}
```

For more information, see View CodeCommit repository details in the *AWS CodeCommit User Guide*.

- For API details, see GetRepository in *AWS CLI Command Reference*.

`list-approval-rule-templates`

The following code example shows how to use `list-approval-rule-templates`.

AWS CLI

To list all approval rule templates in an AWS Region

The following `list-approval-rule-templates` example lists all approval rule templates in the specified Region. If no AWS Region is specified as a parameter, the command returns approval rule templates for the region specified in the AWS CLI profile used to run the command.

```
aws codecommit list-approval-rule-templates \
    --region us-west-2
```

Output:

```
{
    "approvalRuleTemplateNames": [
        "2-approver-rule-for-main",
        "1-approver-rule-for-all-pull-requests"
    ]
}
```

For more information, see Manage Approval Rule Templates in the *AWS CodeCommit User Guide*.

- For API details, see ListApprovalRuleTemplates in *AWS CLI Command Reference*.

`list-associated-approval-rule-templates-for-repository`

The following code example shows how to use `list-associated-approval-rule-templates-for-repository`.

AWS CLI

To list all templates associated with a repository

The following `list-associated-approval-rule-templates-for-repository` example lists all approval rule templates associated with a repository named `MyDemoRepo`.

```
aws codecommit list-associated-approval-rule-templates-for-repository \
    --repository-name MyDemoRepo
```

Output:

```
{
    "approvalRuleTemplateNames": [
        "2-approver-rule-for-main",
        "1-approver-rule-for-all-pull-requests"
    ]
}
```

For more information, see Manage Approval Rule Templates in the *AWS CodeCommit User Guide*.

- For API details, see ListAssociatedApprovalRuleTemplatesForRepository in *AWS CLI Command Reference*.

`list-branches`

The following code example shows how to use `list-branches`.

AWS CLI

To view a list of branch names

The following `list-branches` example lists all branch names in an AWS CodeCommit repository.

```
aws codecommit list-branches \
    --repository-name MyDemoRepo
```

Output:

```
{
    "branches": [
        "MyNewBranch",
        "main"
```

```
    ]
}
```

For more information, see View branch details in AWS CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see ListBranches in *AWS CLI Command Reference*.

`list-pull-requests`

The following code example shows how to use `list-pull-requests`.

AWS CLI

To view a list of pull requests in a repository

The following `list-pull-requests` example lists pull requests created by an IAM user with the ARN `arn:aws:iam::123456789012:user/Li_Juan` and the status of `CLOSED` in an AWS CodeCommit repository named `MyDemoRepo`.

```
aws codecommit list-pull-requests \
    --author-arn arn:aws:iam::123456789012:user/Li_Juan \
    --pull-request-status CLOSED \
    --repository-name MyDemoRepo
```

Output:

```
{
    "nextToken": "",
    "pullRequestIds": ["2","12","16","22","23","35","30","39","47"]
}
```

For more information, see View pull requests in an AWS CodeCommit repository in the *AWS CodeCommit User Guide*.

- For API details, see ListPullRequests in *AWS CLI Command Reference*.

`list-repositories-for-approval-rule-template`

The following code example shows how to use `list-repositories-for-approval-rule-template`.

AWS CLI

To list all repositories associated with a template

The following `list-repositories-for-approval-rule-template` example lists all repositories associated with the specified approval rule template.

```
aws codecommit list-repositories-for-approval-rule-template \
    --approval-rule-template-name 2-approver-rule-for-main
```

Output:

```
{
    "repositoryNames": [
        "MyDemoRepo",
        "MyClonedRepo"
    ]
}
```

For more information, see Manage Approval Rule Templates in the *AWS CodeCommit User Guide*.

- For API details, see ListRepositoriesForApprovalRuleTemplate in *AWS CLI Command Reference*.

`list-repositories`

The following code example shows how to use `list-repositories`.

AWS CLI

To view a list of repositories

The following `list-repositories` example lists all AWS CodeCommit repositories associated with the user's AWS account.

```
aws codecommit list-repositories
```

Output:

```
{
    "repositories": [
```

```
        {
            "repositoryName": "MyDemoRepo",
            "repositoryId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "repositoryName": "MyOtherDemoRepo",
            "repositoryId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see View CodeCommit repository details in the *AWS CodeCommit User Guide*.

- For API details, see ListRepositories in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To view the AWS tags for a repository

The following `list-tags-for-resource` example lists tag keys and tag values for the specified repository.

```
aws codecommit list-tags-for-resource \
    --resource-arn arn:aws:codecommit:us-west-2:123456789012:MyDemoRepo
```

Output:

```
{
    "tags": {
        "Status": "Secret",
        "Team": "Saanvi"
    }
}
```

For more information, see View Tags for a Repository in the *AWS CodeCommit User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

merge-branches-by-fast-forward

The following code example shows how to use merge-branches-by-fast-forward.

AWS CLI

To merge two branches using the fast-forward merge strategy

The following merge-branches-by-fast-forward example merges the specified source branch with the specified destination branch in a repository named MyDemoRepo.

```
aws codecommit merge-branches-by-fast-forward \
    --source-commit-specifier bugfix-bug1234 \
    --destination-commit-specifier bugfix-bug1233 \
    --repository-name MyDemoRepo
```

Output:

```
{
    "commitId": "4f178133EXAMPLE",
    "treeId": "389765daEXAMPLE"
}
```

For more information, see Compare and Merge Branches in the *AWS CodeCommit User Guide*.

- For API details, see MergeBranchesByