 1582220806.0,
            "LastSuccessfulAssociationExecutionDate": 1582220806.0,
            "AssociationOverview": {
                "DetailedStatus": "Success",
                "InstanceAssociationStatusAggregatedCount": {
                    "Success": 2
                }
            }
        },
        {
            "InstanceId": "i-0cb99161f6EXAMPLE",
            "PingStatus": "Online",
            "LastPingDateTime": 1582221158.297,
```

```
            "AgentVersion": "2.3.842.0",
            "IsLatestVersion": true,
            "PlatformType": "Windows",
            "PlatformName": "Microsoft Windows Server 2019 Datacenter",
            "PlatformVersion": "10.0.17763",
            "ResourceType": "EC2Instance",
            "IPAddress": "192.0.2.1",
            "ComputerName": "EC2AMAZ-EXAMPLE.WORKGROUP",
            "AssociationStatus": "Success",
            "LastAssociationExecutionDate": 1582220806.0,
            "LastSuccessfulAssociationExecutionDate": 1582220806.0,
            "AssociationOverview": {
                "DetailedStatus": "Success",
                "InstanceAssociationStatusAggregatedCount": {
                    "Success": 1
                }
            }
        }
    ]
}
```

Example 2: To describe information about a specific managed instance

The following `describe-instance-information` example shows details of the managed instance `i-028ea792daEXAMPLE`.

```
aws ssm describe-instance-information \
    --filters "Key=InstanceIds,Values=i-028ea792daEXAMPLE"
```

Output:

```
{
    "InstanceInformationList": [
        {
            "InstanceId": "i-028ea792daEXAMPLE",
            "PingStatus": "Online",
            "LastPingDateTime": 1582221233.421,
            "AgentVersion": "2.3.842.0",
            "IsLatestVersion": true,
            "PlatformType": "Linux",
            "PlatformName": "SLES",
            "PlatformVersion": "15.1",
            "ResourceType": "EC2Instance",
```

```
            "IPAddress": "192.0.2.0",
            "ComputerName": "ip-198.51.100.0.us-west-2.compute.internal",
            "AssociationStatus": "Success",
            "LastAssociationExecutionDate": 1582220806.0,
            "LastSuccessfulAssociationExecutionDate": 1582220806.0,
            "AssociationOverview": {
                "DetailedStatus": "Success",
                "InstanceAssociationStatusAggregatedCount": {
                    "Success": 2
                }
            }
        }
    ]
}
```

Example 3: To describe information about managed instances with a specific tag key

The following `describe-instance-information` example shows details for managed instances that have the tag key DEV.

```
aws ssm describe-instance-information \
    --filters "Key=tag-key,Values=DEV"
```

Output:

```
{
    "InstanceInformationList": [
        {
            "InstanceId": "i-028ea792daEXAMPLE",
            "PingStatus": "Online",
            "LastPingDateTime": 1582221233.421,
            "AgentVersion": "2.3.842.0",
            "IsLatestVersion": true,
            "PlatformType": "Linux",
            "PlatformName": "SLES",
            "PlatformVersion": "15.1",
            "ResourceType": "EC2Instance",
            "IPAddress": "192.0.2.0",
            "ComputerName": "ip-198.51.100.0.us-west-2.compute.internal",
            "AssociationStatus": "Success",
            "LastAssociationExecutionDate": 1582220806.0,
            "LastSuccessfulAssociationExecutionDate": 1582220806.0,
            "AssociationOverview": {
```

```
                "DetailedStatus": "Success",
                "InstanceAssociationStatusAggregatedCount": {
                    "Success": 2
                }
            }
        }
    ]
}
```

For more information, see Managed Instances in the *AWS Systems Manager User Guide*.

- For API details, see DescribeInstanceInformation in *AWS CLI Command Reference*.

`describe-instance-patch-states-for-patch-group`

The following code example shows how to use `describe-instance-patch-states-for-patch-group`.

AWS CLI

Example 1: To get the instance states for a patch group

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states per-instance for the specified patch group.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
            "MissingCount": 2,
```

```
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 2671,

        }
    ]
}
```

Example 3: To get the instance states for a patch group with fewer than ten instances that require a reboot

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with fewer than ten instances requiring a reboot.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --filters Key=InstalledPendingRebootCount,Type=LessThan,Values=10 \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PatchGroup": "Production",
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 4,
            "InstalledRejectedCount": 0,
            "MissingCount": 2,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 846,
            "NotApplicableCount": 212,
            "OperationStartTime": "2021-08-06T11:03:50.590000-07:00",

            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 0
        }
    ]
}
```

For more information, see Understanding patch compliance state values in the *AWS Systems Manager User Guide*.

- For API details, see DescribeInstancePatchStatesForPatchGroup in *AWS CLI Command Reference*.

`describe-instance-patch-states`

The following code example shows how to use `describe-instance-patch-states`.

AWS CLI

To get the patch summary states for instances

The following `describe-instance-patch-states` example gets the patch summary states for an instance.

```
aws ssm describe-instance-patch-states \
    --instance-ids "i-1234567890abcdef0"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PatchGroup": "my-patch-group",
            "BaselineId": "pb-0713accee01234567",
            "SnapshotId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CriticalNonCompliantCount": 2,
            "SecurityNonCompliantCount": 2,
            "OtherNonCompliantCount": 1,
            "InstalledCount": 123,
            "InstalledOtherCount": 334,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
            "MissingCount": 1,
            "FailedCount": 2,
            "UnreportedNotApplicableCount": 11,
            "NotApplicableCount": 2063,
            "OperationStartTime": "2021-05-03T11:00:56-07:00",
            "OperationEndTime": "2021-05-03T11:01:09-07:00",
            "Operation": "Scan",
            "LastNoRebootInstallOperationTime": "2020-06-14T12:17:41-07:00",
            "RebootOption": "RebootIfNeeded"
        }
    ]
}
```

For more information, see About Patch Compliance in the *AWS Systems Manager User Guide*.

- For API details, see DescribeInstancePatchStates in *AWS CLI Command Reference*.

`describe-instance-patches`

The following code example shows how to use `describe-instance-patches`.

AWS CLI

Example 1: To get the patch state details for an instance

The following `describe-instance-patches` example retrieves details about the patches for the specified instance.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "Patches": [
        {
            "Title": "2019-01 Security Update for Adobe Flash Player for Windows
 Server 2016 for x64-based Systems (KB4480979)",
            "KBId": "KB4480979",
            "Classification": "SecurityUpdates",
            "Severity": "Critical",
            "State": "Installed",
            "InstalledTime": "2019-01-09T00:00:00+00:00"
        },
        {
            "Title": "",
            "KBId": "KB4481031",
            "Classification": "",
            "Severity": "",
            "State": "InstalledOther",
            "InstalledTime": "2019-02-08T00:00:00+00:00"
        }
    ],
    "NextToken": "--token string truncated--"
}
```

Example 2: To get a list of patches in the Missing state for an instance

The following `describe-instance-patches` example retrieves information about patches that are in the Missing state for the specified instance.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
```

```
    --filters Key=State,Values=Missing
```

Output:

```
{
    "Patches": [
        {
            "Title": "Windows Malicious Software Removal Tool x64 - February 2019
 (KB890830)",
            "KBId": "KB890830",
            "Classification": "UpdateRollups",
            "Severity": "Unspecified",
            "State": "Missing",
            "InstalledTime": "1970-01-01T00:00:00+00:00"
        }
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see About Patch Compliance States in the *AWS Systems Manager User Guide*.

Example 3: To get a list of patches installed since a specified InstalledTime for an instance

The following `describe-instance-patches` example retrieves information about patches installed since a specified time for the specified instance by combining the use of `--filters` and `--query`.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
    --filters Key=State,Values=Installed \
    --query 'Patches[?InstalledTime >= `"2023-01-01T16:00:00"`]'
```

Output:

```
[
    {
        "Title": "2023-03 Cumulative Update for Windows Server 2019 (1809) for x64-
based Systems (KB5023702)",
        "KBId": "KB5023702",
        "Classification": "SecurityUpdates",
```

```
        "Severity": "Critical",
        "State": "Installed",
        "InstalledTime": "2023-03-16T11:00:00+00:00"
    }
]
```

- For API details, see DescribeInstancePatches in *AWS CLI Command Reference*.

`describe-inventory-deletions`

The following code example shows how to use `describe-inventory-deletions`.

AWS CLI

Example 1: To get inventory deletions

The following `describe-inventory-deletions` example retrieves details for inventory deletion operations.

```
aws ssm describe-inventory-deletions
```

Output:

```
{
    "InventoryDeletions": [
        {
            "DeletionId": "6961492a-8163-44ec-aa1e-01234567850",
            "TypeName": "Custom:RackInformation",
            "DeletionStartTime": 1550254911.0,
            "LastStatus": "InProgress",
            "LastStatusMessage": "The Delete is in progress",
            "DeletionSummary": {
                "TotalCount": 0,
                "RemainingCount": 0,
                "SummaryItems": []
            },
            "LastStatusUpdateTime": 1550254911.0
        },
        {
            "DeletionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TypeName": "Custom:RackInfo",
            "DeletionStartTime": 1550254859.0,
```

```
            "LastStatus": "InProgress",
            "LastStatusMessage": "The Delete is in progress",
            "DeletionSummary": {
                "TotalCount": 1,
                "RemainingCount": 1,
                "SummaryItems": [
                    {
                        "Version": "1.0",
                        "Count": 1,
                        "RemainingCount": 1
                    }
                ]
            },
            "LastStatusUpdateTime": 1550254859.0
        }
    ]
}
```

For more information, see Working with custom inventory in the *AWS Systems Manager User Guide*.

Example 2: To get details of a specific inventory deletion

The following `describe-inventory-deletions` example retrieves details for a specific inventory deletion operation.

```
aws ssm describe-inventory-deletions \
    --deletion-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "InventoryDeletions": [
        {
            "DeletionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TypeName": "Custom:RackInfo",
            "DeletionStartTime": 1550254859.0,
            "LastStatus": "InProgress",
            "LastStatusMessage": "The Delete is in progress",
            "DeletionSummary": {
                "TotalCount": 1,
                "RemainingCount": 1,
```

```
                "SummaryItems": [
                    {
                        "Version": "1.0",
                        "Count": 1,
                        "RemainingCount": 1
                    }
                ]
            },
            "LastStatusUpdateTime": 1550254859.0
        }
    ]
}
```

For more information, see Working with custom inventory in the *AWS Systems Manager User Guide*.

- For API details, see DescribeInventoryDeletions in *AWS CLI Command Reference*.

`describe-maintenance-window-execution-task-invocations`

The following code example shows how to use `describe-maintenance-window-execution-task-invocations`.

AWS CLI

To get the specific task invocations performed for a maintenance window task execution

The following `describe-maintenance-window-execution-task-invocations` example lists the invocations for the specified task executed as part of the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-task-invocations \
    --window-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --task-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "WindowExecutionTaskInvocationIdentities": [
        {
            "Status": "SUCCESS",
```

```
            "Parameters": "{\"documentName\":\"AWS-RunShellScript\",\"instanceIds\":
[\"i-0000293ffd8c57862\"],\"parameters\":{\"commands\":[\"df\"]},\"maxConcurrency\":
\"1\",\"maxErrors\":\"1\"}",
            "InvocationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "StartTime": 1487692834.723,
            "EndTime": 1487692834.871,
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TaskExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutionTaskInvocations in *AWS CLI Command Reference*.

`describe-maintenance-window-execution-tasks`

The following code example shows how to use `describe-maintenance-window-execution-tasks`.

AWS CLI

To list all tasks associated with a maintenance window execution

The following `describe-maintenance-window-execution-tasks` example lists the tasks associated with the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-tasks \
    --window-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "WindowExecutionTaskIdentities": [
        {
            "Status": "SUCCESS",
            "TaskArn": "AWS-RunShellScript",
            "StartTime": 1487692834.684,
            "TaskType": "RUN_COMMAND",
```

```
            "EndTime": 1487692835.005,
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TaskExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutionTasks in *AWS CLI Command Reference*.

`describe-maintenance-window-executions`

The following code example shows how to use `describe-maintenance-window-executions`.

AWS CLI

Example 1: To list all executions for a maintenance window

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34efEXAMPLE"
```

Output:

```
{
    "WindowExecutions": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Status": "IN_PROGRESS",
            "StartTime": "2021-08-04T11:00:00.000000-07:00"

        },
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Status": "SUCCESS",
```

```
            "StartTime": "2021-08-03T11:00:00.000000-07:00",
            "EndTime": "2021-08-03T11:37:21.450000-07:00"
        },
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Status": "FAILED",
            "StatusDetails": "One or more tasks in the orchestration failed.",
            "StartTime": "2021-08-02T11:00:00.000000-07:00",
            "EndTime": "2021-08-02T11:22:36.190000-07:00"
        }
    ]
}
```

Example 2: To list all executions for a maintenance window before a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window before the specified date.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --filters "Key=ExecutedBefore,Values=2021-08-03T00:00:00Z"
```

Output:

```
{
    "WindowExecutions": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Status": "FAILED",
            "StatusDetails": "One or more tasks in the orchestration failed.",
            "StartTime": "2021-08-02T11:00:00.000000-07:00",
            "EndTime": "2021-08-02T11:22:36.190000-07:00"
        }
    ]
}
```

Example 3: To list all executions for a maintenance window after a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window after the specified date.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --filters "Key=ExecutedAfter,Values=2021-08-04T00:00:00Z"
```

Output:

```
{
    "WindowExecutions": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Status": "IN_PROGRESS",
            "StartTime": "2021-08-04T11:00:00.000000-07:00"
        }
    ]
}
```

For more information, see View information about tasks and task executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutions in *AWS CLI Command Reference*.

`describe-maintenance-window-schedule`

The following code example shows how to use `describe-maintenance-window-schedule`.

AWS CLI

Example 1: To list upcoming executions for a maintenance window

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-schedule \
    --window-id mw-ab12cd34efEXAMPLE
```

Output:

```
{
    "ScheduledWindowExecutions": [
```

```
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "Name": "My-First-Maintenance-Window",
            "ExecutionTime": "2020-02-19T16:00Z"
        },
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "Name": "My-First-Maintenance-Window",
            "ExecutionTime": "2020-02-26T16:00Z"
        }
    ]
}
```

Example 2: To list all upcoming executions for a maintenance window before a specified date

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window that occur before the specified date.

```
aws ssm describe-maintenance-window-schedule \
    --window-id mw-0ecb1226dd7b2e9a6 \
    --filters "Key=ScheduledBefore,Values=2020-02-15T06:00:00Z"
```

Output:

```
{
    "ScheduledWindowExecutions": [
        {
            "WindowId": "mw-0ecb1226dd7b2e9a6",
            "Name": "My-Maintenance-Window",
            "ExecutionTime": "2020-02-13T16:00Z"
        },
        {
            "WindowId": "mw-0ecb1226dd7b2e9a6",
            "Name": "My-Maintenance-Window",
            "ExecutionTime": "2020-02-14T16:00Z"
        }
    ]
}
```

Example 3: To list all upcoming executions for a maintenance window after a specified date

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window that occur after the specified date.

```
aws ssm describe-maintenance-window-schedule \
    --window-id mw-0ecb1226dd7b2e9a6 \
    --filters "Key=ScheduledAfter,Values=2020-02-15T06:00:00Z"
```

Output:

```
{
    "ScheduledWindowExecutions": [
        {
            "WindowId": "mw-0ecb1226dd7b2e9a6",
            "Name": "My-Maintenance-Window",
            "ExecutionTime": "2020-02-15T16:00Z"
        },
        {
            "WindowId": "mw-0ecb1226dd7b2e9a6",
            "Name": "My-Maintenance-Window",
            "ExecutionTime": "2020-02-16T16:00Z"
        }
    ]
}
```

`describe-maintenance-window-targets`

The following code example shows how to use `describe-maintenance-window-targets`.

AWS CLI

Example 1: To list all targets for a Maintenance Window

The following `describe-maintenance-window-targets` example lists all of the targets for a maintenance window.

```
aws ssm describe-maintenance-window-targets \
```

```
    --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{
    "Targets": [
        {
            "ResourceType": "INSTANCE",
            "OwnerInformation": "Single instance",
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "Targets": [
                {
                    "Values": [
                        "i-0000293ffdEXAMPLE"
                    ],
                    "Key": "InstanceIds"
                }
            ],
            "WindowTargetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "ResourceType": "INSTANCE",
            "OwnerInformation": "Two instances in a list",
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "Targets": [
                {
                    "Values": [
                        "i-0000293ffdEXAMPLE",
                        "i-0cb2b964d3EXAMPLE"
                    ],
                    "Key": "InstanceIds"
                }
            ],
            "WindowTargetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

Example 2: To list all targets for a maintenance window matching a specific owner information value

The following `describe-maintenance-window-targets` example lists all of the targets for a maintenance window with a specific value.

```
aws ssm describe-maintenance-window-targets \
    --window-id "mw-0ecb1226ddEXAMPLE" \
    --filters "Key=OwnerInformation,Values=CostCenter1"
```

Output:

```
{
    "Targets": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "WindowTargetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "ResourceType": "INSTANCE",
            "Targets": [
                {
                    "Key": "tag:Environment",
                    "Values": [
                        "Prod"
                    ]
                }
            ],
            "OwnerInformation": "CostCenter1",
            "Name": "ProdTarget1"
        }
    ]
}
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowTargets in *AWS CLI Command Reference*.

`describe-maintenance-window-tasks`

The following code example shows how to use `describe-maintenance-window-tasks`.

AWS CLI

Example 1: To list all tasks for a maintenance window

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TaskArn": "AWS-RestartEC2Instance",
            "TaskParameters": {},
            "Type": "AUTOMATION",
            "Description": "Restarting EC2 Instance for maintenance",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "My-Automation-Example-Task",
            "Priority": 0,
            "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
                }
            ]
        },
        {
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "TaskArn": "AWS-DisableS3BucketPublicReadWrite",
            "TaskParameters": {},
            "Type": "AUTOMATION",
            "Description": "Automation task to disable read/write access on public
 S3 buckets",
            "MaxConcurrency": "10",
            "MaxErrors": "5",

ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
```

```
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
                }
            ]
        }
    ]
}
```

Example 2: To list all tasks for a maintenance window that invokes the AWS-RunPowerShellScript command document

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that invokes the `AWS-RunPowerShellScript` command document.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --filters "Key=TaskArn,Values=AWS-RunPowerShellScript"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "TaskArn": "AWS-RunPowerShellScript",
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 1,
```

```
            "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyTask"
        }
    ]
}
```

Example 3: To list all tasks for a maintenance window that have a Priority of 3

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that have a `Priority` of 3.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --filters "Key=Priority,Values=3"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "TaskArn": "AWS-RunPowerShellScript",
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 3,
            "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyRunCommandTask"
        },
```

```
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
            "TaskArn": "AWS-RestartEC2Instance",
            "Type": "AUTOMATION",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 3,
            "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "10",
            "MaxErrors": "5",
            "Name": "My-Automation-Task",
            "Description": "A description for my Automation task"
        }
    ]
}
```

Example 4: To list all tasks for a maintenance window that have a Priority of 1 and use Run Command

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that have a `Priority` of 1 and use Run Command.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --filters "Key=Priority,Values=1" "Key=TaskType,Values=RUN_COMMAND"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "TaskArn": "AWS-RunPowerShellScript",
```

```
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 1,
            "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyRunCommandTask"
        }
    ]
}
```

For more information, see View information about maintenance windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowTasks in *AWS CLI Command Reference*.

`describe-maintenance-windows-for-target`

The following code example shows how to use `describe-maintenance-windows-for-target`.

AWS CLI

To list all maintenance windows associated with a specific instance

The following `describe-maintenance-windows-for-target` example lists the maintenance windows that have targets or tasks associated with the specified instance.

```
aws ssm describe-maintenance-windows-for-target \
    --targets Key=InstanceIds,Values=i-1234567890EXAMPLE \
    --resource-type INSTANCE
```

Output:

```
{
```

```
    "WindowIdentities": [
        {
            "WindowId": "mw-0c5ed765acEXAMPLE",
            "Name": "My-First-Maintenance-Window"
        }
    ]
}
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowsForTarget in *AWS CLI Command Reference*.

`describe-maintenance-windows`

The following code example shows how to use `describe-maintenance-windows`.

AWS CLI

Example 1: To list all maintenance windows

The following `describe-maintenance-windows` example lists all maintenance windows in your AWS account in the current Region.

```
aws ssm describe-maintenance-windows
```

Output:

```
{
    "WindowIdentities": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "Name": "MyMaintenanceWindow-1",
            "Enabled": true,
            "Duration": 2,
            "Cutoff": 1,
            "Schedule": "rate(180 minutes)",
            "NextExecutionTime": "2020-02-12T23:19:20.596Z"
        },
        {
            "WindowId": "mw-03eb9db428EXAMPLE",
            "Name": "MyMaintenanceWindow-2",
```

```
            "Enabled": true,
            "Duration": 3,
            "Cutoff": 1,
            "Schedule": "rate(7 days)",
            "NextExecutionTime": "2020-02-17T23:22:00.956Z"
        },
        {
            "WindowId": "mw-1a2b3c4d5eEXAMPLE",
            "Name": "MyMaintenanceWindow",
            "Enabled": false,
            "Duration": 2,
            "Cutoff": 0,
            "Schedule": "cron(0 16 ? * TUE *)"
        }
    ]
}
```

Example 2: To list all enabled maintenance windows

The following `describe-maintenance-windows` example lists all enabled maintenance windows.

```
aws ssm describe-maintenance-windows \
    --filters "Key=Enabled,Values=true"
```

Output:

```
{
    "WindowIdentities": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "Name": "MyMaintenanceWindow-1",
            "Enabled": true,
            "Duration": 2,
            "Cutoff": 1,
            "Schedule": "rate(180 minutes)",
            "NextExecutionTime": "2020-02-12T23:19:20.596Z"
        },
        {
            "WindowId": "mw-03eb9db428EXAMPLE",
            "Name": "MyMaintenanceWindow-2",
            "Enabled": true,
            "Duration": 3,
```

```
            "Cutoff": 1,
            "Schedule": "rate(7 days)",
            "NextExecutionTime": "2020-02-17T23:22:00.956Z"
        }
    ]
}
```

Example 3: To list maintenance windows matching a specific name

The following `describe-maintenance-windows` example lists all maintenance windows with the specified name.

```
aws ssm describe-maintenance-windows \
    --filters "Key=Name,Values=MyMaintenanceWindow"
```

Output:

```
{
    "WindowIdentities": [
        {
            "WindowId": "mw-1a2b3c4d5eEXAMPLE",
            "Name": "MyMaintenanceWindow",
            "Enabled": false,
            "Duration": 2,
            "Cutoff": 0,
            "Schedule": "cron(0 16 ? * TUE *)"
        }
    ]
}
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindows in *AWS CLI Command Reference*.

`describe-ops-items`

The following code example shows how to use `describe-ops-items`.

AWS CLI

To list a set of OpsItems

The following `describe-ops-items` example displays a list of all open OpsItems in your AWS account.

```
aws ssm describe-ops-items \
    --ops-item-filters "Key=Status,Values=Open,Operator=Equal"
```

Output:

```
{
    "OpsItemSummaries": [
        {
            "CreatedBy": "arn:aws:sts::123456789012:assumed-role/OpsItem-CWE-Role/

- For API details, see DescribeOpsItems in *AWS CLI Command Reference*.

`describe-parameters`

The following code example shows how to use `describe-parameters`.

AWS CLI

Example 1: To list all parameters

The following `describe-parameters` example lists all parameters in the current AWS account and Region.

```
aws ssm describe-parameters
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MySecureStringParameter",
            "Type": "SecureString",
            "KeyId": "alias/aws/ssm",
            "LastModifiedDate": 1582155479.205,
            "LastModifiedUser": "arn:aws:sts::123456789012:assumed-role/Admin/
Richard-Roe-Managed",
            "Description": "This is a SecureString parameter",
            "Version": 2,
            "Tier": "Advanced",
            "Policies": [
                {
                    "PolicyText": "{\"Type\":\"Expiration\",\"Version\":\"1.0\",
\"Attributes\":{\"Timestamp\":\"2020-07-07T22:30:00Z\"}}",
                    "PolicyType": "Expiration",
                    "PolicyStatus": "Pending"
                },
                {
                    "PolicyText": "{\"Type\":\"ExpirationNotification\",\"Version\":
\"1.0\",\"Attributes\":{\"Before\":\"12\",\"Unit\":\"Hours\"}}",
                    "PolicyType": "ExpirationNotification",
                    "PolicyStatus": "Pending"
                }
            ]
        },
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "LastModifiedDate": 1582154764.222,
            "LastModifiedUser": "arn:aws:iam::123456789012:user/Mary-Major",

            "Version": 1,
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582154711.976,
            "LastModifiedUser": "arn:aws:iam::123456789012:user/Alejandro-Rosalez",
```

```
            "Description": "This is a String parameter",
            "Version": 1,
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "latestAmi",
            "Type": "String",
            "LastModifiedDate": 1580862415.521,
            "LastModifiedUser": "arn:aws:sts::123456789012:assumed-role/lambda-ssm-
role/Automation-UpdateSSM-Param",
            "Version": 3,
            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

Example 2: To list all parameters matching specific metadata

The following `describe-parameters` example lists all parameters matching a filter.

```
aws ssm describe-parameters \
    --filters "Key=Type,Values=StringList"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "LastModifiedDate": 1582154764.222,
            "LastModifiedUser": "arn:aws:iam::123456789012:user/Mary-Major",
            "Description": "This is a StringList parameter",
            "Version": 1,
            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

For more information, see Searching for Parameter Store parameters in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see DescribeParameters in *AWS CLI Command Reference*.

`describe-patch-baselines`

The following code example shows how to use `describe-patch-baselines`.

AWS CLI

Example 1: To list all patch baselines

The following `describe-patch-baselines` example retrieves details for all patch baselines in your account in the current Region.

```
aws ssm describe-patch-baselines
```

Output:

```
{
    "BaselineIdentities": [
        {
            "BaselineName": "AWS-SuseDefaultPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "Default Patch Baseline for Suse Provided by
 AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0123fdb36e334a3b2",
            "OperatingSystem": "SUSE"
        },
        {
            "BaselineName": "AWS-DefaultPatchBaseline",
            "DefaultBaseline": false,
            "BaselineDescription": "Default Patch Baseline Provided by AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed",
            "OperatingSystem": "WINDOWS"
        },
        {
            "BaselineName": "MyWindowsPatchBaseline",
            "DefaultBaseline": true,
```

```
            "BaselineDescription": "My patch baseline for EC2 instances for Windows
 Server",
            "BaselineId": "pb-0ad00e0dd7EXAMPLE",
            "OperatingSystem": "WINDOWS"
        }
    ]
}
```

Example 2: To list all patch baselines provided by AWS

The following `describe-patch-baselines` example lists all patch baselines provided by AWS.

```
aws ssm describe-patch-baselines \
    --filters "Key=OWNER,Values=[AWS]"
```

Output:

```
{
    "BaselineIdentities": [
        {
            "BaselineName": "AWS-SuseDefaultPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "Default Patch Baseline for Suse Provided by
 AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0123fdb36e334a3b2",
            "OperatingSystem": "SUSE"
        },
        {
            "BaselineName": "AWS-DefaultPatchBaseline",
            "DefaultBaseline": false,
            "BaselineDescription": "Default Patch Baseline Provided by AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed",
            "OperatingSystem": "WINDOWS"
        }
    ]
}
```

Example 3: To list all patch baselines that you own

The following `describe-patch-baselines` example lists all custom patch baselines created in your account in the current Region.

```
aws ssm describe-patch-baselines \
    --filters "Key=OWNER,Values=[Self]"
```

Output:

```
{
    "BaselineIdentities": [
        {
            "BaselineName": "MyWindowsPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "My patch baseline for EC2 instances for Windows
 Server",
            "BaselineId": "pb-0ad00e0dd7EXAMPLE",
            "OperatingSystem": "WINDOWS"
        }
    ]
}
```

For more information, see About Predefined and Custom Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchBaselines in *AWS CLI Command Reference*.

`describe-patch-group-state`

The following code example shows how to use `describe-patch-group-state`.

AWS CLI

To get the state of a patch group

The following `describe-patch-group-state` example retrieves the high-level patch compliance summary for a patch group.

```
aws ssm describe-patch-group-state \
    --patch-group "Production"
```

Output:

```
{
    "Instances": 21,
    "InstancesWithCriticalNonCompliantPatches": 1,
    "InstancesWithFailedPatches": 2,
    "InstancesWithInstalledOtherPatches": 3,
    "InstancesWithInstalledPatches": 21,
    "InstancesWithInstalledPendingRebootPatches": 2,
    "InstancesWithInstalledRejectedPatches": 1,
    "InstancesWithMissingPatches": 3,
    "InstancesWithNotApplicablePatches": 4,
    "InstancesWithOtherNonCompliantPatches": 1,
    "InstancesWithSecurityNonCompliantPatches": 1,
    "InstancesWithUnreportedNotApplicablePatches": 2
}
```

For more information, see About patch groups <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-patchgroups.html>__ and Understanding patch compliance state values in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchGroupState in *AWS CLI Command Reference*.

`describe-patch-groups`

The following code example shows how to use `describe-patch-groups`.

AWS CLI

To display patch group registrations

The following `describe-patch-groups` example lists the patch group registrations.

```
aws ssm describe-patch-groups
```

Output:

```
{
    "Mappings": [
        {
            "PatchGroup": "Production",
            "BaselineIdentity": {
                "BaselineId": "pb-0123456789abcdef0",
                "BaselineName": "ProdPatching",
```

```
                "OperatingSystem": "WINDOWS",
                "BaselineDescription": "Patches for Production",
                "DefaultBaseline": false
            }
        },
        {
            "PatchGroup": "Development",
            "BaselineIdentity": {
                "BaselineId": "pb-0713accee01234567",
                "BaselineName": "DevPatching",
                "OperatingSystem": "WINDOWS",
                "BaselineDescription": "Patches for Development",
                "DefaultBaseline": true
            }
        }
    ]
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchGroups in *AWS CLI Command Reference*.

`describe-patch-properties`

The following code example shows how to use `describe-patch-properties`.

AWS CLI

To list the Amazon Linux patch availability

The following `describe-patch-properties` example displays a list of the Amazon Linux products for which patches are available in your AWS account.

```
aws ssm describe-patch-properties \
    --operating-system AMAZON_LINUX \
    --property PRODUCT
```

Output:

```
{
    "Properties": [
```

```
        {
            "Name": "AmazonLinux2012.03"
        },
        {
            "Name": "AmazonLinux2012.09"
        },
        {
            "Name": "AmazonLinux2013.03"
        },
        {
            "Name": "AmazonLinux2013.09"
        },
        {
            "Name": "AmazonLinux2014.03"
        },
        {
            "Name": "AmazonLinux2014.09"
        },
        {
            "Name": "AmazonLinux2015.03"
        },
        {
            "Name": "AmazonLinux2015.09"
        },
        {
            "Name": "AmazonLinux2016.03"
        },
        {
            "Name": "AmazonLinux2016.09"
        },
        {
            "Name": "AmazonLinux2017.03"
        },
        {
            "Name": "AmazonLinux2017.09"
        },
        {
            "Name": "AmazonLinux2018.03"
        }
    ]
}
```

For more information, see About Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchProperties in *AWS CLI Command Reference*.

`describe-sessions`

The following code example shows how to use `describe-sessions`.

AWS CLI

Example 1: To list all active Session Manager sessions

The following `describe-sessions` example retrieves a list of the active sessions created most recently (both connected and disconnected sessions) over the past 30 days that were started by the specified user. This command returns only results for connections to targets initiated using Session Manager. It does not list connections made through other means, such as Remote Desktop Connections or SSH.

```
aws ssm describe-sessions \
    --state "Active" \
    --filters "key=Owner,value=arn:aws:sts::123456789012:assumed-role/Administrator/
Shirley-Rodriguez"
```

Output:

```
{
    "Sessions": [
        {
            "SessionId": "John-07a16060613c408b5",
            "Target": "i-1234567890abcdef0",
            "Status": "Connected",
            "StartDate": 1550676938.352,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-
Rodriguez",
            "OutputUrl": {}
        },
        {
            "SessionId": "John-01edf534b8b56e8eb",
            "Target": "i-9876543210abcdef0",
            "Status": "Connected",
            "StartDate": 1550676842.194,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-
Rodriguez",
```

```
            "OutputUrl": {}
        }
    ]
}
```

Example 2: To list all terminated Session Manager sessions

The following `describe-sessions` example retrieves a list of the most recently terminated sessions from the past 30 days for all users.

```
aws ssm describe-sessions \
    --state "History"
```

Output:

```
{
    "Sessions": [
        {
            "SessionId": "Mary-Major-0022b1eb2b0d9e3bd",
            "Target": "i-1234567890abcdef0",
            "Status": "Terminated",
            "StartDate": 1550520701.256,
            "EndDate": 1550521931.563,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Mary-
Major"
        },
        {
            "SessionId": "Jane-Roe-0db53f487931ed9d4",
            "Target": "i-9876543210abcdef0",
            "Status": "Terminated",
            "StartDate": 1550161369.149,
            "EndDate": 1550162580.329,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Jane-Roe"
        }
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see View Session History in the *AWS Systems Manager User Guide*.

- For API details, see DescribeSessions in *AWS CLI Command Reference*.

`disassociate-ops-item-related-item`

The following code example shows how to use `disassociate-ops-item-related-item`.

AWS CLI

To delete a related item association

The following `disassociate-ops-item-related-item` example deletes the association between the OpsItem and a related item.

```
aws ssm disassociate-ops-item-related-item \
    --ops-item-id "oi-f99f2EXAMPLE" \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Creating an incident for an OpsItem in the *AWS Systems Manager User Guide*.

- For API details, see DisassociateOpsItemRelatedItem in *AWS CLI Command Reference*.

`get-automation-execution`

The following code example shows how to use `get-automation-execution`.

AWS CLI

To display details about an automation execution

The following `get-automation-execution` example displays detailed information about an Automation execution.

```
aws ssm get-automation-execution \
    --automation-execution-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "AutomationExecution": {
        "AutomationExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DocumentName": "AWS-StartEC2Instance",
        "DocumentVersion": "1",
```

```
        "ExecutionStartTime": 1583737233.748,

    }
}
```

For more information, see Walkthrough: Patch a Linux AMI (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetAutomationExecution in *AWS CLI Command Reference*.

`get-calendar-state`

The following code example shows how to use `get-calendar-state`.

AWS CLI

Example 1: To get the current state of a change calendar

The following `get-calendar-state` example returns the state of a calendar at the current time. Because the example doesn't specify a time, the current state of the calendar is reported.

```
aws ssm get-calendar-state \
    --calendar-names "MyCalendar"
```

Output:

```
{
    "State": "OPEN",
    "AtTime": "2020-02-19T22:28:51Z",
    "NextTransitionTime": "2020-02-24T21:15:19Z"
}
```

Example 2: To get the state of a change calendar at a specified time

The following `get-calendar-state` example returns the state of a calendar at the specified time.

```
aws ssm get-calendar-state \
    --calendar-names "MyCalendar" \
    --at-time "2020-07-19T21:15:19Z"
```

Output:

```
{
    "State": "CLOSED",
```

```
    "AtTime": "2020-07-19T21:15:19Z"
}
```

For more information, see Getting the state of a change calendar in the *AWS Systems Manager User Guide*.

- For API details, see GetCalendarState in *AWS CLI Command Reference*.

`get-command-invocation`

The following code example shows how to use `get-command-invocation`.

AWS CLI

To display the details of a command invocation

The following `get-command-invocation` example lists all the invocations of the specified command on the specified instance.

```
aws ssm get-command-invocation \
    --command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "InstanceId": "i-1234567890abcdef0",
    "Comment": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222:a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333",
    "DocumentName": "AWS-UpdateSSMAgent",
    "DocumentVersion": "",
    "PluginName": "aws:updateSsmAgent",
    "ResponseCode": 0,
    "ExecutionStartDateTime": "2020-02-19T18:18:03.419Z",
    "ExecutionElapsedTime": "PT0.091S",
    "ExecutionEndDateTime": "2020-02-19T18:18:03.419Z",
    "Status": "Success",
    "StatusDetails": "Success",
    "StandardOutputContent": "Updating amazon-ssm-agent from 2.3.842.0 to latest
\nSuccessfully downloaded https://s3.us-west-2.amazonaws.com/amazon-ssm-us-east-2/
```

```
ssm-agent-manifest.json\namazon-ssm-agent 2.3.842.0 has already been installed,
 update skipped\n",
    "StandardOutputUrl": "",
    "StandardErrorContent": "",
    "StandardErrorUrl": "",
    "CloudWatchOutputConfig": {
        "CloudWatchLogGroupName": "",
        "CloudWatchOutputEnabled": false
    }
}
```

For more information, see Understanding Command Statuses in the *AWS Systems Manager User Guide*.

- For API details, see GetCommandInvocation in *AWS CLI Command Reference*.

`get-connection-status`

The following code example shows how to use `get-connection-status`.

AWS CLI

To display the connection status of a managed instance

The following `get-connection-status` example returns the connection status of the specified managed instance.

```
aws ssm get-connection-status \
    --target i-1234567890abcdef0
```

Output:

```
{
    "Target": "i-1234567890abcdef0",
    "Status": "connected"
}
```

For more information, see AWS Systems Manager Session Manager in the *AWS Systems Manager User Guide*.

- For API details, see GetConnectionStatus in *AWS CLI Command Reference*.

`get-default-patch-baseline`

The following code example shows how to use `get-default-patch-baseline`.

AWS CLI

Example 1: To display the default Windows patch baseline

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Windows Server.

```
aws ssm get-default-patch-baseline
```

Output:

```
{
    "BaselineId": "pb-0713accee01612345",
    "OperatingSystem": "WINDOWS"
}
```

Example 2: To display the default patch baseline for Amazon Linux

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Amazon Linux.

```
aws ssm get-default-patch-baseline \
    --operating-system AMAZON_LINUX
```

Output:

```
{
    "BaselineId": "pb-047c6eb9c8fc12345",
    "OperatingSystem": "AMAZON_LINUX"
}
```

For more information, see About Predefined and Custom Patch Baselines <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-baselines.html>__ and Set an Existing Patch Baseline as the Default in the *AWS Systems Manager User Guide*.

- For API details, see GetDefaultPatchBaseline in *AWS CLI Command Reference*.

`get-deployable-patch-snapshot-for-instance`

The following code example shows how to use `get-deployable-patch-snapshot-for-instance`.

AWS CLI

To retrieve the current snapshot for the patch baseline an instance uses

The following `get-deployable-patch-snapshot-for-instance` example retrieves details for the current snapshot for the specified patch baseline used by an instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, run `aws configure` and specify only the Region of your instance. Leave the `Access Key` and `Secret Key` fields empty.

Tip: Use `uuidgen` to generate a `snapshot-id`.

```
aws ssm get-deployable-patch-snapshot-for-instance \
    --instance-id "i-1234567890abcdef0" \
    --snapshot-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "SnapshotId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Product": "AmazonLinux2018.03",
    "SnapshotDownloadUrl": "https://patch-baseline-snapshot-us-
east-1.s3.amazonaws.com/
ed85194ef27214f5984f28b4d664d14f7313568fea7d4b6ac6c10ad1f729d7e7-123456789012/

}
```

For more information, see Parameter name: Snapshot ID in the *AWS Systems Manager User Guide*.

- For API details, see GetDeployablePatchSnapshotForInstance in *AWS CLI Command Reference*.

get-document

The following code example shows how to use `get-document`.

AWS CLI

To get document content

The following `get-document` example displays the content of a Systems Manager document.

```
aws ssm get-document \
    --name "AWS-RunShellScript"
```

Output:

```
{
    "Name": "AWS-RunShellScript",
    "DocumentVersion": "1",
    "Status": "Active",
    "Content": "{\n    \"schemaVersion\":\"1.2\",\n    \"description\":\"Run a
 shell script or specify the commands to run.\",\n    \"parameters\":{\n
 \"commands\":{\n            \"type\":\"StringList\",\n            \"description
\":\"(Required) Specify a shell script or a command to run.\",\n
 \"minItems\":1,\n            \"displayType\":\"textarea\"\n        },\n
 \"workingDirectory\":{\n            \"type\":\"String\",\n            \"default
\":\"\",\n            \"description\":\"(Optional) The path to the working
 directory on your instance.\",\n            \"maxChars\":4096\n        },\n
   \"executionTimeout\":{\n            \"type\":\"String\",\n            \"default
\":\"3600\",\n            \"description\":\"(Optional) The time in seconds for a
 command to complete before it is considered to have failed. Default is 3600 (1
 hour). Maximum is 172800 (48 hours).\",\n            \"allowedPattern\":\"([1-9]
[0-9]{0,4})|(1[0-6][0-9]{4})|(17[0-1][0-9]{3})|(172[0-7][0-9]{2})|(172800)\"\n
        }\n    },\n    \"runtimeConfig\":{\n        \"aws:runShellScript\":{\n
            \"properties\":[\n                {\n                    \"id\":
\"0.aws:runShellScript\",\n                    \"runCommand\":\"{{ commands }}\",\n
                    \"workingDirectory\":\"{{ workingDirectory }}\",\n
       \"timeoutSeconds\":\"{{ executionTimeout }}\"\n                }\n
  ]\n        }\n    }\n}\n",
    "DocumentType": "Command",
    "DocumentFormat": "JSON"
}
```

For more information, see AWS Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see GetDocument in *AWS CLI Command Reference*.

`get-inventory-schema`

The following code example shows how to use `get-inventory-schema`.

AWS CLI

Example 1: To view your inventory schema

The following `get-inventory-schema` example returns a list of inventory type names for the account.

```
aws ssm get-inventory-schema
```

Output:

```
{
    "Schemas": [
        {
            "TypeName": "AWS:AWSComponent",
            "Version": "1.0",
            "Attributes": [
                {
                    "Name": "Name",
                    "DataType": "STRING"
                },
                {
                    "Name": "ApplicationType",
                    "DataType": "STRING"
                },
                {
                    "Name": "Publisher",
                    "DataType": "STRING"
                },
                {
                    "Name": "Version",
                    "DataType": "STRING"
                },
                {
```

```
                    "Name": "InstalledTime",
                    "DataType": "STRING"
                },
                {
                    "Name": "Architecture",
                    "DataType": "STRING"
                },
                {
                    "Name": "URL",
                    "DataType": "STRING"
                }
            ]
    }
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see Metadata collected by Inventory in the *AWS Systems Manager User Guide*.

Example 2: To view the inventory schema for a specific inventory type

The following `get-inventory-schema` example returns the inventory schema for the `AWS:AWSComponent` inventory type.

```
aws ssm get-inventory-schema \
    --type-name "AWS:AWSComponent"
```

Output:

```
{
    "Schemas": [
        {
            "TypeName": "AWS:AWSComponent",
            "Version": "1.0",
            "Attributes": [
                {
                    "Name": "Name",
                    "DataType": "STRING"
                },
                {
                    "Name": "ApplicationType",
```

```
                    "DataType": "STRING"
                },
                {
                    "Name": "Publisher",
                    "DataType": "STRING"
                },
                {
                    "Name": "Version",
                    "DataType": "STRING"
                },
                {
                    "Name": "InstalledTime",
                    "DataType": "STRING"
                },
                {
                    "Name": "Architecture",
                    "DataType": "STRING"
                },
                {
                    "Name": "URL",
                    "DataType": "STRING"
                }
            ]
        }
    ]
}
```

For more information, see Metadata collected by Inventory in the *AWS Systems Manager User Guide*.

- For API details, see GetInventorySchema in *AWS CLI Command Reference*.

`get-inventory`

The following code example shows how to use `get-inventory`.

AWS CLI

To view your inventory

The following `get-inventory` example gets the custom metadata for your inventory.

```
aws ssm get-inventory
```

Output:

```
{
    "Entities": [
        {
            "Data": {
                "AWS:InstanceInformation": {
                    "Content": [
                        {
                            "ComputerName": "ip-172-31-44-222.us-
west-2.compute.internal",
                            "InstanceId": "i-0cb2b964d3e14fd9f",
                            "IpAddress": "172.31.44.222",
                            "AgentType": "amazon-ssm-agent",
                            "ResourceType": "EC2Instance",
                            "AgentVersion": "2.0.672.0",
                            "PlatformVersion": "2016.09",
                            "PlatformName": "Amazon Linux AMI",
                            "PlatformType": "Linux"
                        }
                    ],
                    "TypeName": "AWS:InstanceInformation",
                    "SchemaVersion": "1.0",
                    "CaptureTime": "2017-02-20T18:03:58Z"
                }
            },
            "Id": "i-0cb2b964d3e14fd9f"
        }
    ]
}
```

For more information, see AWS Systems Manager Inventory in the *AWS Systems Manager User Guide*.

- For API details, see GetInventory in *AWS CLI Command Reference*.

`get-maintenance-window-execution-task-invocation`

The following code example shows how to use `get-maintenance-window-execution-task-invocation`.

AWS CLI

To get information about a maintenance window task invocation

The following `get-maintenance-window-execution-task-invocation` example lists information about the specified task invocation that is part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution-task-invocation \
    --window-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --task-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" \
    --invocation-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
```

Output:

```
{
    "Status": "SUCCESS",
    "Parameters": "{\"comment\":\"\",\"documentName\":\"AWS-RunPowerShellScript\",
\"instanceIds\":[\"i-1234567890EXAMPLE\"],\"maxConcurrency\":\"1\",\"maxErrors\":
\"1\",\"parameters\":{\"executionTimeout\":[\"3600\"],\"workingDirectory\":[\"\"],
\"commands\":[\"echo Hello\"]},\"timeoutSeconds\":600}",
    "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",

    "StatusDetails": "Failed",
    "TaskExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecutionTaskInvocation in *AWS CLI Command Reference*.

`get-maintenance-window-execution-task`

The following code example shows how to use `get-maintenance-window-execution-task`.

AWS CLI

To get information about a maintenance window task execution

The following `get-maintenance-window-execution-task` example lists information about a task that is part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution-task \
    --window-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --task-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

                ]
            }
        }
    ],
    "Priority": 1,
    "MaxConcurrency": "1",
    "MaxErrors": "3",
    "Status": "SUCCESS",
    "StartTime": "2021-08-04T11:45:35.088000-07:00",
    "EndTime": "2021-08-04T11:53:09.079000-07:00"
}
```

For more information, see View information about tasks and task executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecutionTask in *AWS CLI Command Reference*.

`get-maintenance-window-execution`

The following code example shows how to use `get-maintenance-window-execution`.

AWS CLI

To get information about a maintenance window task execution

The following `get-maintenance-window-execution` example lists information about a task executed as part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution \
    --window-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
```

```
    "Status": "SUCCESS",
    "TaskIds": [
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    ],
    "StartTime": 1487692834.595,
    "EndTime": 1487692835.051,
    "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecution in *AWS CLI Command Reference*.

`get-maintenance-window-task`

The following code example shows how to use `get-maintenance-window-task`.

AWS CLI

To get information about a maintenance window task

The following `get-maintenance-window-task` example retrieves details about the specified maintenance window task.

```
aws ssm get-maintenance-window-task \
    --window-id mw-0c5ed765acEXAMPLE \
    --window-task-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
    "MaxErrors": "1",

    "Name": "ExampleTask"
}
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowTask in *AWS CLI Command Reference*.

`get-maintenance-window`

The following code example shows how to use `get-maintenance-window`.

AWS CLI

To get information about a maintenance window

The following `get-maintenance-window` example retrieves details about the specified maintenance window.

```
aws ssm get-maintenance-window \
    --window-id "mw-03eb9db428EXAMPLE"
```

Output:

```
{
    "AllowUnassociatedTargets": true,
    "CreatedDate": 1515006912.957,
    "Cutoff": 1,
    "Duration": 6,
    "Enabled": true,
    "ModifiedDate": "2020-01-01T10:04:04.099Z",
    "Name": "My-Maintenance-Window",
    "Schedule": "rate(3 days)",
    "WindowId": "mw-03eb9db428EXAMPLE",
    "NextExecutionTime": "2020-02-25T00:08:15.099Z"
}
```

For more information, see View information about maintenance windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindow in *AWS CLI Command Reference*.

`get-ops-item`

The following code example shows how to use `get-ops-item`.

AWS CLI

To view information about an OpsItem

The following `get-ops-item` example displays details about the specified OpsItem.

```
aws ssm get-ops-item \
    --ops-item-id oi-0b725EXAMPLE
```

Output:

```
{
    "OpsItem": {
        "CreatedBy": "arn:aws:sts::123456789012:assumed-role/OpsItem-CWE-Role/
fbf77cbe264a33509569f23e4EXAMPLE",
```

    }
}
```

For more information, see Working with OpsItems in the *AWS Systems Manager User Guide*.

- For API details, see GetOpsItem in *AWS CLI Command Reference*.

`get-ops-summary`

The following code example shows how to use `get-ops-summary`.

AWS CLI

To view a summary of all OpsItems

The following `get-ops-summary` example displays a summary of all OpsItems in your AWS account.

```
aws ssm get-ops-summary
```

Output:

```
{
    "Entities": [
        {
            "Id": "oi-4309fEXAMPLE",
            "Data": {
                "AWS:OpsItem": {
                    "CaptureTime": "2020-02-26T18:58:32.918Z",
                    "Content": [
                        {

        ]
}
```

For more information, see Working with OpsItems in the *AWS Systems Manager User Guide*.

- For API details, see GetOpsSummary in *AWS CLI Command Reference*.

`get-parameter-history`

The following code example shows how to use `get-parameter-history`.

AWS CLI

To get a value history for a parameter

The following `get-parameter-history` example lists the history of changes for the specified parameter, including its value.

```
aws ssm get-parameter-history \
    --name "MyStringParameter"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582154711.976,
            "LastModifiedUser": "arn:aws:iam::123456789012:user/Mary-Major",
            "Description": "This is the first version of my String parameter",
            "Value": "Veni",
            "Version": 1,
            "Labels": [],
            "Tier": "Standard",
```

```
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582156093.471,
            "LastModifiedUser": "arn:aws:iam::123456789012:user/Mary-Major",
            "Description": "This is the second version of my String parameter",
            "Value": "Vidi",
            "Version": 2,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582156117.545,
            "LastModifiedUser": "arn:aws:iam::123456789012:user/Mary-Major",
            "Description": "This is the third version of my String parameter",
            "Value": "Vici",
            "Version": 3,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

For more information, see Working with parameter versions in the *AWS Systems Manager User Guide*.

- For API details, see GetParameterHistory in *AWS CLI Command Reference*.

`get-parameter`

The following code example shows how to use `get-parameter`.

AWS CLI

Example 1: To display the value of a parameter

The following `get-parameter` example lists the value for the specified single parameter.

```
aws ssm get-parameter \
    --name "MyStringParameter"
```

Output:

```
{
    "Parameter": {
        "Name": "MyStringParameter",
        "Type": "String",
        "Value": "Veni",
        "Version": 1,
        "LastModifiedDate": 1530018761.888,
        "ARN": "arn:aws:ssm:us-west-2:123456789012:parameter/MyStringParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

Example 2: To decrypt the value of a SecureString parameter

The following `get-parameter` example decrypts the value of the specified `SecureString` parameter.

```
aws ssm get-parameter \
    --name "MySecureStringParameter" \
    --with-decryption
```

Output:

```
{
    "Parameter": {
        "Name": "MySecureStringParameter",
        "Type": "SecureString",
        "Value": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Version": 2,
        "LastModifiedDate": 1582155479.205,
        "ARN": "arn:aws:ssm:us-west-2:123456789012:parameter/
MySecureStringParameter",
        "DataType": "text"
```

```
    }
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

Example 3: To display the value of a parameter using labels

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```
aws ssm get-parameter \
    --name "MyParameter:label"
```

Output:

```
{
    "Parameter": {
        "Name": "MyParameter",
        "Type": "String",
        "Value": "parameter version 2",
        "Version": 2,
        "Selector": ":label",
        "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
        "ARN": "arn:aws:ssm:us-west-2:123456789111:parameter/MyParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

Example 4: To display the value of a parameter using versions

The following `get-parameter` example lists the value for the specified single parameter version.

```
aws ssm get-parameter \
    --name "MyParameter:2"
```

Output:

```
{
    "Parameter": {
        "Name": "MyParameter",
        "Type": "String",
        "Value": "parameter version 2",
        "Version": 2,
        "Selector": ":2",
        "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
        "ARN": "arn:aws:ssm:us-west-2:123456789111:parameter/MyParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

- For API details, see GetParameter in *AWS CLI Command Reference*.

`get-parameters-by-path`

The following code example shows how to use `get-parameters-by-path`.

AWS CLI

To list parameters in a specific path

The following `get-parameters-by-path` example lists the parameters within the specified hierarchy.

```
aws ssm get-parameters-by-path \
    --path "/site/newyork/department/"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "/site/newyork/department/marketing",
            "Type": "String",
            "Value": "Floor 2",
            "Version": 1,
```

```
            "LastModifiedDate": 1530018761.888,
            "ARN": "arn:aws:ssm:us-west-2:123456789012:parameter/site/newyork/
department/marketing"
        },
        {
            "Name": "/site/newyork/department/infotech",
            "Type": "String",
            "Value": "Floor 3",
            "Version": 1,
            "LastModifiedDate": 1530018823.429,
            "ARN": "arn:aws:ssm:us-west-2:123456789012:parameter/site/newyork/
department/infotech"
        }
    ]
}
```

For more information, see Working with parameter hierarchies in the *AWS Systems Manager User Guide*.

- For API details, see GetParametersByPath in *AWS CLI Command Reference*.

`get-parameters`

The following code example shows how to use `get-parameters`.

AWS CLI

Example 1: To list the values for a parameter

The following `get-parameters` example lists the values for the three specified parameters.

```
aws ssm get-parameters \
    --names "MyStringParameter" "MyStringListParameter" "MyInvalidParameterName"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "Value": "alpha,beta,gamma",
```

```
            "Version": 1,
            "LastModifiedDate": 1582154764.222,
            "ARN": "arn:aws:ssm:us-west-2:123456789012:parameter/
MyStringListParameter",
            "DataType": "text"
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "Value": "Vici",
            "Version": 3,
            "LastModifiedDate": 1582156117.545,
            "ARN": "arn:aws:ssm:us-west-2:123456789012:parameter/MyStringParameter",
            "DataType": "text"
        }
    ],
    "InvalidParameters": [
        "MyInvalidParameterName"
    ]
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

Example 2: To list names and values of multiple parameters using the ``--query`` option

The following `get-parameters` example lists the names and values for the specified parameters.

```
aws ssm get-parameters \
    --names MyStringParameter MyStringListParameter \
    --query "Parameters[*].{Name:Name,Value:Value}"
```

Output:

```
[
    {
        "Name": "MyStringListParameter",
        "Value": "alpha,beta,gamma"
    },
    {
        "Name": "MyStringParameter",
```

```
        "Value": "Vidi"
    }
]
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

Example 3: To display the value of a parameter using labels

The following `get-parameters` example lists the values for the specified parameters, one specified by label and one specified by version.

```
aws ssm get-parameters \
    --names "MyLabelParameter:label" "MyVersionParameter:2"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyLabelParameter",
            "Type": "String",
            "Value": "parameter by label",
            "Version": 1,
            "Selector": ":label",
            "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
            "ARN": "arn:aws:ssm:us-west-2:123456789111:parameter/MyLabelParameter",
            "DataType": "text"
        },
        {
            "Name": "MyVersionParameter",
            "Type": "String",
            "Value": "parameter by version",
            "Version": 2,
            "Selector": ":2",
            "LastModifiedDate": "2021-03-24T16:20:28.236000-07:00",
            "ARN": "arn:aws:ssm:us-west-2:123456789111:parameter/
MyVersionParameter",
            "DataType": "text"
        }
    ],
    "InvalidParameters": []
```

```
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

- For API details, see GetParameters in *AWS CLI Command Reference*.

`get-patch-baseline-for-patch-group`

The following code example shows how to use `get-patch-baseline-for-patch-group`.

AWS CLI

To display the patch baseline for a patch group

The following `get-patch-baseline-for-patch-group` example retrieves details about the patch baseline for the specified patch group.

```
aws ssm get-patch-baseline-for-patch-group \
    --patch-group "DEV"
```

Output:

```
{
    "PatchGroup": "DEV",
    "BaselineId": "pb-0123456789abcdef0",
    "OperatingSystem": "WINDOWS"
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see GetPatchBaselineForPatchGroup in *AWS CLI Command Reference*.

`get-patch-baseline`

The following code example shows how to use `get-patch-baseline`.

AWS CLI

To display a patch baseline

The following `get-patch-baseline` example retrieves the details for the specified patch baseline.

```
aws ssm get-patch-baseline \
    --baseline-id "pb-0123456789abcdef0"
```

Output:

```
{
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
                    ]
                },
                "ComplianceLevel": "CRITICAL",

    "RejectedPatchesAction": "ALLOW_AS_DEPENDENCY",
    "PatchGroups": [
        "QA",
        "DEV"
    ],
```

```
    "CreatedDate": 1550244180.465,
    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
}
```

For more information, see About Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see GetPatchBaseline in *AWS CLI Command Reference*.

`get-service-setting`

The following code example shows how to use `get-service-setting`.

AWS CLI

To retrieve the service setting for Parameter Store throughput

The following `get-service-setting` example retrieves the current service setting for Parameter Store throughput in the specified region.

```
aws ssm get-service-setting \
    --setting-id arn:aws:ssm:us-west-2:123456789012:servicesetting/ssm/parameter-store/high-throughput-enabled
```

Output:

```
{
    "ServiceSetting": {
        "SettingId": "/ssm/parameter-store/high-throughput-enabled",
        "SettingValue": "false",
        "LastModifiedDate": 1555532818.578,
        "LastModifiedUser": "System",
        "ARN": "arn:aws:ssm:us-west-2:123456789012:servicesetting/ssm/parameter-store/high-throughput-enabled",
        "Status": "Default"
    }
}
```

For more information, see Managing Parameter Store throughput in the *AWS Systems Manager User Guide*.

- For API details, see GetServiceSetting in *AWS CLI Command Reference*.

label-parameter-version

The following code example shows how to use `label-parameter-version`.

AWS CLI

Example 1: To add a label to latest version of a parameter

The following `label-parameter-version` example adds a label to the latest version of the specified parameter.

```
aws ssm label-parameter-version \
    --name "MyStringParameter" \
    --labels "ProductionReady"
```

Output:

```
{
    "InvalidLabels": [],
    "ParameterVersion": 3
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

Example 2: To add a label to a specific version of a parameter

The following `label-parameter-version` example adds a label to the specified version of a parameter.

```
aws ssm label-parameter-version \
    --name "MyStringParameter" \
    --labels "ProductionReady" \
    --parameter-version "2" \
    --labels "DevelopmentReady"
```

Output:

```
{
    "InvalidLabels": [],
    "ParameterVersion": 2
```

```
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

- For API details, see LabelParameterVersion in *AWS CLI Command Reference*.

`list-association-versions`

The following code example shows how to use `list-association-versions`.

AWS CLI

To list all versions of an association for a specific association ID

The following `list-association-versions` example lists all versions of the specified associations.

```
aws ssm list-association-versions \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
"AssociationVersions": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "CreatedDate": 1550505536.726,
            "Name": "AWS-UpdateSSMAgent",
            "Parameters": {
                "allowDowngrade": [
                    "false"
                ],
                "version": [
                    ""
                ]
            },
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
```

```
                    "i-1234567890abcdef0"
                ]
            }
        ],
        "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
        "AssociationName": "UpdateSSMAgent"
    }
]
}
```

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see ListAssociationVersions in *AWS CLI Command Reference*.

`list-associations`

The following code example shows how to use `list-associations`.

AWS CLI

Example 1: To list your associations for a specific instance

The following `list-associations` example lists all associations with the AssociationName, UpdateSSMAgent.

```
aws ssm list-associations \
    --association-filter-list "key=AssociationName,value=UpdateSSMAgent"
```

Output:

```
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-016648b75dd622dab"
```

```
                    ]
                }
            ],
            "Overview": {
                "Status": "Pending",
                "DetailedStatus": "Associated",
                "AssociationStatusAggregatedCount": {
                    "Pending": 1
                }
            },
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Systems Manager User Guide*.

Example 2: To list your associations for a specific document

The following `list-associations` example lists all associations for the specified document.

```
aws ssm list-associations \
    --association-filter-list "key=Name,value=AWS-UpdateSSMAgent"
```

Output:

```
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ],
```

```
            "LastExecutionDate": 1550505828.548,
            "Overview": {
                "Status": "Success",
                "DetailedStatus": "Success",
                "AssociationStatusAggregatedCount": {
                    "Success": 1
                }
            },
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        },
    {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-9876543210abcdef0",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-9876543210abcdef0"
                    ]
                }
            ],
            "LastExecutionDate": 1550507531.0,
            "Overview": {
                "Status": "Success",
                "AssociationStatusAggregatedCount": {
                    "Success": 1
                }
            }
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Systems Manager User Guide*.

- For API details, see ListAssociations in *AWS CLI Command Reference*.

`list-command-invocations`

The following code example shows how to use `list-command-invocations`.

AWS CLI

To list the invocations of a specific command

The following `list-command-invocations` example lists all the invocations of a command.

```
aws ssm list-command-invocations \
    --command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --details
```

Output:

```
{
    "CommandInvocations": [
        {
            "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

        }
    ]
}
```

For more information, see Understanding Command Statuses in the *AWS Systems Manager User Guide*.

- For API details, see ListCommandInvocations in *AWS CLI Command Reference*.

`list-commands`

The following code example shows how to use `list-commands`.

AWS CLI

Example 1: To get the status of a specific command

The following `list-commands` example retrieves and displays the status of the specified command.

```
aws ssm list-commands \
    --command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Commands": [
        {
            "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DocumentName": "AWS-RunShellScript",
            "DocumentVersion": "1",
            "Comment": "",
            "ExpiresAfter": "2020-02-19T12:28:02.500000-08:00",
            "Parameters": {
                "commands": [
                    "ifconfig"
                ]
            },

            },
            "TimeoutSeconds": 3600
        }
    ]
}
```

Example 2: To get the status of commands requested after a specific date

The following `list-commands` example retrieves the details of commands requested after the specified date.

```
aws ssm list-commands \
    --filters "key=InvokedAfter,value=2020-02-01T00:00:00Z"
```

Output:

```
{
    "Commands": [
        {
            "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "DocumentName": "AWS-UpdateSSMAgent",
            "DocumentVersion": "",
            "Comment": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333:a1b2c3d4-5678-90ab-

list-compliance-items

The following code example shows how to use `list-compliance-items`.

AWS CLI

Example 1: To list compliance items for a specific instance

The following `list-compliance-items` example lists all compliance items for the specified instance.

```
aws ssm list-compliance-items \
    --resource-ids "i-1234567890abcdef0" \
    --resource-types "ManagedInstance"
```

Output:

```
{
    "ComplianceItems": [
        {
            "ComplianceType": "Association",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-1234567890abcdef0",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Title": "",
            "Status": "COMPLIANT",
            "Severity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550408470.0
            },
            "Details": {
                "DocumentName": "AWS-GatherSoftwareInventory",
                "DocumentVersion": "1"
            }
        },
        {
            "ComplianceType": "Association",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-1234567890abcdef0",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Title": "",
            "Status": "COMPLIANT",
            "Severity": "UNSPECIFIED",
```

```
            "ExecutionSummary": {
                "ExecutionTime": 1550508475.0
            },
            "Details": {
                "DocumentName": "AWS-UpdateSSMAgent",
                "DocumentVersion": "1"
            }
    }
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see Learn details about Compliance in the *AWS Systems Manager User Guide*.

Example 2: To list compliance items for a specific instance and association ID

The following `list-compliance-items` example lists all compliance items for the specified instance and association ID.

```
aws ssm list-compliance-items \
    --resource-ids "i-1234567890abcdef0" \
    --resource-types "ManagedInstance" \
    --
filters "Key=ComplianceType,Values=Association,Type=EQUAL" "Key=Id,Values=a1b2c3d4-5678-90ab
cdef-EXAMPLE22222,Type=EQUAL"
```

Output:

```
{
    "ComplianceItems": [
        {
            "ComplianceType": "Association",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-1234567890abcdef0",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Title": "",
            "Status": "COMPLIANT",
            "Severity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550508475.0
            },
            "Details": {
```

```
                "DocumentName": "AWS-UpdateSSMAgent",
                "DocumentVersion": "1"
            }
        }
    ]
}
```

For more information, see Learn details about Compliance in the *AWS Systems Manager User Guide*.

Example 3: To list compliance items for an instance after a specific date and time

The following `list-compliance-items` example lists all compliance items for an instance after the specified date and time.

```
aws ssm list-compliance-items \
    --resource-ids "i-1234567890abcdef0" \
    --resource-types "ManagedInstance" \
    --filters "Key=ExecutionTime,Values=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

Output:

```
{
    "ComplianceItems": [
        {
            "ComplianceType": "Association",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-1234567890abcdef0",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Title": "",
            "Status": "COMPLIANT",
            "Severity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550508475.0
            },
            "Details": {
                "DocumentName": "AWS-UpdateSSMAgent",
                "DocumentVersion": "1"
            }
        }
    ]
}
```

For more information, see Learn details about Compliance in the *AWS Systems Manager User Guide*.

- For API details, see ListComplianceItems in *AWS CLI Command Reference*.

`list-compliance-summaries`

The following code example shows how to use `list-compliance-summaries`.

AWS CLI

Example 1: To list compliance summaries for all compliance types

The following `list-compliance-summaries` example lists compliance summaries for all compliance types in your account.

```
aws ssm list-compliance-summaries
```

Output:

```
{
    "ComplianceSummaryItems": [
        {
            "ComplianceType": "Association",
            "CompliantSummary": {
                "CompliantCount": 2,
                "SeveritySummary": {

Example 2: To list compliance summaries for a specific compliance type

The following `list-compliance-summaries` example lists the compliance summary for the Patch compliance type.

```
aws ssm list-compliance-summaries \
```

```
    --filters "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

Output:

```
{
    "ComplianceSummaryItems": [
        {
            "ComplianceType": "Patch",
            "CompliantSummary": {
                "CompliantCount": 1,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 1
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 1,
                "SeveritySummary": {
                    "CriticalCount": 1,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        }
    ]
}
```

For more information, see Learn details about Compliance in the *AWS Systems Manager User Guide*.

- For API details, see ListComplianceSummaries in *AWS CLI Command Reference*.

`list-document-metadata-history`

The following code example shows how to use `list-document-metadata-history`.

AWS CLI

To view approval history and status for a change template

The following `list-document-metadata-history` example returns the approval history for the specified Change Manager change template.

```
aws ssm list-document-metadata-history \
    --name MyChangeManageTemplate \
    --metadata DocumentReviews
```

Output:

```
{
    "Name": "MyChangeManagerTemplate",
    "DocumentVersion": "1",
    "Author": "arn:aws:iam::123456789012;:user/JohnDoe",
    "Metadata": {
        "ReviewerResponse": [
            {
                "CreateTime": "2021-07-30T11:58:28.025000-07:00",
                "UpdatedTime": "2021-07-30T12:01:19.274000-07:00",
                "ReviewStatus": "APPROVED",
                "Comment": [
                    {
                        "Type": "COMMENT",
                        "Content": "I approve this template version"
                    }
                ],
                "Reviewer": "arn:aws:iam::123456789012;:user/ShirleyRodriguez"
            },
            {
                "CreateTime": "2021-07-30T11:58:28.025000-07:00",
                "UpdatedTime": "2021-07-30T11:58:28.025000-07:00",
                "ReviewStatus": "PENDING"
            }
        ]
    }
}
```

For more information, see Reviewing and approving or rejecting change templates in the *AWS Systems Manager User Guide*.

- For API details, see ListDocumentMetadataHistory in *AWS CLI Command Reference*.

`list-document-versions`

The following code example shows how to use `list-document-versions`.

AWS CLI

To list document versions

The following `list-document-versions` example lists all versions for a Systems Manager document.

```
aws ssm list-document-versions \
    --name "Example"
```

Output:

```
{
    "DocumentVersions": [
        {
            "Name": "Example",
            "DocumentVersion": "1",
            "CreatedDate": 1583257938.266,
            "IsDefaultVersion": true,
            "DocumentFormat": "YAML",
            "Status": "Active"
        }
    ]
}
```

For more information, see Sending Commands that Use the Document Version Parameter in the *AWS Systems Manager User Guide*.

- For API details, see ListDocumentVersions in *AWS CLI Command Reference*.

`list-documents`

The following code example shows how to use `list-documents`.

AWS CLI

Example 1: To list documents

The following `list-documents` example lists documents owned by the requesting account tagged with the custom tag.

```
aws ssm list-documents \
    --filters Key=Owner,Values=Self Key=tag:DocUse,Values=Testing
```

Output:

```
{
    "DocumentIdentifiers": [
        {
            "Name": "Example",
            "Owner": "29884EXAMPLE",
            "PlatformTypes": [
                "Windows",
                "Linux"
            ],
            "DocumentVersion": "1",
            "DocumentType": "Automation",
            "SchemaVersion": "0.3",
            "DocumentFormat": "YAML",
            "Tags": [
                {
                    "Key": "DocUse",
                    "Value": "Testing"
                }
            ]
        }
    ]
}
```

For more information, see AWS Systems Manager Documents in the *AWS Systems Manager User Guide*.

Example 2: To list shared documents

The following `list-documents` example lists shared documents, including private shared documents not owned by AWS.

```
aws ssm list-documents \
    --filters Key=Name,Values=sharedDocNamePrefix  Key=Owner,Values=Private
```

Output:

```
{
    "DocumentIdentifiers": [
        {
            "Name": "Example",
            "Owner": "12345EXAMPLE",
            "PlatformTypes": [
                "Windows",
                "Linux"
            ],
            "DocumentVersion": "1",
            "DocumentType": "Command",
            "SchemaVersion": "0.3",
            "DocumentFormat": "YAML",
            "Tags": []
        }
    ]
}
```

For more information, see AWS Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see ListDocuments in *AWS CLI Command Reference*.

`list-inventory-entries`

The following code example shows how to use `list-inventory-entries`.

AWS CLI

Example 1: To view specific inventory type entries for an instance

The following `list-inventory-entries` example lists the inventory entries for the AWS:Application inventory type on a specific instance.

```
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \
    --type-name "AWS:Application"
```

Output:

```
{
    "TypeName": "AWS:Application",
    "InstanceId": "i-1234567890abcdef0",
    "SchemaVersion": "1.1",
    "CaptureTime": "2019-02-15T12:17:55Z",
    "Entries": [
        {
            "Architecture": "i386",
            "Name": "Amazon SSM Agent",
            "PackageId": "{a1b2c3d4-5678-90ab-cdef-EXAMPLE11111}",
            "Publisher": "Amazon Web Services",
            "Version": "2.3.274.0"
        },
        {
            "Architecture": "x86_64",
            "InstalledTime": "2018-05-03T13:42:34Z",
            "Name": "AmazonCloudWatchAgent",
            "Publisher": "",
            "Version": "1.200442.0"
        }
    ]
}
```

For more information, see AWS Systems Manager Inventory in the *AWS Systems Manager User Guide*.

Example 2: To view custom inventory entries assigned to an instance

The following `list-inventory-entries` example lists a custom inventory entry assigned to an instance.

```
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \
    --type-name "Custom:RackInfo"
```

Output:

```
{
    "TypeName": "Custom:RackInfo",
    "InstanceId": "i-1234567890abcdef0",
    "SchemaVersion": "1.0",
```

```
    "CaptureTime": "2021-05-22T10:01:01Z",
    "Entries": [
        {
            "RackLocation": "Bay B/Row C/Rack D/Shelf E"
        }
    ]
}
```

For more information, see Assigning custom inventory metadata to a managed node in the *AWS Systems Manager User Guide*.

- For API details, see ListInventoryEntries in *AWS CLI Command Reference*.

`list-ops-item-related-items`

The following code example shows how to use `list-ops-item-related-items`.

AWS CLI

To list the related-item resources of an OpsItem

The following `list-ops-item-related-items` example lists the related-item resources of an OpsItem.

```
aws ssm list-ops-item-related-items \
    --ops-item-id "oi-f99f2EXAMPLE"
```

Output:

```
{
    "Summaries": [
        {
            "OpsItemId": "oi-f99f2EXAMPLE",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ResourceType": "AWS::SSMIncidents::IncidentRecord",
            "AssociationType": "IsParentOf",
            "ResourceUri": "arn:aws:ssm-incidents::123456789012:incident-record/
example-response/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreatedBy": {
                "Arn": "arn:aws:sts::123456789012:assumed-role/
AWSServiceRoleForIncidentManager/IncidentResponse"
            },
            "CreatedTime": "2021-08-11T18:47:14.994000+00:00",
```

```
            "LastModifiedBy": {
                "Arn": "arn:aws:sts::123456789012:assumed-role/
AWSServiceRoleForIncidentManager/IncidentResponse"
            },
            "LastModifiedTime": "2021-08-11T18:47:14.994000+00:00"
        }
    ]
}
```

For more information, see Creating an incident for an OpsItem in the *AWS Systems Manager User Guide*.

- For API details, see ListOpsItemRelatedItems in *AWS CLI Command Reference*.

`list-resource-compliance-summaries`

The following code example shows how to use `list-resource-compliance-summaries`.

AWS CLI

Example 1: To list resource-level compliance summary counts

The following `list-resource-compliance-summaries` example lists resource-level compliance summary counts.

```
aws ssm list-resource-compliance-summaries
```

Output:

```
{
    "ResourceComplianceSummaryItems": [
        {
            "ComplianceType": "Association",
            "ResourceType": "ManagedInstance",

            }
        }
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see Learn details about Compliance in the *AWS Systems Manager User Guide*.

Example 2: To list resource-level compliance summaries for a specific compliance type

The following `list-resource-compliance-summaries` example lists resource-level compliance summaries for the Patch compliance type.

```
aws ssm list-resource-compliance-summaries \
    --filters "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

Output:

```
{
    "ResourceComplianceSummaryItems": [
        {
            "ComplianceType": "Patch",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-9876543210abcdef0",
            "Status": "COMPLIANT",
            "OverallSeverity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550248550.0,
                "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "ExecutionType": "Command"
            },
            "CompliantSummary": {
                "CompliantCount": 397,
                "SeveritySummary": {
```

```
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 397
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 0,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        }
    ]
}
```

For more information, see Learn details about Compliance in the *AWS Systems Manager User Guide*.

- For API details, see ListResourceComplianceSummaries in *AWS CLI Command Reference*.

`list-resource-data-sync`

The following code example shows how to use `list-resource-data-sync`.

AWS CLI

To list your resource data sync configurations

The following `list-resource-data-sync` example retrieves information about your resource data sync configurations.

```
aws ssm list-resource-data-sync
```

Output:

```
{
    "ResourceDataSyncItems": [
        {
            "SyncName": "MyResourceDataSync",
            "S3Destination": {
                "BucketName": "amzn-s3-demo-bucket",
                "SyncFormat": "JsonSerDe",
                "Region": "us-west-2"
            },
            "LastSyncTime": 1550261472.003,
            "LastSuccessfulSyncTime": 1550261472.003,
            "LastStatus": "Successful",
            "SyncCreatedTime": 1543235736.72,
            "LastSyncStatusMessage": "The sync was successfully completed"
        }
    ]
}
```

For more information, see Creating a resource data sync for Inventory in the *AWS Systems Manager User Guide*.

- For API details, see ListResourceDataSync in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags applied to a patch baseline

The following `list-tags-for-resource` example lists the tags for a patch baseline.

```
aws ssm list-tags-for-resource \
    --resource-type "PatchBaseline" \
    --resource-id "pb-0123456789abcdef0"
```

Output:

```
{
    "TagList": [
        {
```

```
            "Key": "Environment",
            "Value": "Production"
        },
        {
            "Key": "Region",
            "Value": "EMEA"
        }
    ]
}
```

For more information, see Working with Patch Manager resources using the AWS CLI in the *AWS Systems Manager User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`modify-document-permission`

The following code example shows how to use `modify-document-permission`.

AWS CLI

To modify document permissions

The following `modify-document-permission` example shares a Systems Manager document publicly.

```
aws ssm modify-document-permission \
    --name "Example" \
    --permission-type "Share" \
    --account-ids-to-add "All"
```

This command produces no output.

For more information, see Share a Systems Manager Document in the *AWS Systems Manager User Guide*.

- For API details, see ModifyDocumentPermission in *AWS CLI Command Reference*.

`put-compliance-items`

The following code example shows how to use `put-compliance-items`.

AWS CLI

To register a compliance type and compliance details to a designated instance

The following `put-compliance-items` example registers the compliance type `Custom:AVCheck` to the specified managed instance.

```
aws ssm put-compliance-items \
    --resource-id "i-1234567890abcdef0" \
    --resource-type "ManagedInstance" \
    --compliance-type "Custom:AVCheck" \
    --execution-summary "ExecutionTime=2019-02-18T16:00:00Z" \
    --items "Id=Version2.0,Title=ScanHost,Severity=CRITICAL,Status=COMPLIANT"
```

This command produces no output.

For more information, see Assign custom compliance metadata using the AWS CLI in the *AWS Systems Manager User Guide*.

- For API details, see PutComplianceItems in *AWS CLI Command Reference*.

`put-inventory`

The following code example shows how to use `put-inventory`.

AWS CLI

To assign customer metadata to an instance

The following `put-inventory` example assigns rack location information to an instance.

Linux version.

```
aws ssm put-inventory \
    --instance-id "i-016648b75dd622dab" \
    --items '[{"TypeName": "Custom:RackInfo","SchemaVersion": "1.0","CaptureTime":
 "2019-01-22T10:01:01Z","Content":[{"RackLocation": "Bay B/Row C/Rack D/Shelf
 E"}]}]'
```

Windows version.

```
aws ssm put-inventory ^
```

```
    --instance-id "i-016648b75dd622dab" ^
    --
items "TypeName=Custom:RackInfo,SchemaVersion=1.0,CaptureTime=2019-01-22T10:01:01Z,Content=[
 B/Row C/Rack D/Shelf F'}]"
```

This command produces no output.

For more information, see Working with custom inventory in the *AWS Systems Manager User Guide*.

- For API details, see PutInventory in *AWS CLI Command Reference*.

`put-parameter`

The following code example shows how to use `put-parameter`.

AWS CLI

Example 1: To change a parameter value

The following `put-parameter` example changes the value of the specified parameter.

```
aws ssm put-parameter \
    --name "MyStringParameter" \
    --type "String" \
    --value "Vici" \
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Standard"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), Managing parameter tiers, and Working with parameter policies in the *AWS Systems Manager User Guide*.

Example 2: To create an advanced parameter

The following `put-parameter` example creates an advanced parameter.

```
aws ssm put-parameter \
    --name "MyAdvancedParameter" \
    --description "This is an advanced parameter" \
    --value "Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod
 tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam,
 quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat
 [truncated]" \
    --type "String" \
    --tier Advanced
```

Output:

```
{
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), Managing parameter tiers, and Working with parameter policies in the *AWS Systems Manager User Guide*.

Example 3: To convert a standard parameter to an advanced parameter

The following `put-parameter` example converts an existing standard parameter into an advanced parameter.

```
aws ssm put-parameter \
    --name "MyConvertedParameter" \
    --value "abc123" \
    --type "String" \
    --tier Advanced \
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), Managing parameter tiers, and Working with parameter policies in the *AWS Systems Manager User Guide*.

Example 4: To create a parameter with a policy attached

The following `put-parameter` example creates an advanced parameter with a parameter policy attached.

```
aws ssm put-parameter \
    --name "/Finance/Payroll/q2accesskey" \
    --value "P@sSwW)rd" \
    --type "SecureString" \
    --tier Advanced \
    --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":
{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification\",
\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},{\"Type\":
\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":\"60\",\"Unit
\":\"Days\"}}]"
```

Output:

```
{
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), Managing parameter tiers, and Working with parameter policies in the *AWS Systems Manager User Guide*.

Example 5: To add a policy to an existing parameter

The following `put-parameter` example attaches a policy to an existing advanced parameter.

```
aws ssm put-parameter \
    --name "/Finance/Payroll/q2accesskey" \
    --value "N3wP@sSwW)rd" \
    --type "SecureString" \
    --tier Advanced \
    --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":
{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification\",
\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},{\"Type\":
\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":\"60\",\"Unit
\":\"Days\"}}]" \
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), Managing parameter tiers, and Working with parameter policies in the *AWS Systems Manager User Guide*.

- For API details, see PutParameter in *AWS CLI Command Reference*.

`register-default-patch-baseline`

The following code example shows how to use `register-default-patch-baseline`.

AWS CLI

To set the default patch baseline

The following `register-default-patch-baseline` example registers the specified custom patch baseline as the default patch baseline for the operating system type that it supports.

```
aws ssm register-default-patch-baseline \
    --baseline-id "pb-abc123cf9bEXAMPLE"
```

Output:

```
{
    "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

The following `register-default-patch-baseline` example registers the default patch baseline provided by AWS for CentOS as the default patch baseline.

```
aws ssm register-default-patch-baseline \
    --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0574b43a65ea646ed"
```

Output:

```
{
    "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

For more information, see About Predefined and Custom Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see RegisterDefaultPatchBaseline in *AWS CLI Command Reference*.

`register-patch-baseline-for-patch-group`

The following code example shows how to use `register-patch-baseline-for-patch-group`.

AWS CLI

To register a patch baseline for a patch group

The following `register-patch-baseline-for-patch-group` example registers a patch baseline for a patch group.

```
aws ssm register-patch-baseline-for-patch-group \
    --baseline-id "pb-045f10b4f382baeda" \
    --patch-group "Production"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f382baeda",
    "PatchGroup": "Production"
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see RegisterPatchBaselineForPatchGroup in *AWS CLI Command Reference*.

`register-target-with-maintenance-window`

The following code example shows how to use `register-target-with-maintenance-window`.

AWS CLI

Example 1: To register a single target with a maintenance window

The following `register-target-with-maintenance-window` example registers an instance with a maintenance window.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --targets "Key=InstanceIds,Values=i-0000293ffd8c57862" \
    --owner-information "Single instance" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 2: To register multiple targets with a maintenance window using instance IDs

The following `register-target-with-maintenance-window` example registers two instances with a maintenance window by specifying their instance IDs.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --targets "Key=InstanceIds,Values=i-0000293ffd8c57862,i-0cb2b964d3e14fd9f" \
    --owner-information "Two instances in a list" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 3: To register targets with a maintenance window using resource tags

The following `register-target-with-maintenance-window` example registers instances with a maintenance window by specifying resource tags that have been applied to the instances.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-06cf17cbefcb4bf4f" \
    --targets "Key=tag:Environment,Values=Prod" "Key=Role,Values=Web" \
    --owner-information "Production Web Servers" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 4: To register targets using a group of tag keys

The following `register-target-with-maintenance-window` example register instances that all have one or more tag keys assigned to them, regardless of their key values.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-0c50858d01EXAMPLE" \
    --resource-type "INSTANCE" \
    --targets "Key=tag-key,Values=Name,Instance-Type,CostCenter"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 5: To register targets using a resource group name

The following `register-target-with-maintenance-window` example register a specified resource group, regardless of the type of resources it contains.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-0c50858d01EXAMPLE" \
    --resource-type "RESOURCE_GROUP" \
    --targets "Key=resource-groups:Name,Values=MyResourceGroup"
```

Output:

```
{
```

```
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Register a Target Instance with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see RegisterTargetWithMaintenanceWindow in *AWS CLI Command Reference*.

`register-task-with-maintenance-window`

The following code example shows how to use `register-task-with-maintenance-window`.

AWS CLI

Example 1: To register an Automation task with a maintenance window

The following `register-task-with-maintenance-window` example registers an Automation task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --cli-binary-format raw-in-base64-out \
    --window-id "mw-082dcd7649EXAMPLE" \
    --targets Key=InstanceIds,Values=i-1234520122EXAMPLE \
    --task-arn AWS-RestartEC2Instance \
    --service-role-arn arn:aws:iam::123456789012:role/SSM \
    --task-type AUTOMATION \
    --task-invocation-parameters '{"Automation":
{"DocumentVersion":"$LATEST","Parameters":{"InstanceId":["{{RESOURCE_ID}}"]}}}' \
    --priority 0 \
    --max-concurrency 1 \
    --max-errors 1 \
    --name "AutomationExample" \
    --description "Restarting EC2 Instance for maintenance"
```

Output:

```
{
    "WindowTaskId":"11144444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

Example 2: To register a Lambda task with a Maintenance Window

The following `register-task-with-maintenance-window` example registers a Lambda task with a Maintenance Window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --cli-binary-format raw-in-base64-out \
    --window-id "mw-082dcd7649dee04e4" \
    --targets Key=InstanceIds,Values=i-12344d305eEXAMPLE \
    --task-arn arn:aws:lambda:us-west-2:123456789012:function:SSMTestLAMBDA \
    --service-role-arn arn:aws:iam::123456789012:role/SSM \
    --task-type LAMBDA \
    --task-invocation-parameters '{"Lambda":{"Payload":"{\"InstanceId\":
\"{{RESOURCE_ID}}\",\"targetType\":\"{{TARGET_TYPE}}\"}","Qualifier":"$LATEST"}}' \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Lambda_Example" \
    --description "My Lambda Example"
```

Output:

```
{
    "WindowTaskId":"22244444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

Example 3: To register a Run Command task with a maintenance window

The following `register-task-with-maintenance-window` example registers a Run Command task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --cli-binary-format raw-in-base64-out \
    --window-id "mw-082dcd7649dee04e4" \
    --targets "Key=InstanceIds,Values=i-12344d305eEXAMPLE" \
    --service-role-arn "arn:aws:iam::123456789012:role/SSM" \
    --task-type "RUN_COMMAND" \
    --name "SSMInstallPowerShellModule" \
```

```
    --task-arn "AWS-InstallPowerShellModule" \
    --task-invocation-parameters "{\"RunCommand\":{\"Comment\":\"\",
\"OutputS3BucketName\":\"runcommandlogs\",\"Parameters\":{\"commands\":[\"Get-
Module -ListAvailable\"],\"executionTimeout\":[\"3600\"],\"source\":[\"https:\/
\/gallery.technet.microsoft.com\/EZOut-33ae0fb7\/file\/110351\/1\/EZOut.zip\"],
\"workingDirectory\":[\"\\\\\"]},\"TimeoutSeconds\":600}}" \
    --max-concurrency 1 \
    --max-errors 1 \
    --priority 10
```

Output:

```
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

Example 4: To register a Step Functions task with a maintenance window

The following `register-task-with-maintenance-window` example registers a Step Functions task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --cli-binary-format raw-in-base64-out \
    --window-id "mw-1234d787d6EXAMPLE" \
    --targets Key=WindowTargetIds,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --task-arn arn:aws:states:us-
west-2:123456789012:stateMachine:SSMTestStateMachine \
    --service-role-arn arn:aws:iam::123456789012:role/MaintenanceWindows \
    --task-type STEP_FUNCTIONS \
    --task-invocation-parameters '{"StepFunctions":{"Input":"{\"InstanceId\":
\"{{RESOURCE_ID}}\"}"}}' \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Step_Functions_Example" \
    --description "My Step Functions Example"
```

Output:

```
{
    "WindowTaskId":"44444444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

Example 5: To register a task using a maintenance windows target ID

The following `register-task-with-maintenance-window` example registers a task using a maintenance window target ID. The maintenance window target ID was in the output of the `aws ssm register-target-with-maintenance-window` command. You can also retrieve it from the output of the `aws ssm describe-maintenance-window-targets` command.

```
aws ssm register-task-with-maintenance-window \
    --cli-binary-format raw-in-base64-out \
    --targets "Key=WindowTargetIds,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" \
    --task-arn "AWS-RunShellScript" \
    --service-role-arn "arn:aws:iam::123456789012:role/MaintenanceWindowsRole" \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --task-type "RUN_COMMAND" \
    --task-parameters  "{\"commands\":{\"Values\":[\"df\"]}}" \
    --max-concurrency 1 \
    --max-errors 1 \
    --priority 10
```

Output:

```
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see RegisterTaskWithMaintenanceWindow in *AWS CLI Command Reference*.

`remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI

To remove a tag from a patch baseline

The following `remove-tags-from-resource` example removes tags from a patch baseline.

```
aws ssm remove-tags-from-resource \
    --resource-type "PatchBaseline" \
    --resource-id "pb-0123456789abcdef0" \
    --tag-keys "Region"
```

This command produces no output.

For more information, see Working with Patch Manager resources using the AWS CLI in the *AWS Systems Manager User Guide*.

- For API details, see RemoveTagsFromResource in *AWS CLI Command Reference*.

`reset-service-setting`

The following code example shows how to use `reset-service-setting`.

AWS CLI

To reset the service setting for Parameter Store throughput

The following `reset-service-setting` example resets the service setting for Parameter Store throughput in the specified region to no longer use increased throughput.

```
aws ssm reset-service-setting \
    --setting-id arn:aws:ssm:us-west-2:123456789012:servicesetting/ssm/parameter-store/high-throughput-enabled
```

Output:

```
{
    "ServiceSetting": {
        "SettingId": "/ssm/parameter-store/high-throughput-enabled",
        "SettingValue": "false",
        "LastModifiedDate": 1555532818.578,
```

```
        "LastModifiedUser": "System",
        "ARN": "arn:aws:ssm:us-west-2:123456789012:servicesetting/ssm/parameter-
store/high-throughput-enabled",
        "Status": "Default"
    }
}
```

For more information, see Managing Parameter Store throughput in the *AWS Systems Manager User Guide*.

- For API details, see ResetServiceSetting in *AWS CLI Command Reference*.

`resume-session`

The following code example shows how to use `resume-session`.

AWS CLI

To resume a Session Manager session

The following `resume-session` example resumes a Session Manager session with an instance after it has been disconnected. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```
aws ssm resume-session \
    --session-id Mary-Major-07a16060613c408b5
```

Output:

```
{
    "SessionId": "Mary-Major-07a16060613c408b5",
    "TokenValue":
 "AAEAAVbTGsaOnyvcUoNGqifbv5r/8lgxuQljCuY8qVcvOnoBAAAAAFxtd3jIXAFUUXGTJ7zF/
AWJPwDviOlF5p3dlAgrqVIVO6IEXhkHLz0/1gXKRKEME71E6TLOplLDJAMZ
+kREejkZu4c5AxMkrQjMF+gtHP1bYJKTwtHQd1wjulPLexO8SHl7g5R/
wekrj6WsDUpnEegFBfGftpAIz2GXQVfTJXKfkc5qepQ11C11DOIT2dozOqXgHwfQHfAKLErM5dWDZqKwyT1Z3iw7unQd

QI5Xr7s1XJBEnSKR54o4fN0GV9RWl0RZsZm1m1ki0JJtiwwgZ",
    "StreamUrl": "wss://ssmmessages.us-west-2.amazonaws.com/v1/data-channel/Mary-
Major-07a16060613c408b5?role=publish_subscribe"
}
```

For more information, see Install the Session Manager Plugin for the AWS CLI in the *AWS Systems Manager User Guide*.

- For API details, see ResumeSession in *AWS CLI Command Reference*.

`send-automation-signal`

The following code example shows how to use `send-automation-signal`.

AWS CLI

To send a signal to an automation execution

The following `send-automation-signal` example sends an Approve signal to an Automation execution.

```
aws ssm send-automation-signal \
    --automation-execution-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --signal-type "Approve"
```

This command produces no output.

For more information, see Running an Automation Workflow with Approvers in the *AWS Systems Manager User Guide*.

- For API details, see SendAutomationSignal in *AWS CLI Command Reference*.

`send-command`

The following code example shows how to use `send-command`.

AWS CLI

Example 1: To run a command on one or more remote instances

The following `send-command` example runs an `echo` command on a target instance.

```
aws ssm send-command \
    --document-name "AWS-RunShellScript" \
    --parameters 'commands=["echo HelloWorld"]' \
    --targets "Key=instanceids,Values=i-1234567890abcdef0" \
```

```
    --comment "echo HelloWorld"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "echo HelloWorld",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "echo HelloWorld"
            ]
        },
        "InstanceIds": [
            "i-0f00f008a2dcbefe2"
        ],
        "Targets": [],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 1,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 2: To get IP information about an instance

The following `send-command` example retrieves the IP information about an instance.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",

            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 3: To run a command on instances with specific tags

The following `send-command` example runs a command on instances that have the tag key "ENV" and the value "Dev".

```
aws ssm send-command \
    --targets "Key=tag:ENV,Values=Dev" \
    --document-name "AWS-RunShellScript" \
    --parameters "commands=ifconfig"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "ifconfig"
            ]
        },
        "InstanceIds": [],
        "Targets": [
            {
```

```
                "Key": "tag:ENV",
                "Values": [
                    "Dev"
                ]
            }
        ],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 0,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 4: To run a command that sends SNS notifications

The following `send-command` example runs a command that sends SNS notifications for all notification events and the `Command` notification type.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
```

```
    --service-role-arn "arn:aws:iam::123456789012:role/SNS_Role" \
    --notification-config "NotificationArn=arn:aws:sns:us-
west-2:123456789012:SNSTopicName,NotificationEvents=All,NotificationType=Command"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "IP config",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "ifconfig"
            ]
        },
        "InstanceIds": [
            "i-1234567890abcdef0"
        ],
        "Targets": [],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 1,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "arn:aws:iam::123456789012:role/SNS_Role",
        "NotificationConfig": {
            "NotificationArn": "arn:aws:sns:us-west-2:123456789012:SNSTopicName",
            "NotificationEvents": [
                "All"
            ],
            "NotificationType": "Command"
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
```

```
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 5: To run a command that outputs to S3 and CloudWatch

The following `send-command` example runs a command that outputs command details to an S3 bucket and to a CloudWatch Logs log group.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --output-s3-bucket-name "s3-bucket-name" \
    --output-s3-key-prefix "runcommand" \
    --cloud-watch-output-
config "CloudWatchOutputEnabled=true,CloudWatchLogGroupName=CWLGroupName"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "IP config",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "ifconfig"
            ]
        },
        "InstanceIds": [
            "i-1234567890abcdef0"
        ],
        "Targets": [],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
```

```
        "StatusDetails": "Pending",
        "OutputS3BucketName": "s3-bucket-name",
        "OutputS3KeyPrefix": "runcommand",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 1,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "CWLGroupName",
            "CloudWatchOutputEnabled": true
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 6: To run commands on multiple instances with different tags

The following `send-command` example runs a command on instances with two different tag keys and values.

```
aws ssm send-command \
    --document-name "AWS-RunPowerShellScript" \
    --parameters commands=["echo helloWorld"] \
    --targets Key=tag:Env,Values=Dev Key=tag:Role,Values=WebServers
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE66666",
        "DocumentName": "AWS-RunPowerShellScript",
        "DocumentVersion": "",
        "Comment": "",
```

```
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "echo helloWorld"
            ]
        },
        "InstanceIds": [],
        "Targets": [
            {
                "Key": "tag:Env",
                "Values": [
                    "Dev"
                ]
            },
            {
                "Key": "tag:Role",
                "Values": [
                    "WebServers"
                ]
            }
        ],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 0,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
```

```
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 7: To target multiple instances with the same tag key

The following `send-command` example runs a command on instances that have the same tag key but with different values.

```
aws ssm send-command \
    --document-name "AWS-RunPowerShellScript" \
    --parameters commands=["echo helloWorld"] \
    --targets Key=tag:Env,Values=Dev,Test
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE77777",
        "DocumentName": "AWS-RunPowerShellScript",
        "DocumentVersion": "",
        "Comment": "",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "echo helloWorld"
            ]
        },
        "InstanceIds": [],
        "Targets": [
            {
                "Key": "tag:Env",
                "Values": [
                    "Dev",
                    "Test"
                ]
            }
        ],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
```

```
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 0,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 8: To run a command that uses a shared document

The following `send-command` example runs a shared document on a target instance.

```
aws ssm send-command \
    --document-name "arn:aws:ssm:us-west-2:123456789012:document/ExampleDocument" \
    --targets "Key=instanceids,Values=i-1234567890abcdef0"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE88888",
        "DocumentName": "arn:aws:ssm:us-west-2:123456789012:document/
ExampleDocument",
        "DocumentVersion": "",
        "Comment": "",
        "ExpiresAfter": 1550181014.717,
```

```
        "Parameters": {},
        "InstanceIds": [],
        "Targets": [
            {
                "Key": "instanceids",
                "Values": [
                    "i-1234567890abcdef0"
                ]
            }
        ],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 0,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Using shared SSM documents in the *AWS Systems Manager User Guide*.

- For API details, see SendCommand in *AWS CLI Command Reference*.

`start-associations-once`

The following code example shows how to use `start-associations-once`.

AWS CLI

To run an association immediately and only one time

The following `start-associations-once` example run the specified association immediately and only once. There is no output if the command succeeds.

```
aws ssm start-associations-once \
    --association-ids "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Viewing association histories in the *AWS Systems Manager User Guide*.

- For API details, see StartAssociationsOnce in *AWS CLI Command Reference*.

`start-automation-execution`

The following code example shows how to use `start-automation-execution`.

AWS CLI

Example 1: To execute an automation document

The following `start-automation-execution` example runs an Automation document.

```
aws ssm start-automation-execution \
    --document-name "AWS-UpdateLinuxAmi" \
    --parameters "AutomationAssumeRole=arn:aws:iam::123456789012:role/
SSMAutomationRole,SourceAmiId=ami-EXAMPLE,IamInstanceProfileName=EC2InstanceRole"
```

Output:

```
{
    "AutomationExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Running an Automation Workflow Manually in the *AWS Systems Manager User Guide*.

Example 2: To run a shared automation document

The following `start-automation-execution` example runs a shared Automation document.

```
aws ssm start-automation-execution \
    --document-name "arn:aws:ssm:us-west-2:123456789012:document/ExampleDocument"
```

Output:

```
{
    "AutomationExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Using shared SSM documents in the *AWS Systems Manager User Guide*.

- For API details, see StartAutomationExecution in *AWS CLI Command Reference*.

`start-change-request-execution`

The following code example shows how to use `start-change-request-execution`.

AWS CLI

Example 1: To start a change request

The following `start-change-request-execution` example starts a change request with minimal options specified.

```
aws ssm start-change-request-execution \
    --change-request-name MyChangeRequest \
    --document-name AWS-HelloWorldChangeTemplate \
    --runbooks '[{"DocumentName": "AWS-HelloWorld","Parameters":
 {"AutomationAssumeRole": ["arn:aws:iam:us-west-2:1112223233444:role/
MyChangeManagerAssumeRole"]}}]' \
    --parameters
 Approver="JohnDoe",ApproverType="IamUser",ApproverSnsTopicArn="arn:aws:sns:us-
west-2:1112223233444:MyNotificationTopic"
```

Output:

```
{
    "AutomationExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Example 2: To start a change request using an external JSON file

The following `start-change-request-execution` example starts a change request with multiple options specified in a JSON file.

```
aws ssm start-change-request-execution \
    --cli-input-json file://MyChangeRequest.json
```

Contents of `MyChangeRequest.json`:

```
{
    "ChangeRequestName": "MyChangeRequest",
    "DocumentName": "AWS-HelloWorldChangeTemplate",
    "DocumentVersion": "$DEFAULT",
    "ScheduledTime": "2021-12-30T03:00:00",
    "ScheduledEndTime": "2021-12-30T03:05:00",
    "Tags": [
        {
            "Key": "Purpose",
            "Value": "Testing"
        }
    ],
    "Parameters": {
        "Approver": [
            "JohnDoe"
        ],
        "ApproverType": [
            "IamUser"
        ],
        "ApproverSnsTopicArn": [
            "arn:aws:sns:us-west-2:123456789012:MyNotificationTopic"
        ]
    },
    "Runbooks": [
        {
            "DocumentName": "AWS-HelloWorld",
            "DocumentVersion": "1",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Parameters": {
                "AutomationAssumeRole": [
                    "arn:aws:iam::123456789012:role/MyChangeManagerAssumeRole"
                ]
```

```
            }
        }
    ],
    "ChangeDetails": "### Document Name: HelloWorldChangeTemplate\n\n## What does
 this document do?\nThis change template demonstrates the feature set available
 for creating change templates for Change Manager. This template starts a Runbook
 workflow for the Automation document called AWS-HelloWorld.\n\n## Input Parameters
\n* ApproverSnsTopicArn: (Required) Amazon Simple Notification Service ARN for
 approvers.\n* Approver: (Required) The name of the approver to send this request
 to.\n* ApproverType: (Required) The type of reviewer.\n  * Allowed Values: IamUser,
 IamGroup, IamRole, SSOGroup, SSOUser\n\n## Output Parameters\nThis document has no
 outputs \n"
}
```

Output:

```
{
    "AutomationExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Creating change requests in the *AWS Systems Manager User Guide*.

- For API details, see StartChangeRequestExecution in *AWS CLI Command Reference*.

`start-session`

The following code example shows how to use `start-session`.

AWS CLI

Example 1: To start a Session Manager session

The following `start-session` example establishes a connection with an instance for a Session Manager session. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```
aws ssm start-session \
    --target "i-1234567890abcdef0"
```

Output:

```
Starting session with SessionId: Jane-Roe-07a16060613c408b5
```

Example 2: To start a Session Manager session using SSH

The following `start-session` example establishes a connection with an instance for a Session Manager session using SSH. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call, and that the command uses the default user on the instance, such as `ec2-user` for EC2 instances for Linux.

```
ssh -i /path/my-key-pair.pem ec2-user@i-02573cafcfEXAMPLE
```

Output:

```
Starting session with SessionId: ec2-user-07a16060613c408b5
```

For more information, see Start a Session and Install the Session Manager Plugin for the AWS CLI in the *AWS Systems Manager User Guide*.

- For API details, see StartSession in *AWS CLI Command Reference*.

`stop-automation-execution`

The following code example shows how to use `stop-automation-execution`.

AWS CLI

To stop an automation execution

The following `stop-automation-execution` example stops an Automation document.

```
aws ssm stop-automation-execution \
    --automation-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Running an Automation Workflow Manually in the *AWS Systems Manager User Guide*.

- For API details, see StopAutomationExecution in *AWS CLI Command Reference*.

`terminate-session`

The following code example shows how to use `terminate-session`.

AWS CLI

To end a Session Manager session

The following `terminate-session` example permanently ends a session that was created by the user "Shirley-Rodriguez" and closes the data connection between the Session Manager client and SSM Agent on the instance.

```
aws ssm terminate-session \
    --session-id "Shirley-Rodriguez-07a16060613c408b5"
```

Output:

```
{
    "SessionId": "Shirley-Rodriguez-07a16060613c408b5"
}
```

For more information, see Terminate a Session in the *AWS Systems Manager User Guide*.

- For API details, see TerminateSession in *AWS CLI Command Reference*.

`unlabel-parameter-version`

The following code example shows how to use `unlabel-parameter-version`.

AWS CLI

To delete parameter labels

The following `unlabel-parameter-version` example deletes the specified labels from the given parameter version.

```
aws ssm unlabel-parameter-version \
    --name "parameterName" \
    --parameter-version 2 \
    --labels "label_1" "label_2" "label_3"
```

Output:

```
{
    "RemovedLabels": [
        "label_1",
```

```
        "label_2",
        "label_3"
    ],
    "InvalidLabels": []
}
```

For more information, see Delete parameter labels (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see UnlabelParameterVersion in *AWS CLI Command Reference*.

`update-association-status`

The following code example shows how to use `update-association-status`.

AWS CLI

To update the association status

The following `update-association-status` example updates the association status of the association between an instance and a document.

```
aws ssm update-association-status \
    --name "AWS-UpdateSSMAgent" \
    --instance-id "i-1234567890abcdef0" \
    --association-
status "Date=1424421071.939,Name=Pending,Message=temp_status_change,AdditionalInfo=Additiona
Config-Needed"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-1234567890abcdef0",
        "AssociationVersion": "1",
        "Date": 1550507529.604,
        "LastUpdateAssociationDate": 1550507806.974,
        "Status": {
            "Date": 1424421071.0,
            "Name": "Pending",
            "Message": "temp_status_change",
```

```
            "AdditionalInfo": "Additional-Config-Needed"
        },
        "Overview": {
            "Status": "Success",
            "AssociationStatusAggregatedCount": {
                "Success": 1
            }
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "i-1234567890abcdef0"
                ]
            }
        ],
        "LastExecutionDate": 1550507808.0,
        "LastSuccessfulExecutionDate": 1550507808.0
    }
}
```

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see UpdateAssociationStatus in *AWS CLI Command Reference*.

`update-association`

The following code example shows how to use `update-association`.

AWS CLI

Example 1: To update a document association

The following `update-association` example updates an association with a new document version.

```
aws ssm update-association \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --document-version "\$LATEST"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-UpdateSSMAgent",
        "AssociationVersion": "2",
        "Date": 1550508093.293,
        "LastUpdateAssociationDate": 1550508106.596,
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$LATEST",
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Targets": [
            {
                "Key": "tag:Name",
                "Values": [
                    "Linux"
                ]
            }
        ],
        "LastExecutionDate": 1550508094.879,
        "LastSuccessfulExecutionDate": 1550508094.879
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

Example 2: To update the schedule expression of an association

The following `update-association` example updates the schedule expression for the specified association.

```
aws ssm update-association \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --schedule-expression "cron(0 0 0/4 1/1 * ? *)"
```

Output:

```
{
```

```
    "AssociationDescription": {
        "Name": "AWS-HelloWorld",
        "AssociationVersion": "2",
        "Date": "2021-02-08T13:54:19.203000-08:00",
        "LastUpdateAssociationDate": "2021-06-29T11:51:07.933000-07:00",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Targets": [
            {
                "Key": "aws:NoOpAutomationTag",
                "Values": [
                    "AWS-NoOpAutomationTarget-Value"
                ]
            }
        ],
        "ScheduleExpression": "cron(0 0 0/4 1/1 * ? *)",
        "LastExecutionDate": "2021-06-26T19:00:48.110000-07:00",
        "ApplyOnlyAtCronInterval": false
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

- For API details, see UpdateAssociation in *AWS CLI Command Reference*.

`update-document-default-version`

The following code example shows how to use `update-document-default-version`.

AWS CLI

To update the default version of a document

The following `update-document-default-version` example updates the default version of a Systems Manager document.

```
aws ssm update-document-default-version \
    --name "Example" \
```

```
    --document-version "2"
```

Output:

```
{
    "Description": {
        "Name": "Example",
        "DefaultVersion": "2"
    }
}
```

For more information, see Writing SSM Document Content in the *AWS Systems Manager User Guide*.

- For API details, see UpdateDocumentDefaultVersion in *AWS CLI Command Reference*.

`update-document-metadata`

The following code example shows how to use `update-document-metadata`.

AWS CLI

To approve the latest version of a change template

The following `update-document-metadata` example provides an approval for the latest version of a change template that has been submitted for review.

```
aws ssm update-document-metadata \
    --name MyChangeManagerTemplate \
    --document-reviews 'Action=Approve,Comment=[{Type=Comment,Content=Approved!}]'
```

This command produces no output.

For more information, see Reviewing and approving or rejecting change templates in the *AWS Systems Manager User Guide*.

- For API details, see UpdateDocumentMetadata in *AWS CLI Command Reference*.

`update-document`

The following code example shows how to use `update-document`.

AWS CLI

To create a new version of a document

The following `update-document` example creates a new version of a document when run on a Windows computer. The document specified by `--document` must be in JSON format. Note that `file://` must be referenced followed by the path of the content file. Because of the $ at the beginning of the `--document-version` parameter, On Windows you must surround the value with double quotes. On Linux, MacOS, or at a PowerShell prompt, you must surround the value with single quotes.

Windows version.

```
aws ssm update-document \
    --name "RunShellScript" \
    --content "file://RunShellScript.json" \
    --document-version "$LATEST"
```

Linux/Mac version.

```
aws ssm update-document \
    --name "RunShellScript" \
    --content "file://RunShellScript.json" \
    --document-version '$LATEST'
```

Contents of `RunShellScript.json`:

```
{
    "schemaVersion": "2.0",
    "description": "Run an updated script",
    "parameters": {
        "commands": {
            "type": "StringList",
            "description": "(Required) Specify a shell script or a command to run."
        }
    },
    "mainSteps": [
        {
            "action": "aws:runShellScript",
            "name": "runShellScript",
            "inputs": {
                "runCommand": "{{ commands }}"
```

```
            }
        }
    ]
}
```

Output:

```
{
    "DocumentDescription": {
        "Status": "Updating",
        "Hash": "f775e5df4904c6fa46686c4722fae9de1950dace25cd9608ff8d622046b68d9b",
        "Name": "RunShellScript",
        "Parameters": [
            {
                "Type": "StringList",
                "Name": "commands",
                "Description": "(Required) Specify a shell script or a command to
 run."
            }
        ],
        "DocumentType": "Command",
        "PlatformTypes": [
            "Linux"
        ],
        "DocumentVersion": "2",
        "HashType": "Sha256",
        "CreatedDate": 1487899655.152,
        "Owner": "123456789012",
        "SchemaVersion": "2.0",
        "DefaultVersion": "1",
        "LatestVersion": "2",
        "Description": "Run an updated script"
    }
}
```

For more information, see AWS Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see UpdateDocument in *AWS CLI Command Reference*.

`update-maintenance-window-target`

The following code example shows how to use `update-maintenance-window-target`.

AWS CLI

To update a maintenance window target

The following `update-maintenance-window-target` example updates only the name of a maintenance window target.

```
aws ssm update-maintenance-window-target \
    --window-id "mw-0c5ed765acEXAMPLE" \
    --window-target-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name "NewName" \
    --no-replace
```

Output:

```
{
    "Description": "",
    "OwnerInformation": "",
    "WindowTargetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "WindowId": "mw-0c5ed765acEXAMPLE",
    "Targets": [
        {
            "Values": [
                "i-1234567890EXAMPLE"
            ],
            "Key": "InstanceIds"
        }
    ],
    "Name": "NewName"
}
```

For more information, see Update a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindowTarget in *AWS CLI Command Reference*.

`update-maintenance-window-task`

The following code example shows how to use `update-maintenance-window-task`.

AWS CLI

To update a maintenance window task

The following `update-maintenance-window-task` example updates the service role for a maintenance window task.

```
aws ssm update-maintenance-window-task \
    --window-id "mw-0c5ed765acEXAMPLE" \
    --window-task-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --service-role-arn "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM"
```

Output:

```
{
    "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
    "MaxErrors": "1",
    "TaskArn": "AWS-UpdateEC2Config",
    "MaxConcurrency": "1",
    "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "TaskParameters": {},
    "Priority": 1,
    "TaskInvocationParameters": {
        "RunCommand": {
            "TimeoutSeconds": 600,
            "Parameters": {
                "allowDowngrade": [
                    "false"
                ]
            }
        }
    },
    "WindowId": "mw-0c5ed765acEXAMPLE",
    "Description": "UpdateEC2Config",
    "Targets": [
        {
            "Values": [
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
            ],
            "Key": "WindowTargetIds"
        }
    ],
    "Name": "UpdateEC2Config"
}
```

For more information, see Update a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindowTask in *AWS CLI Command Reference*.

`update-maintenance-window`

The following code example shows how to use `update-maintenance-window`.

AWS CLI

Example 1: To update a maintenance window

The following `update-maintenance-window` example updates the name of a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --name "My-Renamed-MW"
```

Output:

```
{
    "Cutoff": 1,
    "Name": "My-Renamed-MW",
    "Schedule": "cron(0 16 ? * TUE *)",
    "Enabled": true,
    "AllowUnassociatedTargets": true,
    "WindowId": "mw-1a2b3c4d5e6f7g8h9",
    "Duration": 4
}
```

Example 2: To disable a maintenance window

The following `update-maintenance-window` example disables a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --no-enabled
```

Output:

```
{
    "Cutoff": 1,
    "Name": "My-Renamed-MW",
    "Schedule": "cron(0 16 ? * TUE *)",
    "Enabled": false,
    "AllowUnassociatedTargets": true,
    "WindowId": "mw-1a2b3c4d5e6f7g8h9",
    "Duration": 4
}
```

Example 3: To enable a maintenance window

The following `update-maintenance-window` example enables a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --enabled
```

Output:

```
{
    "Cutoff": 1,
    "Name": "My-Renamed-MW",
    "Schedule": "cron(0 16 ? * TUE *)",
    "Enabled": true,
    "AllowUnassociatedTargets": true,
    "WindowId": "mw-1a2b3c4d5e6f7g8h9",
    "Duration": 4
}
```

For more information, see Update a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindow in *AWS CLI Command Reference*.

`update-managed-instance-role`

The following code example shows how to use `update-managed-instance-role`.

AWS CLI

To update the IAM role of a managed instance

The following `update-managed-instance-role` example updates the IAM instance profile of a managed instance.

```
aws ssm update-managed-instance-role \
    --instance-id "mi-08ab247cdfEXAMPLE" \
    --iam-role "ExampleRole"
```

This command produces no output.

For more information, see Step 4: Create an IAM Instance Profile for Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see UpdateManagedInstanceRole in *AWS CLI Command Reference*.

`update-ops-item`

The following code example shows how to use `update-ops-item`.

AWS CLI

To update an OpsItem

The following `update-ops-item` example updates the description, priority, and category for an OpsItem. In addition, the command specifies an SNS topic where the notifications are sent when this OpsItem is edited or changed.

```
aws ssm update-ops-item \
    --ops-item-id "oi-287b5EXAMPLE" \
    --description "Primary OpsItem for failover event 2020-01-01-fh398yf" \
    --priority 2 \
    --category "Security" \
    --notifications "Arn=arn:aws:sns:us-west-2:123456789012:my-us-east-2-topic"
```

This command produces no output.

For more information, see Working with OpsItems in the *AWS Systems Manager User Guide*.

- For API details, see UpdateOpsItem in *AWS CLI Command Reference*.

`update-patch-baseline`

The following code example shows how to use `update-patch-baseline`.

AWS CLI

Example 1: To update a patch baseline

The following `update-patch-baseline` example adds the specified two patches as rejected and one patch as approved to the specified patch baseline.

```
aws ssm update-patch-baseline \
    --baseline-id "pb-0123456789abcdef0" \
    --rejected-patches "KB2032276" "MS10-048" \
    --approved-patches "KB2124261"
```

Output:

```
{
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
                    ]
                },
                "ComplianceLevel": "CRITICAL",
                "ApproveAfterDays": 0,
                "EnableNonSecurity": false
            }
        ]
    },
    "ApprovedPatches": [
        "KB2124261"
    ],
```

```
    "ApprovedPatchesComplianceLevel": "UNSPECIFIED",
    "ApprovedPatchesEnableNonSecurity": false,
    "RejectedPatches": [
        "KB2032276",
        "MS10-048"
    ],
    "RejectedPatchesAction": "ALLOW_AS_DEPENDENCY",
    "CreatedDate": 1550244180.465,
    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
}
```

For more information, see Updating or deleting a custom patch baseline in the *AWS Systems Manager User Guide*.

Example 2: To rename a patch baseline

The following `update-patch-baseline` example renames the specified patch baseline.

```
aws ssm update-patch-baseline \
    --baseline-id "pb-0713accee01234567" \
    --name "Windows-Server-2012-R2-Important-and-Critical-Security-Updates"
```

Output:

```
{
    "BaselineId": "pb-0713accee01234567",
    "Name": "Windows-Server-2012-R2-Important-and-Critical-Security-Updates",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": [
            {
                "Key": "PRODUCT",
                "Values": [
                    "WindowsServer2012R2"
                ]
            },
            {
                "Key": "MSRC_SEVERITY",
                "Values": [
                    "Critical",
                    "Important"
```

```

For more information, see Updating or deleting a custom patch baseline in the *AWS Systems Manager User Guide*.

- For API details, see UpdatePatchBaseline in *AWS CLI Command Reference*.

`update-resource-data-sync`

The following code example shows how to use `update-resource-data-sync`.

AWS CLI

To update a resource data sync

The following `update-resource-data-sync` example updates a SyncFromSource resource data sync.

```
aws ssm update-resource-data-sync \
    --sync-name exampleSync \
    --sync-type SyncFromSource \
    --sync-source '{"SourceType":"SingleAccountMultiRegions", "SourceRegions":["us-east-1", "us-west-2"]}'
```

This command produces no output.

For more information, see Setting Up Systems Manager Explorer to Display Data from Multiple Accounts and Regions in the *AWS Systems Manager User Guide*.

- For API details, see UpdateResourceDataSync in *AWS CLI Command Reference*.

`update-service-setting`

The following code example shows how to use `update-service-setting`.

AWS CLI

To update the service setting for Parameter Store throughput

The following `update-service-setting` example updates the current service setting for Parameter Store throughput in the specified region to use increased throughput.

```
aws ssm update-service-setting \
```

```
    --setting-id arn:aws:ssm:us-west-2:123456789012:servicesetting/ssm/parameter-
store/high-throughput-enabled \
    --setting-value true
```

This command produces no output.

For more information, see Increasing Parameter Store Throughput in the *AWS Systems Manager User Guide*.

- For API details, see UpdateServiceSetting in *AWS CLI Command Reference*.

Amazon Textract examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Textract.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`analyze-document`

The following code example shows how to use `analyze-document`.

AWS CLI

To analyze text in a document

The following `analyze-document` example shows how to analyze text in a document.

For Linux and macOS, use the following command.

```
aws textract analyze-document \
```

```
    --document '{"S3Object":{"Bucket":"amzn-s3-demo-bucket","Name":"document"}}' \
    --feature-types '["TABLES","FORMS"]'
```

For Windows, use the following command.

```
aws textract analyze-document \
    --document "{\"S3Object\":{\"Bucket\":\"amzn-s3-demo-bucket\",\"Name\":
\"document\"}}" \
    --feature-types "[\"TABLES\",\"FORMS\"]"
```

Output:

```
{
    "Blocks": [
        {
            "Geometry": {
                "BoundingBox": {
                    "Width": 1.0,
                    "Top": 0.0,
                    "Left": 0.0,
                    "Height": 1.0
                },
                "Polygon": [
                    {
                        "Y": 0.0,
                        "X": 0.0
                    },
                    {
                        "Y": 0.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 0.0
                    }
                ]
            },
            "Relationships": [
                {
```

```
                    "Type": "CHILD",
                    "Ids": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

                    ]
                }
            ],
            "BlockType": "PAGE",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
        }
    ],
    "DocumentMetadata": {
        "Pages": 1
    }
}
```

For more information, see Analyzing Document Text with Amazon Textract in the *Amazon Textract Developer Guide*.

- For API details, see AnalyzeDocument in *AWS CLI Command Reference*.

`detect-document-text`

The following code example shows how to use `detect-document-text`.

AWS CLI

To detect text in a document

The following `detect-document-text` example shows how to detect text in a document.

For Linux and macOS, use the following command.

```
aws textract detect-document-text \
    --document '{"S3Object":{"Bucket":"amzn-s3-demo-bucket","Name":"document"}}'
```

For Windows, use the following command.

```
aws textract detect-document-text \
    --document "{\"S3Object\":{\"Bucket\":\"amzn-s3-demo-bucket\",\"Name\":
\"document\"}}"
```

Output:

```
{
    "Blocks": [
        {
            "Geometry": {
                "BoundingBox": {
                    "Width": 1.0,
                    "Top": 0.0,
                    "Left": 0.0,
                    "Height": 1.0
                },
                "Polygon": [
                    {
                        "Y": 0.0,
                        "X": 0.0
                    },
                    {
                        "Y": 0.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,

- For API details, see GetDocumentTextDetection in *AWS CLI Command Reference*.

`start-document-analysis`

The following code example shows how to use `start-document-analysis`.

AWS CLI

To start analyzing text in a multi-page document

The following `start-document-analysis` example shows how to start asynchronous analysis of text in a multi-page document.

For Linux and macOS, use the following command.

```
aws textract start-document-analysis \
    --document-location '{"S3Object":{"Bucket":"amzn-s3-demo-
bucket","Name":"document"}}' \
    --feature-types '["TABLES","FORMS"]' \
    --notification-channel "SNSTopicArn=arn:aws:sns:us-
west-2:123456789012:AmazonTextractTopic,RoleArn=arn:aws:iam::123456789012:role/
TextractRole"
```

For Windows, use the following command.

```
aws textract start-document-analysis \
    --document-location "{\"S3Object\":{\"Bucket\":\"amzn-s3-demo-bucket\",\"Name\":
\"document\"}}" \
    --feature-types "[\"TABLES\", \"FORMS\"]" \
    --notification-channel "SNSTopicArn=arn:aws:sns:us-
west-2:123456789012:AmazonTextractTopic,RoleArn=arn:aws:iam::123456789012:role/
TextractRole"
```

Output:

```
{
    "JobId": "df7cf32ebbd2a5de113535fcf4d921926a701b09b4e7d089f3aebadb41e0712b"
}
```

For more information, see Processing Documents Asynchronously in the *Amazon Textract Developer Guide*.

- For API details, see StartDocumentAnalysis in *AWS CLI Command Reference*.

`start-document-text-detection`

The following code example shows how to use `start-document-text-detection`.

AWS CLI

To start detecting text in a multi-page document

The following `start-document-text-detection` example shows how to start asynchronous detection of text in a multi-page document.

For Linux and macOS, use the following command.

```
aws textract start-document-text-detection \
    --document-location '{"S3Object":{"Bucket":"amzn-s3-demo-
bucket","Name":"document"}}' \
    --notification-channel "SNSTopicArn=arn:aws:sns:us-
west-2:123456789012:AmazonTextractTopic,RoleArn=arn:aws:iam::123456789012:role/
TextractRole"
```

For Windows, use the following command.

```
aws textract start-document-text-detection \
    --document-location "{\"S3Object\":{\"Bucket\":\"amzn-s3-demo-bucket\",\"Name\":\"document\"}}" \
    --notification-channel "SNSTopicArn=arn:aws:sns:us-west-2:123456789012:AmazonTextractTopic,RoleArn=arn:aws:iam::123456789012:role/TextractRole"
```

Output:

```
{
    "JobId": "57849a3dc627d4df74123dca269d69f7b89329c870c65bb16c9fd63409d200b9"
}
```

For more information, see Processing Documents Asynchronously in the *Amazon Textract Developer Guide*.

- For API details, see StartDocumentTextDetection in *AWS CLI Command Reference*.

Amazon Transcribe examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Transcribe.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-language-model`

The following code example shows how to use `create-language-model`.

AWS CLI

Example 1: To create a custom language model using both training and tuning data.

The following `create-language-model` example creates a custom language model. You can use a custom language model to improve transcription performance for domains such as legal, hospitality, finance, and insurance. For language-code, enter a valid language code. For base-model-name, specify a base model that is best suited for the sample rate of the audio that you want to transcribe with your custom language model. For model-name, specify the name that you want to call the custom language model.

```
aws transcribe create-language-model \
    --language-code language-code \
    --base-model-name base-model-name \
    --model-name cli-clm-example \
    --input-data-config S3Uri="s3://amzn-s3-demo-bucket/Amazon-S3-Prefix-for-
training-data",TuningDataS3Uri="s3://amzn-s3-demo-bucket/Amazon-S3-Prefix-for-
tuning-data",DataAccessRoleArn="arn:aws:iam::AWS-account-number:role/IAM-role-with-
permissions-to-create-a-custom-language-model"
```

Output:

```
{
    "LanguageCode": "language-code",
    "BaseModelName": "base-model-name",
    "ModelName": "cli-clm-example",
    "InputDataConfig": {
        "S3Uri": "s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/",
        "TuningDataS3Uri": "s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/",
        "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-with-
permissions-create-a-custom-language-model"
    },
    "ModelStatus": "IN_PROGRESS"
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

Example 2: To create a custom language model using only training data.

The following `create-language-model` example transcribes your audio file. You can use a custom language model to improve transcription performance for domains such as legal,

hospitality, finance, and insurance. For language-code, enter a valid language code. For base-model-name, specify a base model that is best suited for the sample rate of the audio that you want to transcribe with your custom language model. For model-name, specify the name that you want to call the custom language model.

```
aws transcribe create-language-model \
    --language-code en-US \
    --base-model-name base-model-name \
    --model-name cli-clm-example \
    --input-data-config S3Uri="s3://amzn-s3-demo-bucket/Amazon-S3-Prefix-For-Training-Data",DataAccessRoleArn="arn:aws:iam::AWS-account-number:role/IAM-role-with-permissions-to-create-a-custom-language-model"
```

Output:

```
{
    "LanguageCode": "en-US",
    "BaseModelName": "base-model-name",
    "ModelName": "cli-clm-example",
    "InputDataConfig": {
        "S3Uri": "s3://amzn-s3-demo-bucket/Amazon-S3-Prefix-For-Training-Data/",
        "DataAccessRoleArn": "arn:aws:iam::your-AWS-account-number:role/IAM-role-with-permissions-to-create-a-custom-language-model"
    },
    "ModelStatus": "IN_PROGRESS"
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateLanguageModel in *AWS CLI Command Reference*.

`create-medical-vocabulary`

The following code example shows how to use `create-medical-vocabulary`.

AWS CLI

To create a medical custom vocabulary

The following `create-medical-vocabulary` example creates a custom vocabulary. To create a custom vocabulary, you must have created a text file with all the terms that you want to

transcribe more accurately. For vocabulary-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of that text file. For language-code, specify a language code corresponding to the language of your custom vocabulary. For vocabulary-name, specify what you want to call your custom vocabulary.

```
aws transcribe create-medical-vocabulary \
    --vocabulary-name cli-medical-vocab-example \
    --language-code language-code \
    --vocabulary-file-uri https://amzn-s3-demo-bucket.AWS-Region.amazonaws.com/the-text-file-for-the-medical-custom-vocabulary.txt
```

Output:

```
{
    "VocabularyName": "cli-medical-vocab-example",
    "LanguageCode": "language-code",
    "VocabularyState": "PENDING"
}
```

For more information, see Improving transcription accuracy with medical custom vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateMedicalVocabulary in *AWS CLI Command Reference*.

`create-vocabulary-filter`

The following code example shows how to use `create-vocabulary-filter`.

AWS CLI

To create a vocabulary filter

The following `create-vocabulary-filter` example creates a vocabulary filter that uses a text file that contains a list of words that you wouldn't want to appear in a transcription. For language-code, specify the language code corresponding to the language of your vocabulary filter. For vocabulary-filter-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of the text file. For vocabulary-filter-name, specify the name of your vocabulary filter.

```
aws transcribe create-vocabulary-filter \
    --language-code language-code \
```

```
    --vocabulary-filter-file-uri s3://amzn-s3-demo-bucket/vocabulary-filter.txt \
    --vocabulary-filter-name cli-vocabulary-filter-example
```

Output:

```
{
    "VocabularyFilterName": "cli-vocabulary-filter-example",
    "LanguageCode": "language-code"
}
```

For more information, see Using custom vocabulary filters to delete, mask, or flag words in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateVocabularyFilter in *AWS CLI Command Reference*.

`create-vocabulary`

The following code example shows how to use `create-vocabulary`.

AWS CLI

To create a custom vocabulary

The following `create-vocabulary` example creates a custom vocabulary. To create a custom vocabulary, you must have created a text file with all the terms that you want to transcribe more accurately. For vocabulary-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of that text file. For language-code, specify a language code corresponding to the language of your custom vocabulary. For vocabulary-name, specify what you want to call your custom vocabulary.

```
aws transcribe create-vocabulary \
    --language-code language-code \
    --vocabulary-name cli-vocab-example \
    --vocabulary-file-uri s3://amzn-s3-demo-bucket/Amazon-S3-prefix/the-text-file-for-the-custom-vocabulary.txt
```

Output:

```
{
    "VocabularyName": "cli-vocab-example",
```

```
    "LanguageCode": "language-code",
    "VocabularyState": "PENDING"
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateVocabulary in *AWS CLI Command Reference*.

`delete-language-model`

The following code example shows how to use `delete-language-model`.

AWS CLI

To delete a custom language model

The following `delete-language-model` example deletes a custom language model.

```
aws transcribe delete-language-model \
    --model-name model-name
```

This command produces no output.

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteLanguageModel in *AWS CLI Command Reference*.

`delete-medical-transcription-job`

The following code example shows how to use `delete-medical-transcription-job`.

AWS CLI

To delete a medical transcription job

The following `delete-medical-transcription-job` example deletes a medical transcription job.

```
aws transcribe delete-medical-transcription-job \
    --medical-transcription-job-name medical-transcription-job-name
```

This command produces no output.

For more information, see DeleteMedicalTranscriptionJob in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteMedicalTranscriptionJob in *AWS CLI Command Reference*.

`delete-medical-vocabulary`

The following code example shows how to use `delete-medical-vocabulary`.

AWS CLI

To delete a medical custom vocabulary

The following `delete-medical-vocabulary` example deletes a medical custom vocabulary. For vocabulary-name, specify the name of the medical custom vocabulary.

```
aws transcribe delete-medical-vocabulary \
    --vocabulary-name medical-custom-vocabulary-name
```

This command produces no output.

For more information, see Improving transcription accuracy with medical custom vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteMedicalVocabulary in *AWS CLI Command Reference*.

`delete-transcription-job`

The following code example shows how to use `delete-transcription-job`.

AWS CLI

To delete one of your transcription jobs

The following `delete-transcription-job` example deletes one of your transcription jobs.

```
aws transcribe delete-transcription-job \
    --transcription-job-name your-transcription-job
```

This command produces no output.

For more information, see DeleteTranscriptionJob in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteTranscriptionJob in *AWS CLI Command Reference*.

`delete-vocabulary-filter`

The following code example shows how to use `delete-vocabulary-filter`.

AWS CLI

To delete a vocabulary filter

The following `delete-vocabulary-filter` example deletes a vocabulary filter.

```
aws transcribe delete-vocabulary-filter \
    --vocabulary-filter-name vocabulary-filter-name
```

This command produces no output.

For more information, see Using custom vocabulary filters to delete, mask, or flag words in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteVocabularyFilter in *AWS CLI Command Reference*.

`delete-vocabulary`

The following code example shows how to use `delete-vocabulary`.

AWS CLI

To delete a custom vocabulary

The following `delete-vocabulary` example deletes a custom vocabulary.

```
aws transcribe delete-vocabulary \
    --vocabulary-name vocabulary-name
```

This command produces no output.

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteVocabulary in *AWS CLI Command Reference*.

`describe-language-model`

The following code example shows how to use `describe-language-model`.

AWS CLI

To get information about a specific custom language model

The following `describe-language-model` example gets information about a specific custom language model. For example, under BaseModelName you can see whether your model is trained using a NarrowBand or WideBand model. Custom language models with a NarrowBand base model can transcribe audio with a sample rate less than 16 kHz. Language models using a WideBand base model can transcribe audio with a sample rate greater than 16 kHz. The S3Uri parameter indicates the Amazon S3 prefix you've used to access the training data to create the custom language model.

```
aws transcribe describe-language-model \
    --model-name cli-clm-example
```

Output:

```
{
    "LanguageModel": {
        "ModelName": "cli-clm-example",
        "CreateTime": "2020-09-25T17:57:38.504000+00:00",
        "LastModifiedTime": "2020-09-25T17:57:48.585000+00:00",
        "LanguageCode": "language-code",
        "BaseModelName": "base-model-name",
        "ModelStatus": "IN_PROGRESS",
        "UpgradeAvailability": false,
        "InputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/",
            "TuningDataS3Uri": "s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/",
            "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-
with-permissions-to-create-a-custom-language-model"
        }
    }
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see DescribeLanguageModel in *AWS CLI Command Reference*.

`get-medical-transcription-job`

The following code example shows how to use `get-medical-transcription-job`.

AWS CLI

To get information about a specific medical transcription job

The following `get-medical-transcription-job` example gets information about a specific medical transcription job. To access the transcription results, use the TranscriptFileUri parameter. If you've enabled additional features for the transcription job, you can see them in the Settings object. The Specialty parameter shows the medical specialty of the provider. The Type parameter indicates whether the speech in the transcription job is of a medical conversation, or a medical dictation.

```
aws transcribe get-medical-transcription-job \
    --medical-transcription-job-name vocabulary-dictation-medical-transcription-job
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-
job",
        "TranscriptionJobStatus": "COMPLETED",
        "LanguageCode": "en-US",
        "MediaSampleRateHertz": 48000,
        "MediaFormat": "mp4",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-audio-file.file-extension"
        },
        "Transcript": {
            "TranscriptFileUri": "https://s3.Region.amazonaws.com/Amazon-S3-Prefix/
vocabulary-dictation-medical-transcription-job.json"
        },
        "StartTime": "2020-09-21T21:17:27.045000+00:00",
        "CreationTime": "2020-09-21T21:17:27.016000+00:00",
        "CompletionTime": "2020-09-21T21:17:59.561000+00:00",
        "Settings": {
```

```
            "ChannelIdentification": false,
            "ShowAlternatives": false,
            "VocabularyName": "cli-medical-vocab-example"
        },
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Transcribing an audio file of a medical conversation in the *Amazon Transcribe Developer Guide*.

- For API details, see GetMedicalTranscriptionJob in *AWS CLI Command Reference*.

`get-medical-vocabulary`

The following code example shows how to use `get-medical-vocabulary`.

AWS CLI

To get information about a medical custom vocabulary

The following `get-medical-vocabulary` example gets information on a medical custom vocabulary. You can use the VocabularyState parameter to see the processing state of the vocabulary. If it's READY, you can use it in the StartMedicalTranscriptionJob operation.

```
aws transcribe get-medical-vocabulary \
    --vocabulary-name medical-vocab-example
```

Output:

```
{
    "VocabularyName": "medical-vocab-example",
    "LanguageCode": "en-US",
    "VocabularyState": "READY",
    "LastModifiedTime": "2020-09-19T23:59:04.349000+00:00",
    "DownloadUri": "https://link-to-download-the-text-file-used-to-create-your-
medical-custom-vocabulary"
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see GetMedicalVocabulary in *AWS CLI Command Reference*.

`get-transcription-job`

The following code example shows how to use `get-transcription-job`.

AWS CLI

To get information about a specific transcription job

The following `get-transcription-job` example gets information about a specific transcription job. To access the transcription results, use the TranscriptFileUri parameter. Use the MediaFileUri parameter to see which audio file you transcribed with this job. You can use the Settings object to see the optional features you've enabled in the transcription job.

```
aws transcribe get-transcription-job \
    --transcription-job-name your-transcription-job
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "your-transcription-job",
        "TranscriptionJobStatus": "COMPLETED",
        "LanguageCode": "language-code",
        "MediaSampleRateHertz": 48000,
        "MediaFormat": "mp4",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.file-
extension"
        },
        "Transcript": {
            "TranscriptFileUri": "https://Amazon-S3-file-location-of-transcription-
output"
        },
        "StartTime": "2020-09-18T22:27:23.970000+00:00",
        "CreationTime": "2020-09-18T22:27:23.948000+00:00",
        "CompletionTime": "2020-09-18T22:28:21.197000+00:00",
        "Settings": {
            "ChannelIdentification": false,
            "ShowAlternatives": false
        },
```

```
        "IdentifyLanguage": true,
        "IdentifiedLanguageScore": 0.8672199249267578
    }
}
```

For more information, see Getting Started (AWS Command Line Interface) in the *Amazon Transcribe Developer Guide*.

- For API details, see GetTranscriptionJob in *AWS CLI Command Reference*.

`get-vocabulary-filter`

The following code example shows how to use `get-vocabulary-filter`.

AWS CLI

To get information about a vocabulary filter

The following `get-vocabulary-filter` example gets information about a vocabulary filter. You can use the DownloadUri parameter to get the list of words you used to create the vocabulary filter.

```
aws transcribe get-vocabulary-filter \
    --vocabulary-filter-name testFilter
```

Output:

```
{
    "VocabularyFilterName": "testFilter",
    "LanguageCode": "language-code",
    "LastModifiedTime": "2020-05-07T22:39:32.147000+00:00",
    "DownloadUri": "https://Amazon-S3-location-to-download-your-vocabulary-filter"
}
```

For more information, see Filter Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see GetVocabularyFilter in *AWS CLI Command Reference*.

`get-vocabulary`

The following code example shows how to use `get-vocabulary`.

AWS CLI

To get information about a custom vocabulary

The following `get-vocabulary` example gets information on a previously created custom vocabulary.

```
aws transcribe get-vocabulary \
    --vocabulary-name cli-vocab-1
```

Output:

```
{
    "VocabularyName": "cli-vocab-1",
    "LanguageCode": "language-code",
    "VocabularyState": "READY",
    "LastModifiedTime": "2020-09-19T23:22:32.836000+00:00",
    "DownloadUri": "https://link-to-download-the-text-file-used-to-create-your-
custom-vocabulary"
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see GetVocabulary in *AWS CLI Command Reference*.

`list-language-models`

The following code example shows how to use `list-language-models`.

AWS CLI

To list your custom language models

The following `list-language-models` example lists the custom language models associated with your AWS account and Region. You can use the `S3Uri` and `TuningDataS3Uri` parameters to find the Amazon S3 prefixes you've used as your training data, or your tuning data. The BaseModelName tells you whether you've used a NarrowBand, or WideBand model to create a custom language model. You can transcribe audio with a sample rate of less than 16 kHz with a custom language model using a NarrowBand base model. You can transcribe audio 16 kHz or greater with a custom language model using a WideBand base model. The `ModelStatus`

parameter shows whether you can use the custom language model in a transcription job. If the value is COMPLETED, you can use it in a transcription job.

```
aws transcribe list-language-models
```

Output:

```
{
    "Models": [
        {
            "ModelName": "cli-clm-2",
            "CreateTime": "2020-09-25T17:57:38.504000+00:00",

- For API details, see ListLanguageModels in *AWS CLI Command Reference*.

`list-medical-transcription-jobs`

The following code example shows how to use `list-medical-transcription-jobs`.

AWS CLI

To list your medical transcription jobs

The following `list-medical-transcription-jobs` example lists the medical transcription jobs associated with your AWS account and Region. To get more information about a particular transcription job, copy the value of a MedicalTranscriptionJobName parameter in the transcription output, and specify that value for the `MedicalTranscriptionJobName` option of the `get-medical-transcription-job` command. To see more of your transcription jobs, copy the value of the NextToken parameter, run the `list-medical-transcription-jobs` command again, and specify that value in the `--next-token` option.

```
aws transcribe list-medical-transcription-jobs
```

Output:

```
{
    "NextToken": "3/PblzkiGhzjER3KHuQt2fmbPLF7cDYafjFMEoGn44ON/

        }
    ]
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see ListVocabularies in *AWS CLI Command Reference*.

`list-vocabulary-filters`

The following code example shows how to use `list-vocabulary-filters`.

AWS CLI

To list your vocabulary filters

The following `list-vocabulary-filters` example lists the vocabulary filters associated with your AWS account and Region.

```
aws transcribe list-vocabulary-filters
```

Output:

```
{
    "VocabularyFilters": [
        {
            "VocabularyFilterName": "testFilter",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-07T22:39:32.147000+00:00"
        },
        {
            "VocabularyFilterName": "testFilter2",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-21T23:29:35.174000+00:00"
        },
        {
            "VocabularyFilterName": "filter2",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-08T20:18:26.426000+00:00"
        },
        {
            "VocabularyFilterName": "filter-review",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-06-03T18:52:30.448000+00:00"
        },
        {
            "VocabularyFilterName": "crlf-filt",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-22T19:42:42.737000+00:00"
        }
    ]
}
```

For more information, see Using custom vocabulary filters to delete, mask, or flag words in the *Amazon Transcribe Developer Guide*.

- For API details, see ListVocabularyFilters in *AWS CLI Command Reference*.

start-medical-transcription-job

The following code example shows how to use `start-medical-transcription-job`.

AWS CLI

Example 1: To transcribe a medical dictation stored as an audio file

The following `start-medical-transcription-job` example transcribes an audio file. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-20T00:35:22.256000+00:00",
        "CreationTime": "2020-09-20T00:35:22.218000+00:00",
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
```

```
}
```

For more information, see Transcribing an audio file of a medical conversation in the *Amazon Transcribe Developer Guide*.

Example 2: To transcribe a clinician-patient dialogue stored as an audio file

The following `start-medical-transcription-job` example transcribes an audio file containing a clinician-patient dialogue. You specify the location of the transcription output in the OutputBucketName parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://mysecondfile.json
```

Contents of `mysecondfile.json`:

```
{
    "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "simple-conversation-medical-transcription-
job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-20T23:19:49.965000+00:00",
        "CreationTime": "2020-09-20T23:19:49.941000+00:00",
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
```

```
    }
}
```

For more information, see Transcribing an audio file of a medical conversation in the *Amazon Transcribe Developer Guide*.

Example 3: To transcribe a multichannel audio file of a clinician-patient dialogue

The following `start-medical-transcription-job` example transcribes the audio from each channel in the audio file and merges the separate transcriptions from each channel into a single transcription output. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://mythirdfile.json
```

Contents of `mythirdfile.json`:

```
{
    "MedicalTranscriptionJobName": "multichannel-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    },
    "Settings":{
        "ChannelIdentification": true
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "multichannel-conversation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
```

```
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-20T23:46:44.081000+00:00",
        "CreationTime": "2020-09-20T23:46:44.053000+00:00",
        "Settings": {
            "ChannelIdentification": true
        },
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see Transcribing multi-channel audio in the *Amazon Transcribe Developer Guide*.

Example 4: To transcribe an audio file of a clinician-patient dialogue and identify the speakers in the transcription output

The following `start-medical-transcription-job` example transcribes an audio file and labels the speech of each speaker in the transcription output. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myfourthfile.json
```

Contents of `myfourthfile.json`:

```
{
    "MedicalTranscriptionJobName": "speaker-id-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    },
    "Settings":{
        "ShowSpeakerLabels": true,
        "MaxSpeakerLabels": 2
    }
```

```
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "speaker-id-conversation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T18:43:37.265000+00:00",
        "CreationTime": "2020-09-21T18:43:37.157000+00:00",
        "Settings": {
            "ShowSpeakerLabels": true,
            "MaxSpeakerLabels": 2
        },
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see Enabling speaker partitioning in the *Amazon Transcribe Developer Guide*.

Example 5: To transcribe a medical conversation stored as an audio file with up to two transcription alternatives

The following `start-medical-transcription-job` example creates up to two alternative transcriptions from a single audio file. Every transcriptions has a level of confidence associated with it. By default, Amazon Transcribe returns the transcription with the highest confidence level. You can specify that Amazon Transcribe return additional transcriptions with lower confidence levels. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myfifthfile.json
```

Contents of `myfifthfile.json`:

```
{
    "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    },
    "Settings":{
        "ShowAlternatives": true,
        "MaxAlternatives": 2
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "alternatives-conversation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T19:09:18.199000+00:00",
        "CreationTime": "2020-09-21T19:09:18.171000+00:00",
        "Settings": {
            "ShowAlternatives": true,
            "MaxAlternatives": 2
        },
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see Alternative transcriptions in the *Amazon Transcribe Developer Guide*.

Example 6: To transcribe an audio file of a medical dictation with up to two alternative transcriptions

The following `start-medical-transcription-job` example transcribes an audio file and uses a vocabulary filter to mask any unwanted words. You specify the location of the transcription output in the OutputBucketName parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://mysixthfile.json
```

Contents of `mysixthfile.json`:

```
{
    "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    },
    "Settings":{
        "ShowAlternatives": true,
        "MaxAlternatives": 2
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "alternatives-dictation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T21:01:14.592000+00:00",
        "CreationTime": "2020-09-21T21:01:14.569000+00:00",
        "Settings": {
            "ShowAlternatives": true,
            "MaxAlternatives": 2
        },
```

```
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Alternative transcriptions in the *Amazon Transcribe Developer Guide*.

Example 7: To transcribe an audio file of a medical dictation with increased accuracy by using a custom vocabulary

The following `start-medical-transcription-job` example transcribes an audio file and uses a medical custom vocabulary you've previously created to increase the transcription accuracy. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myseventhfile.json
```

Contents of `myseventhfile.json`:

```
{
    "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    },
    "Settings":{
        "VocabularyName": "cli-medical-vocab-1"
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-
job",
        "TranscriptionJobStatus": "IN_PROGRESS",
```

```
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T21:17:27.045000+00:00",
        "CreationTime": "2020-09-21T21:17:27.016000+00:00",
        "Settings": {
            "VocabularyName": "cli-medical-vocab-1"
        },
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Improving transcription accuracy with medical custom vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see StartMedicalTranscriptionJob in *AWS CLI Command Reference*.

`start-transcription-job`

The following code example shows how to use `start-transcription-job`.

AWS CLI

Example 1: To transcribe an audio file

The following `start-transcription-job` example transcribes your audio file.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "TranscriptionJobName": "cli-simple-transcription-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-simple-transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-17T16:01:42.912000+00:00",
        "CreationTime": "2020-09-17T16:01:42.886000+00:00"
    }
}
```

For more information, see Getting Started (AWS Command Line Interface) in the *Amazon Transcribe Developer Guide*.

Example 2: To transcribe a multi-channel audio file

The following `start-transcription-job` example transcribes your multi-channel audio file.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mysecondfile.json
```

Contents of `mysecondfile.json`:

```
{
    "TranscriptionJobName": "cli-channelid-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "ChannelIdentification":true
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-channelid-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-17T16:07:56.817000+00:00",
        "CreationTime": "2020-09-17T16:07:56.784000+00:00",
        "Settings": {
            "ChannelIdentification": true
        }
    }
}
```

For more information, see Transcribing Multi-Channel Audio in the *Amazon Transcribe Developer Guide*.

Example 3: To transcribe an audio file and identify the different speakers

The following `start-transcription-job` example transcribes your audio file and identifies the speakers in the transcription output.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mythirdfile.json
```

Contents of `mythirdfile.json`:

```
{
    "TranscriptionJobName": "cli-speakerid-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "ShowSpeakerLabels": true,
        "MaxSpeakerLabels": 2
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-speakerid-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-17T16:22:59.696000+00:00",
        "CreationTime": "2020-09-17T16:22:59.676000+00:00",
        "Settings": {
            "ShowSpeakerLabels": true,
            "MaxSpeakerLabels": 2
        }
    }
}
```

For more information, see Identifying Speakers in the *Amazon Transcribe Developer Guide*.

Example 4: To transcribe an audio file and mask any unwanted words in the transcription output

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myfourthfile.json
```

Contents of `myfourthfile.json`:

```
{
    "TranscriptionJobName": "cli-filter-mask-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "VocabularyFilterName": "your-vocabulary-filter",
```

```
        "VocabularyFilterMethod": "mask"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-filter-mask-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
        "StartTime": "2020-09-18T16:36:18.568000+00:00",
        "CreationTime": "2020-09-18T16:36:18.547000+00:00",
        "Settings": {
            "VocabularyFilterName": "your-vocabulary-filter",
            "VocabularyFilterMethod": "mask"
        }
    }
}
```

For more information, see Using custom vocabulary filters to delete, mask, or flag words in the *Amazon Transcribe Developer Guide*.

Example 5: To transcribe an audio file and remove any unwanted words in the transcription output

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myfifthfile.json
```

Contents of `myfifthfile.json`:

```
{
    "TranscriptionJobName": "cli-filter-remove-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
```

```
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "VocabularyFilterName": "your-vocabulary-filter",
        "VocabularyFilterMethod": "remove"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-filter-remove-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-18T16:36:18.568000+00:00",
        "CreationTime": "2020-09-18T16:36:18.547000+00:00",
        "Settings": {
            "VocabularyFilterName": "your-vocabulary-filter",
            "VocabularyFilterMethod": "remove"
        }
    }
}
```

For more information, see Using custom vocabulary filters to delete, mask, or flag words in the *Amazon Transcribe Developer Guide*.

Example 6: To transcribe an audio file with increased accuracy using a custom vocabulary

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mysixthfile.json
```

Contents of `mysixthfile.json`:

```
{
    "TranscriptionJobName": "cli-vocab-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "VocabularyName": "your-vocabulary"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-vocab-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-18T16:36:18.568000+00:00",
        "CreationTime": "2020-09-18T16:36:18.547000+00:00",
        "Settings": {
            "VocabularyName": "your-vocabulary"
        }
    }
}
```

For more information, see Using custom vocabulary filters to delete, mask, or flag words in the *Amazon Transcribe Developer Guide*.

Example 7: To identify the language of an audio file and transcribe it

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myseventhfile.json
```

Contents of `myseventhfile.json`:

```
{
    "TranscriptionJobName": "cli-identify-language-transcription-job",
    "IdentifyLanguage": true,
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-identify-language-transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-18T22:27:23.970000+00:00",
        "CreationTime": "2020-09-18T22:27:23.948000+00:00",
        "IdentifyLanguage": true
    }
}
```

For more information, see Identifying the Language in the *Amazon Transcribe Developer Guide*.

Example 8: To transcribe an audio file with personally identifiable information redacted

The following `start-transcription-job` example transcribes your audio file and redacts any personally identifiable information in the transcription output.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myeighthfile.json
```

Contents of `myeighthfile.json`:

```
{
    "TranscriptionJobName": "cli-redaction-job",
    "LanguageCode": "language-code",
```

```
    "Media": {
        "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
    },
    "ContentRedaction": {
        "RedactionOutput":"redacted",
        "RedactionType":"PII"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-redaction-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
        "StartTime": "2020-09-25T23:49:13.195000+00:00",
        "CreationTime": "2020-09-25T23:49:13.176000+00:00",
        "ContentRedaction": {
            "RedactionType": "PII",
            "RedactionOutput": "redacted"
        }
    }
}
```

For more information, see Automatic Content Redaction in the *Amazon Transcribe Developer Guide*.

Example 9: To generate a transcript with personally identifiable information (PII) redacted and an unredacted transcript

The following `start-transcription-job` example generates two transcrptions of your audio file, one with the personally identifiable information redacted, and the other without any redactions.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myninthfile.json
```

Contents of `myninthfile.json`:

```
{
    "TranscriptionJobName": "cli-redaction-job-with-unredacted-transcript",
    "LanguageCode": "language-code",
    "Media": {
        "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
    },
    "ContentRedaction": {
        "RedactionOutput":"redacted_and_unredacted",
        "RedactionType":"PII"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-redaction-job-with-unredacted-transcript",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
        "StartTime": "2020-09-25T23:59:47.677000+00:00",
        "CreationTime": "2020-09-25T23:59:47.653000+00:00",
        "ContentRedaction": {
            "RedactionType": "PII",
            "RedactionOutput": "redacted_and_unredacted"
        }
    }
}
```

For more information, see Automatic Content Redaction in the *Amazon Transcribe Developer Guide*.

Example 10: To use a custom language model you've previously created to transcribe an audio file.

The following `start-transcription-job` example transcribes your audio file with a custom language model you've previously created.

```
aws transcribe start-transcription-job \
```

```
    --cli-input-json file://mytenthfile.json
```

Contents of `mytenthfile.json`:

```
{
    "TranscriptionJobName": "cli-clm-2-job-1",
    "LanguageCode": "language-code",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.file-extension"
    },
    "ModelSettings": {
        "LanguageModelName":"cli-clm-2"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-clm-2-job-1",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.file-
extension"
        },
        "StartTime": "2020-09-28T17:56:01.835000+00:00",
        "CreationTime": "2020-09-28T17:56:01.801000+00:00",
        "ModelSettings": {
            "LanguageModelName": "cli-clm-2"
        }
    }
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see StartTranscriptionJob in *AWS CLI Command Reference*.

`update-medical-vocabulary`

The following code example shows how to use `update-medical-vocabulary`.

AWS CLI

To update a medical custom vocabulary with new terms.

The following `update-medical-vocabulary` example replaces the terms used in a medical custom vocabulary with the new ones. Prerequisite: to replace the terms in a medical custom vocabulary, you need a file with new terms.

```
aws transcribe update-medical-vocabulary \
    --vocabulary-file-uri s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/medical-custom-vocabulary.txt \
    --vocabulary-name medical-custom-vocabulary \
    --language-code language
```

Output:

```
{
    "VocabularyName": "medical-custom-vocabulary",
    "LanguageCode": "en-US",
    "VocabularyState": "PENDING"
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see UpdateMedicalVocabulary in *AWS CLI Command Reference*.

`update-vocabulary-filter`

The following code example shows how to use `update-vocabulary-filter`.

AWS CLI

To replace the words in a vocabulary filter

The following `update-vocabulary-filter` example replaces the words in a vocabulary filter with new ones. Prerequisite: To update a vocabulary filter with the new words, you must have those words saved as a text file.

```
aws transcribe update-vocabulary-filter \
```

```
    --vocabulary-filter-file-uri s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/your-
text-file-to-update-your-vocabulary-filter.txt \
    --vocabulary-filter-name vocabulary-filter-name
```

Output:

```
{
    "VocabularyFilterName": "vocabulary-filter-name",
    "LanguageCode": "language-code",
    "LastModifiedTime": "2020-09-23T18:40:35.139000+00:00"
}
```

For more information, see Using custom vocabulary filters to delete, mask, or flag words in the *Amazon Transcribe Developer Guide*.

- For API details, see UpdateVocabularyFilter in *AWS CLI Command Reference*.

`update-vocabulary`

The following code example shows how to use `update-vocabulary`.

AWS CLI

To update a custom vocabulary with new terms.

The following `update-vocabulary` example overwrites the terms used to create a custom vocabulary with the new ones that you provide. Prerequisite: to replace the terms in a custom vocabulary, you need a file with new terms.

```
aws transcribe update-vocabulary \
    --vocabulary-file-uri s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/custom-
vocabulary.txt \
    --vocabulary-name custom-vocabulary \
    --language-code language-code
```

Output:

```
{
    "VocabularyName": "custom-vocabulary",
    "LanguageCode": "language",
    "VocabularyState": "PENDING"
```

```
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see UpdateVocabulary in *AWS CLI Command Reference*.

Amazon Translate examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Translate.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`import-terminology`

The following code example shows how to use `import-terminology`.

AWS CLI

To import a custom terminology from a file

The following `import-terminology` example creates a terminology called `MyTestTerminology` from the `test-terminology.csv` file.

```
aws translate import-terminology \
    --name MyTestTerminology \
    --description "Creating a test terminology in AWS Translate" \
    --merge-strategy OVERWRITE \
    --data-file fileb://test-terminology.csv \
    --terminology-data Format=CSV
```

Contents of `test-terminology.csv`:

en,fr,es,zh Hello world!,Bonjour tout le monde!,Hola Mundo!,????
Amazon,Amazon,Amazon,Amazon

Output:

```
{
    "TerminologyProperties": {
        "SourceLanguageCode": "en",
        "Name": "MyTestTerminology",
        "TargetLanguageCodes": [
            "fr",
            "es",
            "zh"
        ],
        "SizeBytes": 97,
        "LastUpdatedAt": 1571089500.851,
        "CreatedAt": 1571089500.851,
        "TermCount": 6,
        "Arn": "arn:aws:translate:us-west-2:123456789012:terminology/
MyTestTerminology/LATEST",
        "Description": "Creating a test terminology in AWS Translate"
    }
}
```

For more information, see Customizing your translations with custom terminology in the *Amazon Translate Developer Guide*.

- For API details, see ImportTerminology in *AWS CLI Command Reference*.

Trusted Advisor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Trusted Advisor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

`get-organization-recommendation`

The following code example shows how to use `get-organization-recommendation`.

AWS CLI

To get an organization recommendation

The following `get-organization-recommendation` example gets an organization recommendation by its identifier.

```
aws trustedadvisor get-organization-recommendation \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-recommendation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "organizationRecommendation": {
        "arn": "arn:aws:trustedadvisor:::organization-recommendation/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

`list-organization-recommendation-accounts`

The following code example shows how to use `list-organization-recommendation-accounts`.

AWS CLI

To list organization recommendation accounts

The following `list-organization-recommendation-accounts` example lists all account recommendation summaries for an organization recommendation by its identifier.

```
aws trustedadvisor list-organization-recommendation-accounts \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-recommendation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "accountRecommendationLifecycleSummaries": [{
        "accountId": "123456789012",
        "accountRecommendationArn":
 "arn:aws:trustedadvisor::123456789012:recommendation/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "lifecycleStage": "resolved",
        "updateReason": "Resolved issue",
        "updateReasonCode": "valid_business_case",
        "lastUpdatedAt": "2023-01-17T18:25:44.552Z"
    }],
    "nextToken": "REDACTED"
```

```
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see ListOrganizationRecommendationAccounts in *AWS CLI Command Reference*.

`list-organization-recommendation-resources`

The following code example shows how to use `list-organization-recommendation-resources`.

AWS CLI

To list organization recommendation resources

The following `list-organization-recommendation-resources` example lists all resources for an organization recommendation by its identifier.

```
aws trustedadvisor list-organization-recommendation-resources \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-recommendation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "organizationRecommendationResourceSummaries": [
        {
            "arn": "arn:aws:trustedadvisor::123456789012:recommendation-resource/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/bb38affc0ce0681d9a6cd13f30238ba03a8f63dfe7a379dc403c619119d86af",

`list-organization-recommendations`

The following code example shows how to use `list-organization-recommendations`.

AWS CLI

Example 1: To list organization recommendations

The following `list-organization-recommendations` example lists all organization recommendations and does not include a filter.

```
aws trustedadvisor list-organization-recommendations
```

Output:

```
{
    "organizationRecommendationSummaries": [
        {
            "arn": "arn:aws:trustedadvisor:::organization-recommendation/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "name": "Lambda Runtime Deprecation Warning",
```

```
            "awsServices": [
                "lambda"
            ],
            "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "lifecycleStage": "resolved",
            "pillars": [
                "security"
            ],
            "resourcesAggregates": {
                "errorCount": 0,
                "okCount": 0,
                "warningCount": 0
            },
            "source": "ta_check",
            "status": "warning",
            "type": "priority"
        },
        {
            "arn": "arn:aws:trustedadvisor:::organization-recommendation/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "name": "Lambda Runtime Deprecation Warning",
            "awsServices": [
                "lambda"
            ],
            "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "lifecycleStage": "resolved",
            "pillars": [
                "security"
            ],
            "resourcesAggregates": {
                "errorCount": 0,
                "okCount": 0,
                "warningCount": 0
            },
            "source": "ta_check",
            "status": "warning",
            "type": "priority"
        }
    ],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

Example 2: To list organization recommendations with a filter

The following `list-organization-recommendations` example filters and returns a max of one organization recommendation that is a part of the "security" pillar.

```
aws trustedadvisor list-organization-recommendations \
    --pillar security \
    --max-items 100
```

Output:

```
{
    "organizationRecommendationSummaries": [{
        "arn": "arn:aws:trustedadvisor:::organization-recommendation/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "name": "Lambda Runtime Deprecation Warning",
        "awsServices": [
            "lambda"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "lifecycleStage": "resolved",
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
            "errorCount": 0,
            "okCount": 0,
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "warning",
        "type": "priority"
    }],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

Example 3: To list organization recommendations with a pagination token

The following `list-organization-recommendations` example uses the "nextToken" returned from a previous request to fetch the next page of organization recommendations.

```
aws trustedadvisor list-organization-recommendations \
    --pillar security \
    --max-items 100 \
    --starting-token <next-token>
```

Output:

```
{
    "organizationRecommendationSummaries": [{
        "arn": "arn:aws:trustedadvisor:::organization-recommendation/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "name": "Lambda Runtime Deprecation Warning",
        "awsServices": [
            "lambda"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "lifecycleStage": "resolved",
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
            "errorCount": 0,
            "okCount": 0,
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "warning",
        "type": "priority"
    }]
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see ListOrganizationRecommendations in *AWS CLI Command Reference*.

`list-recommendation-resources`

The following code example shows how to use `list-recommendation-resources`.

AWS CLI

To list recommendation resources

The following `list-recommendation-resources` example lists all resources for a recommendation by its identifier.

```
aws trustedadvisor list-recommendation-resources \
    --recommendation-identifier arn:aws:trustedadvisor::123456789012:recommendation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "recommendationResourceSummaries": [
        {
            "arn": "arn:aws:trustedadvisor::123456789012:recommendation-resource/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/18959a1f1973cff8e706e9d9bde28bba36cd602a6b2cb86c8b61252835236010",

`update-organization-recommendation-lifecycle`

The following code example shows how to use `update-organization-recommendation-lifecycle`.

AWS CLI

To update an organization recommendation lifecycle

The following `update-organization-recommendation-lifecycle` example updates the lifecycle of an organization recommendation by its identifier.

```
aws trustedadvisor update-organization-recommendation-lifecycle \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-recommendation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lifecycle-stage dismissed \
    --update-reason-code not_applicable
```

This command produces no output.

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see UpdateOrganizationRecommendationLifecycle in *AWS CLI Command Reference*.

`update-recommendation-lifecycle`

The following code example shows how to use `update-recommendation-lifecycle`.

AWS CLI

To update a recommendation lifecycle

The following `update-recommendation-lifecycle` example updates the lifecycle of a recommendation by its identifier.

```
aws trustedadvisor update-recommendation-lifecycle \
    --recommendation-identifier arn:aws:trustedadvisor::123456789012:recommendation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lifecycle-stage resolved \
    --update-reason-code valid_business_case
```

This command produces no output.

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see UpdateRecommendationLifecycle in *AWS CLI Command Reference*.

Verified Permissions examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Verified Permissions.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-identity-source`

The following code example shows how to use `create-identity-source`.

AWS CLI

To create an identity source

The following `create-identity-source` example creates an identity source that lets you reference identities stored in the specified Amazon Cognito user pool. Those identities are available in Verified Permissions as entities of type `User`.

```
aws verifiedpermissions create-identity-source \
    --configuration file://config.txt \
    --principal-entity-type "User" \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `config.txt`:

```
{
    "cognitoUserPoolConfiguration": {
        "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-
west-2_1a2b3c4d5",
        "clientIds":["a1b2c3d4e5f6g7h8i9j0kalbmc"]
    }
}
```

Output:

```
{
    "createdDate": "2023-05-19T20:30:28.214829+00:00",
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see CreateIdentitySource in *AWS CLI Command Reference*.

`create-policy-store`

The following code example shows how to use `create-policy-store`.

AWS CLI

To create a policy store

The following `create-policy-store` example creates a policy store in the current AWS Region.

```
aws verifiedpermissions create-policy-store \
    --validation-settings "mode=STRICT"
```

Output:

```
{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
    "createdDate": "2023-05-16T17:41:29.103459+00:00",
    "lastUpdatedDate": "2023-05-16T17:41:29.103459+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see CreatePolicyStore in *AWS CLI Command Reference*.

`create-policy-template`

The following code example shows how to use `create-policy-template`.

AWS CLI

To create a policy template

The following `create-policy-template` example creates a policy template with a statement that contains a placeholder for the principal.

```
aws verifiedpermissions create-policy-template \
    --statement file://template1.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `template1.txt`:

```
permit(
    principal in ?principal,
    action == Action::"view",
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```
{
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111"
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see CreatePolicyTemplate in *AWS CLI Command Reference*.

`create-policy`

The following code example shows how to use `create-policy`.

AWS CLI

Example 1: To create a static policy

The following `create-policy` example creates a static policy with a policy scope that specifies both a principal and a resource.

```
aws verifiedpermissions create-policy \
    --definition file://definition1.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `definition1.txt`:

```
{
    "static": {
        "description":  "Grant everyone of janeFriends UserGroup access to the
 vacationFolder Album",
        "statement": "permit(principal in UserGroup::\"janeFriends\", action,
 resource in Album::\"vacationFolder\" );"
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:33:37.382907+00:00",
    "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
    "policyId": "SPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "STATIC",
    "principal": {
        "entityId": "janeFriends",
        "entityType": "UserGroup"
    },
    "resource": {
        "entityId": "vacationFolder",
        "entityType": "Album"
    }
}
```

Example 2: To create a static policy that grants access to a resource to everyone

The following `create-policy` example creates a static policy with a policy scope that specifies only a resource.

```
aws verifiedpermissions create-policy \
    --definition file://definition2.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `definition2.txt`:

```
{
```

```
    "static": {
        "description":  "Grant everyone access to the publicFolder Album",
        "statement": "permit(principal, action, resource in Album::\"publicFolder
\");"
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:39:44.975897+00:00",
    "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
    "policyId": "PbfR73F8oh5MMfr9uRtFDB",
    "policyStoreId": "PSEXAMPLEabcdefg222222",
    "policyType": "STATIC",
    "resource": {
        "entityId": "publicFolder",
        "entityType": "Album"
    }
}
```

Example 3: To create a template-linked policy that is associated with the specified template

The following `create-policy` example creates a template-linked policy using the specified policy template and associates the specified principal to use with the new template-linked policy.

```
aws verifiedpermissions create-policy \
    --definition file://definition.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `definition.txt`:

```
{
    "templateLinked": {
        "policyTemplateId": "PTEXAMPLEabcdefg111111",
        "principal": {
            "entityType": "User",
            "entityId": "alice"
        }
    }
```

```
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:49:51.490211+00:00",
    "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",
    "policyId": "TPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "TEMPLATE_LINKED",
    "principal": {
        "entityId": "alice",
        "entityType": "User"
    },
    "resource": {
        "entityId": "VacationPhoto94.jpg",
        "entityType": "Photo"
    }
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see CreatePolicy in *AWS CLI Command Reference*.

`delete-identity-source`

The following code example shows how to use `delete-identity-source`.

AWS CLI

To delete an identity source

The following `delete-identity-source` example deletes the identity source that has the specified Id.

```
aws verifiedpermissions delete-identity-source \
    --identity-source-id ISEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see DeleteIdentitySource in *AWS CLI Command Reference*.

`delete-policy-store`

The following code example shows how to use `delete-policy-store`.

AWS CLI

To delete a policy store

The following `delete-policy-store` example deletes the policy store that has the specified Id.

```
aws verifiedpermissions delete-policy-store \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see DeletePolicyStore in *AWS CLI Command Reference*.

`delete-policy-template`

The following code example shows how to use `delete-policy-template`.

AWS CLI

To delete a policy template

The following `delete-policy-template` example deletes the policy template that has the specified Id.

```
aws verifiedpermissions delete-policy-template \
    --policy-template-id PTEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see DeletePolicyTemplate in *AWS CLI Command Reference*.

`delete-policy`

The following code example shows how to use `delete-policy`.

AWS CLI

To delete a static or template-linked policy

The following `delete-policy` example deletes the policy that has the specified Id.

```
aws verifiedpermissions delete-policy \
    --policy-id SPEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

`get-identity-source`

The following code example shows how to use `get-identity-source`.

AWS CLI

To retrieve details about an identity source

The following `get-identity-source` example displays the details for the identity source with the specified Id.

```
aws verifiedpermissions get-identity-source \
    --identity-source-id  ISEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "createdDate": "2023-06-12T22:27:49.150035+00:00",
    "details": {
        "clientIds": [ "a1b2c3d4e5f6g7h8i9j0kalbmc" ],
        "discoveryUrl": "https://cognito-idp.us-west-2.amazonaws.com/us-
west-2_1a2b3c4d5",
        "openIdIssuer": "COGNITO",
        "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-
west-2_1a2b3c4d5"
    },
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-06-12T22:27:49.150035+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "principalEntityType": "User"
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see GetIdentitySource in *AWS CLI Command Reference*.

`get-policy-store`

The following code example shows how to use `get-policy-store`.

AWS CLI

To retrieve details about a policy store

The following `get-policy-store` example displays the details for the policy store with the specified Id.

```
aws verifiedpermissions get-policy-store \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
```

```
    "createdDate": "2023-06-05T20:16:46.225598+00:00",
    "lastUpdatedDate": "2023-06-08T20:40:23.173691+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "validationSettings": { "mode": "OFF" }
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see GetPolicyStore in *AWS CLI Command Reference*.

`get-policy-template`

The following code example shows how to use `get-policy-template`.

AWS CLI

To retrieve details about a policy template

The following `get-policy-template` example displays the details for the policy template with the specified ID.

```
aws verifiedpermissions get-policy-template \
    --policy-template-id  PTEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111",
    "statement": "permit(\n    principal in ?principal,\n    action == Action::
\"view\",\n    resource == Photo::\"VacationPhoto94.jpg\"\n);"
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see GetPolicyTemplate in *AWS CLI Command Reference*.

`get-policy`

The following code example shows how to use `get-policy`.

AWS CLI

To retrieve details about a policy

The following `get-policy` example displays the details for the policy with the specified ID.

```
aws verifiedpermissions get-policy \
    --policy-id PSEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "createdDate": "2023-06-12T20:33:37.382907+00:00",
    "definition": {
        "static": {
            "description": "Grant everyone of janeFriends UserGroup access to the
 vacationFolder Album",
            "statement": "permit(principal in UserGroup::\"janeFriends\", action,
 resource in Album::\"vacationFolder\" );"
        }
    },
    "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
    "policyId": "SPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "STATIC",
    "principal": {
        "entityId": "janeFriends",
        "entityType": "UserGroup"
    },
    "resource": {
        "entityId": "vacationFolder",
        "entityType": "Album"
    }
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

`get-schema`

The following code example shows how to use `get-schema`.

AWS CLI

To retrieve the schema in a policy store

The following `get-schema` example displays the details of the schema in the specified policy store.

```
aws verifiedpermissions get-schema \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "schema": "{\"MySampleNamespace\":{\"entityTypes\":{\"Employee\":{\"shape
\":{\"attributes\":{\"jobLevel\":{\"type\":\"Long\"},\"name\":{\"type\":\"String
\"}},\"type\":\"Record\"}}},\"actions\":{\"remoteAccess\":{\"appliesTo\":
{\"principalTypes\":[\"Employee\"]}}}}",
    "createdDate": "2023-06-14T17:47:13.999885+00:00",
    "lastUpdatedDate": "2023-06-14T17:47:13.999885+00:00"
}
```

For more information about schema, see Policy store schema in the *Amazon Verified Permissions User Guide*.

- For API details, see GetSchema in *AWS CLI Command Reference*.

`is-authorized-with-token`

The following code example shows how to use `is-authorized-with-token`.

AWS CLI

Example 1: To request an authorization decision for a user request (allow)

The following `is-authorized-with-token` example requests an authorization decision for a user who was authenticated by Amazon Cognito. The request uses the identity token provided

by Cognito rather than the access token. In this example, the specified information store is configured to return principals as entities of type `CognitoUser`.

```
aws verifiedpermissions is-authorized-with-token \
    --action actionId="View",actionType="Action" \
    --resource entityId="vacationPhoto94.jpg",entityType="Photo" \
    --policy-store-id PSEXAMPLEabcdefg111111 \
    --identity-token "AbCdE12345...long.string...54321EdCbA"
```

The policy store contains a policy with the following statement that accepts identities from the specified Cognito user pool and application Id.

```
permit(
    principal == CognitoUser::"us-west-2_1a2b3c4d5|a1b2c3d4e5f6g7h8i9j0kalbmc",
    action,
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```
{
    "decision":"Allow",
    "determiningPolicies":[
        {
            "policyId":"SPEXAMPLEabcdefg111111"
        }
    ],
    "errors":[]
}
```

For more information about using identities from a Cognito user pool, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see IsAuthorizedWithToken in *AWS CLI Command Reference*.

`is-authorized`

The following code example shows how to use `is-authorized`.

AWS CLI

Example 1: To request an authorization decision for a user request (allow)

The following `is-authorized` example requests an authorization decision for a principal of type `User` named `Alice`, who wants to perform the `updatePhoto` operation, on a resource of type `Photo` named `VacationPhoto94.jpg`.

The response shows that the request is allowed by one policy.

```
aws verifiedpermissions is-authorized \
    --principal entityType=User,entityId=alice \
    --action actionType=Action,actionId=view \
    --resource entityType=Photo,entityId=VactionPhoto94.jpg \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "decision": "ALLOW",
    "determiningPolicies": [
        {
            "policyId": "SPEXAMPLEabcdefg111111"
        }
    ],
    "errors": []
}
```

Example 2: To request an authorization decision for a user request (deny)

The following `is-authorized` example requests the same authorization decision as the previous example, except that the principal is `User::"Bob"`. The policy store doesn't contain any policy that allows that user access to `Album::"alice_folder"`.

The output indicates that the `Deny` was implicit because the list of `DeterminingPolicies` is empty.

```
aws verifiedpermissions is-authorized \
    --principal entityType=User,entityId=bob \
    --action actionType=Action,actionId=view \
    --resource entityType=Photo,entityId=VactionPhoto94.jpg \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
```

```
    "decision": "DENY",
    "determiningPolicies": [],
    "errors": []
}
```

For more information, see Implementing authorization in Amazon Verified Permissions in the *Amazon Verified Permissions User Guide*.

- For API details, see IsAuthorized in *AWS CLI Command Reference*.

`list-identity-sources`

The following code example shows how to use `list-identity-sources`.

AWS CLI

To list the available identity sources

The following `list-identity-sources` example lists all identity sources in the specified policy store.

```
aws verifiedpermissions list-identity-sources \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "identitySources": [
        {
            "createdDate": "2023-06-12T22:27:49.150035+00:00",
            "details": {
                "clientIds": [ "a1b2c3d4e5f6g7h8i9j0kalbmc" ],
                "discoveryUrl": "https://cognito-idp.us-west-2.amazonaws.com/us-
west-2_1a2b3c4d5",
                "openIdIssuer": "COGNITO",
                "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/
us-west-2_1a2b3c4d5"
            },
            "identitySourceId": "ISEXAMPLEabcdefg111111",
            "lastUpdatedDate": "2023-06-12T22:27:49.150035+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "principalEntityType": "User"
        }
```

```
    ]
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see ListIdentitySources in *AWS CLI Command Reference*.

`list-policies`

The following code example shows how to use `list-policies`.

AWS CLI

To list the available policies

The following `list-policies` example lists all policies in the specified policy store.

```
aws verifiedpermissions list-policies \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "policies": [
        {
            "createdDate": "2023-06-12T20:33:37.382907+00:00",
            "definition": {
                "static": {
                    "description": "Grant everyone of janeFriends UserGroup access
 to the vacationFolder Album"
                }
            },

        }
    ]
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

`list-policy-stores`

The following code example shows how to use `list-policy-stores`.

AWS CLI

To list the available policy stores

The following `list-policy-stores` example lists all policy stores in the AWS Region. All commands for Verified Permissions except `create-policy-store` and `list-policy-stores` require that you specify the Id of the policy store you want to work with.

```
aws verifiedpermissions list-policy-stores
```

Output:

```
{
    "policyStores": [
        {
            "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
            "createdDate": "2023-06-05T20:16:46.225598+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg111111"
        },
        {
            "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg222222",
            "createdDate": "2023-06-08T18:09:37.364356+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg222222"
        },
        {
            "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg333333",
            "createdDate": "2023-06-08T18:09:46.920600+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg333333"
        }
    ]
```

```
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see ListPolicyStores in *AWS CLI Command Reference*.

`list-policy-templates`

The following code example shows how to use `list-policy-templates`.

AWS CLI

To list the available policy templates

The following `list-policy-templates` example lists all policy templates in the specified policy store.

```
aws verifiedpermissions list-policy-templates \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "policyTemplates": [
        {
            "createdDate": "2023-06-12T20:47:42.804511+00:00",
            "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyTemplateId": "PTEXAMPLEabcdefg111111"
        }
    ]
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see ListPolicyTemplates in *AWS CLI Command Reference*.

`put-schema`

The following code example shows how to use `put-schema`.

AWS CLI

To save a schema to a policy store

The following `put-schema` example creates or replaces the schema in the specified policy store.

The `cedarJson` parameter in the input file takes a string representation of a JSON object. It contains embedded quotation marks (") within the outermost quotation mark pair. This requires you to convert the JSON to a string by preceding all embedded quotation marks with a backslash character (\") and combining all lines into a single text line with no line breaks.

Example strings can be displayed wrapped across multiple lines here for readability, but the operation requires the parameters be submitted as single line strings.

aws verifiedpermissions put-schema --definition file://schema.txt --policy-store-id PSEXAMPLEabcdefg111111

Contents of `schema.txt`:

```
{
    "cedarJson": "{\"MySampleNamespace\": {\"actions\": {\"remoteAccess\": {
            \"appliesTo\": {\"principalTypes\": [\"Employee\"]}}},\"entityTypes\": {
            \"Employee\": {\"shape\": {\"attributes\": {\"jobLevel\": {\"type\":
            \"Long\"},\"name\": {\"type\": \"String\"}},\"type\": \"Record\"}}}}}"
}
```

Output:

```
{
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "namespaces": [
        "MySampleNamespace"
    ],
    "createdDate": "2023-06-14T17:47:13.999885+00:00",
    "lastUpdatedDate": "2023-06-14T17:47:13.999885+00:00"
}
```

For more information about schema, see Policy store schema in the *Amazon Verified Permissions User Guide*.

- For API details, see PutSchema in *AWS CLI Command Reference*.

`update-identity-source`

The following code example shows how to use `update-identity-source`.

AWS CLI

To update an identity source

The following `update-identity-source` example modifies the specified identity source by providing a new Cognito user pool configuration and changing the entity type returned by the identity source.

```
aws verifiedpermissions update-identity-source \
    --identity-source-id ISEXAMPLEabcdefg111111 \
    --update-configuration file://config.txt \
    --principal-entity-type "Employee" \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `config.txt`:

```
{
    "cognitoUserPoolConfiguration": {
        "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-
west-2_1a2b3c4d5",
        "clientIds":["a1b2c3d4e5f6g7h8i9j0kalbmc"]
    }
}
```

Output:

```
{
    "createdDate": "2023-05-19T20:30:28.214829+00:00",
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdateIdentitySource in *AWS CLI Command Reference*.

`update-policy-store`

The following code example shows how to use `update-policy-store`.

AWS CLI

To update a policy store

The following `update-policy-store` example modifies a policy store by changing its validation setting.

```
aws verifiedpermissions update-policy-store \
    --validation-settings "mode=STRICT" \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
    "createdDate": "2023-05-16T17:41:29.103459+00:00",
    "lastUpdatedDate": "2023-05-16T17:41:29.103459+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdatePolicyStore in *AWS CLI Command Reference*.

`update-policy-template`

The following code example shows how to use `update-policy-template`.

AWS CLI

Example 1: To update a policy template

The following `update-policy-template` example modifies the specified template-linked policy to replace its policy statement.

```
aws verifiedpermissions update-policy-template \
    --policy-template-id PTEXAMPLEabcdefg111111 \
    --statement file://template1.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `template1.txt`:

```
permit(
    principal in ?principal,
    action == Action::"view",
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```
{
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111"
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdatePolicyTemplate in *AWS CLI Command Reference*.

`update-policy`

The following code example shows how to use `update-policy`.

AWS CLI

To update a static policy

The following `update-policy` example modifies an existing static policy by updating its description and statement.

```
aws verifiedpermissions update-policy \
    --policy-id SPEXAMPLEabcdefg111111 \
    --definition file://updated-definition.txt \
```

```
    --policy-store-id PSEXAMPLEabcdefg111111
```

The `statement` parameter takes a string representation of a JSON object. It contains embedded quotation marks (") within the outermost quotation mark pair. This requires you to convert the JSON to a string by preceding all embedded quotation marks with a backslash character (\") and combining all lines into a single text line with no line breaks.

You can display example strings wrapped across multiple lines for readability, but the operation requires the parameters to be submitted as single-line strings.

Contents of `updated-definition.txt`:

```
{
    "static": {
        "description": "Updated policy to grant janeFriends UserGroup access to the
 vacationFolder Album with view action only",
        "statement": "permit(principal in UserGroup::\"janeFriends\", action ==
 Action::\"view\", resource in Album::\"vacationFolder\" );"
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:33:37.382907+00:00",
    "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
    "policyId": "SPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "STATIC",
    "principal": {
        "entityId": "janeFriends",
        "entityType": "UserGroup"
    },
    "resource": {
        "entityId": "vacationFolder",
        "entityType": "Album"
    }
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdatePolicy in *AWS CLI Command Reference*.

VPC Lattice examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with VPC Lattice.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-listener`

The following code example shows how to use `create-listener`.

AWS CLI

To create a listener

The following `create-listener` example creates an HTTPS listener with a default rule that forwards traffic to the specified VPC Lattice target group.

```
aws vpc-lattice create-listener \
    --name my-service-listener \
    --protocol HTTPS \
    --port 443 \
    --service-identifier svc-0285b53b2eEXAMPLE \
    --default-action file://listener-config.json
```

Contents of `listener-config.json`:

```
{
    "forward": {
```

```
        "targetGroups": [
            {
                "targetGroupIdentifier": "tg-0eaa4b9ab4EXAMPLE"
            }
        ]
    }
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE/listener/listener-07cc7fb0abEXAMPLE",
    "defaultAction": {
        "forward": {
            "targetGroups": [
                {
                    "targetGroupIdentifier": "tg-0eaa4b9ab4EXAMPLE",
                    "weight": 100
                }
            ]
        }
    },
    "id": "listener-07cc7fb0abEXAMPLE",
    "name": "my-service-listener",
    "port": 443,
    "protocol": "HTTPS",
    "serviceArn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "serviceId": "svc-0285b53b2eEXAMPLE"
}
```

For more information, see Listeners in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateListener in *AWS CLI Command Reference*.

`create-resource-configuration`

The following code example shows how to use `create-resource-configuration`.

AWS CLI

To create a resource configuration

The following `create-resource-configuration` example creates a resource configuration that specifies a single IPv4 address.

```
aws vpc-lattice create-resource-configuration \
    --name my-resource-config \
    --type SINGLE \
    --resource-gateway-identifier rgw-0bba03f3d56060135 \
    --resource-configuration-definition 'ipResource={ipAddress=10.0.14.85}'
```

Output:

```
{
    "allowAssociationToShareableServiceNetwork": true,
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:resourceconfiguration/
rcfg-07129f3acded87625",
    "id": "rcfg-07129f3acded87625",
    "name": "my-resource-config",
    "portRanges": [
        "1-65535"
    ],
    "protocol": "TCP",
    "resourceConfigurationDefinition": {
        "ipResource": {
            "ipAddress": "10.0.14.85"
        }
    },
    "resourceGatewayId": "rgw-0bba03f3d56060135",
    "status": "ACTIVE",
    "type": "SINGLE"
}
```

For more information, see Resource configurations for VPC resources in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateResourceConfiguration in *AWS CLI Command Reference*.

`create-resource-gateway`

The following code example shows how to use `create-resource-gateway`.

AWS CLI

To create a resource gateway

The following `create-resource-gateway` example creates a resource gateway for the specified subnet.

```
aws vpc-lattice create-resource-gateway \
    --name my-resource-gateway \
    --vpc-identifier vpc-0bf4c2739bc05a69 \
    --subnet-ids subnet-08e8943905b63a683
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:resourcegateway/
rgw-0bba03f3d56060135",
    "id": "rgw-0bba03f3d56060135",
    "ipAddressType": "IPV4",
    "name": "my-resource-gateway",
    "securityGroupIds": [
        "sg-087ffd596c5fe962c"
    ],
    "status": "ACTIVE",
    "subnetIds": [
        "subnet-08e8943905b63a683"
    ],
    "vpcIdentifier": "vpc-0bf4c2739bc05a694"
}
```

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateResourceGateway in *AWS CLI Command Reference*.

`create-service-network-service-association`

The following code example shows how to use `create-service-network-service-association`.

AWS CLI

To create a service association

The following `create-service-network-service-association` example associates the specified service with the specified service network.

```
aws vpc-lattice create-service-network-service-association \
    --service-identifier svc-0285b53b2eEXAMPLE \
    --service-network-identifier sn-080ec7dc93EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-
west-2:123456789012:servicenetworkserviceassociation/snsa-0e16955a8cEXAMPLE",
    "createdBy": "123456789012",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-
svcs.us-west-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CEXAMPLE"
    },
    "id": "snsa-0e16955a8cEXAMPLE",
    "status": "CREATE_IN_PROGRESS"
}
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateServiceNetworkServiceAssociation in *AWS CLI Command Reference*.

`create-service-network-vpc-association`

The following code example shows how to use `create-service-network-vpc-association`.

AWS CLI

To create a VPC association

The following `create-service-network-vpc-association` example associates the specified vpc with the specified service network. The specified security group controls which resources in the VPC can access the service network and its services.

```
aws vpc-lattice create-service-network-vpc-association \
```

```
    --vpc-identifier vpc-0a1b2c3d4eEXAMPLE \
    --service-network-identifier sn-080ec7dc93EXAMPLE \
    --security-group-ids sg-0aee16bc6cEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",
    "createdBy": "123456789012",
    "id": "snva-0821fc8631EXAMPLE",
    "securityGroupIds": [
        "sg-0aee16bc6cEXAMPLE"
    ],
    "status": "CREATE_IN_PROGRESS"
}
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateServiceNetworkVpcAssociation in *AWS CLI Command Reference*.

`create-service-network`

The following code example shows how to use `create-service-network`.

AWS CLI

To create a service network

The following `create-service-network` example creates a service network with the specified name.

```
aws vpc-lattice create-service-network \
    --name my-service-network
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "authType": "NONE",
    "id": "sn-080ec7dc93EXAMPLE",
```

```
    "name": "my-service-network"
}
```

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateServiceNetwork in *AWS CLI Command Reference*.

`create-service`

The following code example shows how to use `create-service`.

AWS CLI

To create a service

The following `create-service` example creates a service with the specified name.

```
aws vpc-lattice create-service \
    --name my-lattice-service
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "authType": "NONE",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.1a2b3c4.vpc-lattice-
svcs.us-west-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CEXAMPLE"
    },
    "id": "svc-0285b53b2eEXAMPLE",
    "name": "my-lattice-service",
    "status": "CREATE_IN_PROGRESS"
}
```

For more information, see Services in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateService in *AWS CLI Command Reference*.

`create-target-group`

The following code example shows how to use `create-target-group`.

AWS CLI

Example 1: To create a target group of type INSTANCE

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-instance \
    --type INSTANCE \
    --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "healthCheck": {
            "enabled": true,
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
            "matcher": {
                "httpCode": "200"
            },
            "path": "/",
            "protocol": "HTTPS",
            "protocolVersion": "HTTP1",
            "unhealthyThresholdCount": 2
        },
        "port": 443,
        "protocol": "HTTPS",
```

```
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-instance",
    "status": "CREATE_IN_PROGRESS",
    "type": "INSTANCE"
}
```

Example 2: To create a target group of type IP

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-ip \
    --type IP \
    --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{
    "ipAddressType": "IPV4",
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "healthCheck": {
            "enabled": true,
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
            "matcher": {
                "httpCode": "200"
```

```
            },
            "path": "/",
            "protocol": "HTTPS",
            "protocolVersion": "HTTP1",
            "unhealthyThresholdCount": 2
        },
        "ipAddressType": "IPV4",
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-ip",
    "status": "CREATE_IN_PROGRESS",
    "type": "IP"
}
```

Example 3: To create a target group of type LAMBDA

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-lambda \
    --type LAMBDA
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-lambda",
    "status": "CREATE_IN_PROGRESS",
    "type": "LAMBDA"
}
```

Example 4: To create a target group of type ALB

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-alb \
    --type ALB \
    --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-alb",
    "status": "CREATE_IN_PROGRESS",
    "type": "ALB"
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateTargetGroup in *AWS CLI Command Reference*.

`delete-auth-policy`

The following code example shows how to use `delete-auth-policy`.

AWS CLI

To delete an auth policy

The following `delete-auth-policy` example deletes the auth policy for the specified service.

```
aws vpc-lattice delete-auth-policy \
    --resource-identifier svc-0285b53b2eEXAMPLE
```

This command produces no output.

For more information, see Auth policies in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteAuthPolicy in *AWS CLI Command Reference*.

`delete-listener`

The following code example shows how to use `delete-listener`.

AWS CLI

To delete a listener

The following `delete-listener` example deletes the specified listener.

```
aws vpc-lattice delete-listener \
    --listener-identifier listener-07cc7fb0abEXAMPLE \
    --service-identifier svc-0285b53b2eEXAMPLE
```

This command produces no output.

For more information, see Listeners in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteListener in *AWS CLI Command Reference*.

`delete-resource-configuration`

The following code example shows how to use `delete-resource-configuration`.

AWS CLI

To delete a resource configuration

The following `delete-resource-configuration` example deletes the specified resource configuration.

```
aws vpc-lattice delete-resource-configuration \
```

```
    --resource-configuration-identifier rcfg-07129f3acded87625
```

This command produces no output.

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteResourceConfiguration in *AWS CLI Command Reference*.

`delete-resource-gateway`

The following code example shows how to use `delete-resource-gateway`.

AWS CLI

To delete a resource gateway

The following `delete-resource-gateway` example deletes the specified resource gateway.

```
aws vpc-lattice delete-resource-gateway \
    --resource-gateway-identifier rgw-0bba03f3d56060135
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:resourcegateway/
rgw-0bba03f3d56060135",
    "id": "rgw-0bba03f3d56060135",
    "name": "my-resource-gateway",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteResourceGateway in *AWS CLI Command Reference*.

`delete-service-network-service-association`

The following code example shows how to use `delete-service-network-service-association`.

AWS CLI

To delete a service association

The following `delete-service-network-service-association` example disassociates the specified service association.

```
aws vpc-lattice delete-service-network-service-association \
    --service-network-service-association-identifier snsa-031fabb4d8EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-
west-2:123456789012:servicenetworkserviceassociation/snsa-031fabb4d8EXAMPLE",
    "id": "snsa-031fabb4d8EXAMPLE",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteServiceNetworkServiceAssociation in *AWS CLI Command Reference*.

`delete-service-network-vpc-association`

The following code example shows how to use `delete-service-network-vpc-association`.

AWS CLI

To delete a VPC association

The following `delete-service-network-vpc-association` example disassociates the specified VPC association.

```
aws vpc-lattice delete-service-network-vpc-association \
    --service-network-vpc-association-identifier snva-0821fc8631EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",
```

```
    "id": "snva-0821fc8631EXAMPLE",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteServiceNetworkVpcAssociation in *AWS CLI Command Reference*.

`delete-service-network`

The following code example shows how to use `delete-service-network`.

AWS CLI

To delete a service network

The following `delete-service-network` example deletes the specified service network.

```
aws vpc-lattice delete-service-network \
    --service-network-identifier sn-080ec7dc93EXAMPLE
```

This command produces no output.

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteServiceNetwork in *AWS CLI Command Reference*.

`delete-service`

The following code example shows how to use `delete-service`.

AWS CLI

To delete a service

The following `delete-service` example deletes the specified service.

```
aws vpc-lattice delete-service \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "id": "svc-0285b53b2eEXAMPLE",
    "name": "my-lattice-service",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Services in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteService in *AWS CLI Command Reference*.

`delete-target-group`

The following code example shows how to use `delete-target-group`.

AWS CLI

To delete a target group

The following `delete-target-group` example deletes the specified target group.

```
aws vpc-lattice delete-target-group \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteTargetGroup in *AWS CLI Command Reference*.

`deregister-targets`

The following code example shows how to use `deregister-targets`.

AWS CLI

To deregister a target

The following `deregister-targets` example deregisters the specified target from the specified target group.

```
aws vpc-lattice deregister-targets \
    --targets id=i-07dd579bc5EXAMPLE \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "successful": [
        {
            "id": "i-07dd579bc5EXAMPLE",
            "port": 443
        }
    ],
    "unsuccessful": []
}
```

For more information, see Register targets in the *Amazon VPC Lattice User Guide*.

- For API details, see DeregisterTargets in *AWS CLI Command Reference*.

`get-auth-policy`

The following code example shows how to use `get-auth-policy`.

AWS CLI

To get information about an auth policy

The following `get-auth-policy` example gets information about the auth policy for the specified service.

```
aws vpc-lattice get-auth-policy \
    --resource-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "createdAt": "2023-06-07T03:51:20.266Z",
    "lastUpdatedAt": "2023-06-07T04:39:27.082Z",
    "policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:role/my-clients\"},
\"Action\":\"vpc-lattice-svcs:Invoke\",\"Resource\":\"arn:aws:vpc-lattice:us-
west-2:123456789012:service/svc-0285b53b2eEXAMPLE\"}]}",
    "state": "Active"
}
```

For more information, see Auth policies in the *Amazon VPC Lattice User Guide*.

- For API details, see GetAuthPolicy in *AWS CLI Command Reference*.

`get-listener`

The following code example shows how to use `get-listener`.

AWS CLI

To get information about a service listener

The following `get-listener` example gets information about the specified listener for the specified service.

```
aws vpc-lattice get-listener \
    --listener-identifier listener-0ccf55918cEXAMPLE \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE/listener/listener-0ccf55918cEXAMPLE",
    "createdAt": "2023-05-07T05:08:45.192Z",
    "defaultAction": {
        "forward": {
            "targetGroups": [
                {
                    "targetGroupIdentifier": "tg-0ff213abb6EXAMPLE",
```

```
                    "weight": 1
                }
            ]
        }
    },
    "id": "listener-0ccf55918cEXAMPLE",
    "lastUpdatedAt": "2023-05-07T05:08:45.192Z",
    "name": "http-80",
    "port": 80,
    "protocol": "HTTP",
    "serviceArn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "serviceId": "svc-0285b53b2eEXAMPLE"
}
```

For more information, see Define routing in the *Amazon VPC Lattice User Guide*.

- For API details, see GetListener in *AWS CLI Command Reference*.

`get-resource-configuration`

The following code example shows how to use `get-resource-configuration`.

AWS CLI

To get information about a resource configuration

The following `get-resource-configuration` example gets information about the specified resource configuration.

```
aws vpc-lattice get-resource-configuration \
    --resource-configuration-identifier rcfg-07129f3acded87625
```

Output:

```
{
    "allowAssociationToShareableServiceNetwork": true,
    "amazonManaged": false,
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:resourceconfiguration/
rcfg-07129f3acded87625",
    "createdAt": "2025-02-01T00:57:35.871000+00:00",
    "id": "rcfg-07129f3acded87625",
```

```

    "portRanges": [
        "1-65535"
    ],
    "protocol": "TCP",
    "resourceConfigurationDefinition": {
        "ipResource": {
            "ipAddress": "10.0.14.85"
        }
    },
    "resourceGatewayId": "rgw-0bba03f3d56060135",
    "status": "ACTIVE",
    "type": "SINGLE"
}
```

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see GetResourceConfiguration in *AWS CLI Command Reference*.

`get-resource-gateway`

The following code example shows how to use `get-resource-gateway`.

AWS CLI

To get information about a resource gateway

The following `get-resource-gateway` example gets information about the specified resource gateway.

```
aws vpc-lattice get-resource-gateway \
    --resource-gateway-identifier rgw-0bba03f3d56060135
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:resourcegateway/
rgw-0bba03f3d56060135",
    "createdAt": "2025-02-01T00:57:33.241000+00:00",
    "id": "rgw-0bba03f3d56060135",
```

```

    "name": "my-resource-gateway",
    "securityGroupIds": [
        "sg-087ffd596c5fe962c"
    ],
    "status": "ACTIVE",
    "subnetIds": [
        "subnet-08e8943905b63a683"
    ],
    "vpcId": "vpc-0bf4c2739bc05a694"
}
```

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see GetResourceGateway in *AWS CLI Command Reference*.

`get-service-network-service-association`

The following code example shows how to use `get-service-network-service-association`.

AWS CLI

To get information about a service association

The following `get-service-network-service-association` example gets information about the specified service association.

```
aws vpc-lattice get-service-network-service-association \
    --service-network-service-association-identifier snsa-031fabb4d8EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-
west-2:123456789012:servicenetworkserviceassociation/snsa-031fabb4d8EXAMPLE",

    "serviceNetworkId": "sn-080ec7dc93EXAMPLE",
    "serviceNetworkName": "my-service-network",
    "status": "ACTIVE"
}
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see GetServiceNetworkServiceAssociation in *AWS CLI Command Reference*.

`get-service-network-vpc-association`

The following code example shows how to use `get-service-network-vpc-association`.

AWS CLI

To get information about a VPC association

The following `get-service-network-vpc-association` example gets information about the specified VPC association.

```
aws vpc-lattice get-service-network-vpc-association \
    --service-network-vpc-association-identifier snva-0821fc8631EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",
    "createdAt": "2023-06-06T23:41:08.421Z",
    "createdBy": "123456789012",

    "lastUpdatedAt": "2023-06-06T23:41:08.421Z",
    "securityGroupIds": [
```

```
        "sg-0aee16bc6cEXAMPLE"
    ],
    "serviceNetworkArn": "arn:aws:vpc-lattice:us-west-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "serviceNetworkId": "sn-080ec7dc93EXAMPLE",
    "serviceNetworkName": "my-service-network",
    "status": "ACTIVE",
    "vpcId": "vpc-0a1b2c3d4eEXAMPLE"
}
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see GetServiceNetworkVpcAssociation in *AWS CLI Command Reference*.

`get-service-network`

The following code example shows how to use `get-service-network`.

AWS CLI

To get information about a service network

The following `get-service-network` example gets information about the specified service network.

```
aws vpc-lattice get-service-network \
    --service-network-identifier sn-080ec7dc93EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "authType": "AWS_IAM",
    "createdAt": "2023-05-05T15:26:08.417Z",
    "id": "sn-080ec7dc93EXAMPLE",
    "lastUpdatedAt": "2023-05-05T15:26:08.417Z",
    "name": "my-service-network",
    "numberOfAssociatedServices": 2,
    "numberOfAssociatedVPCs": 3
}
```

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see GetServiceNetwork in *AWS CLI Command Reference*.

`get-service`

The following code example shows how to use `get-service`.

AWS CLI

To get information about a service

The following `get-service` example gets information about the specified service.

```
aws vpc-lattice get-service \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "authType": "AWS_IAM",
    "createdAt": "2023-05-05T21:35:29.339Z",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-
svcs.us-west-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CFUOHIZH"
    },
    "id": "svc-0285b53b2eEXAMPLE",
    "lastUpdatedAt": "2023-05-05T21:35:29.339Z",
    "name": "my-lattice-service",
    "status": "ACTIVE"
}
```

For more information, see Services in the *Amazon VPC Lattice User Guide*.

- For API details, see GetService in *AWS CLI Command Reference*.

`get-target-group`

The following code example shows how to use `get-target-group`.

AWS CLI

To get information about a target group

The following `get-target-group` example gets information about the specified target group, which has a target type of `INSTANCE`.

```
aws vpc-lattice get-target-group \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "healthCheck": {
            "enabled": true,
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
            "matcher": {
                "httpCode": "200"
            },

    ],
    "status": "ACTIVE",
    "type": "INSTANCE"
```

```
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see GetTargetGroup in *AWS CLI Command Reference*.

`list-listeners`

The following code example shows how to use `list-listeners`.

AWS CLI

To list service listeners

The following `list-listeners` example lists the listeners for the specified service.

```
aws vpc-lattice list-listeners \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE/listener/listener-0ccf55918cEXAMPLE",
            "createdAt": "2023-05-07T05:08:45.192Z",
            "id": "listener-0ccf55918cEXAMPLE",
            "lastUpdatedAt": "2023-05-07T05:08:45.192Z",
            "name": "http-80",
            "port": 80,
            "protocol": "HTTP"
        }
    ]
}
```

For more information, see Define routing in the *Amazon VPC Lattice User Guide*.

- For API details, see ListListeners in *AWS CLI Command Reference*.

`list-resource-configurations`

The following code example shows how to use `list-resource-configurations`.

AWS CLI

To list your resource configurations

The following `list-resource-configurations` example lists your resource configurations.

```
aws vpc-lattice list-resource-configurations
```

Output:

```
{
    "items": [
        {
            "amazonManaged": false,
            "arn": "arn:aws:vpc-lattice:us-
west-2:123456789012:resourceconfiguration/rcfg-07129f3acded87625",
            "createdAt": "2025-02-01T00:57:35.871000+00:00",
            "id": "rcfg-07129f3acded87625",
            "lastUpdatedAt": "2025-02-01T00:57:46.874000+00:00",
            "name": "my-resource-config",
            "resourceGatewayId": "rgw-0bba03f3d56060135",
            "status": "ACTIVE",
            "type": "SINGLE"
        }
    ]
}
```

For more information, see Resource configurations in the *Amazon VPC Lattice User Guide*.

- For API details, see ListResourceConfigurations in *AWS CLI Command Reference*.

`list-resource-endpoint-associations`

The following code example shows how to use `list-resource-endpoint-associations`.

AWS CLI

To list the VPC endpoint associations

The following `list-resource-endpoint-associations` example lists the VPC endpoints associated with the specified resource configuration.

```
aws vpc-lattice list-resource-endpoint-associations \
```

```
    --resource-configuration-identifier rcfg-07129f3acded87625
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:vpc-lattice:us-
west-2:123456789012:resourceendpointassociation/rea-0956a7435baf89326",
            "createdAt": "2025-02-01T00:57:38.998000+00:00",
            "id": "rea-0956a7435baf89326",
            "resourceConfigurationArn": "arn:aws:vpc-lattice:us-
west-2:123456789012:resourceconfiguration/rcfg-07129f3acded87625",
            "resourceConfigurationId": "rcfg-07129f3acded87625",
            "vpcEndpointId": "vpce-019b90d6f16d4f958",
            "vpcEndpointOwner": "123456789012"
        }
    ]
}
```

For more information, see Manage associations for a VPC Lattice resource configuration in the *Amazon VPC Lattice User Guide*.

- For API details, see ListResourceEndpointAssociations in *AWS CLI Command Reference*.

`list-resource-gateways`

The following code example shows how to use `list-resource-gateways`.

AWS CLI

To list your resource gateways

The following `list-resource-gateways` example lists your resource gateways.

```
aws vpc-lattice list-resource-gateways
```

Output:

```
{
    "items": [
        {
```

```
            "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:resourcegateway/
rgw-0bba03f3d56060135",
            "createdAt": "2025-02-01T00:57:33.241000+00:00",
            "id": "rgw-0bba03f3d56060135",
            "ipAddressType": "IPV4",
            "lastUpdatedAt": "2025-02-01T00:57:44.351000+00:00",
            "name": "my-resource-gateway",
            "securityGroupIds": [
                "sg-087ffd596c5fe962c"
            ],
            "status": "ACTIVE",
            "subnetIds": [
                "subnet-08e8943905b63a683"
            ],
            "vpcIdentifier": "vpc-0bf4c2739bc05a694"
        }
    ]
}
```

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see ListResourceGateways in *AWS CLI Command Reference*.

`list-service-network-service-associations`

The following code example shows how to use `list-service-network-service-associations`.

AWS CLI

To list service associations

The following `list-service-network-service-associations` example lists the service associations for the specified service network. The `--query` option scopes the output to the IDs of the service associations.

```
aws vpc-lattice list-service-network-service-associations \
    --service-network-identifier sn-080ec7dc93EXAMPLE \
    --query items[*].id
```

Output:

```
[
    "snsa-031fabb4d8EXAMPLE",
    "snsa-0e16955a8cEXAMPLE"
]
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworkServiceAssociations in *AWS CLI Command Reference*.

`list-service-network-vpc-associations`

The following code example shows how to use `list-service-network-vpc-associations`.

AWS CLI

To list VPC associations

The following `list-service-network-vpc-associations` example lists the VPC associations for the specified service network. The `--query` option scopes the output to the IDs of the VPC associations.

```
aws vpc-lattice list-service-network-vpc-associations \
    --service-network-identifier sn-080ec7dc93EXAMPLE \
    --query items[*].id
```

Output:

```
[
    "snva-0821fc8631EXAMPLE",
    "snva-0c5dcb60d6EXAMPLE"
]
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworkVpcAssociations in *AWS CLI Command Reference*.

`list-service-network-vpc-endpoint-associations`

The following code example shows how to use `list-service-network-vpc-endpoint-associations`.

AWS CLI

To list the VPC endpoint associations

The following `list-service-network-vpc-endpoint-associations` example lists the VPC endpoints associated with the specific service network.

```
aws vpc-lattice list-service-network-vpc-endpoint-associations \
    --service-network-identifier sn-0808d1748faee0c1e
```

Output:

```
{
    "items": [
        {
            "createdAt": "2025-02-01T01:21:36.667000+00:00",
            "serviceNetworkArn": "arn:aws:vpc-lattice:us-
west-2:123456789012:servicenetwork/sn-0808d1748faee0c1e",
            "state": "ACTIVE",
            "vpcEndpointId": "vpce-0cc199f605eaeace7",
            "vpcEndpointOwnerId": "123456789012"
        }
    ]
}
```

For more information, see Manage the associations for a VPC Lattice service network in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworkVpcEndpointAssociations in *AWS CLI Command Reference*.

`list-service-networks`

The following code example shows how to use `list-service-networks`.

AWS CLI

To list your service networks

The following `list-service-networks` example lists the service networks owned or shared with the calling account. The `--query` option scopes the results to the Amazon Resource Names (ARN) of the service networks.

```
aws vpc-lattice list-service-networks \
    --query items[*].arn
```

Output:

```
[
    "arn:aws:vpc-lattice:us-west-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "arn:aws:vpc-lattice:us-west-2:123456789111:servicenetwork/sn-0ec4d436cfEXAMPLE"
]
```

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworks in *AWS CLI Command Reference*.

`list-services`

The following code example shows how to use `list-services`.

AWS CLI

To list your services

The following `list-services` example lists the services owned or shared with the calling account. The `--query` option scopes the results to the Amazon Resource Names (ARN) of the services.

```
aws vpc-lattice list-services \
    --query items[*].arn
```

Output:

```
[
    "arn:aws:vpc-lattice:us-west-2:123456789012:service/svc-0285b53b2eEXAMPLE",
    "arn:aws:vpc-lattice:us-west-2:123456789111:service/svc-0b8ac96550EXAMPLE"
]
```

For more information, see Services in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServices in *AWS CLI Command Reference*.

`list-target-groups`

The following code example shows how to use `list-target-groups`.

AWS CLI

To list your target groups

The following `list-target-groups` example lists the target groups with a target type of LAMBDA.

```
aws vpc-lattice list-target-groups \
    --target-group-type LAMBDA
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:targetgroup/
tg-045c1b7d9dEXAMPLE",
            "createdAt": "2023-05-06T05:22:16.637Z",
            "id": "tg-045c1b7d9dEXAMPLE",
            "lastUpdatedAt": "2023-05-06T05:22:16.637Z",
            "name": "my-target-group-lam",
            "serviceArns": [
                "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE"
            ],
            "status": "ACTIVE",
            "type": "LAMBDA"
        }
    ]
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see ListTargetGroups in *AWS CLI Command Reference*.

`list-targets`

The following code example shows how to use `list-targets`.

AWS CLI

To list the targets for a target group

The following `list-targets` example lists the targets for the specified target group.

```
aws vpc-lattice list-targets \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "items": [
        {
            "id": "i-07dd579bc5EXAMPLE",
            "port": 443,
            "status": "HEALTHY"
        },
        {
            "id": "i-047b3c9078EXAMPLE",
            "port": 443,
            "reasonCode": "HealthCheckFailed",
            "status": "UNHEALTHY"
        }
    ]
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see ListTargets in *AWS CLI Command Reference*.

`put-auth-policy`

The following code example shows how to use `put-auth-policy`.

AWS CLI

To create an auth policy for a service

The following `put-auth-policy` example grants access to requests from any authenticated principal that uses the specified IAM role. The resource is the ARN of the service to which the policy is attached.

```
aws vpc-lattice put-auth-policy \
    --resource-identifier svc-0285b53b2eEXAMPLE \
    --policy file://auth-policy.json
```

Contents of `auth-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:role/my-clients"
            },
            "Action": "vpc-lattice-svcs:Invoke",
            "Resource": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE"
        }
    ]
}
```

Output:

```
{
    "policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:role/my-clients\"},
\"Action\":\"vpc-lattice-svcs:Invoke\",\"Resource\":\"arn:aws:vpc-lattice:us-
west-2:123456789012:service/svc-0285b53b2eEXAMPLE\"}]}",
    "state": "Active"
}
```

For more information, see Auth policies in the *Amazon VPC Lattice User Guide*.

- For API details, see PutAuthPolicy in *AWS CLI Command Reference*.

`register-targets`

The following code example shows how to use `register-targets`.

AWS CLI

To register a target

The following `register-targets` example registers the specified targets with the specified target group.

```
aws vpc-lattice register-targets \
    --targets id=i-047b3c9078EXAMPLE id=i-07dd579bc5EXAMPLE \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "successful": [
        {
            "id": "i-07dd579bc5EXAMPLE",
            "port": 443
        }
    ],
    "unsuccessful": [
        {
            "failureCode": "UnsupportedTarget",
            "failureMessage": "Instance targets must be in the same VPC as their
 target group",
            "id": "i-047b3c9078EXAMPLE",
            "port": 443
        }
    ]
}
```

For more information, see Register targets in the *Amazon VPC Lattice User Guide*.

- For API details, see RegisterTargets in *AWS CLI Command Reference*.

AWS WAF Classic examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAF Classic.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`put-logging-configuration`

The following code example shows how to use `put-logging-configuration`.

AWS CLI

To create a logging configuration for the web ACL ARN with the specified Kinesis Firehose stream ARN

The following `put-logging-configuration` example displays logging configuration for WAF with CloudFront.

```
aws waf put-logging-configuration \
    --logging-configuration ResourceArn=arn:aws:waf::123456789012:webacl/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111,LogDestinationConfigs=arn:aws:firehose:us-
east-1:123456789012:deliverystream/aws-waf-logs-firehose-stream,RedactedFields=[]
```

Output:

```
{
    "LoggingConfiguration": {
        "ResourceArn": "arn:aws:waf::123456789012:webacl/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "LogDestinationConfigs": [
            "arn:aws:firehose:us-east-1:123456789012:deliverystream/aws-waf-logs-
firehose-stream"
        ]
    }
}
```

For more information, see Logging Web ACL traffic information in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see PutLoggingConfiguration in *AWS CLI Command Reference*.

update-byte-match-set

The following code example shows how to use `update-byte-match-set`.

AWS CLI

To update a byte match set

The following `update-byte-match-set` example deletes a ByteMatchTuple object (filter) in a ByteMatchSet.

```
aws waf update-byte-match-set \
    --cli-binary-format raw-in-base64-out \
    --byte-match-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 Action="DELETE",ByteMatchTuple={FieldToMatch={Type="HEADER",Data="referer"},TargetString="b
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with string match conditions in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateByteMatchSet in *AWS CLI Command Reference*.

update-ip-set

The following code example shows how to use `update-ip-set`.

AWS CLI

To update an IP set

The following `update-ip-set` example updates an IPSet with an IPv4 address and deletes an IPv6 address.

```
aws waf update-ip-set \
    --ip-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
```

```
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates Action="INSERT",IPSetDescriptor={Type="IPV4",Value="12.34.56.78/16"}
 Action="DELETE",IPSetDescriptor={Type="IPV6",Value="1111:0000:0000:0000:0000:0000:0000:0111
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

Alternatively, you can use a JSON file to specify the input, as shown in the following example.

```
aws waf update-ip-set \
    --ip-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates file://change.json
```

Contents of `change.json`:

```
[
    {
        "Action": "INSERT",
        "IPSetDescriptor": {
            "Type": "IPV4",
            "Value": "12.34.56.78/16"
        }
    },
    {
        "Action": "DELETE",
        "IPSetDescriptor": {
            "Type": "IPV6",
            "Value": "1111:0000:0000:0000:0000:0000:0000:0111/128"
        }
    }
]
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with IP match conditions in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateIpSet in *AWS CLI Command Reference*.

`update-rule`

The following code example shows how to use `update-rule`.

AWS CLI

To update a rule

The following `update-rule` example deletes a Predicate object in a rule.

```
aws waf update-rule \
    --rule-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 Action="DELETE",Predicate={Negated=false,Type="ByteMatch",DataId="MyByteMatchSetID"}
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with rules in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateRule in *AWS CLI Command Reference*.

`update-size-constraint-set`

The following code example shows how to use `update-size-constraint-set`.

AWS CLI

To update a size constraint set

The following `update-size-constraint-set` example deletes a SizeConstraint object (filters) in a size constraint set.

```
aws waf update-size-constraint-set \
    --size-constraint-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 Action="DELETE",SizeConstraint={FieldToMatch={Type="QUERY_STRING"},TextTransformation="NONE
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with size constraint conditions in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateSizeConstraintSet in *AWS CLI Command Reference*.

`update-sql-injection-match-set`

The following code example shows how to use `update-sql-injection-match-set`.

AWS CLI

To update a SQL Injection Match Set

The following `update-sql-injection-match-set` example deletes a SqlInjectionMatchTuple object (filters) in a SQL injection match set.

```
aws waf update-sql-injection-match-set \
    --sql-injection-match-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 Action="DELETE",SqlInjectionMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformati
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with SQL injection match conditions in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateSqlInjectionMatchSet in *AWS CLI Command Reference*.

`update-web-acl`

The following code example shows how to use `update-web-acl`.

AWS CLI

To update a web ACL

The following `update-web-acl` example deletes an `ActivatedRule` object in a WebACL.

```
aws waf update-web-acl \
    --web-acl-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates Action="DELETE",ActivatedRule='{Priority=1,RuleId="WAFRule-1-
Example",Action={Type="ALLOW"},Type="REGULAR"}'
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with Web ACLs in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateWebAcl in *AWS CLI Command Reference*.

`update-xss-match-set`

The following code example shows how to use `update-xss-match-set`.

AWS CLI

To update an XSSMatchSet

The following `update-xss-match-set` example deletes an XssMatchTuple object (filters) in an XssMatchSet.

```
aws waf update-xss-match-set \
    --xss-match-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 Action="DELETE",XssMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_D
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with cross-site scripting match conditions in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateXssMatchSet in *AWS CLI Command Reference*.

AWS WAF Classic Regional examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAF Classic Regional.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-web-acl`

The following code example shows how to use `associate-web-acl`.

AWS CLI

To associate a web ACL with a resource

The following `associate-web-acl` example associates a web ACL, specified by the web-acl-id, with a resource, specified by the resource-arn. The resource ARN can refer to either an application load balancer or an API Gateway.

```
aws waf-regional associate-web-acl \
    --web-acl-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --resource-arn 12cs345-67cd-890b-1cd2-c3a4567d89f1
```

This command produces no output.

For more information, see Working with Web ACLs in the *AWS WAF Developer Guide*.

- For API details, see AssociateWebAcl in *AWS CLI Command Reference*.

`put-logging-configuration`

The following code example shows how to use `put-logging-configuration`.

AWS CLI

To create a logging configuration for the web ACL ARN with the specified Kinesis Firehose stream ARN

The following `put-logging-configuration` example displays logging configuration for WAF with ALB/APIGateway in Region `us-west-2`.

```
aws waf-regional put-logging-configuration \
    --logging-configuration ResourceArn=arn:aws:waf-
regional:us-west-2:123456789012:webacl/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111,LogDestinationConfigs=arn:aws:firehose:us-
west-2:123456789012:deliverystream/aws-waf-logs-firehose-stream,RedactedFields=[]
```

Output:

```
{
    "LoggingConfiguration": {
        "ResourceArn": "arn:aws:waf-regional:us-west-2:123456789012:webacl/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "LogDestinationConfigs": [
            "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-logs-
firehose-stream"
        ]
```

```
    }
}
```

For more information, see Logging Web ACL traffic information in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see PutLoggingConfiguration in *AWS CLI Command Reference*.

`update-byte-match-set`

The following code example shows how to use `update-byte-match-set`.

AWS CLI

To update a byte match set

The following `update-byte-match-set` example deletes a `ByteMatchTuple` object (filter) in a `ByteMatchSet`. Because the `updates` value has embedded double quotes, you must surround the value with single quotes.

```
aws waf-regional update-byte-match-set \
    --cli-binary-format raw-in-base64-out \
    --byte-match-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",ByteMatchTuple={FieldToMatch={Type="HEADER",Data="referer"},TargetString="
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with string match conditions in the *AWS WAF Developer Guide*.

- For API details, see UpdateByteMatchSet in *AWS CLI Command Reference*.

`update-ip-set`

The following code example shows how to use `update-ip-set`.

AWS CLI

To update an IP set

The following `update-ip-set` example updates an IPSet with an IPv4 address and deletes an IPv6 address. Get the value for `change-token` by running the `get-change-token` command. Because the value for updates includes embedded double-quotes, you must surround the value with single quotes.

```
aws waf-regional update-ip-set \
    --ip-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates 'Action="INSERT",IPSetDescriptor={Type="IPV4",Value="12.34.56.78/16"}'
 'Action="DELETE",IPSetDescriptor={Type="IPV6",Value="1111:0000:0000:0000:0000:0000:0000:011
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

Alternatively, you can use a JSON file to specify the input, as shown in the following example.

```
aws waf-regional update-ip-set \
    --ip-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1  \
    --updates file://change.json
```

Contents of `change.json`:

```
[
    {
        "Action": "INSERT",
        "IPSetDescriptor":
        {
            "Type": "IPV4",
            "Value": "12.34.56.78/16"
        }
    },
    {
        "Action": "DELETE",
```

```
        "IPSetDescriptor":
        {
            "Type": "IPV6",
            "Value": "1111:0000:0000:0000:0000:0000:0000:0111/128"
        }
    }
]
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with IP match conditions in the *AWS WAF Developer Guide*.

- For API details, see UpdateIpSet in *AWS CLI Command Reference*.

`update-rule`

The following code example shows how to use `update-rule`.

AWS CLI

To update a rule

The following `update-rule` example deletes a `Predicate` object in a rule. Because the `updates` value has embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-rule \
    --rule-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",Predicate={Negated=false,Type="ByteMatch",DataId="MyByteMatchSetID"}'
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with rules in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateRule in *AWS CLI Command Reference*.

`update-size-constraint-set`

The following code example shows how to use `update-size-constraint-set`.

AWS CLI

To update a size constraint set

The following `update-size-constraint-set` example deletes a SizeConstraint` object (filters) in a size constraint set. Because the `updates` value contains embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-size-constraint-set \
    --size-constraint-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",SizeConstraint={FieldToMatch={Type="QUERY_STRING"},TextTransformation="NON
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with size constraint conditions in the *AWS WAF Developer Guide*.

- For API details, see UpdateSizeConstraintSet in *AWS CLI Command Reference*.

`update-sql-injection-match-set`

The following code example shows how to use `update-sql-injection-match-set`.

AWS CLI

To update a SQL Injection Match Set

The following `update-sql-injection-match-set` example deletes a `SqlInjectionMatchTuple` object (filters) in a SQL injection match set. Because the `updates` value contains embedded double quotes, you must surround the entire value in single quotes.

```
aws waf-regional update-sql-injection-match-set \
    --sql-injection-match-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",SqlInjectionMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformat
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with SQL injection match conditions in the *AWS WAF Developer Guide*.

- For API details, see UpdateSqlInjectionMatchSet in *AWS CLI Command Reference*.

`update-web-acl`

The following code example shows how to use `update-web-acl`.

AWS CLI

To update a web ACL

The following `update-web-acl` example deletes an `ActivatedRule` object in a WebACL. Because the `updates` value contains embedded double quotes, you must surround the entire value in single quotes.

```
aws waf-regional update-web-acl \
    --web-acl-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates Action="DELETE",ActivatedRule='{Priority=1,RuleId="WAFRule-1-
Example",Action={Type="ALLOW"},Type="ALLOW"}'
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with Web ACLs in the *AWS WAF Developer Guide*.

- For API details, see UpdateWebAcl in *AWS CLI Command Reference*.

`update-xss-match-set`

The following code example shows how to use `update-xss-match-set`.

AWS CLI

To update an XSSMatchSet

The following `update-xss-match-set` example deletes an `XssMatchTuple` object (filters) in an `XssMatchSet`. Because the `updates` value contains embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-xss-match-set \
    --xss-match-set-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",XssMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_
```

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with cross-site scripting match conditions in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateXssMatchSet in *AWS CLI Command Reference*.

AWS WAFV2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAFV2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-web-acl`

The following code example shows how to use `associate-web-acl`.

AWS CLI

To associate a web ACL with a regional AWS resource

The following `associate-web-acl` example associates the specified web ACL with an Application Load Balancer.

```
aws wafv2 associate-web-acl \
    --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/waf-cli-alb/1ea17125f8b25a2a
```

This command produces no output.

For more information, see Associating or Disassociating a Web ACL with an AWS Resource in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see AssociateWebAcl in *AWS CLI Command Reference*.

`check-capacity`

The following code example shows how to use `check-capacity`.

AWS CLI

To obtain the capacity used by a set of rules

The following `check-capacity` example retrieves the capacity requirements for a rule set that contains a rate-based rule statement, and an AND rule statement that contains nested rules. The `--cli-binary-format raw-in-base64-out` option lets you specify the `SearchString` value as plain text instead of base64.

```
aws wafv2 check-capacity \
    --scope REGIONAL \
    --rules file://waf-rule-list.json \
    --cli-binary-format raw-in-base64-out
```

Contents of `waf-rule-list.json`:

```
[
    {
        "Name":"basic-rule",
        "Priority":0,
        "Statement":{
            "AndStatement":{
                "Statements":[
                    {
                        "ByteMatchStatement":{
                            "SearchString":"example.com",
                            "FieldToMatch":{
                                "SingleHeader":{
                                    "Name":"host"
                                }
                            },
                            "TextTransformations":[
                                {
                                    "Priority":0,
                                    "Type":"LOWERCASE"
                                }
                            ],
                            "PositionalConstraint":"EXACTLY"
                        }
                    },
                    {
                        "GeoMatchStatement":{
                            "CountryCodes":[
                                "US",
                                "IN"
                            ]
```

```
                        }
                    }
                ]
            }
        },
        "Action":{
            "Allow":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"basic-rule"
        }
    },
    {
        "Name":"rate-rule",
        "Priority":1,
        "Statement":{
            "RateBasedStatement":{
                "Limit":1000,
                "AggregateKeyType":"IP"
            }
        },
        "Action":{
            "Block":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"rate-rule"
        }
    }
]
```

Output:

```
{
    "Capacity":15
}
```

For more information, see AWS WAF Web ACL Capacity Units (WCU) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see CheckCapacity in *AWS CLI Command Reference*.

`create-ip-set`

The following code example shows how to use `create-ip-set`.

AWS CLI

To create an IP set for use in your web ACLs and rule groups

The following `create-ip-set` example creates an IP set with a single address range specification.

```
aws wafv2 create-ip-set \
    --name testip \
    --scope REGIONAL \
    --ip-address-version IPV4 \
    --addresses 198.51.100.0/16
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"",
        "Name":"testip",
        "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see CreateIpSet in *AWS CLI Command Reference*.

`create-regex-pattern-set`

The following code example shows how to use `create-regex-pattern-set`.

AWS CLI

To create a regex pattern set for use in your web ACLs and rule groups

The following `create-regex-pattern-set` example creates a regex pattern set with two regex patterns specified.

```
aws wafv2 create-regex-pattern-set \
    --name regexPatterSet01 \
    --scope REGIONAL \
    --description 'Test web-acl' \
    --regular-expression-list '[{"RegexString": "/[0-9]*/"},{"RegexString": "/[a-z]*/"}]'
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"Test web-acl",
        "Name":"regexPatterSet01",
        "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see CreateRegexPatternSet in *AWS CLI Command Reference*.

`create-rule-group`

The following code example shows how to use `create-rule-group`.

AWS CLI

To create a custom rule group for use in your web ACLs

The following `create-rule-group` example creates a custom rule group for regional use. The rule statements for the group are provided in a JSON-formatted file. The `--cli-binary-format raw-in-base64-out` option lets you specify the `SearchString` value as plain text instead of base64.

```
aws wafv2 create-rule-group \
    --name "TestRuleGroup" \
    --scope REGIONAL \
    --capacity 250 \
    --rules file://waf-rule.json \
    --visibility-
config SampledRequestsEnabled=true,CloudWatchMetricsEnabled=true,MetricName=TestRuleGroupMet
 \
    --cli-binary-format raw-in-base64-out
```

Contents of `waf-rule.json`:

```
[
    {
        "Name":"basic-rule",
        "Priority":0,
        "Statement":{
            "AndStatement":{
                "Statements":[
                    {
                        "ByteMatchStatement":{
                            "SearchString":"example.com",
                            "FieldToMatch":{
                                "SingleHeader":{
                                    "Name":"host"
                                }
                            },
                            "TextTransformations":[
                                {
                                    "Priority":0,
                                    "Type":"LOWERCASE"
                                }
                            ],
                            "PositionalConstraint":"EXACTLY"
                        }
                    },
                    {
```

```
                        "GeoMatchStatement":{
                            "CountryCodes":[
                                "US",
                                "IN"
                            ]
                        }
                    }
                ]
            }
        },
        "Action":{
            "Allow":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"basic-rule"
        }
    }
]
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/
TestRuleGroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"",
        "Name":"TestRuleGroup",
        "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Managing Your Own Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see CreateRuleGroup in *AWS CLI Command Reference*.

create-web-acl

The following code example shows how to use `create-web-acl`.

AWS CLI

To create a web ACL

The following `create-web-acl` example creates a web ACL for regional use. The rule statements for the web ACL are provided in a JSON-formatted file. The `--cli-binary-format raw-in-base64-out` option lets you specify the `SearchString` value as plain text instead of base64.

```
aws wafv2 create-web-acl \
    --name TestWebAcl \
    --scope REGIONAL \
    --default-action Allow={} \
    --visibility-
config SampledRequestsEnabled=true,CloudWatchMetricsEnabled=true,MetricName=TestWebAclMetric
 \
    --rules file://waf-rule.json \
    --cli-binary-format raw-in-base64-out
```

Contents of `waf-rule.json`:

```
[
    {
        "Name":"basic-rule",
        "Priority":0,
        "Statement":{
            "AndStatement":{
                "Statements":[
                    {
                        "ByteMatchStatement":{
                            "SearchString":"example.com",
                            "FieldToMatch":{
                                "SingleHeader":{
                                    "Name":"host"
                                }
                            },
                            "TextTransformations":[
                                {
```

```
                                    "Priority":0,
                                    "Type":"LOWERCASE"
                                }
                            ],
                            "PositionalConstraint":"EXACTLY"
                        }
                    },
                    {
                        "GeoMatchStatement":{
                            "CountryCodes":[
                                "US",
                                "IN"
                            ]
                        }
                    }
                ]
            }
        },
        "Action":{
            "Allow":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"basic-rule"
        }
    }
]
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/TestWebAcl/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"",
        "Name":"TestWebAcl",
        "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see CreateWebAcl in *AWS CLI Command Reference*.

`delete-ip-set`

The following code example shows how to use `delete-ip-set`.

AWS CLI

To delete an IP set

The following `delete-ip-set` example deletes the specified IP set. This call requires an ID, which you can obtain from the call, `list-ip-sets`, and a lock token, which you can obtain from the calls, `list-ip-sets` and `get-ip-set`.

```
aws wafv2 delete-ip-set \
    --name test1 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteIpSet in *AWS CLI Command Reference*.

`delete-logging-configuration`

The following code example shows how to use `delete-logging-configuration`.

AWS CLI

To disable logging for a web ACL

The following `delete-logging-configuration` example removes any logging configuration from the specified web ACL.

```
aws wafv2 delete-logging-configuration \
```

```
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see Logging Web ACL Traffic Information in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteLoggingConfiguration in *AWS CLI Command Reference*.

`delete-regex-pattern-set`

The following code example shows how to use `delete-regex-pattern-set`.

AWS CLI

To delete a regex pattern set

The following `delete-regex-pattern-set` example deletes the specified regex pattern set. This call requires an ID, which you can obtain from the call, `list-regex-pattern-sets`, and a lock token, which you can obtain from the call `list-regex-pattern-sets` or the call `get-regex-pattern-set`.

```
aws wafv2 delete-regex-pattern-set \
    --name regexPatterSet01 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteRegexPatternSet in *AWS CLI Command Reference*.

`delete-rule-group`

The following code example shows how to use `delete-rule-group`.

AWS CLI

To delete a custom rule group

The following `delete-rule-group` example deletes the specified custom rule group. This call requires an ID, which you can obtain from the call, `list-rule-groups`, and a lock token, which you can obtain from the call `list-rule-groups` or the call `get-rule-group`.

```
aws wafv2 delete-rule-group \
    --name TestRuleGroup \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see Managing Your Own Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteRuleGroup in *AWS CLI Command Reference*.

`delete-web-acl`

The following code example shows how to use `delete-web-acl`.

AWS CLI

To delete a web ACL

The following `delete-web-acl` example deletes the specified web ACL from your account. A web ACL can only be deleted when it's not associated with any resources. This call requires an ID, which you can obtain from the call, `list-web-acls`, and a lock token, which you can obtain from the call `list-web-acls` or the call `get-web-acl`.

```
aws wafv2 delete-web-acl \
    --name test \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteWebAcl in *AWS CLI Command Reference*.

`describe-managed-rule-group`

The following code example shows how to use `describe-managed-rule-group`.

AWS CLI

To retrieve the description for a managed rule group

The following `describe-managed-rule-group` example retrieves the description for an AWS managed rule group.

```
aws wafv2 describe-managed-rule-group \
    --vendor-name AWS \
    --name AWSManagedRulesCommonRuleSet \
    --scope REGIONAL
```

Output:

```
{
    "Capacity": 700,
    "Rules": [
        {
            "Name": "NoUserAgent_HEADER",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "UserAgent_BadBots_HEADER",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "SizeRestrictions_QUERYSTRING",
            "Action": {
                "Block": {}
            }
        },

            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "CrossSiteScripting_URIPATH",
            "Action": {
                "Block": {}
            }
        }
    ]
}
```

For more information, see Managed Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DescribeManagedRuleGroup in *AWS CLI Command Reference*.

`disassociate-web-acl`

The following code example shows how to use `disassociate-web-acl`.

AWS CLI

To disassociate a web ACL from a regional AWS resource

The following `disassociate-web-acl` example removes any existing web ACL association from the specified Application Load Balancer.

```
aws wafv2 disassociate-web-acl \
```

```
    --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/waf-cli-alb/1ea17125f8b25a2a
```

This command produces no output.

For more information, see Associating or Disassociating a Web ACL with an AWS Resource in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateWebAcl in *AWS CLI Command Reference*.

`get-ip-set`

The following code example shows how to use `get-ip-set`.

AWS CLI

To retrieve a specific IP set

The following `get-ip-set` example retrieves the IP set with the specified name, scope, and ID. You can get the ID for an IP set from the commands `create-ip-set` and `list-ip-sets`.

```
aws wafv2 get-ip-set \
    --name testip \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "IPSet":{
        "Description":"",
        "Name":"testip",
        "IPAddressVersion":"IPV4",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
        "Addresses":[
            "192.0.2.0/16"
        ]
    },
    "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

```
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetIpSet in *AWS CLI Command Reference*.

`get-logging-configuration`

The following code example shows how to use `get-logging-configuration`.

AWS CLI

To retrieve the logging configurations for a web ACL

The following `get-logging-configuration` example retrieves the logging configuration for the specified web ACL.

```
aws wafv2 get-logging-configuration \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "LoggingConfiguration":{
        "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "RedactedFields":[
            {
                "Method":{

                }
            }
        ],
        "LogDestinationConfigs":[
            "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-logs-
custom-transformation"
        ]
    }
}
```

For more information, see Logging Web ACL Traffic Information in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetLoggingConfiguration in *AWS CLI Command Reference*.

`get-rate-based-statement-managed-keys`

The following code example shows how to use `get-rate-based-statement-managed-keys`.

AWS CLI

To retrieve a list of IP addresses that are blocked by a rate-based rule

The following `get-rate-based-statement-managed-keys` example retrieves the IP addresses currently blocked by a rate-based rule that's being used for a regional application.

```
aws wafv2 get-rate-based-statement-managed-keys \
    --scope REGIONAL \
    --web-acl-name testwebacl2 \
    --web-acl-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --rule-name ratebasedtest
```

Output:

```
{
    "ManagedKeysIPV4":{
        "IPAddressVersion":"IPV4",
        "Addresses":[
            "198.51.100.0/32"
        ]
    },
    "ManagedKeysIPV6":{
        "IPAddressVersion":"IPV6",
        "Addresses":[

        ]
    }
}
```

For more information, see Rate-Based Rule Statement in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetRateBasedStatementManagedKeys in *AWS CLI Command Reference*.

`get-regex-pattern-set`

The following code example shows how to use `get-regex-pattern-set`.

AWS CLI

To retrieve a specific regex pattern set

The following `get-regex-pattern-set` example retrieves the regex pattern set with the specified name, scope, and ID. You can get the ID for a regex pattern set from the commands `create-regex-pattern-set` and `list-regex-pattern-sets`.

```
aws wafv2 get-regex-pattern-set \
    --name regexPatterSet01 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RegexPatternSet":{
        "Description":"Test web-acl",
        "RegularExpressionList":[
            {
                "RegexString":"/[0-9]*/"
            },
            {

`get-rule-group`

The following code example shows how to use `get-rule-group`.

AWS CLI

To retrieve a specific custom rule group

The following `get-rule-group` example retrieves the custom rule group with the specified name, scope, and ID. You can get the ID for a rule group from the commands `create-rule-group` and `list-rule-groups`.

```
aws wafv2 get-rule-group \
    --name ff \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RuleGroup":{
        "Capacity":1,
        "Description":"",
        "Rules":[
            {
                "Priority":0,
                "Action":{
                    "Block":{

                    }
                },
                "VisibilityConfig":{
                    "SampledRequestsEnabled":true,
                    "CloudWatchMetricsEnabled":true,
                    "MetricName":"jj"
                },
                "Name":"jj",
                "Statement":{
                    "SizeConstraintStatement":{
                        "ComparisonOperator":"LE",
                        "TextTransformations":[
                            {
                                "Priority":0,
```

```
                                "Type":"NONE"
                            }
                        ],
                        "FieldToMatch":{
                            "UriPath":{

                            }
                        },
                        "Size":7
                    }
                }
            }
        ],
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"ff"
        },
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/ff/

        "Name":"ff"
    },
    "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Managing Your Own Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetRuleGroup in *AWS CLI Command Reference*.

`get-sampled-requests`

The following code example shows how to use `get-sampled-requests`.

AWS CLI

To retrieve a sample of web requests for a web ACL

The following `get-sampled-requests` example retrieves the sampled web requests for the specified web ACL, rule metric, and time frame.

```
aws wafv2 get-sampled-requests \
```

```
    --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --rule-metric-name AWS-AWSManagedRulesSQLiRuleSet \
    --scope=REGIONAL \
    --time-window StartTime=2020-02-12T20:00Z,EndTime=2020-02-12T21:10Z \
    --max-items 100
```

Output:

```
{
    "TimeWindow": {
        "EndTime": 1581541800.0,
        "StartTime": 1581537600.0
    },
    "SampledRequests": [
        {
            "Action": "BLOCK",
            "Timestamp": 1581541799.564,

            },
            "Weight": 1
        }
    ],
    "PopulationSize": 4
}
```

For more information, see Viewing a Sample of Web Requests in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetSampledRequests in *AWS CLI Command Reference*.

`get-web-acl-for-resource`

The following code example shows how to use `get-web-acl-for-resource`.

AWS CLI

To retrieve the web ACL that's associated with an AWS resource

The following `get-web-acl-for-resource` example retrieves the JSON for the web ACL that's associated with the specified resource.

```
aws wafv2 get-web-acl-for-resource \
    --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/waf-cli-alb/1ea17125f8b25a2a
```

Output:

```
{
    "WebACL":{
        "Capacity":3,
        "Description":"",
        "Rules":[
            {
                "Priority":1,
                "Action":{
                    "Block":{

                    }
                },
                "VisibilityConfig":{
                    "SampledRequestsEnabled":true,
                    "CloudWatchMetricsEnabled":true,
                    "MetricName":"testrule01"
                },
                "Name":"testrule01",
                "Statement":{
                    "AndStatement":{
                        "Statements":[
                            {
                                "ByteMatchStatement":{

        "Name":"test01"
    }
}
```

For more information, see Associating or Disassociating a Web ACL with an AWS Resource in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetWebAclForResource in *AWS CLI Command Reference*.

get-web-acl

The following code example shows how to use `get-web-acl`.

AWS CLI

To retrieve a web ACL

The following `get-web-acl` example retrieves the web ACL with the specified name, scope, and ID. You can get the ID for a web ACL from the commands `create-web-acl` and `list-web-acls`.

```
aws wafv2 get-web-acl \
    --name test01 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "WebACL":{
        "Capacity":3,
        "Description":"",
        "Rules":[

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetWebAcl in *AWS CLI Command Reference*.

`list-available-managed-rule-groups`

The following code example shows how to use `list-available-managed-rule-groups`.

AWS CLI

To retrieve the managed rule groups

The following `list-available-managed-rule-groups` example returns the list of all managed rule groups that are currently available for use in your web ACLs.

```
aws wafv2 list-available-managed-rule-groups \
    --scope REGIONAL
```

Output:

```
{
    "ManagedRuleGroups": [
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesCommonRuleSet",
            "Description": "Contains rules that are generally applicable to web
 applications. This provides protection against exploitation of a wide range of
 vulnerabilities, including those described in OWASP publications and common Common
 Vulnerabilities and Exposures (CVE)."
        },
        {
            "VendorName": "AWS",
```

```
            "Name": "AWSManagedRulesAdminProtectionRuleSet",
            "Description": "Contains rules that allow you to block external access
to exposed admin pages. This may be useful if you are running third-party software
or would like to reduce the risk of a malicious actor gaining administrative access
to your application."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesKnownBadInputsRuleSet",
            "Description": "Contains rules that allow you to block request patterns
that are known to be invalid and are associated with exploitation or discovery of
vulnerabilities. This can help reduce the risk of a malicious actor discovering a
vulnerable application."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesSQLiRuleSet",
            "Description": "Contains rules that allow you to block request patterns
associated with exploitation of SQL databases, like SQL injection attacks. This can
help prevent remote injection of unauthorized queries."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesLinuxRuleSet",
            "Description": "Contains rules that block request patterns associated
with exploitation of vulnerabilities specific to Linux, including LFI attacks. This
can help prevent attacks that expose file contents or execute code for which the
attacker should not have had access."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesUnixRuleSet",
            "Description": "Contains rules that block request patterns associated
with exploiting vulnerabilities specific to POSIX/POSIX-like OS, including LFI
attacks. This can help prevent attacks that expose file contents or execute code
for which access should not been allowed."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesWindowsRuleSet",
            "Description": "Contains rules that block request patterns associated
with exploiting vulnerabilities specific to Windows, (e.g., PowerShell commands).
This can help prevent exploits that allow attacker to run unauthorized commands or
execute malicious code."
```

```
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesPHPRuleSet",
            "Description": "Contains rules that block request patterns associated
 with exploiting vulnerabilities specific to the use of the PHP, including injection
 of unsafe PHP functions. This can help prevent exploits that allow an attacker to
 remotely execute code or commands."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesWordPressRuleSet",
            "Description": "The WordPress Applications group contains rules that
 block request patterns associated with the exploitation of vulnerabilities specific
 to WordPress sites."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesAmazonIpReputationList",
            "Description": "This group contains rules that are based on Amazon
 threat intelligence. This is useful if you would like to block sources associated
 with bots or other threats."
        }
    ]
}
```

For more information, see Managed Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListAvailableManagedRuleGroups in *AWS CLI Command Reference*.

`list-ip-sets`

The following code example shows how to use `list-ip-sets`.

AWS CLI

To retrieve a list of IP sets

The following `list-ip-sets` example retrieves all IP sets for the account that have regional scope.

```
aws wafv2 list-ip-sets \
```

```
    --scope REGIONAL
```

Output:

```
{
    "IPSets":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"",
            "Name":"testip",
            "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111  "
        }
    ],
    "NextMarker":"testip"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListIpSets in *AWS CLI Command Reference*.

`list-logging-configurations`

The following code example shows how to use `list-logging-configurations`.

AWS CLI

To retrieve a list of all logging configurations for a region

The following `list-logging-configurations` example retrieves all logging configurations for web ACLs that are scoped for regional use in the `us-west-2` region.

```
aws wafv2 list-logging-configurations \
    --scope REGIONAL
```

Output:

```
{
```

```
    "LoggingConfigurations":[
        {
            "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
test-2/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RedactedFields":[
                {
                    "QueryString":{

                    }
                }
            ],
            "LogDestinationConfigs":[
                "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-
logs-test"
            ]
        },
        {
            "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
test/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "RedactedFields":[
                {
                    "Method":{

                    }
                }
            ],
            "LogDestinationConfigs":[
                "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-
logs-custom-transformation"
            ]
        }
    ]
}
```

For more information, see Logging Web ACL Traffic Information in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListLoggingConfigurations in *AWS CLI Command Reference*.

`list-regex-pattern-sets`

The following code example shows how to use `list-regex-pattern-sets`.

AWS CLI

To retrieve a list of regex pattern sets

The following `list-regex-pattern-sets` example retrieves all regex pattern sets for the account that are defined in the region `us-west-2`.

```
aws wafv2 list-regex-pattern-sets \
    --scope REGIONAL
```

Output:

```
{
    "NextMarker":"regexPatterSet01",
    "RegexPatternSets":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/
regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"Test web-acl",
            "Name":"regexPatterSet01",
            "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListRegexPatternSets in *AWS CLI Command Reference*.

`list-resources-for-web-acl`

The following code example shows how to use `list-resources-for-web-acl`.

AWS CLI

To retrieve the resources associated with a web ACL

The following `list-resources-for-web-acl` example retrieves the API Gateway REST API resources that are currently associated with the specified web ACL in the region `us-west-2`.

```
aws wafv2 list-resources-for-web-acl \
    --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/TestWebAcl/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --resource-type API_GATEWAY
```

Output:

```
{
    "ResourceArns": [
        "arn:aws:apigateway:us-west-2::/restapis/EXAMPLE111/stages/testing"
    ]
}
```

For more information, see Associating or Disassociating a Web ACL with an AWS Resource in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListResourcesForWebAcl in *AWS CLI Command Reference*.

`list-rule-groups`

The following code example shows how to use `list-rule-groups`.

AWS CLI

To retrieve a list of custom rule groups

The following `list-rule-groups` example retrieves all custom rule groups that are defined for the account for the specified scope.

```
aws wafv2 list-rule-groups \
    --scope REGIONAL
```

Output:

```
{
    "RuleGroups":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/
TestRuleGroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"",
```

```
            "Name":"TestRuleGroup",
            "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Description":"",
            "Name":"test",
            "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ],
    "NextMarker":"test"
}
```

For more information, see Managing Your Own Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListRuleGroups in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve all tags for an AWS WAF resource

The following `list-tags-for-resource` example retrieves the list of all tag key, value pairs for the specified web ACL.

```
aws wafv2 list-tags-for-resource \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/testwebacl2/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "NextMarker":"",
    "TagInfoForResource":{
```

```
        "ResourceARN":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
testwebacl2/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TagList":[

        ]
    }
}
```

For more information, see Getting Started with AWS WAF in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-web-acls`

The following code example shows how to use `list-web-acls`.

AWS CLI

To retrieve the web ACLs for a scope

The following `list-web-acls` example retrieves all web ACLs that are defined for the account for the specified scope.

```
aws wafv2 list-web-acls \
    --scope REGIONAL
```

Output:

```
{
    "NextMarker":"Testt",
    "WebACLs":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/Testt/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"sssss",
            "Name":"Testt",
            "LockToken":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
```

```
}
```

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListWebAcls in *AWS CLI Command Reference*.

`put-logging-configuration`

The following code example shows how to use `put-logging-configuration`.

AWS CLI

To add a logging configuration to a web ACL

The following `put-logging-configuration` example adds the Amazon Kinesis Data Firehose logging configuration `aws-waf-logs-custom-transformation` to the specified web ACL, with no fields redacted from the logs.

```
aws wafv2 put-logging-configuration \
    --logging-configuration ResourceArn=arn:aws:wafv2:us-
west-2:123456789012:regional/webacl/test-cli/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111,LogDestinationConfigs=arn:aws:firehose:us-
west-2:123456789012:deliverystream/aws-waf-logs-custom-transformation
```

Output:

```
{
    "LoggingConfiguration":{
        "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-
cli/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "LogDestinationConfigs":[
            "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-logs-
custom-transformation"
        ]
    }
}
```

For more information, see Logging Web ACL Traffic Information in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see PutLoggingConfiguration in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to an AWS WAF resource

The following `tag-resource` example adds a tag with a key of `Name` and value set to `AWSWAF` to the specified web ACL.

```
aws wafv2 tag-resource \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
apiGatewayWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags Key=Name,Value=AWSWAF
```

This command produces no output.

For more information, see Getting Started with AWS WAF in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from an AWS WAF resource

The following `untag-resource` example removes the tag with the key `KeyName` from the specified web ACL.

```
aws wafv2 untag-resource \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
apiGatewayWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tag-keys "KeyName"
```

This command produces no output.

For more information, see Getting Started with AWS WAF in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-ip-set`

The following code example shows how to use `update-ip-set`.

AWS CLI

To modify the settings for an existing IP set

The following `update-ip-set` example updates the settings for the specified IP set. This call requires an ID, which you can obtain from the call, `list-ip-sets`, and a lock token which you can obtain from the calls, `list-ip-sets` and `get-ip-set`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-ip-set \
    --name testip \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --addresses 198.51.100.0/16 \
    --lock-token a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "NextLockToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateIpSet in *AWS CLI Command Reference*.

`update-regex-pattern-set`

The following code example shows how to use `update-regex-pattern-set`.

AWS CLI

To modify the settings for an existing regex pattern set

The following `update-regex-pattern-set` example updates the settings for the specified regex pattern set. This call requires an ID, which you can obtain from the call, `list-regex-pattern-sets`, and a lock token which you can obtain from the calls, `list-regex-pattern-sets` and `get-regex-pattern-set`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-regex-pattern-set \
    --name ExampleRegex \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --regular-expression-list RegexString="^.+$"  \
    --lock-token a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "NextLockToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateRegexPatternSet in *AWS CLI Command Reference*.

update-rule-group

The following code example shows how to use `update-rule-group`.

AWS CLI

To update a custom rule group

The following `update-rule-group` example changes the visibility configuration for an existing custom rule group. This call requires an ID, which you can obtain from the call, `list-rule-groups`, and a lock token which you can obtain from the calls, `list-rule-groups` and `get-rule-group`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-rule-group \
    --name TestRuleGroup \
    --scope REGIONAL \
```

```
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --visibility-
config SampledRequestsEnabled=false,CloudWatchMetricsEnabled=false,MetricName=TestMetricsFor
```

Output:

```
{
    "NextLockToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see Managing Your Own Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateRuleGroup in *AWS CLI Command Reference*.

update-web-acl

The following code example shows how to use `update-web-acl`.

AWS CLI

To update a web ACL

The following `update-web-acl` example changes settings for an existing web ACL. This call requires an ID, which you can obtain from the call, `list-web-acls`, and a lock token and other settings, which you can obtain from the call `get-web-acl`. This call also returns a lock token that you can use for a subsequent update. The `--cli-binary-format raw-in-base64-out` option lets you specify the `SearchString` value as plain text instead of base64.

```
aws wafv2 update-web-acl \
    --name TestWebAcl \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --default-action Block={} \
    --visibility-
config SampledRequestsEnabled=false,CloudWatchMetricsEnabled=false,MetricName=NewMetricTestW
 \
    --rules file://waf-rule.json \
    --cli-binary-format raw-in-base64-out
```

Contents of `waf-rule.json`:

```
[
    {
        "Name": "basic-rule",
        "Priority": 0,
        "Statement": {
            "AndStatement": {
                "Statements": [
                    {
                        "ByteMatchStatement": {
                            "SearchString": "example.com",
                            "FieldToMatch": {
                                "SingleHeader": {
                                    "Name": "host"
                                }
                            },
                            "TextTransformations": [
                                {
                                    "Priority": 0,
                                    "Type": "LOWERCASE"
                                }
                            ],
                            "PositionalConstraint": "EXACTLY"
                        }
                    },
                    {
                        "GeoMatchStatement": {
                            "CountryCodes": [
                                "US",
                                "IN"
                            ]
                        }
                    }
                ]
            }
        },
        "Action": {
            "Allow": {}
        },
        "VisibilityConfig": {
            "SampledRequestsEnabled": true,
            "CloudWatchMetricsEnabled": true,
            "MetricName": "basic-rule"
```

```
        }
    }
]
```

Output:

```
{
    "NextLockToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateWebAcl in *AWS CLI Command Reference*.

WorkDocs examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with WorkDocs.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`abort-document-version-upload`

The following code example shows how to use `abort-document-version-upload`.

AWS CLI

To stop a document version upload

The following `abort-document-version-upload` example stops a previously initiated document version upload.

```
aws workdocs abort-document-version-upload \
    --document-id feaba64d4efdf271c2521b60a2a44a8f057e84beaabbe22f01267313209835f2 \
    --version-id 1536773972914-
ddb67663e782e7ce8455ebc962217cf9f9e47b5a9a702e5c84dcccd417da9313
```

This command produces no output.

- For API details, see AbortDocumentVersionUpload in *AWS CLI Command Reference*.

`activate-user`

The following code example shows how to use `activate-user`.

AWS CLI

To activate a user

The following `activate-user` example activates an inactive user.

```
aws workdocs activate-user \
    --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
{
    "User": {
        "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
        "Username": "exampleUser",
        "EmailAddress": "exampleUser@site.awsapps.com",
        "GivenName": "Example",
        "Surname": "User",
        "OrganizationId": "d-926726012c",
        "RootFolderId":
 "75f67c183aa1217409ac87576a45c03a5df5e6d8c51c35c01669970538e86cd0",
        "RecycleBinFolderId":
 "642b7dd3e60b14204534f3df7b1959e01b5d170f8c2707f410e40a8149120a57",
        "Status": "ACTIVE",
        "Type": "MINIMALUSER",
        "CreatedTimestamp": 1521226107.747,
        "ModifiedTimestamp": 1525297406.462,
        "Storage": {
            "StorageUtilizedInBytes": 0,
```

```
            "StorageRule": {
                "StorageAllocatedInBytes": 0,
                "StorageType": "QUOTA"
            }
        }
    }
}
```

- For API details, see ActivateUser in *AWS CLI Command Reference*.

`add-resource-permissions`

The following code example shows how to use `add-resource-permissions`.

AWS CLI

To add permissions for a resource

The following `add-resource-permissions` example adds permissions to the resource for the specified principals.

```
aws workdocs add-resource-permissions \
    --resource-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 \
    --principals Id=anonymous,Type=ANONYMOUS,Role=VIEWER
```

Output:

```
{
    "ShareResults": [
        {
            "PrincipalId": "anonymous",
            "Role": "VIEWER",
            "Status": "SUCCESS",
            "ShareId":
 "d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65",
            "StatusMessage": ""
        }
    ]
}
```

- For API details, see AddResourcePermissions in *AWS CLI Command Reference*.

`create-comment`

The following code example shows how to use `create-comment`.

AWS CLI

To add a new comment

The following `create-comment` example adds a new comment to the specified document version.

```
aws workdocs create-comment \
    --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 \
    --version-
id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 \
    --text "This is a comment."
```

Output:

```
{
    "Comment": {
        "CommentId": "1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
        "ThreadId": "1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
        "Text": "This is a comment.",
        "Contributor": {
            "Id": "arn:aws:iam::123456789012:user/exampleUser",
            "Username": "exampleUser",
            "GivenName": "Example",
            "Surname": "User",
            "Status": "ACTIVE"
        },
        "CreatedTimestamp": 1534799058.197,
        "Status": "PUBLISHED",
        "Visibility": "PUBLIC"
    }
}
```

- For API details, see CreateComment in *AWS CLI Command Reference*.

`create-custom-metadata`

The following code example shows how to use `create-custom-metadata`.

AWS CLI

To create custom metadata

The following `create-custom-metadata` example creates custom metadata for the specified document.

```
aws workdocs create-custom-metadata \
    --resource-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 \
    --custom-metadata KeyName1=example,KeyName2=example2
```

This command produces no output.

- For API details, see CreateCustomMetadata in *AWS CLI Command Reference*.

`create-folder`

The following code example shows how to use `create-folder`.

AWS CLI

To create a folder

The following `create-folder` example creates a folder.

```
aws workdocs create-folder \
    --name documents \
    --parent-folder-
id 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

```
{
    "Metadata": {
        "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
        "Name": "documents",
        "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
        "ParentFolderId":
 "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
```

```
        "CreatedTimestamp": 1534450467.622,
        "ModifiedTimestamp": 1534450467.622,
        "ResourceState": "ACTIVE",
        "Signature": "",
        "Size": 0,
        "LatestVersionSize": 0
    }
}
```

- For API details, see CreateFolder in *AWS CLI Command Reference*.

`create-labels`

The following code example shows how to use `create-labels`.

AWS CLI

To create labels

The following `create-labels` example creates a series of labels for a document.

```
aws workdocs create-labels \
    --resource-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 \
    --labels "documents" "examples" "my_documents"
```

This command produces no output.

- For API details, see CreateLabels in *AWS CLI Command Reference*.

`create-notification-subscription`

The following code example shows how to use `create-notification-subscription`.

AWS CLI

To create a notification subscription

The following `create-notification-subscription` example configures a notification subscription for the specified Amazon WorkDocs organization.

```
aws workdocs create-notification-subscription \
    --organization-id d-123456789c \
```

```
    --protocol HTTPS \
    --subscription-type ALL \
    --notification-endpoint "https://example.com/example"
```

Output:

```
{
    "Subscription": {
        "SubscriptionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "EndPoint": "https://example.com/example",
        "Protocol": "HTTPS"
    }
}
```

- For API details, see CreateNotificationSubscription in *AWS CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

To create a new user

The following `create-user` example creates a new user in a Simple AD or Microsoft AD directory.

```
aws workdocs create-user \
    --organization-id d-926726012c \
    --username exampleUser2 \
    --email-address exampleUser2@site.awsapps.com \
    --given-name example2Name \
    --surname example2Surname \
    --password examplePa$$w0rd
```

Output:

```
{
    "User": {
        "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
        "Username": "exampleUser2",
        "EmailAddress": "exampleUser2@site.awsapps.com",
```

```
        "GivenName": "example2Name",
        "Surname": "example2Surname",
        "OrganizationId": "d-926726012c",
        "RootFolderId":
 "35b886cb17198cbd547655e58b025dff0cf34aaed638be52009567e23dc67390",
        "RecycleBinFolderId":
 "9858c3e9ed4c2460dde9aadb4c69fde998070dd46e5e985bd08ec6169ea249ff",
        "Status": "ACTIVE",
        "Type": "MINIMALUSER",
        "CreatedTimestamp": 1535478836.584,
        "ModifiedTimestamp": 1535478836.584,
        "Storage": {
            "StorageUtilizedInBytes": 0,
            "StorageRule": {
                "StorageAllocatedInBytes": 0,
                "StorageType": "QUOTA"
            }
        }
    }
}
```

- For API details, see CreateUser in *AWS CLI Command Reference*.

`deactivate-user`

The following code example shows how to use `deactivate-user`.

AWS CLI

To deactivate a user

The following `deactivate-user` example deactivates an active user.

```
aws workdocs deactivate-user \
    --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

This command produces no output.

- For API details, see DeactivateUser in *AWS CLI Command Reference*.

`delete-comment`

The following code example shows how to use `delete-comment`.

AWS CLI

To delete a specified comment from a document version

The following `delete-comment` example deletes the specified comment from the specified document version.

```
aws workdocs delete-comment \
    --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 \
    --version-
id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 \
    --comment-id 1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5
```

This command produces no output.

- For API details, see DeleteComment in *AWS CLI Command Reference*.

`delete-custom-metadata`

The following code example shows how to use `delete-custom-metadata`.

AWS CLI

To delete custom metadata from a resource

The following `delete-custom-metadata` example deletes all custom metadata from the specified resource.

```
aws workdocs delete-custom-metadata \
    --resource-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 \
    --delete-all
```

This command produces no output.

- For API details, see DeleteCustomMetadata in *AWS CLI Command Reference*.

`delete-document`

The following code example shows how to use `delete-document`.

AWS CLI

To delete a document

The following `delete-document` example deletes the specified document.

```
aws workdocs delete-document \
    --document-id b83ed5e5b167b65ef69de9d597627ff1a0d4f07a45e67f1fab7d26b54427de0a
```

This command produces no output.

- For API details, see DeleteDocument in *AWS CLI Command Reference*.

`delete-folder-contents`

The following code example shows how to use `delete-folder-contents`.

AWS CLI

To delete the contents of a folder

The following `delete-folder-contents` example deletes the contents of the specified folder.

```
aws workdocs delete-folder-contents \
    --folder-id 26fa8aa4ba2071447c194f7b150b07149dbdb9e1c8a301872dcd93a4735ce65d
```

This command produces no output.

- For API details, see DeleteFolderContents in *AWS CLI Command Reference*.

`delete-folder`

The following code example shows how to use `delete-folder`.

AWS CLI

To delete a folder

The following `delete-folder` example deletes the specified folder.

```
aws workdocs delete-folder \
```

```
    --folder-id 26fa8aa4ba2071447c194f7b150b07149dbdb9e1c8a301872dcd93a4735ce65d
```

This command produces no output.

- For API details, see DeleteFolder in *AWS CLI Command Reference*.

`delete-labels`

The following code example shows how to use `delete-labels`.

AWS CLI

To delete labels

The following `delete-labels` example deletes the specified labels from a document.

```
aws workdocs delete-labels \
    --resource-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 \
    --labels "documents" "examples"
```

This command produces no output.

- For API details, see DeleteLabels in *AWS CLI Command Reference*.

`delete-notification-subscription`

The following code example shows how to use `delete-notification-subscription`.

AWS CLI

To delete a notification subscription

The following `delete-notification-subscription` example deletes the specified notification subscription.

```
aws workdocs delete-notification-subscription \
    --subscription-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --organization-id d-123456789c
```

This command produces no output.

- For API details, see DeleteNotificationSubscription in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes a user.

```
aws workdocs delete-user \
    --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

This command produces no output.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`describe-activities`

The following code example shows how to use `describe-activities`.

AWS CLI

To get a list of user activities

The following `describe-activities` example returns a list of the latest user activities for the specified organization, with a limit set for the latest two activities.

```
aws workdocs describe-activities \
    --organization-id d-926726012c \
    --limit 2
```

Output:

```
{
    "UserActivities": [
        {
            "Type": "DOCUMENT_VERSION_DOWNLOADED",

`describe-comments`

The following code example shows how to use `describe-comments`.

AWS CLI

To list all comments for a specified document version

The following `describe-comments` example lists all the comments for the specified document version.

```
aws workdocs describe-comments \
    --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 \
    --version-
id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920
```

Output:

```
{
    "Comments": [
        {
            "CommentId": "1534799058197-

            "Status": "PUBLISHED",
            "Visibility": "PUBLIC"
        }
    ]
}
```

- For API details, see DescribeComments in *AWS CLI Command Reference*.

`describe-document-versions`

The following code example shows how to use `describe-document-versions`.

AWS CLI

To retrieve a document's versions

The following `describe-document-versions` example retrieves the document versions for the specified document, including initialized versions and a URL for the source document.

```
aws workdocs describe-document-versions \
    --document-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 \
    --fields SOURCE
```

Output:

```
{
    "DocumentVersions": [
        {
            "Id":
 "1534452029587-15e129dfc187505c407588df255be83de2920d733859f1d2762411d22a83e3ef",

`describe-folder-contents`

The following code example shows how to use `describe-folder-contents`.

AWS CLI

To describe the contents of a folder

The following `describe-folder-contents` example describes all the active contents of the specified folder, including its documents and subfolders, sorted by date in ascending order.

```
aws workdocs describe-folder-contents \
    --folder-id 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678 \
    --sort DATE \
    --order ASCENDING \
    --type ALL
```

Output:

```
{
    "Folders": [
```

```
        {
            "Id":

            },
            "ResourceState": "ACTIVE"
        }
    ]
```

```
}
```

- For API details, see DescribeFolderContents in *AWS CLI Command Reference*.

`describe-groups`

The following code example shows how to use `describe-groups`.

AWS CLI

To retrieve a list of groups

The following `describe-groups` example lists the groups associated with the specified Amazon WorkDocs organization.

```
aws workdocs describe-groups \
    --search-query "e" \
    --organization-id d-123456789c
```

Output:

```
{
    "Groups": [
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444&d-123456789c",
            "Name": "Example Group 1"
        },
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-5555&d-123456789c",
            "Name": "Example Group 2"
        }
    ]
}
```

- For API details, see DescribeGroups in *AWS CLI Command Reference*.

`describe-notification-subscriptions`

The following code example shows how to use `describe-notification-subscriptions`.

AWS CLI

To retrieve a list of notification subscriptions

The following `describe-notification-subscriptions` example retrieves the notification subscriptions for the specified Amazon WorkDocs organization.

```
aws workdocs describe-notification-subscriptions \
    --organization-id d-123456789c
```

Output:

```
{
    "Subscriptions": [
        {
            "SubscriptionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "EndPoint": "https://example.com/example",
            "Protocol": "HTTPS"
        }
    ]
}
```

- For API details, see DescribeNotificationSubscriptions in *AWS CLI Command Reference*.

`describe-resource-permissions`

The following code example shows how to use `describe-resource-permissions`.

AWS CLI

To get a list of permissions for a resource

The following `describe-resource-permissions` example returns a list of the permissions for the specified resource (document or folder).

```
aws workdocs describe-resource-permissions \
    --resource-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3
```

Output:

```
{
```

```
    "Principals": [
        {
            "Id": "anonymous",
            "Type": "ANONYMOUS",
            "Roles": [
                {
                    "Role": "VIEWER",
                    "Type": "DIRECT"
                }
            ]
        },
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
            "Type": "USER",
            "Roles": [
                {
                    "Role": "OWNER",
                    "Type": "DIRECT"
                }
            ]
        },
        {
            "Id": "d-926726012c",
            "Type": "ORGANIZATION",
            "Roles": [
                {
                    "Role": "VIEWER",
                    "Type": "INHERITED"
                }
            ]
        }
    ]
}
```

- For API details, see DescribeResourcePermissions in *AWS CLI Command Reference*.

`describe-users`

The following code example shows how to use `describe-users`.

AWS CLI

To retrieve details for specified users

The following `describe-users` example retrieves details for all the users in the specified organization.

```
aws workdocs describe-users \
    --organization-id d-926726012c
```

Output:

```
{
    "Users": [
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
            "Username": "example1User",

        }
    ]
}
```

- For API details, see DescribeUsers in *AWS CLI Command Reference*.

`get-document-path`

The following code example shows how to use `get-document-path`.

AWS CLI

To retrieve a document's path information

The following `get-document-path` example retrieves the path information (hierarchy from the root folder) for the specified document, and includes the names of the parent folders.

```
aws workdocs get-document-path \
    --document-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 \
    --fields NAME
```

Output:

```
{
    "Path": {
        "Components": [
            {
                "Id":
 "a43d29cbb8e7c4d25cfee8b803a504b0dc63e760b55ad0c611c6b87691eb6ff3",
                "Name": "/"
            },
            {
                "Id":

            }
        ]
    }
}
```

- For API details, see GetDocumentPath in *AWS CLI Command Reference*.

`get-document-version`

The following code example shows how to use `get-document-version`.

AWS CLI

To retrieve version metadata for a specified document

The following `get-document-version` example retrieves version metadata for the specified document, including a source URL and custom metadata.

```
aws workdocs get-document-version \
    --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 \
    --version-
id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 \
    --fields SOURCE \
    --include-custom-metadata
```

Output:

```
{
    "Metadata": {
        "Id":
 "1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920",
        "Name": "exampleDoc",
        "ContentType": "application/vnd.openxmlformats-

```

- For API details, see GetDocumentVersion in *AWS CLI Command Reference*.

`get-document`

The following code example shows how to use `get-document`.

AWS CLI

To retrieve document details

The following `get-document` example retrieves the details of the specified document.

```
aws workdocs get-document \
    --document-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65
```

Output:

```
{

        },
        "ResourceState": "ACTIVE"
```

```
    }
}
```

- For API details, see GetDocument in *AWS CLI Command Reference*.

`get-folder-path`

The following code example shows how to use `get-folder-path`.

AWS CLI

To retrieve path information for a folder

The following `get-folder-path` example retrieves the path information (hierarchy from the root folder) for the specified folder, and includes the names of the parent folders.

```
aws workdocs get-folder-path \
    --folder-id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08 \
    --fields NAME
```

Output:

```
{
    "Path": {
        "Components": [
            {
                "Id":
 "a43d29cbb8e7c4d25cfee8b803a504b0dc63e760b55ad0c611c6b87691eb6ff3",
                "Name": "/"
            },
            {
                "Id":
 "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
                "Name": "Top Level Folder"
            },
            {
                "Id":
 "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
                "Name": "Sublevel Folder"
            }
        ]
    }
```

```
}
```

- For API details, see GetFolderPath in *AWS CLI Command Reference*.

`get-folder`

The following code example shows how to use `get-folder`.

AWS CLI

To retrieve the metadata for a folder

The following `get-folder` example retrieves the metadata for the specified folder.

```
aws workdocs get-folder \
    --folder-id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08
```

Output:

```
{
    "Metadata": {
        "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
        "Name": "exampleFolder",
        "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
        "ParentFolderId":
 "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
        "CreatedTimestamp": 1534450467.622,
        "ModifiedTimestamp": 1534451113.504,
        "ResourceState": "ACTIVE",
        "Signature": "1a23456b78901c23d4ef56gh7EXAMPLE",
        "Size": 23019,
        "LatestVersionSize": 11537
    }
}
```

- For API details, see GetFolder in *AWS CLI Command Reference*.

`get-resources`

The following code example shows how to use `get-resources`.

AWS CLI

To retrieve shared resources

The following `get-resources` example retrieves the resources shared with the specified Amazon WorkDocs user.

```
aws workdocs get-resources \
    --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333" \
    --collection-type SHARED_WITH_ME
```

Output:

```
{
"Folders": [],
"Documents": []
}
```

- For API details, see GetResources in *AWS CLI Command Reference*.

`initiate-document-version-upload`

The following code example shows how to use `initiate-document-version-upload`.

AWS CLI

To initiate a document version upload

The following `initiate-document-version-upload` example creates a new document object and version object.

```
aws workdocs initiate-document-version-upload \
    --name exampledocname \
    --parent-folder-
id eacd546d952531c633452ed67cac23161aa0d5df2e8061223a59e8f67e7b6189
```

Output:

```
{
    "Metadata": {
        "Id": "feaba64d4efdf271c2521b60a2a44a8f057e84beaabbe22f01267313209835f2",
```

```
        "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",

    }
}
```

- For API details, see InitiateDocumentVersionUpload in *AWS CLI Command Reference*.

`remove-all-resource-permissions`

The following code example shows how to use `remove-all-resource-permissions`.

AWS CLI

To remove all permissions from a specified resource

The following `remove-all-resource-permissions` example removes all permissions from the specified resource.

```
aws workdocs remove-all-resource-permissions \
    --resource-id 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

This command produces no output.

- For API details, see RemoveAllResourcePermissions in *AWS CLI Command Reference*.

`remove-resource-permission`

The following code example shows how to use `remove-resource-permission`.

AWS CLI

To remove permissions from a resource

The following `remove-resource-permission` example removes permissions from the resource for the specified principal.

```
aws workdocs remove-resource-permission \
    --resource-id 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678 \
    --principal-id anonymous
```

This command produces no output.

- For API details, see RemoveResourcePermission in *AWS CLI Command Reference*.

`update-document-version`

The following code example shows how to use `update-document-version`.

AWS CLI

To change a document version status to Active

The following `update-document-version` example changes the status of the document version to Active.

```
aws workdocs update-document-version \
```

```
    --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 \
    --version-
id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 \
    --version-status ACTIVE
```

This command produces no output.

- For API details, see UpdateDocumentVersion in *AWS CLI Command Reference*.

`update-document`

The following code example shows how to use `update-document`.

AWS CLI

To update a document

The following `update-document` example updates a document's name and parent folder.

```
aws workdocs update-document \
    --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 \
    --name updatedDoc \
    --parent-folder-
id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08
```

This command produces no output.

- For API details, see UpdateDocument in *AWS CLI Command Reference*.

`update-folder`

The following code example shows how to use `update-folder`.

AWS CLI

To update a folder

The following `update-folder` example updates a folder's name and parent folder.

```
aws workdocs update-folder \
    --folder-id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08 \
```

```
    --name exampleFolder1 \
    --parent-folder-
id 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

This command produces no output.

- For API details, see UpdateFolder in *AWS CLI Command Reference*.

`update-user`

The following code example shows how to use `update-user`.

AWS CLI

To update a user

The following `update-user` example updates the time zone for the specified user.

```
aws workdocs update-user \
    --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c" \
    --time-zone-id "America/Los_Angeles"
```

Output:

```
{
    "User": {
        "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
        "Username": "exampleUser",
        "EmailAddress": "exampleUser@site.awsapps.com",
        "GivenName": "Example",
        "Surname": "User",
        "OrganizationId": "d-926726012c",
        "RootFolderId":
 "c5eceb5e1a2d1d460c9d1af8330ae117fc8d39bb1d3ed6acd0992d5ff192d986",
        "RecycleBinFolderId":
 "6ca20102926ad15f04b1d248d6d6e44f2449944eda5c758f9a1e9df6a6b7fa66",
        "Status": "ACTIVE",
        "Type": "USER",
        "TimeZoneId": "America/Los_Angeles",
        "Storage": {
            "StorageUtilizedInBytes": 0,
            "StorageRule": {
```

```
                "StorageAllocatedInBytes": 53687091200,
                "StorageType": "QUOTA"
            }
        }
    }
}
```

- For API details, see UpdateUser in *AWS CLI Command Reference*.

Amazon WorkMail examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkMail.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-delegate-to-resource`

The following code example shows how to use `associate-delegate-to-resource`.

AWS CLI

To add a delegate to a resource

The following `associate-delegate-to-resource` example adds a delegate to a resource.

```
aws workmail associate-delegate-to-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-68bf2d3b1c0244aab7264c24b9217443 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

For more information, see Editing resource details in the *Amazon WorkMail Administrator Guide*.

- For API details, see AssociateDelegateToResource in *AWS CLI Command Reference*.

`associate-member-to-group`

The following code example shows how to use `associate-member-to-group`.

AWS CLI

To add a member to a group

The following `associate-member-to-group` example adds the specified member to a group.

```
aws workmail associate-member-to-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --member-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

For more information, see Adding members to a group in the *Amazon WorkMail Administrator Guide*.

- For API details, see AssociateMemberToGroup in *AWS CLI Command Reference*.

`create-alias`

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias

The following `create-alias` example creates an alias for the specified entity (user or group).

```
aws workmail create-alias \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
```

```
    --alias exampleAlias@site.awsapps.com
```

This command produces no output.

For more information, see Managing group aliases in the *Amazon WorkMail Administrator Guide*.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

To create a new group

The following `create-group` example creates a new group for the specified organization.

```
aws workmail create-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --name exampleGroup1
```

Output:

```
{
    "GroupId": "S-1-1-11-1122222222-2222233333-3333334444-4444"
}
```

For more information, see Adding a group in the *Amazon WorkMail Administrator Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`create-resource`

The following code example shows how to use `create-resource`.

AWS CLI

To create a new resource

The following `create-resource` example creates a new resource (meeting room) for the specified organization.

```
aws workmail create-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --name exampleRoom1 \
    --type ROOM
```

Output:

```
{
    "ResourceId": "r-7afe0efbade843a58cdc10251fce992c"
}
```

For more information, see Adding a resource in the *Amazon WorkMail Administrator Guide*.

- For API details, see CreateResource in *AWS CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

To create a new user

The following `create-user` example creates a new user.

```
aws workmail create-user \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --name exampleName \
    --display-name exampleDisplayName \
    --password examplePa$$w0rd
```

Output:

```
{
    "UserId": "S-1-1-11-1111111111-2222222222-3333333333-3333"
}
```

For more information, see Adding a user in the *Amazon WorkMail Administrator Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

`delete-access-control-rule`

The following code example shows how to use `delete-access-control-rule`.

AWS CLI

To delete an access control rule

The following `delete-access-control-rule` example deletes the specified access control rule from the specified Amazon WorkMail organization.

```
aws workmail delete-access-control-rule \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --name "myRule"
```

This command produces no output.

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see DeleteAccessControlRule in *AWS CLI Command Reference*.

`delete-alias`

The following code example shows how to use `delete-alias`.

AWS CLI

To delete an alias

The following `delete-alias` example deletes the alias for the specified entity (user or group).

```
aws workmail delete-alias \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --alias exampleAlias@site.awsapps.com
```

This command produces no output.

For more information, see Managing user aliases in the *Amazon WorkMail Administrator Guide*.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To delete an existing group

The following `delete-group` example deletes an existing group from Amazon WorkMail.

```
aws workmail delete-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

This command produces no output.

For more information, see Deleting a group in the *Amazon WorkMail Administrator Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

`delete-mailbox-permissions`

The following code example shows how to use `delete-mailbox-permissions`.

AWS CLI

To delete mailbox permissions

The following `delete-mailbox-permissions` example deletes mailbox permissions that were previously granted to a user or group. The entity represents the user that owns the mailbox, and the grantee represents the user or group for whom to delete permissions.

```
aws workmail delete-mailbox-permissions \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --grantee-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

For more information, see Managing mailbox permissions for users in the *Amazon WorkMail Administrator Guide*.

- For API details, see DeleteMailboxPermissions in *AWS CLI Command Reference*.

`delete-resource`

The following code example shows how to use `delete-resource`.

AWS CLI

To delete an existing resource

The following `delete-resource` example deletes an existing resource from Amazon WorkMail.

```
aws workmail delete-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-7afe0efbade843a58cdc10251fce992c
```

This command produces no output.

For more information, see Deleting a resource in the *Amazon WorkMail Administrator Guide*.

- For API details, see DeleteResource in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes the specified user from Amazon WorkMail and all subsequent systems.

```
aws workmail delete-user \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

For more information, see Working with users in the *Amazon WorkMail Administrator Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`deregister-from-work-mail`

The following code example shows how to use `deregister-from-work-mail`.

AWS CLI

To disable an existing entity

The following `deregister-from-work-mail` example disables an existing entity (user, group, or resource) from using Amazon WorkMail.

```
aws workmail deregister-from-work-mail \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

For more information, see Disabling users in the *Amazon WorkMail Administrator Guide*.

- For API details, see DeregisterFromWorkMail in *AWS CLI Command Reference*.

`describe-group`

The following code example shows how to use `describe-group`.

AWS CLI

To retrieve information for a group

The following `describe-group` example retrieves information about the specified group.

```
aws workmail describe-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

Output:

```
{
    "GroupId": "S-1-1-11-1122222222-2222233333-3333334444-4444",
    "Name": "exampleGroup1",
    "State": "ENABLED"
}
```

For more information, see Working with groups in the *Amazon WorkMail Administrator Guide*.

- For API details, see DescribeGroup in *AWS CLI Command Reference*.

`describe-organization`

The following code example shows how to use `describe-organization`.

AWS CLI

To retrieve information for an organization

The following `describe-organization` example retrieves information for the specified Amazon WorkMail organization.

```
aws workmail describe-organization \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "OrganizationId": "m-d281d0a2fd824be5b6cd3d3ce909fd27",
    "Alias": "alias",
    "State": "Active",
    "DirectoryId": "d-926726012c",
    "DirectoryType": "VpcDirectory",
    "DefaultMailDomain": "site.awsapps.com",
    "CompletedDate": 1522693605.468,
    "ARN": "arn:aws:workmail:us-west-2:123456789012:organization/m-
n1pq2345678r901st2u3vx45x6789yza"
}
```

For more information, see Working with Organizations in the *Amazon WorkMail Administrator Guide*.

- For API details, see DescribeOrganization in *AWS CLI Command Reference*.

`describe-resource`

The following code example shows how to use `describe-resource`.

AWS CLI

To retrieve information for a resource

The following `describe-resource` example retrieves information about the specified resource.

```
aws workmail describe-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-7afe0efbade843a58cdc10251fce992c
```

Output:

```
{
    "ResourceId": "r-7afe0efbade843a58cdc10251fce992c",
    "Name": "exampleRoom1",
    "Type": "ROOM",
    "BookingOptions": {
        "AutoAcceptRequests": true,
        "AutoDeclineRecurringRequests": false,
        "AutoDeclineConflictingRequests": true
    },
    "State": "ENABLED"
}
```

For more information, see Working with resources in the *Amazon WorkMail Administrator Guide*.

- For API details, see DescribeResource in *AWS CLI Command Reference*.

`describe-user`

The following code example shows how to use `describe-user`.

AWS CLI

To retrieve user information

The following `describe-user` example retrieves information about the specified user.

```
aws workmail describe-user \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "UserId": "S-1-1-11-1111111111-2222222222-3333333333-3333",
    "Name": "exampleUser1",
    "Email": "exampleUser1@site.awsapps.com",
    "DisplayName": "",
    "State": "ENABLED",
    "UserRole": "USER",
    "EnabledDate": 1532459261.827
}
```

For more information, see Working with users in the *Amazon WorkMail Administrator Guide*.

- For API details, see DescribeUser in *AWS CLI Command Reference*.

`disassociate-delegate-from-resource`

The following code example shows how to use `disassociate-delegate-from-resource`.

AWS CLI

To remove a member from a resource

The following `disassociate-delegate-from-resource` example removes the specified member from a resource.

```
aws workmail disassociate-delegate-from-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-68bf2d3b1c0244aab7264c24b9217443 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

For more information, see Editing resource details in the *Amazon WorkMail Administrator Guide*.

- For API details, see DisassociateDelegateFromResource in *AWS CLI Command Reference*.

`disassociate-member-from-group`

The following code example shows how to use `disassociate-member-from-group`.

AWS CLI

To remove a member from a group

The following `disassociate-member-from-group` example removes the specified member from a group.

```
aws workmail disassociate-member-from-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --member-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

For more information, see Removing members from a group in the *Amazon WorkMail Administrator Guide*.

- For API details, see DisassociateMemberFromGroup in *AWS CLI Command Reference*.

`get-access-control-effect`

The following code example shows how to use `get-access-control-effect`.

AWS CLI

To get the effect of access control rules

The following `get-access-control-effect` example retrieves the effect of the specified Amazon WorkMail organization's access control rules for the specified IP address, access protocol action, and user ID.

```
aws workmail get-access-control-effect \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --ip-address "192.0.2.0" \
```

```
    --action "WindowsOutlook" \
    --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333"
```

Output:

```
{
    "Effect": "DENY",
    "MatchedRules": [
        "myRule"
    ]
}
```

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see GetAccessControlEffect in *AWS CLI Command Reference*.

`get-mailbox-details`

The following code example shows how to use `get-mailbox-details`.

AWS CLI

To get a user's mailbox details

The following `get-mailbox-details` example retrieves details about the specified user's mailbox.

```
aws workmail get-mailbox-details \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "MailboxQuota": 51200,
    "MailboxSize": 0.03890800476074219
}
```

For more information, see Working with users in the *Amazon WorkMail Administrator Guide*.

- For API details, see GetMailboxDetails in *AWS CLI Command Reference*.

`list-access-control-rules`

The following code example shows how to use `list-access-control-rules`.

AWS CLI

To list access control rules

The following `list-access-control-rules` example lists the access control rules for the specified Amazon WorkMail organization.

```
aws workmail list-access-control-rules \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza
```

Output:

```
{
    "Rules": [
        {
            "Name": "default",
            "Effect": "ALLOW",
            "Description": "Default WorkMail Rule",
            "DateCreated": 0.0,
            "DateModified": 0.0
        },
        {
            "Name": "myRule",
            "Effect": "DENY",
            "Description": "my rule",
            "UserIds": [
            "S-1-1-11-1111111111-2222222222-3333333333-3333"
            ],
            "DateCreated": 1581635628.0,
            "DateModified": 1581635628.0
        }
    ]
}
```

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListAccessControlRules in *AWS CLI Command Reference*.

`list-aliases`

The following code example shows how to use `list-aliases`.

AWS CLI

To list aliases for a member

The following `list-aliases` example lists aliases for the specified member (user or group).

```
aws workmail list-aliases \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "Aliases": [
        "exampleAlias@site.awsapps.com",
        "exampleAlias1@site.awsapps.com"
    ]
}
```

For more information, see Managing user aliases in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListAliases in *AWS CLI Command Reference*.

`list-group-members`

The following code example shows how to use `list-group-members`.

AWS CLI

To list group members

The following `list-group-members` example lists the members of the specified group.

```
aws workmail list-group-members \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
```

```
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

Output:

```
{
    "Members": [
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
            "Name": "exampleUser1",
            "Type": "USER",
            "State": "ENABLED",
            "EnabledDate": 1532459261.827
        }
    ]
}
```

For more information, see Working with groups in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListGroupMembers in *AWS CLI Command Reference*.

`list-groups`

The following code example shows how to use `list-groups`.

AWS CLI

To retrieve a list of groups

The following `list-groups` example retrieves summaries of the groups in the specified organization.

```
aws workmail list-groups \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "Groups": [
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444",
            "Name": "exampleGroup1",
```

```
            "State": "DISABLED"
        },
        {
            "Id": "S-4-4-44-1122222222-2222233333-3333334444-4444",
            "Name": "exampleGroup2",
            "State": "ENABLED"
        }
    ]
}
```

For more information, see Viewing a list of groups in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListGroups in *AWS CLI Command Reference*.

`list-mailbox-permissions`

The following code example shows how to use `list-mailbox-permissions`.

AWS CLI

To retrieve mailbox permissions

The following `list-mailbox-permissions` example retrieves the mailbox permissions associated with the specified entity's mailbox.

```
aws workmail list-mailbox-permissions \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "Permissions": [
        {
            "GranteeId": "S-1-1-11-1122222222-2222233333-3333334444-4444",
            "GranteeType": "USER",
            "PermissionValues": [
                "FULL_ACCESS"
            ]
        }
    ]
}
```

For more information, see Working with mailbox permissions in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListMailboxPermissions in *AWS CLI Command Reference*.

`list-organizations`

The following code example shows how to use `list-organizations`.

AWS CLI

To retrieve a list of organizations

The following `list-organizations` example retrieves summaries of the customer's organizations.

```
aws workmail list-organizations
```

Output:

```
{
    "OrganizationSummaries": [
        {
            "OrganizationId": "m-d281d0a2fd824be5b6cd3d3ce909fd27",
            "Alias": "exampleAlias",
            "State": "Active"
        }
    ]
}
```

For more information, see Working with organizations in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListOrganizations in *AWS CLI Command Reference*.

`list-resource-delegates`

The following code example shows how to use `list-resource-delegates`.

AWS CLI

To list the delegates for a resource

The following `list-resource-delegates` example retrieves the delegates associated with the specified resource.

```
aws workmail list-resource-delegates \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-68bf2d3b1c0244aab7264c24b9217443
```

Output:

```
{
    "Delegates": [
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
            "Type": "USER"
        }
    ]
}
```

For more information, see Editing resource details in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListResourceDelegates in *AWS CLI Command Reference*.

`list-resources`

The following code example shows how to use `list-resources`.

AWS CLI

To retrieve a list of resources

The following `list-resources` example retrieves summaries of the resources for the specified organization.

```
aws workmail list-resources \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "Resources": [
        {
            "Id": "r-7afe0efbade843a58cdc10251fce992c",
```

```
            "Name": "exampleRoom1",
            "Type": "ROOM",
            "State": "ENABLED"
        }
    ]
}
```

For more information, see Viewing a list of resources in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListResources in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for the specified Amazon WorkMail organization.

```
aws workmail list-tags-for-resource \
    --resource-arn arn:aws:workmail:us-west-2:123456789012:organization/m-n1pq2345678r901st2u3vx45x6789yza
```

Output:

```
{
    "Tags": [
        {
            "Key": "priority",
            "Value": "1"
        }
    ]
}
```

For more information, see Tagging an Organization in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-users`

The following code example shows how to use `list-users`.

AWS CLI

To retrieve a list of users

The following `list-users` example retrieves summaries of the users in the specified organization.

```
aws workmail list-users \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "Users": [
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
            "Email": "exampleUser1@site.awsapps.com",
            "Name": "exampleUser1",
            "State": "ENABLED",
            "UserRole": "USER",
            "EnabledDate": 1532459261.827
        },
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444",
            "Name": "exampleGuestUser",
            "State": "DISABLED",
            "UserRole": "SYSTEM_USER"
        }
    ]
}
```

For more information, see Viewing a list of users in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListUsers in *AWS CLI Command Reference*.

`put-access-control-rule`

The following code example shows how to use `put-access-control-rule`.

AWS CLI

To put a new access control rule

The following `put-access-control-rule` example denies the specified user access to the specified Amazon WorkMail organization.

```
aws workmail put-access-control-rule \
    --name "myRule" \
    --effect "DENY" \
    --description "my rule" \
    --user-ids "S-1-1-11-1111111111-2222222222-3333333333-3333" \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza
```

This command produces no output.

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see PutAccessControlRule in *AWS CLI Command Reference*.

`put-mailbox-permissions`

The following code example shows how to use `put-mailbox-permissions`.

AWS CLI

To set mailbox permissions

The following `put-mailbox-permissions` example sets full access permissions for the specified grantee (user or group). The entity represents the owner of the mailbox.

```
aws workmail put-mailbox-permissions \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --grantee-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --permission-values FULL_ACCESS
```

This command produces no output.

For more information, see Managing mailbox permissions for users in the *Amazon WorkMail Administrator Guide*.

- For API details, see PutMailboxPermissions in *AWS CLI Command Reference*.

`register-to-work-mail`

The following code example shows how to use `register-to-work-mail`.

AWS CLI

To register an existing or disabled entity

The following `register-to-work-mail` example enables the specified existing entity (user, group, or resource) to use Amazon WorkMail.

```
aws workmail register-to-work-mail \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --email exampleGroup1@site.awsapps.com
```

This command produces no output.

For more information, see Enabling groups in the *Amazon WorkMail Administrator Guide*.

- For API details, see RegisterToWorkMail in *AWS CLI Command Reference*.

`reset-password`

The following code example shows how to use `reset-password`.

AWS CLI

To reset a user's password

The following `reset-password` example resets the password for the specified user.

```
aws workmail reset-password \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --password examplePa$$w0rd
```

This command produces no output.

For more information, see Resetting user password in the *Amazon WorkMail Administrator Guide*.

- For API details, see ResetPassword in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To apply a tag to a resource

The following `tag-resource` example applies a tag with key "priority" and value "1" to the specified Amazon WorkMail organization.

```
aws workmail tag-resource \
    --resource-arn arn:aws:workmail:us-west-2:123456789012:organization/m-n1pq2345678r901st2u3vx45x6789yza \
    --tags "Key=priority,Value=1"
```

This command produces no output.

For more information, see Tagging an Organization in the *Amazon WorkMail Administrator Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a resource

The following `untag-resource` example removes the specified tag from the specified Amazon WorkMail organization.

```
aws workmail untag-resource \
    --resource-arn arn:aws:workmail:us-west-2:123456789012:organization/m-n1pq2345678r901st2u3vx45x6789yza \
```

```
    --tag-keys "priority"
```

This command produces no output.

For more information, see Tagging an Organization in the *Amazon WorkMail Administrator Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-mailbox-quota`

The following code example shows how to use `update-mailbox-quota`.

AWS CLI

To update a user's mailbox quota

The following `update-mailbox-quota` example changes the specified user's mailbox quota.

```
aws workmail update-mailbox-quota \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --mailbox-quota 40000
```

This command produces no output.

For more information, see Working with users in the *Amazon WorkMail Administrator Guide*.

- For API details, see UpdateMailboxQuota in *AWS CLI Command Reference*.

`update-primary-email-address`

The following code example shows how to use `update-primary-email-address`.

AWS CLI

To update a primary email address

The following `update-primary-email-address` example updates the primary email address of the specified entity (user, group, or resource).

```
aws workmail update-primary-email-address \
```

```
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --email exampleUser2@site.awsapps.com
```

This command produces no output.

For more information, see Editing user details in the *Amazon WorkMail Administrator Guide*.

- For API details, see UpdatePrimaryEmailAddress in *AWS CLI Command Reference*.

`update-resource`

The following code example shows how to use `update-resource`.

AWS CLI

To update a resource

The following `update-resource` example updates the name of the specified resource.

```
aws workmail update-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-7afe0efbade843a58cdc10251fce992c \
    --name exampleRoom2
```

This command produces no output.

For more information, see Editing resource details in the *Amazon WorkMail Administrator Guide*.

- For API details, see UpdateResource in *AWS CLI Command Reference*.

Amazon WorkMail Message Flow examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkMail Message Flow.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`get-raw-message-content`

The following code example shows how to use `get-raw-message-content`.

AWS CLI

To get the raw content of an email message

The following `get-raw-message-content` example gets the raw content of an in-transit email message and sends it to a text file named `test`. The contents of `test` after the command runs are shown below.

```
aws workmailmessageflow get-raw-message-content test \
    --message-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Contents of `test`:

```
Subject: Hello World
From: =?UTF-8?Q?marymajor_marymajor?= <marymajor@example.com>
To: =?UTF-8?Q?mateojackson=40example=2Enet?= <mateojackson@example.net>

```

This command produces no output.

For more information, see Retrieving Message Content with AWS Lambda in the *Amazon WorkMail Administrator Guide*.

- For API details, see GetRawMessageContent in *AWS CLI Command Reference*.

WorkSpaces examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with WorkSpaces.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-tags`

The following code example shows how to use `create-tags`.

AWS CLI

To add tags to a WorkSpace

The following `create-tags` example adds the specified tags to the specified WorkSpace.

```
aws workspaces create-tags \
    --resource-id ws-dk1xzr417 \
    --tags Key=Department,Value=Finance
```

This command produces no output.

For more information, see Tag WorkSpaces resources in the *Amazon WorkSpaces Administration Guide*.

- For API details, see CreateTags in *AWS CLI Command Reference*.

`create-workspaces`

The following code example shows how to use `create-workspaces`.

AWS CLI

Example 1: To create an AlwaysOn WorkSpace

The following `create-workspaces` example creates an AlwaysOn WorkSpace for the specified user, using the specified directory and bundle.

```
aws workspaces create-workspaces \
    --workspaces DirectoryId=d-926722edaf,UserName=Mateo,BundleId=wsb-0zsvgp8fc
```

Output:

```
{
    "FailedRequests": [],
    "PendingRequests": [
        {
```

```
            "WorkspaceId": "ws-kcqms853t",
            "DirectoryId": "d-926722edaf",
            "UserName": "Mateo",
            "State": "PENDING",
            "BundleId": "wsb-0zsvgp8fc"
        }
    ]
}
```

Example 2: To create an AutoStop WorkSpace

The following `create-workspaces` example creates an AutoStop WorkSpace for the specified user, using the specified directory and bundle.

```
aws workspaces create-workspaces \
    --
workspaces DirectoryId=d-926722edaf,UserName=Mary,BundleId=wsb-0zsvgp8fc,WorkspaceProperties
```

Output:

```
{
    "FailedRequests": [],
    "PendingRequests": [
        {
            "WorkspaceId": "ws-dk1xzr417",
            "DirectoryId": "d-926722edaf",
            "UserName": "Mary",
            "State": "PENDING",
            "BundleId": "wsb-0zsvgp8fc"
        }
    ]
}
```

Example 3: To create a user-decoupled WorkSpace

The following `create-workspaces` example creates a user-decoupled WorkSpace by setting the username to `[UNDEFINED]`, and specifying a WorkSpace name, directory ID, and bundle ID.

```
aws workspaces create-workspaces \
    --workspaces
 DirectoryId=d-926722edaf,UserName='"[UNDEFINED]"',WorkspaceName=MaryWorkspace1,BundleId=wsb
```

Output:

```
{
    "FailedRequests": [],
    "PendingRequests": [
        {
            "WorkspaceId": "ws-abcd1234",
            "DirectoryId": "d-926722edaf",
            "UserName": "[UNDEFINED]",
            "State": "PENDING",
            "BundleId": "wsb-0zsvgp8fc",
            "WorkspaceName": "MaryWorkspace1"
        }
    ]
}
```

For more information, see Launch a virtual desktop in the *Amazon WorkSpaces Administration Guide*.

- For API details, see CreateWorkspaces in *AWS CLI Command Reference*.

`delete-tags`

The following code example shows how to use `delete-tags`.

AWS CLI

To delete a tag from a WorkSpace

The following `delete-tags` example deletes the specified tag from the specified WorkSpace.

```
aws workspaces delete-tags \
    --resource-id ws-dk1xzr417 \
    --tag-keys Department
```

This command produces no output.

For more information, see Tag WorkSpaces resources in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DeleteTags in *AWS CLI Command Reference*.

`deregister-workspace-directory`

The following code example shows how to use `deregister-workspace-directory`.

AWS CLI

To deregister a directory

The following `deregister-workspace-directory` example deregisters the specified directory.

```
aws workspaces deregister-workspace-directory \
    --directory-id d-926722edaf
```

This command produces no output.

For more information, see Register a directory with WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DeregisterWorkspaceDirectory in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe the tags for a WorkSpace

The following `describe-tags` example describes the tags for the specified WorkSpace.

```
aws workspaces describe-tags \
    --resource-id ws-dk1xzr417
```

Output:

```
{
    "TagList": [
        {
            "Key": "Department",
            "Value": "Finance"
        }
    ]
```

```
}
```

For more information, see Tag WorkSpaces resources in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`describe-workspace-bundles`

The following code example shows how to use `describe-workspace-bundles`.

AWS CLI

To list the bundles provided by Amazon

The following `describe-workspace-bundles` example lists the names and IDs of the bundles provided by Amazon, in table format and sorted by name.

```
aws workspaces describe-workspace-bundles \
    --owner AMAZON \
    --query "Bundles[*].[Name, BundleId]"
```

Output:

```
[
    [
        "Standard with Amazon Linux 2",
        "wsb-clj85qzj1"
    ],
    [
        "Performance with Windows 10 (Server 2016 based)",
        "wsb-gm4d5tx2v"
    ],
    [
        "PowerPro with Windows 7",
        "wsb-1pzkp0bx4"
    ],
    [
        "Power with Amazon Linux 2",
        "wsb-2bs6k5lgn"
    ],
    [
```

```
        "Graphics with Windows 10 (Server 2019 based)",
        "wsb-03gyjnfyy"
    ]
]
```

For more information, see WorkSpaces bundles and images in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspaceBundles in *AWS CLI Command Reference*.

`describe-workspace-directories`

The following code example shows how to use `describe-workspace-directories`.

AWS CLI

To describe a registered directory

The following `describe-workspace-directories` example describes the specified registered directory.

```
aws workspaces describe-workspace-directories \
    --directory-ids d-926722edaf
```

Output:

```
{
    "Directories": [
        {
            "DirectoryId": "d-926722edaf",
            "Alias": "d-926722edaf",
            "DirectoryName": "example.com",
            "RegistrationCode": "WSpdx+9RJ8JT",
            "SubnetIds": [
                "subnet-9d19c4c6",
                "subnet-500d5819"
            ],
            "DnsIpAddresses": [
                "172.16.1.140",
                "172.16.0.30"
            ],
            "CustomerUserName": "Administrator",
```

```
            "IamRoleId": "arn:aws:iam::123456789012:role/workspaces_DefaultRole",
            "DirectoryType": "SIMPLE_AD",
            "WorkspaceSecurityGroupId": "sg-0d89e927e5645d7c5",
            "State": "REGISTERED",
            "WorkspaceCreationProperties": {
                "EnableInternetAccess": false,
                "UserEnabledAsLocalAdministrator": true,
                "EnableMaintenanceMode": true
            },
            "WorkspaceAccessProperties": {
                "DeviceTypeWindows": "ALLOW",
                "DeviceTypeOsx": "ALLOW",
                "DeviceTypeWeb": "DENY",
                "DeviceTypeIos": "ALLOW",
                "DeviceTypeAndroid": "ALLOW",
                "DeviceTypeChromeOs": "ALLOW",
                "DeviceTypeZeroClient": "ALLOW",
                "DeviceTypeLinux": "DENY"
            },
            "Tenancy": "SHARED",
            "SelfservicePermissions": {
                "RestartWorkspace": "ENABLED",
                "IncreaseVolumeSize": "DISABLED",
                "ChangeComputeType": "DISABLED",
                "SwitchRunningMode": "DISABLED",
                "RebuildWorkspace": "DISABLED"
            }
        }
    ]
}
```

For more information, see Manage directories for WorkSpaces Personal in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspaceDirectories in *AWS CLI Command Reference*.

`describe-workspaces-connection-status`

The following code example shows how to use `describe-workspaces-connection-status`.

AWS CLI

To describe the connection status of a WorkSpace

The following `describe-workspaces-connection-status` example describes the connection status of the specified WorkSpace.

```
aws workspaces describe-workspaces-connection-status \
    --workspace-ids ws-dk1xzr417
```

Output:

```
{
    "WorkspacesConnectionStatus": [
        {
            "WorkspaceId": "ws-dk1xzr417",
            "ConnectionState": "CONNECTED",
            "ConnectionStateCheckTimestamp": 1662526214.744
        }
    ]
}
```

For more information, see Administer your WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspacesConnectionStatus in *AWS CLI Command Reference*.

`describe-workspaces`

The following code example shows how to use `describe-workspaces`.

AWS CLI

To describe a WorkSpace

The following `describe-workspaces` example describes the specified WorkSpace.

```
aws workspaces describe-workspaces \
    --workspace-ids ws-dk1xzr417
```

Output:

```
{
    "Workspaces": [
        {
            "WorkspaceId": "ws-dk1xzr417",
```

```
            "DirectoryId": "d-926722edaf",
            "UserName": "Mary",
            "IpAddress": "172.16.0.175",
            "State": "STOPPED",
            "BundleId": "wsb-0zsvgp8fc",
            "SubnetId": "subnet-500d5819",
            "ComputerName": "WSAMZN-RBSLTTD9",
            "WorkspaceProperties": {
                "RunningMode": "AUTO_STOP",
                "RunningModeAutoStopTimeoutInMinutes": 60,
                "RootVolumeSizeGib": 80,
                "UserVolumeSizeGib": 10,
                "ComputeTypeName": "VALUE"
            },
            "ModificationStates": []
        }
    ]
}
```

For more information, see Administer your WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspaces in *AWS CLI Command Reference*.

`migrate-workspace`

The following code example shows how to use `migrate-workspace`.

AWS CLI

To migrate a WorkSpace

The following `migrate-workspace` example migrates the specified WorkSpace to the specified bundle.

```
aws workspaces migrate-workspace \
    --source-workspace-id ws-dk1xzr417 \
    --bundle-id wsb-j4dky1gs4
```

Output:

```
{
```

```
    "SourceWorkspaceId": "ws-dk1xzr417",
    "TargetWorkspaceId": "ws-x5h1lbkp5"
}
```

For more information, see Migrate a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see MigrateWorkspace in *AWS CLI Command Reference*.

`modify-workspace-creation-properties`

The following code example shows how to use `modify-workspace-creation-properties`.

AWS CLI

To modify a WorkSpace creation property of a directory

The following `modify-workspace-creation-properties` example enables the `EnableInternetAccess` property for the specified directory. This enables automatic assignment of public IP addresses for the WorkSpaces created for the directory.

```
aws workspaces modify-workspace-creation-properties \
    --resource-id d-926722edaf \
    --workspace-creation-properties EnableInternetAccess=true
```

This command produces no output.

For more information, see Manage directories for WorkSpaces Personal in the *Amazon WorkSpaces Administration Guide*.

- For API details, see ModifyWorkspaceCreationProperties in *AWS CLI Command Reference*.

`modify-workspace-properties`

The following code example shows how to use `modify-workspace-properties`.

AWS CLI

To modify the running mode of a WorkSpace

The following `modify-workspace-properties` example sets the running mode of the specified WorkSpace to `AUTO_STOP`.

```
aws workspaces modify-workspace-properties \
    --workspace-id ws-dk1xzr417 \
    --workspace-properties RunningMode=AUTO_STOP
```

This command produces no output.

For more information, see Modify a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see ModifyWorkspaceProperties in *AWS CLI Command Reference*.

`modify-workspace-state`

The following code example shows how to use `modify-workspace-state`.

AWS CLI

To modify the state of a WorkSpace

The following `modify-workspace-state` example sets the state of the specified WorkSpace to `ADMIN_MAINTENANCE`.

```
aws workspaces modify-workspace-state \
    --workspace-id ws-dk1xzr417 \
    --workspace-state ADMIN_MAINTENANCE
```

This command produces no output.

For more information, see WorkSpace maintenance in the *Amazon WorkSpaces Administration Guide*.

- For API details, see ModifyWorkspaceState in *AWS CLI Command Reference*.

`reboot-workspaces`

The following code example shows how to use `reboot-workspaces`.

AWS CLI

To reboot a WorkSpace

The following `reboot-workspaces` example reboots the specified WorkSpace.

```
aws workspaces reboot-workspaces \
    --reboot-workspace-requests ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Reboot a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RebootWorkspaces in *AWS CLI Command Reference*.

`rebuild-workspaces`

The following code example shows how to use `rebuild-workspaces`.

AWS CLI

To rebuild a WorkSpace

The following `rebuild-workspaces` example rebuilds the specified WorkSpace.

```
aws workspaces rebuild-workspaces \
    --rebuild-workspace-requests ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Rebuild a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RebuildWorkspaces in *AWS CLI Command Reference*.

`register-workspace-directory`

The following code example shows how to use `register-workspace-directory`.

AWS CLI

To register a directory

The following `register-workspace-directory` example registers the specified directory for use with Amazon WorkSpaces.

```
aws workspaces register-workspace-directory \
    --directory-id d-926722edaf
```

This command produces no output.

For more information, see Register an existing AWS Directory Service directory with WorkSpaces Personal in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RegisterWorkspaceDirectory in *AWS CLI Command Reference*.

`restore-workspace`

The following code example shows how to use `restore-workspace`.

AWS CLI

To restore a WorkSpace

The following `restore-workspace` example restores the specified WorkSpace.

```
aws workspaces restore-workspace \
    --workspace-id ws-dk1xzr417
```

This command produces no output.

For more information, see Restore a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RestoreWorkspace in *AWS CLI Command Reference*.

`start-workspaces`

The following code example shows how to use `start-workspaces`.

AWS CLI

To start an AutoStop WorkSpace

The following `start-workspaces` example starts the specified WorkSpace. The WorkSpace must have a running mode of `AutoStop`.

```
aws workspaces start-workspaces \
    --start-workspace-requests WorkspaceId=ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Stop and start an AutoStop WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see StartWorkspaces in *AWS CLI Command Reference*.

`stop-workspaces`

The following code example shows how to use `stop-workspaces`.

AWS CLI

To stop an AutoStop WorkSpace

The following `stop-workspaces` example stops the specified WorkSpace. The WorkSpace must have a running mode of `AutoStop`.

```
aws workspaces stop-workspaces \
    --stop-workspace-requests WorkspaceId=ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Stop and start an AutoStop WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see StopWorkspaces in *AWS CLI Command Reference*.

`terminate-workspaces`

The following code example shows how to use `terminate-workspaces`.

AWS CLI

To terminate a WorkSpace

The following `terminate-workspaces` example terminates the specified workspace.

```
aws workspaces terminate-workspaces \
    --terminate-workspace-requests ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Delete a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see TerminateWorkspaces in *AWS CLI Command Reference*.

X-Ray examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with X-Ray.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-get-traces`

The following code example shows how to use `batch-get-traces`.

AWS CLI

To get a list of traces

The following `batch-get-traces` example retrieves a list of traces specified by an ID. The full trace includes a document for each segment, compiled from all of the segment documents received with the same trace ID.

```
aws xray batch-get-traces \
    --trace-ids 1-5d82881a-0a9126e92a73e971eed891b9
```

Output:

```
{
    "Traces": [
        {
            "Id": "1-5d82881a-0a9126e92a73e971eed891b9",
            "Duration": 0.232,
            "Segments": [
                {

            ]
        }
    ],
    "UnprocessedTraceIds": []
}
```

For more information, see Using the AWS X-Ray API with the AWS CLI in the *AWS X-Ray Developer Guide*.

- For API details, see BatchGetTraces in *AWS CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

To create a group

The following `create-group` example creates a group resource named `AdminGroup`. The group gets a filter expression that defines the criteria of the group as a segment related to a specific service causing a fault or an error.

```
aws xray create-group \
    --group-name "AdminGroup" \
```

```
    --filter-expression "service(\"mydomain.com\") {fault OR error}"
```

Output:

```
{
    "Group": {
        "GroupName": "AdminGroup",
        "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
AdminGroup/123456789",
        "FilterExpression": "service(\"mydomain.com\") {fault OR error}"
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`create-sampling-rule`

The following code example shows how to use `create-sampling-rule`.

AWS CLI

To create a sampling rule

The following `create-sampling-rule` example creates a rule to control sampling behavior for instrumented applications. The rules are provided by a JSON file. The majority of the sampling rule fields are required to create the rule.

```
aws xray create-sampling-rule \
    --cli-input-json file://9000-base-scorekeep.json
```

Contents of `9000-base-scorekeep.json`:

```
{
    "SamplingRule": {
        "RuleName": "base-scorekeep",
        "ResourceARN": "*",
        "Priority": 9000,
        "FixedRate": 0.1,
```

```
        "ReservoirSize": 5,
        "ServiceName": "Scorekeep",
        "ServiceType": "*",
        "Host": "*",
        "HTTPMethod": "*",
        "URLPath": "*",
        "Version": 1
    }
}
```

Output:

```
{
    "SamplingRuleRecord": {
        "SamplingRule": {
            "RuleName": "base-scorekeep",
            "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/base-
scorekeep",
            "ResourceARN": "*",
            "Priority": 9000,
            "FixedRate": 0.1,
            "ReservoirSize": 5,
            "ServiceName": "Scorekeep",
            "ServiceType": "*",
            "Host": "*",
            "HTTPMethod": "*",
            "URLPath": "*",
            "Version": 1,
            "Attributes": {}
        },
        "CreatedAt": 1530574410.0,
        "ModifiedAt": 1530574410.0
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see CreateSamplingRule in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To delete a group

The following `delete-group` example deletes the specified group resource.

```
aws xray delete-group \
    --group-name "AdminGroup" \
    --group-arn "arn:aws:xray:us-west-2:123456789012:group/AdminGroup/123456789"
```

This command produces no output.

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

`delete-sampling-rule`

The following code example shows how to use `delete-sampling-rule`.

AWS CLI

To delete a sampling rule

The following `delete-sampling-rule` example deletes the specified sampling rule. You can specify the group by using either the group name or group ARN.

```
aws xray delete-sampling-rule \
    --rule-name polling-scorekeep
```

Output:

```
{
    "SamplingRuleRecord": {
        "SamplingRule": {
            "RuleName": "polling-scorekeep",
            "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/polling-
scorekeep",
            "ResourceARN": "*",
```

```
            "Priority": 5000,
            "FixedRate": 0.003,
            "ReservoirSize": 0,
            "ServiceName": "Scorekeep",
            "ServiceType": "*",
            "Host": "*",
            "HTTPMethod": "GET",
            "URLPath": "/api/state/*",
            "Version": 1,
            "Attributes": {}
        },
        "CreatedAt": 1530574399.0,
        "ModifiedAt": 1530574399.0
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see DeleteSamplingRule in *AWS CLI Command Reference*.

`get-encryption-config`

The following code example shows how to use `get-encryption-config`.

AWS CLI

To retrieve the encryption configuration

The following `get-encryption-config` example retrieves the current encryption configuration for your AWS X-Ray data.

```
aws xray get-encryption-config
```

Output:

```
{
    "EncryptionConfig": {
        "KeyId": "ae4aa6d49-a4d8-9df9-a475-4ff6d7898456",
        "Status": "ACTIVE",
        "Type": "NONE"
    }
```

```
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see GetEncryptionConfig in *AWS CLI Command Reference*.

`get-group`

The following code example shows how to use `get-group`.

AWS CLI

To retrieve a group

The following `get-group` example displays details for the specified group resource. The details include the group name, the group ARN, and the filter expression that defines the criteria for that group. Groups can also be retrieved by ARN.

```
aws xray get-group \
    --group-name "AdminGroup"
```

Output:

```
{
    "Group": {
        "GroupName": "AdminGroup",
        "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
AdminGroup/123456789",
        "FilterExpression": "service(\"mydomain.com\") {fault OR error}"
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see GetGroup in *AWS CLI Command Reference*.

`get-groups`

The following code example shows how to use `get-groups`.

AWS CLI

To retrieve all groups

The following `get-groups` example displays details for all active groups.

```
aws xray get-groups
```

Output:

```
{
    "Groups": [
        {
            "GroupName": "AdminGroup",
            "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
AdminGroup/123456789",
            "FilterExpression": "service(\"example.com\") {fault OR error}"
        },
        {
            "GroupName": "SDETGroup",
            "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
SDETGroup/987654321",
            "FilterExpression": "responsetime > 2"
        }
    ]
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see GetGroups in *AWS CLI Command Reference*.

`get-sampling-rules`

The following code example shows how to use `get-sampling-rules`.

AWS CLI

To retrieve all sampling rules

The following `get-sampling-rules` example displays details for all available sampling rules.

```
aws xray get-sampling-rules
```

Output:

```
{
    "SamplingRuleRecords": [
        {
            "SamplingRule": {
                "RuleName": "Default",
                "RuleARN": "arn:aws:xray:us-west-2::sampling-rule/Default",
                "ResourceARN": "*",
                "Priority": 10000,
                "FixedRate": 0.01,
                "ReservoirSize": 0,
                "ServiceName": "*",
                "ServiceType": "*",
                "Host": "*",
                "HTTPMethod": "*",
                "URLPath": "*",
                "Version": 1,
                "Attributes": {}
            },
            "CreatedAt": 0.0,
            "ModifiedAt": 1530558121.0
        },
        {
            "SamplingRule": {
                "RuleName": "base-scorekeep",
                "RuleARN": "arn:aws:xray:us-west-2::sampling-rule/base-scorekeep",
                "ResourceARN": "*",
                "Priority": 9000,
                "FixedRate": 0.1,
                "ReservoirSize": 2,
                "ServiceName": "Scorekeep",
                "ServiceType": "*",
                "Host": "*",
                "HTTPMethod": "*",

                "Version": 1,
                "Attributes": {}
            },
            "CreatedAt": 1530573954.0,
            "ModifiedAt": 1530920505.0
```

```
        },
        {
            "SamplingRule": {
                "RuleName": "polling-scorekeep",
                "RuleARN": "arn:aws:xray:us-west-2::sampling-rule/polling-
scorekeep",
                "ResourceARN": "*",
                "Priority": 5000,
                "FixedRate": 0.003,
                "ReservoirSize": 0,
                "ServiceName": "Scorekeep",
                "ServiceType": "*",
                "Host": "*",
                "HTTPMethod": "GET",
                "URLPath": "/api/state/*",
                "Version": 1,
                "Attributes": {}
            },
            "CreatedAt": 1530918163.0,
            "ModifiedAt": 1530918163.0
        }
    ]
}
```

For more information, see Using Sampling Rules with the X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see GetSamplingRules in *AWS CLI Command Reference*.

`get-sampling-targets`

The following code example shows how to use `get-sampling-targets`.

AWS CLI

To request a sampling quota

The following `get-sampling-targets` example requests a sampling quota for rules that the service is using to sample requests. The response from AWS X-Ray includes a quota that can be used instead of borrowing from the reservoir.

```
aws xray get-sampling-targets \
```

```
    --sampling-statistics-documents '[ { "RuleName": "base-scorekeep", "ClientID":
"ABCDEF1234567890ABCDEF10", "Timestamp": "2018-07-07T00:20:06", "RequestCount":
110, "SampledCount": 20, "BorrowCount": 10 }, { "RuleName": "polling-scorekeep",
"ClientID": "ABCDEF1234567890ABCDEF10", "Timestamp": "2018-07-07T00:20:06",
"RequestCount": 31, "SampledCount": 0, "BorrowCount": 0 } ]'
```

Output:

```
{
    "SamplingTargetDocuments": [
        {
            "RuleName": "base-scorekeep",
            "FixedRate": 0.1,
            "ReservoirQuota": 2,
            "ReservoirQuotaTTL": 1530923107.0,
            "Interval": 10
        },
        {
            "RuleName": "polling-scorekeep",
            "FixedRate": 0.003,
            "ReservoirQuota": 0,
            "ReservoirQuotaTTL": 1530923107.0,
            "Interval": 10
        }
    ],
    "LastRuleModification": 1530920505.0,
    "UnprocessedStatistics": []
}
```

For more information, see Using Sampling Rules with the X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see GetSamplingTargets in *AWS CLI Command Reference*.

`get-service-graph`

The following code example shows how to use `get-service-graph`.

AWS CLI

To get a service graph

The following `get-service-graph` example displays a document within a specified time period that describes services processing incoming requests, and the downstream services that they call as a result.

```
aws xray get-service-graph \
    --start-time 1568835392.0 \
    --end-time 1568835446.0
```

Output:

```
{
    "Services": [
        {
            "ReferenceId": 0,
            "Name": "Scorekeep",
            "Names": [
                "Scorekeep"
            ],
            "Root": true,
            "Type": "AWS::ElasticBeanstalk::Environment",
            "State": "active",
            "StartTime": 1568835392.0,
            "EndTime": 1568835446.0,
            "Edges": [
                {
                    "ReferenceId": 1,
                    "StartTime": 1568835392.0,
                    "EndTime": 1568835446.0,

`get-trace-summaries`

The following code example shows how to use `get-trace-summaries`.

AWS CLI

To get a trace summary

The following `get-trace-summaries` example retrieves IDs and metadata for traces available within a specified time frame.

```
aws xray get-trace-summaries \
    --start-time 1568835392.0 \
    --end-time 1568835446.0
```

Output:

```
{
    "TraceSummaries": [
        {
            "Http": {
                "HttpURL": "http://scorekeep-env-1.123456789.us-
west-2.elasticbeanstalk.com/api/move/VSAE93HF/GSSD2NTB/DP0PCC09"
            }
        },
        {
            "Http": {
                "HttpURL": "http://scorekeep-env-1.123456789.us-
west-2.elasticbeanstalk.com/api/move/GCQ2B35P/FREELDFT/4LRE643M"
            }
        },
        {
            "Http": {
                "HttpURL": "http://scorekeep-env-1.123456789.us-
west-2.elasticbeanstalk.com/api/game/VSAE93HF/GSSD2NTB/starttime/1568835513"
            }
        },
        {
            "Http": {
                "HttpURL": "http://scorekeep-env-1.123456789.us-
west-2.elasticbeanstalk.com/api/move/4MQNA5NN/L99KK2RF/null"
            }
        }
```

```
    ]
}
```

For more information, see Using the AWS X-Ray API with the AWS CLI in the *AWS X-Ray Developer Guide*.

- For API details, see GetTraceSummaries in *AWS CLI Command Reference*.

`put-encryption-config`

The following code example shows how to use `put-encryption-config`.

AWS CLI

To update the encryption configuration

The following `put-encryption-config` example updates the encryption configuration for AWS X-Ray data to use the default AWS managed KMS key `aws/xray`.

```
aws xray put-encryption-config \
    --type KMS \
    --key-id alias/aws/xray
```

Output:

```
{
    "EncryptionConfig": {
        "KeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "Status": "UPDATING",
        "Type": "KMS"
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see PutEncryptionConfig in *AWS CLI Command Reference*.

`put-trace-segments`

The following code example shows how to use `put-trace-segments`.

AWS CLI

To upload a segment

The following `put-trace-segments` example uploads segment documents to AWS X-Ray. The segment document is consumed as a list of JSON segment documents.

```
aws xray put-trace-segments \
    --trace-segment-documents "{\"id\":\"20312a0e2b8809f4\",\"name
\":\"DynamoDB\",\"trace_id\":\"1-5832862d-a43aafded3334a971fe312db\",
\"start_time\":1.479706157195E9,\"end_time\":1.479706157202E9,\"parent_id\":
\"79736b962fe3239e\",\"http\":{\"response\":{\"content_length\":60,\"status
\":200}},\"inferred\":true,\"aws\":{\"consistent_read\":false,\"table_name
\":\"scorekeep-session-xray\",\"operation\":\"GetItem\",\"request_id\":
\"SCAU23OM6M8FO38UASGC7785ARVV4KQNSO5AEMVJF66Q9ASUAAJG\",\"resource_names\":
[\"scorekeep-session-xray\"]},\"origin\":\"AWS::DynamoDB::Table\"}"
```

Output:

```
{
    "UnprocessedTraceSegments": []
}
```

For more information, see Sending Trace Data to AWS X-Ray in the *AWS X-Ray Developer Guide*.

- For API details, see PutTraceSegments in *AWS CLI Command Reference*.

`update-group`

The following code example shows how to use `update-group`.

AWS CLI

To update a group

The following `update-group` example updates the criteria by which to accept traces into the group named `AdminGroup`. You can specify the desired group by using either the group name or group ARN.

```
aws xray update-group \
    --group-name "AdminGroup" \
    --group-arn "arn:aws:xray:us-west-2:123456789012:group/AdminGroup/123456789" \
```

```
    --filter-expression "service(\"mydomain.com\") {fault}"
```

Output:

```
{
    "Group": {
        "GroupName": "AdminGroup",
        "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
AdminGroup/123456789",
        "FilterExpression": "service(\"mydomain.com\") {fault}"
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

`update-sampling-rule`

The following code example shows how to use `update-sampling-rule`.

AWS CLI

To update a sampling rule

The following `update-sampling-rule` example modifies a sampling rule's configuration. The rules are consumed from a JSON file. Only the fields being updated are required.

```
aws xray update-sampling-rule \
    --cli-input-json file://1000-default.json
```

Contents of `1000-default.json`:

```
{
    "SamplingRuleUpdate": {
        "RuleName": "Default",
        "FixedRate": 0.01,
        "ReservoirSize": 0
    }
}
```

Output:

```
{
    "SamplingRuleRecord": {
        "SamplingRule": {
            "RuleName": "Default",
            "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/Default",
            "ResourceARN": "*",
            "Priority": 10000,
            "FixedRate": 0.01,
            "ReservoirSize": 0,
            "ServiceName": "*",
            "ServiceType": "*",
            "Host": "*",
            "HTTPMethod": "*",
            "URLPath": "*",
            "Version": 1,
            "Attributes": {}
        },
        "CreatedAt": 0.0,
        "ModifiedAt": 1529959993.0
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see UpdateSamplingRule in *AWS CLI Command Reference*.

AWS CLI with Bash script code examples

The code examples in this topic show you how to use the AWS Command Line Interface with Bash script with AWS.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Some services contain additional example categories that show how to leverage libraries or functions specific to the service.

Services

- API Gateway examples using AWS CLI with Bash script
- Athena examples using AWS CLI with Bash script
- AWS Batch examples using AWS CLI with Bash script
- AWS Cloud Map examples using AWS CLI with Bash script
- CloudFormation examples using AWS CLI with Bash script
- CloudFront examples using AWS CLI with Bash script
- CloudWatch examples using AWS CLI with Bash script
- CloudWatch Logs examples using AWS CLI with Bash script
- Amazon Cognito Identity Provider examples using AWS CLI with Bash script
- AWS Config examples using AWS CLI with Bash script
- Connect Customer examples using AWS CLI with Bash script
- Direct Connect examples using AWS CLI with Bash script
- Amazon DocumentDB examples using AWS CLI with Bash script
- DynamoDB examples using AWS CLI with Bash script
- Amazon EC2 examples using AWS CLI with Bash script
- Amazon ECR examples using AWS CLI with Bash script
- Amazon ECS examples using AWS CLI with Bash script
- Amazon EKS examples using AWS CLI with Bash script
- Elastic Load Balancing - Version 2 examples using AWS CLI with Bash script
- ElastiCache examples using AWS CLI with Bash script
- Amazon EMR examples using AWS CLI with Bash script
- OpenSearch Service examples using AWS CLI with Bash script
- AWS FIS examples using AWS CLI with Bash script
- AWS Glue examples using AWS CLI with Bash script
- HealthImaging examples using AWS CLI with Bash script

- Amazon RDS examples using AWS CLI with Bash script
- Amazon Redshift examples using AWS CLI with Bash script
- Amazon S3 examples using AWS CLI with Bash script
- SageMaker AI examples using AWS CLI with Bash script
- Secrets Manager examples using AWS CLI with Bash script
- Amazon SES examples using AWS CLI with Bash script
- Amazon SNS examples using AWS CLI with Bash script
- Step Functions examples using AWS CLI with Bash script
- AWS STS examples using AWS CLI with Bash script
- Support examples using AWS CLI with Bash script
- Systems Manager examples using AWS CLI with Bash script
- Amazon Textract examples using AWS CLI with Bash script
- VPC Lattice examples using AWS CLI with Bash script
- AWS WAFV2 examples using AWS CLI with Bash script
- WorkSpaces examples using AWS CLI with Bash script

API Gateway examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with API Gateway.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Scenarios

Create a rest API with function proxy integration

The following code example shows how to:

- Create an IAM role for Lambda execution
- Create and deploy a Lambda function
- Create a REST API
- Configure Lambda proxy integration
- Deploy and test the API
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

set -euo pipefail

# Simple API Gateway Lambda Integration Script
# This script creates a REST API with Lambda proxy integration

# Generate random identifiers
```

```

Getting started with query analytics

The following code example shows how to:

- Create an S3 bucket for query results
- Create a database
- Create a table
- Run a query
- Create and use named queries
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# Amazon Athena Getting Started Script
# This script demonstrates how to use Amazon Athena with AWS CLI
# It creates a database, table, runs queries, and manages named queries

set -euo pipefail

AWS Batch examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with AWS Batch.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Getting started with batch processing and serverless containers

The following code example shows how to:

- Create an IAM execution role
- Create a compute environment
- Create a job queue
- Create a job definition
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# AWS Batch Fargate Getting Started Script - Security Hardened Version
# This script demonstrates creating AWS Batch resources with Fargate orchestration
#

Scenarios

Configure container service connectivity

The following code example shows how to:

- Create the VPC infrastructure
- Set up logging
- Create the ECS cluster
- Configure IAM roles
- Create the service with Service Connect
- Verify the deployment
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# ECS Service Connect Tutorial Script v4 - Modified to use Default VPC
# This script creates an ECS cluster with Service Connect and deploys an nginx
 service
# Uses the default VPC to avoid VPC limits

set -e  # Exit on any error

Service discovery

The following code example shows how to:

- Create a public DNS namespace with Route 53 hosted zone integration
- Create services discoverable via DNS queries and API calls
- Register service instances with different discovery configurations
- Discover services using both DNS queries and Cloud Map API
- Verify service discovery using dig command and API calls
- Clean up resources in proper order (instances, services, namespace)

AWS CLI with Bash script

> **Note**
>

CloudFormation examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with CloudFormation.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Creating your first infrastructure stack

The following code example shows how to:

- Create a CloudFormation template
- Test the web server
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# CloudFormation Getting Started Script
# This script creates a CloudFormation stack with a web server and security group,
# monitors the stack creation, and provides cleanup options.

set -euo pipefail

# Set up logging with secure permissions

Getting started with managed kubernetes clusters

The following code example shows how to:

- Create a VPC for your EKS cluster
- Create IAM roles for your EKS cluster
- Create your EKS cluster
- Configure kubectl to communicate with your cluster
- Create a managed node group
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# Amazon EKS Cluster Creation Script (v2)
# This script creates an Amazon EKS cluster with a managed node group using the AWS
 CLI

# Set up logging
LOG_FILE="eks-cluster-creation-v2.log"
exec > >(tee -a "$LOG_FILE") 2>&1
```

```
echo "Starting Amazon EKS cluster creation script at $(date)"
echo "All commands and outputs will be logged to $LOG_FILE"

# Error handling function

CloudFront examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with CloudFront.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Get started with a basic content distribution network

The following code example shows how to:

- Create an Amazon S3 bucket
- Upload content to the bucket
- Create a CloudFront distribution with OAC
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# CloudFront Getting Started Tutorial Script
# This script creates an S3 bucket, uploads sample content, creates a CloudFront
 distribution with OAC,
# and demonstrates how to access content through CloudFront.

set -euo pipefail

# Set up logging
LOG_FILE="cloudfront-tutorial.log"
exec > >(tee -a "$LOG_FILE") 2>&1

echo "Starting CloudFront Getting Started Tutorial at $(date)"

# Function to handle errors

CloudWatch examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with CloudWatch.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Creating a monitoring dashboard with function name as a variable

The following code example shows how to:

- Create a CloudWatch dashboard
- Add Lambda metrics widgets with a function name variable
- Verify the dashboard
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

  - GetDashboard
  - Invoke
  - ListDashboards

- ListFunctions
- PutDashboard

Run CPU stress tests on virtual machine instances using fault injection

The following code example shows how to:

- Create IAM roles
- Create a CloudWatch alarm
- Create an experiment template
- Run the experiment
- Verify the results
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# AWS FIS CPU Stress Test Tutorial Script
# This script automates the steps in the AWS FIS CPU stress test tutorial

#    approach using epoch time calculations that work across all Linux distributions

# Set up logging

Using property variables in monitoring dashboards to monitor multiple serverless functions

The following code example shows how to:

- Create Lambda functions for monitoring
- Create a CloudWatch dashboard
- Add a property variable to the dashboard
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# CloudWatch Dashboard with Lambda Function Variable Script
# This script creates a CloudWatch dashboard with a property variable for Lambda
 function names

set -euo pipefail

# Security: Set restrictive umask
umask 0077

# Set up logging with secure permissions
LOG_FILE="cloudwatch-dashboard-script-v4.log"
touch "$LOG_FILE"
chmod 600 "$LOG_FILE"
echo "Starting script execution at $(date)" >> "$LOG_FILE"

# Function to log commands and their output (with sensitive data sanitization)
log_cmd() {
```

```
    local cmd="$1"

CloudWatch Logs examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with CloudWatch Logs.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Configure container service connectivity

The following code example shows how to:

- Create the VPC infrastructure
- Set up logging
- Create the ECS cluster
- Configure IAM roles
- Create the service with Service Connect
- Verify the deployment
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# ECS Service Connect Tutorial Script v4 - Modified to use Default VPC
# This script creates an ECS cluster with Service Connect and deploys an nginx
 service
# Uses the default VPC to avoid VPC limits
```

```
set -e  # Exit on any error

# Configuration
SCRIPT_NAME="ECS Service Connect Tutorial"

Creating your first serverless function

The following code example shows how to:

- Create an IAM role for Lambda
- Create function code
- Create a Lambda function
- Test your Lambda function
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash
# AWS Lambda - Create Your First Function
# This script creates a Lambda function, invokes it with a test event,
# views CloudWatch logs, and cleans up all resources.
#
# Source: https://docs.aws.amazon.com/lambda/latest/dg/getting-started.html
#
# Resources created:
#   - IAM role (Lambda execution role with basic logging permissions)
#   - Lambda function (Python 3.13 or Node.js 22.x runtime)
#   - CloudWatch log group (created automatically by Lambda on invocation)

Amazon Cognito Identity Provider examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with Amazon Cognito Identity Provider.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Getting started with user pools

The following code example shows how to:

- Create a user pool
- Create an app client
- Set up a domain for your user pool
- Create a user as an administrator
- Enable self-registration
- List users in the user pool

- Clean up resources

AWS Config examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with AWS Config.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Getting started with configuration management

The following code example shows how to:

- Create an Amazon S3 bucket
- Create an Amazon SNS topic
- Create an IAM role for Config
- Set up the Config configuration recorder
- Set up the Config delivery channel
- Start the configuration recorder
- Verify the Config setup

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash
```

```

Amazon DocumentDB examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with Amazon DocumentDB.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Getting started with document databases

The following code example shows how to:

- Create a DB subnet group
- Create a DocumentDB cluster

- Create a DocumentDB instance
- Configure security and connectivity
- Clean up resources

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash
# Amazon DocumentDB - Getting Started
# This script creates a DocumentDB cluster with encrypted storage, stores the
# master password in Secrets Manager, and displays connection information.

DynamoDB examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with DynamoDB.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Basics
- Actions
- Scenarios

Basics

Learn the basics

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table, then delete the table.

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

The DynamoDB getting started scenario.

`ListTables`

The following code example shows how to use `ListTables`.

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
###############################################################################
# function dynamodb_list_tables
#
# This function lists all the tables in a DynamoDB.
#
# Returns:
#       0 - If successful.
#       1 - If it fails.
###############################################################################
function dynamodb_list_tables() {
  response=$(aws dynamodb list-tables \
    --output text \
    --query "TableNames")

  local error_code=${?}
```

```
  if [[ $error_code -ne 0 ]]; then
    aws_cli_error_log $error_code
    errecho "ERROR: AWS reports batch-write-item operation failed.$response"
    return 1
  fi

  echo "$response" | tr -s "[:space:]" "\n"

  return 0
}
```

The utility functions used in this example.

```

Scenarios

Advanced Global Secondary Index scenarios

The following code example shows how to work with advanced Global Secondary Index configurations.

- Create a table with multiple GSIs.
- Create a table with on-demand capacity and GSI.
- Put items into a table with multiple GSIs.
- Query multiple GSIs with different conditions.

AWS CLI with Bash script

Create a table with multiple GSIs.

```
# Create a table with multiple GSIs
aws dynamodb create-table \
    --table-name MusicLibrary \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
        AttributeName=AlbumTitle,AttributeType=S \
        AttributeName=Genre,AttributeType=S \
```

```
        AttributeName=Year,AttributeType=N \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST \
    --global-secondary-indexes \
        "[
            {
                \"IndexName\": \"AlbumIndex\",
                \"KeySchema\": [{\"AttributeName\":\"AlbumTitle\",\"KeyType\":\"HASH
\"}],
                \"Projection\": {\"ProjectionType\":\"ALL\"}
            },
            {
                \"IndexName\": \"GenreYearIndex\",
                \"KeySchema\": [
                    {\"AttributeName\":\"Genre\",\"KeyType\":\"HASH\"},
                    {\"AttributeName\":\"Year\",\"KeyType\":\"RANGE\"}
                ],
                \"Projection\": {\"ProjectionType\":\"INCLUDE\",\"NonKeyAttributes
\":[\"Artist\",\"SongTitle\"]}
            }
        ]"
```

Create a table with on-demand capacity and GSI.

```
# Create a table with on-demand capacity and GSI
aws dynamodb create-table \
    --table-name MusicOnDemand \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
        AttributeName=Genre,AttributeType=S \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST \
    --global-secondary-indexes \
        "[
            {
                \"IndexName\": \"GenreIndex\",
                \"KeySchema\": [{\"AttributeName\":\"Genre\",\"KeyType\":\"HASH\"}],
```

```
                \"Projection\": {\"ProjectionType\":\"ALL\"}
            }
        ]"
```

Put items into a table with multiple GSIs.

```
# Add items to MusicLibrary table
aws dynamodb put-item \
    --table-name MusicLibrary \
    --item '{
        "Artist": {"S": "The Beatles"},
        "SongTitle": {"S": "Hey Jude"},
        "AlbumTitle": {"S": "Past Masters"},
        "Genre": {"S": "Rock"},
        "Year": {"N": "1968"}
    }'

aws dynamodb put-item \
    --table-name MusicLibrary \
    --item '{
        "Artist": {"S": "Miles Davis"},
        "SongTitle": {"S": "So What"},
        "AlbumTitle": {"S": "Kind of Blue"},
        "Genre": {"S": "Jazz"},
        "Year": {"N": "1959"}
    }'
```

Query items from a table with multiple GSIs.

```
# Query the AlbumIndex GSI
echo "Querying AlbumIndex GSI:"
aws dynamodb query \
    --table-name MusicLibrary \
    --index-name AlbumIndex \
    --key-condition-expression "AlbumTitle = :album" \
    --expression-attribute-values '{":album":{"S":"Kind of Blue"}}'

# Query the GenreYearIndex GSI with a range condition
echo "Querying GenreYearIndex GSI with range condition:"
aws dynamodb query \
    --table-name MusicLibrary \
```

```
    --index-name GenreYearIndex \
    --key-condition-expression "Genre = :genre AND #yr > :year" \
    --expression-attribute-names '{"#yr": "Year"}' \
    --expression-attribute-values '{":genre":{"S":"Rock"},":year":{"N":"1965"}}'
```

Create and manage MRSC global tables

The following code example shows how to create and manage DynamoDB global tables with Multi-Region Strong Consistency (MRSC).

- Create a table with Multi-Region Strong Consistency.
- Verify MRSC configuration and replica status.
- Test strong consistency across Regions with immediate reads.
- Perform conditional writes with MRSC guarantees.
- Clean up MRSC global table resources.

AWS CLI with Bash script

Create a table with Multi-Region Strong Consistency.

```
# Step 1: Create a new table in us-east-2 (primary region for MRSC)
# Note: Table must be empty when enabling MRSC
aws dynamodb create-table \
    --table-name MusicTable \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST \
    --region us-east-2
```

```
# Wait for table to become active
aws dynamodb wait table-exists --table-name MusicTable --region us-east-2

# Step 2: Add replica and witness with Multi-Region Strong Consistency
# MRSC requires exactly three replicas in supported regions
aws dynamodb update-table \
    --table-name MusicTable \
    --replica-updates '[{"Create": {"RegionName": "us-east-1"}}]' \
    --global-table-witness-updates '[{"Create": {"RegionName": "us-west-2"}}]' \
    --multi-region-consistency STRONG \
    --region us-east-2
```

Verify MRSC configuration and replica status.

```
# Verify the global table configuration and MRSC setting
aws dynamodb describe-table \
    --table-name MusicTable \
    --region us-east-2 \
    --query 'Table.
{TableName:TableName,TableStatus:TableStatus,MultiRegionConsistency:MultiRegionConsistency,R
{Region:RegionName,Status:ReplicaStatus}}'
```

Test strong consistency with immediate reads across Regions.

```
# Write an item to the primary region
aws dynamodb put-item \
    --table-name MusicTable \
    --item '{"Artist": {"S":"The Beatles"},"SongTitle": {"S":"Hey Jude"},"Album":
 {"S":"The Beatles 1967-1970"},"Year": {"N":"1968"}}' \
    --region us-east-2

# Read the item from replica region to verify strong consistency (cannot read or
 write to witness)
# No wait time needed - MRSC provides immediate consistency
echo "Reading from us-east-1 (immediate consistency):"
aws dynamodb get-item \
    --table-name MusicTable \
    --key '{"Artist": {"S":"The Beatles"},"SongTitle": {"S":"Hey Jude"}}' \
    --consistent-read \
    --region us-east-1
```

Perform conditional writes with MRSC guarantees.

```
# Perform a conditional update from a different region
# This demonstrates that conditions work consistently across all regions
aws dynamodb update-item \
    --table-name MusicTable \
    --key '{"Artist": {"S":"The Beatles"},"SongTitle": {"S":"Hey Jude"}}' \
    --update-expression "SET #rating = :rating" \
    --condition-expression "attribute_exists(Artist)" \
    --expression-attribute-names '{"#rating": "Rating"}' \
    --expression-attribute-values '{":rating": {"N":"5"}}' \
    --region us-east-1
```

Clean up MRSC global table resources.

```
# Remove replica tables (must be done before deleting the primary table)
aws dynamodb update-table \
    --table-name MusicTable \
    --replica-updates '[{"Delete": {"RegionName": "us-east-1"}}]' \
    --global-table-witness-updates '[{"Delete": {"RegionName": "us-west-2"}}]' \
    --region us-east-2

# Wait for replicas to be deleted
echo "Waiting for replicas to be deleted..."
sleep 30

# Delete the primary table
aws dynamodb delete-table \
    --table-name MusicTable \
    --region us-east-2
```

Getting started with NoSQL databases

The following code example shows how to:

- Create a table in DynamoDB
- Update data in a DynamoDB table
- Query data in a DynamoDB table
- Delete your DynamoDB table

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# DynamoDB Getting Started Tutorial Script
# This script demonstrates basic operations with Amazon DynamoDB:
# - Creating a table
# - Writing data to the table
# - Reading data from the table
# - Updating data in the table
# - Querying data in the table
# - Deleting the table (cleanup)

set -uo pipefail

# Set up logging with secure permissions

Manage Global Secondary Indexes

The following code example shows how to manage the complete lifecycle of Global Secondary Indexes.

- Create a table with a Global Secondary Index.
- Add a new GSI to an existing table.
- Update (increase) GSI warm throughput.
- Query data using GSIs.
- Delete a GSI.

AWS CLI with Bash script

Create a table with a Global Secondary Index.

```
# Create a table with a GSI
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
        AttributeName=AlbumTitle,AttributeType=S \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST \
    --global-secondary-indexes \
        "IndexName=AlbumIndex,\
        KeySchema=[{AttributeName=AlbumTitle,KeyType=HASH}],\
        Projection={ProjectionType=ALL}"
```

Add a new (on-demand) GSI to an existing table.

```
# Add a new GSI to an existing table
aws dynamodb update-table \
    --table-name MusicCollection \
    --attribute-definitions \
        AttributeName=Genre,AttributeType=S \
    --global-secondary-index-updates \
```

```
        "[{\"Create\":{\"IndexName\":\"GenreIndex\",\
        \"KeySchema\":[{\"AttributeName\":\"Genre\",\"KeyType\":\"HASH\"}],\
        \"Projection\":{\"ProjectionType\":\"ALL\"}}}]"
```

Update (increase) GSI warm throughput.

```
# Increase the warm throughput of a GSI (default values are 12k reads, 4k writes)
aws dynamodb update-table \
    --table-name MusicCollection \
    --global-secondary-index-updates \
        "[{\"Update\":{\"IndexName\":\"AlbumIndex\",\
        \"WarmThroughput\":{\"ReadUnitsPerSecond\":15000,\"WriteUnitsPerSecond
\":6000}}}]"
```

Query data using GSIs.

```
# Query the AlbumIndex GSI
aws dynamodb query \
    --table-name MusicCollection \
    --index-name AlbumIndex \
    --key-condition-expression "AlbumTitle = :album" \
    --expression-attribute-values '{":album":{"S":"Let It Be"}}'

# Query the GenreIndex GSI
aws dynamodb query \
    --table-name MusicCollection \
    --index-name GenreIndex \
    --key-condition-expression "Genre = :genre" \
    --expression-attribute-values '{":genre":{"S":"Jazz"}}'
```

Delete a GSI.

```
# Delete a GSI from a table
aws dynamodb update-table \
    --table-name MusicCollection \
    --global-secondary-index-updates \
        "[{\"Delete\":{\"IndexName\":\"GenreIndex\"}}]"
```

Manage resource-based policies

The following code example shows how to manage the complete lifecycle of resource-based policies for DynamoDB tables.

- Create a table with a resource policy.
- Get a resource policy.
- Update a resource policy.
- Delete a resource policy.

AWS CLI with Bash script

Create a table with a resource policy.

```
# Step 1: Create a DynamoDB table
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST

# Step 2: Create a resource-based policy document
cat > policy.json << 'EOF'
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
```

```
        "AWS": "arn:aws:iam::123456789012:role/DynamoDBReadOnly"
      },
      "Action": [
        "dynamodb:GetItem",
        "dynamodb:BatchGetItem",
        "dynamodb:Query",
        "dynamodb:Scan"
      ],
      "Resource": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection"
    }
  ]
}
EOF

# Step 3: Attach the resource-based policy to the table
aws dynamodb put-resource-policy \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --policy file://policy.json
```

Get a resource policy.

```
# Get the resource-based policy attached to a table
aws dynamodb get-resource-policy \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection
```

Update a resource policy.

```
# Step 1: Create an updated policy document
cat > updated-policy.json << 'EOF'
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": [
          "arn:aws:iam::123456789012:role/DynamoDBReadOnly",
          "arn:aws:iam::123456789012:role/DynamoDBAnalytics"
        ]
      },
      "Action": [
```

```
        "dynamodb:GetItem",
        "dynamodb:BatchGetItem",
        "dynamodb:Query",
        "dynamodb:Scan"
      ],
      "Resource": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection"
    }
  ]
}
EOF

# Step 2: Update the resource-based policy on the table
aws dynamodb put-resource-policy \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --policy file://updated-policy.json
```

Delete a resource policy.

```
# Delete the resource-based policy from a table
aws dynamodb delete-resource-policy \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection
```

Set up Attribute-Based Access Control

The following code example shows how to implement Attribute-Based Access Control (ABAC) for DynamoDB.

- Create an IAM policy for ABAC.
- Create tables with tags for different departments.
- List and filter tables based on tags.

AWS CLI with Bash script

Create an IAM policy for ABAC.

```
# Step 1: Create a policy document for ABAC
cat > abac-policy.json << 'EOF'
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "dynamodb:GetItem",
        "dynamodb:BatchGetItem",
        "dynamodb:Query",
        "dynamodb:Scan"
      ],
      "Resource": "arn:aws:dynamodb:*:*:table/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Department": "${aws:PrincipalTag/Department}"
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": [
        "dynamodb:PutItem",
        "dynamodb:UpdateItem",
        "dynamodb:DeleteItem",
        "dynamodb:BatchWriteItem"
      ],
      "Resource": "arn:aws:dynamodb:*:*:table/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Department": "${aws:PrincipalTag/Department}",
          "aws:ResourceTag/Environment": "Development"
        }
      }
    }
  ]
}
EOF
```

```
# Step 2: Create the IAM policy
aws iam create-policy \
    --policy-name DynamoDBDepartmentBasedAccess \
    --policy-document file://abac-policy.json
```

Create tables with tags for different departments.

```
# Create a DynamoDB table with tags for ABAC
aws dynamodb create-table \
    --table-name FinanceData \
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Department,Value=Finance \
        Key=Environment,Value=Development

# Create another table with different tags
aws dynamodb create-table \
    --table-name MarketingData \
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Department,Value=Marketing \
        Key=Environment,Value=Production
```

List and filter tables based on tags.

```
# List all DynamoDB tables
echo "Listing all tables:"
aws dynamodb list-tables

# Get ARNs for all tables
echo -e "\nGetting ARNs for all tables:"
```

```
TABLE_ARNS=$(aws dynamodb list-tables --query "TableNames[*]" --output text | xargs
 -I {} aws dynamodb describe-table --table-name {} --query "Table.TableArn" --output
 text)

# For each table ARN, list its tags
echo -e "\nListing tags for each table:"
for ARN in $TABLE_ARNS; do
    TABLE_NAME=$(echo $ARN | awk -F/ '{print $2}')
    echo -e "\nTags for table: $TABLE_NAME"
    aws dynamodb list-tags-of-resource --resource-arn $ARN
done

# Example: Find tables with a specific tag
echo -e "\nFinding tables with Environment=Production tag:"
for ARN in $TABLE_ARNS; do
    TABLE_NAME=$(echo $ARN | awk -F/ '{print $2}')
    TAGS=$(aws dynamodb list-tags-of-resource --resource-arn $ARN --query "Tags[?
Key=='Environment' && Value=='Production']" --output text)
    if [ ! -z "$TAGS" ]; then
        echo "Table with Production tag: $TABLE_NAME"
    fi
done
```

Work with Local Secondary Indexes

The following code example shows how to create and query tables with Local Secondary Indexes.

- Create a table with a Local Secondary Index (LSI).
- Create a table with multiple LSIs with different projection types.
- Query data using LSIs.

AWS CLI with Bash script

Create a table with a Local Secondary Index.

```
# Create a table with a Local Secondary Index
aws dynamodb create-table \
    --table-name CustomerOrders \
    --attribute-definitions \
        AttributeName=CustomerID,AttributeType=S \
        AttributeName=OrderID,AttributeType=S \
        AttributeName=OrderDate,AttributeType=S \
    --key-schema \
        AttributeName=CustomerID,KeyType=HASH \
        AttributeName=OrderID,KeyType=RANGE \
    --local-secondary-indexes \
        "IndexName=OrderDateIndex,\
        KeySchema=[{AttributeName=CustomerID,KeyType=HASH},
{AttributeName=OrderDate,KeyType=RANGE}],\
        Projection={ProjectionType=ALL}" \
    --billing-mode PAY_PER_REQUEST
```

Create a table with multiple LSIs.

```
# Create a table with multiple Local Secondary Indexes
aws dynamodb create-table \
    --table-name CustomerDetails \
    --attribute-definitions \
        AttributeName=CustomerID,AttributeType=S \
        AttributeName=Name,AttributeType=S \
        AttributeName=Email,AttributeType=S \
        AttributeName=RegistrationDate,AttributeType=S \
    --key-schema \
        AttributeName=CustomerID,KeyType=HASH \
        AttributeName=Name,KeyType=RANGE \
    --local-secondary-indexes \
        "[
            {
                \"IndexName\": \"EmailIndex\",
                \"KeySchema\": [
                    {\"AttributeName\":\"CustomerID\",\"KeyType\":\"HASH\"},
                    {\"AttributeName\":\"Email\",\"KeyType\":\"RANGE\"}
                ],
                \"Projection\": {\"ProjectionType\":\"INCLUDE\",\"NonKeyAttributes
\":[\"Address\",\"Phone\"]}
            },
            {
```

```
                \"IndexName\": \"RegistrationIndex\",
                \"KeySchema\": [
                    {\"AttributeName\":\"CustomerID\",\"KeyType\":\"HASH\"},
                    {\"AttributeName\":\"RegistrationDate\",\"KeyType\":\"RANGE\"}
                ],
                \"Projection\": {\"ProjectionType\":\"KEYS_ONLY\"}
            }
        ]" \
    --billing-mode PAY_PER_REQUEST
```

Query data using LSIs.

```
# Query the OrderDateIndex LSI
aws dynamodb query \
    --table-name CustomerOrders \
    --index-name OrderDateIndex \
    --key-condition-expression "CustomerID = :custId AND OrderDate BETWEEN :date1
 AND :date2" \
    --expression-attribute-values '{
        ":custId": {"S": "C1"},
        ":date1": {"S": "2023-01-01"},
        ":date2": {"S": "2023-02-01"}
    }'

# Query with a filter expression
aws dynamodb query \
    --table-name CustomerOrders \
    --index-name OrderDateIndex \
    --key-condition-expression "CustomerID = :custId" \
    --filter-expression "Amount > :amount" \
    --expression-attribute-values '{
        ":custId": {"S": "C1"},
        ":amount": {"N": "150"}
    }'
```

  - CreateTable
  - Query

Work with Streams and Time-to-Live

The following code example shows how to manage DynamoDB Streams and Time-to-Live features.

- Create a table with Streams enabled.
- Describe Streams.
- Create a Lambda function for processing Streams.
- Enable TTL on a table.
- Add items with TTL attributes.
- Describe TTL settings.

AWS CLI with Bash script

Create a table with Streams enabled.

```
# Create a table with DynamoDB Streams enabled
aws dynamodb create-table \
    --table-name StreamsDemo \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --stream-specification StreamEnabled=true,StreamViewType=NEW_AND_OLD_IMAGES
```

Describe Streams.

```
# Get information about the stream
aws dynamodb describe-table \
    --table-name StreamsDemo \
    --query "Table.StreamSpecification"

# Get the stream ARN
STREAM_ARN=$(aws dynamodb describe-table \
    --table-name StreamsDemo \
    --query "Table.LatestStreamArn" \
    --output text)

echo "Stream ARN: $STREAM_ARN"
```

```
# Describe the stream
aws dynamodbstreams describe-stream \
    --stream-arn $STREAM_ARN
```

Create a Lambda function for Streams.

```
# Step 1: Create an IAM role for the Lambda function
cat > trust-policy.json << 'EOF'
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "lambda.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
EOF

aws iam create-role \
    --role-name DynamoDBStreamsLambdaRole \
    --assume-role-policy-document file://trust-policy.json

# Step 2: Attach permissions to the role
aws iam attach-role-policy \
    --role-name DynamoDBStreamsLambdaRole \
    --policy-arn arn:aws:iam::aws:policy/service-role/AWSLambdaDynamoDBExecutionRole

# Step 3: Create a Lambda function (code would be in a separate file)
echo "Lambda function creation would be done separately with appropriate code"

# Step 4: Create an event source mapping
echo "Example command to create event source mapping:"
echo "aws lambda create-event-source-mapping \\"
echo "    --function-name ProcessDynamoDBRecords \\"
echo "    --event-source $STREAM_ARN \\"
echo "    --batch-size 100 \\"
echo "    --starting-position LATEST"
```

Enable TTL on a table.

```
# Create a table for TTL demonstration
aws dynamodb create-table \
    --table-name TTLDemo \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST

# Wait for table to become active
aws dynamodb wait table-exists --table-name TTLDemo

# Enable TTL on the table
aws dynamodb update-time-to-live \
    --table-name TTLDemo \
    --time-to-live-specification "Enabled=true, AttributeName=ExpirationTime"
```

Add items with TTL attributes.

```
# Calculate expiration time (current time + 1 day in seconds)
EXPIRATION_TIME=$(date -d "+1 day" +%s)

# Add an item with TTL attribute
aws dynamodb put-item \
    --table-name TTLDemo \
    --item '{
        "ID": {"S": "item1"},
        "Data": {"S": "This item will expire in 1 day"},
        "ExpirationTime": {"N": "'$EXPIRATION_TIME'"}
    }'

# Add an item that expires in 1 hour
EXPIRATION_TIME_HOUR=$(date -d "+1 hour" +%s)
aws dynamodb put-item \
    --table-name TTLDemo \
    --item '{
        "ID": {"S": "item2"},
        "Data": {"S": "This item will expire in 1 hour"},
```

```
        "ExpirationTime": {"N": "'$EXPIRATION_TIME_HOUR'"}
    }'
```

Describe TTL settings.

```
# Describe TTL settings for a table
aws dynamodb describe-time-to-live \
    --table-name TTLDemo
```

- For API details, see the following topics in *AWS CLI Command Reference*.
  - AttachRolePolicy
  - CreateRole
  - CreateTable
  - DescribeTable
  - DescribeTimeToLive
  - PutItem
  - UpdateTimeToLive

Work with global tables and multi-Region replication eventual consistency (MREC)

The following code example shows how to manage DynamoDB global tables with multi-Region replication with eventual consistency (MREC).

- Create a table with multi-Region replication (MREC).
- Put and get items from replica tables.
- Remove replicas one-by-one.
- Clean up by deleting the table.

AWS CLI with Bash script

Create a table with multi-Region replication.

```
# Step 1: Create a new table (MusicTable) in US East (Ohio), with DynamoDB Streams
 enabled (NEW_AND_OLD_IMAGES)
aws dynamodb create-table \
```

```
    --table-name MusicTable \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST \
    --stream-specification StreamEnabled=true,StreamViewType=NEW_AND_OLD_IMAGES \
    --region us-east-2

# Step 2: Create an identical MusicTable table in US East (N. Virginia)
aws dynamodb update-table --table-name MusicTable --cli-input-json \
'{
  "ReplicaUpdates":
  [
    {
      "Create": {
        "RegionName": "us-east-1"
      }
    }
  ]
}' \
--region us-east-2

# Step 3: Create a table in Europe (Ireland)
aws dynamodb update-table --table-name MusicTable --cli-input-json \
'{
  "ReplicaUpdates":
  [
    {
      "Create": {
        "RegionName": "eu-west-1"
      }
    }
  ]
}' \
--region us-east-2
```

Describe the multi-Region table.

```
# Step 4: View the list of replicas created using describe-table
```

```
aws dynamodb describe-table \
    --table-name MusicTable \
    --region us-east-2 \
    --query 'Table.
{TableName:TableName,TableStatus:TableStatus,MultiRegionConsistency:MultiRegionConsistency,R
{Region:RegionName,Status:ReplicaStatus}}'
```

Put items in a replica table.

```
# Step 5: To verify that replication is working, add a new item to the Music table
 in US East (Ohio)
aws dynamodb put-item \
    --table-name MusicTable \
    --item '{"Artist": {"S":"item_1"},"SongTitle": {"S":"Song Value 1"}}' \
    --region us-east-2
```

Get items from replica tables.

```
# Step 6: Wait for a few seconds, and then check to see whether the item has been
# successfully replicated to US East (N. Virginia) and Europe (Ireland)
aws dynamodb get-item \
    --table-name MusicTable \
    --key '{"Artist": {"S":"item_1"},"SongTitle": {"S":"Song Value 1"}}' \
    --region us-east-1

aws dynamodb get-item \
    --table-name MusicTable \
    --key '{"Artist": {"S":"item_1"},"SongTitle": {"S":"Song Value 1"}}' \
    --region eu-west-1
```

Remove replicas.

```
# Step 7: Delete the replica table in Europe (Ireland) Region
aws dynamodb update-table --table-name MusicTable --cli-input-json \
'{
  "ReplicaUpdates":
  [
    {
      "Delete": {
```

```
        "RegionName": "eu-west-1"
      }
    }
  ]
}' \
--region us-east-2

# Delete the replica table in US East (N. Virginia) Region
aws dynamodb update-table --table-name MusicTable --cli-input-json \
'{
  "ReplicaUpdates":
  [
    {
      "Delete": {
        "RegionName": "us-east-1"
      }
    }
  ]
}' \
--region us-east-2
```

Clean up by deleting the table.

```
# Clean up: Delete the primary table
aws dynamodb delete-table --table-name MusicTable --region us-east-2

echo "Global table demonstration complete."
```

- For API details, see the following topics in *AWS CLI Command Reference*.
  - CreateTable
  - DeleteTable
  - DescribeTable
  - GetItem
  - PutItem
  - UpdateTable

Work with resource tagging

The following code example shows how to manage tags for DynamoDB resources.

- Create a table with tags.
- List tags for a resource.
- Add tags to a resource.
- Remove tags from a resource.
- Filter tables by tags.

AWS CLI with Bash script

Create a table with tags.

```
# Create a table with tags
aws dynamodb create-table \
    --table-name TaggedTable \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Environment,Value=Production \
        Key=Project,Value=Analytics \
        Key=Owner,Value=DataTeam
```

List tags for a resource.

```
# Get the table ARN
TABLE_ARN=$(aws dynamodb describe-table \
    --table-name TaggedTable \
    --query "Table.TableArn" \
    --output text)

# List tags for the table
aws dynamodb list-tags-of-resource \
    --resource-arn $TABLE_ARN
```

Add tags to a resource.

```
# Add tags to an existing table
aws dynamodb tag-resource \
    --resource-arn $TABLE_ARN \
    --tags \
        Key=CostCenter,Value=12345 \
        Key=BackupSchedule,Value=Daily
```

Remove tags from a resource.

```
# Remove tags from a table
aws dynamodb untag-resource \
    --resource-arn $TABLE_ARN \
    --tag-keys Owner BackupSchedule
```

Filter tables by tags.

```
# Create another table with different tags
aws dynamodb create-table \
    --table-name AnotherTaggedTable \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Environment,Value=Development \
        Key=Project,Value=Testing

# Wait for table to become active
aws dynamodb wait table-exists --table-name AnotherTaggedTable

# List all tables
echo "All tables:"
aws dynamodb list-tables

# Get ARNs for all tables
echo -e "\nFiltering tables by Environment=Production tag:"
```

```
TABLE_ARNS=$(aws dynamodb list-tables --query "TableNames[*]" --output text | xargs
 -I {} aws dynamodb describe-table --table-name {} --query "Table.TableArn" --output
 text)

# Find tables with specific tag
for ARN in $TABLE_ARNS; do
    TABLE_NAME=$(echo $ARN | awk -F/ '{print $2}')
    TAGS=$(aws dynamodb list-tags-of-resource --resource-arn $ARN --query "Tags[?
Key=='Environment' && Value=='Production']" --output text)
    if [ ! -z "$TAGS" ]; then
        echo "Table with Production tag: $TABLE_NAME"
    fi
done
```

- For API details, see the following topics in *AWS CLI Command Reference*.
  - CreateTable
  - ListTagsOfResource
  - TagResource
  - UntagResource

Work with table encryption

The following code example shows how to manage encryption options for DynamoDB tables.

- Create a table with default encryption.
- Create a table with a customer managed CMK.
- Update table encryption settings.
- Describe table encryption.

AWS CLI with Bash script

Create a table with default encryption.

```
# Create a table with default encryption (AWS owned key)
aws dynamodb create-table \
    --table-name CustomerData \
    --attribute-definitions \
        AttributeName=CustomerID,AttributeType=S \
```

```
    --key-schema \
        AttributeName=CustomerID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --sse-specification Enabled=true,SSEType=KMS
```

Create a table with a customer managed CMK.

```
# Step 1: Create a customer managed key in KMS
aws kms create-key \
    --description "Key for DynamoDB table encryption" \
    --key-usage ENCRYPT_DECRYPT \
    --customer-master-key-spec SYMMETRIC_DEFAULT

# Store the key ID for later use
KEY_ID=$(aws kms list-keys --query "Keys[?contains(KeyArn, 'Key for
 DynamoDB')].KeyId" --output text)

# Step 2: Create a table with the customer managed key
aws dynamodb create-table \
    --table-name SensitiveData \
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=$KEY_ID
```

Update table encryption.

```
# Update a table to use a different KMS key
aws dynamodb update-table \
    --table-name CustomerData \
    --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=$KEY_ID
```

Describe table encryption.

```
# Describe the table to see encryption settings
aws dynamodb describe-table \
    --table-name CustomerData \
```

```
    --query "Table.SSEDescription"
```

- For API details, see the following topics in *AWS CLI Command Reference*.
  - CreateKey
  - CreateTable
  - DescribeTable
  - UpdateTable

Amazon EC2 examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with Amazon EC2.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Basics
- Actions
- Scenarios

Basics

Learn the basics

The following code example shows how to:

- Create a key pair and security group.
- Select an Amazon Machine Image (AMI) and compatible instance type, then create an instance.

- Stop and restart the instance.
- Associate an Elastic IP address with your instance.
- Connect to your instance with SSH, then clean up resources.

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run an interactive scenario at a command prompt.

```
###############################################################################
# function get_started_with_ec2_instances
#
# Runs an interactive scenario that shows how to get started using EC2 instances.
#
#     "EC2 access" permissions are needed to run this code.
#
# Returns:
#       0 - If successful.
#       1 - If an error occurred.
###############################################################################
function get_started_with_ec2_instances() {
  # Requires version 4 for mapfile.

    errecho "  255 is a catch-all error."
  fi

  return 0
}
```

- For API details, see RunInstances in *AWS CLI Command Reference*.

`StartInstances`

The following code example shows how to use `StartInstances`.

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
###############################################################################
# function ec2_start_instances
#
# This function starts one or more Amazon Elastic Compute Cloud (Amazon EC2)
 instances.
#
# Parameters:
#       -i instance_id - The ID(s) of the instance(s) to start (comma-separated).
#       -h - Display help.
#
# Returns:
#       0 - If successful.
#       1 - If it fails.
###############################################################################
function ec2_start_instances() {
  local instance_ids
  local option OPTARG # Required to use getopts command in a function.

  # bashsupport disable=BP5008
  function usage() {
    echo "function ec2_start_instances"
    echo "Starts one or more Amazon Elastic Compute Cloud (Amazon EC2) instances."
    echo "  -i instance_id - The ID(s) of the instance(s) to start (comma-
separated)."
    echo "  -h - Display help."
    echo ""
  }

  # Retrieve the calling parameters.
  while getopts "i:h" option; do
    case "${option}" in
      i) instance_ids="${OPTARG}" ;;
      h)
        usage
```

```
        return 0
        ;;
      \?)
        echo "Invalid parameter"
        usage
        return 1
        ;;
    esac
  done
  export OPTIND=1

  if [[ -z "$instance_ids" ]]; then
    errecho "ERROR: You must provide one or more instance IDs with the -i
 parameter."
    usage
    return 1
  fi

  response=$(aws ec2 start-instances \
    --instance-ids "${instance_ids}") || {
    aws_cli_error_log ${?}
    errecho "ERROR: AWS reports start-instances operation failed with $response."
    return 1
  }

  return 0
}
```

The utility functions used in this example.

```
###############################################################################
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
###############################################################################
function errecho() {
  printf "%s\n" "$*" 1>&2
}
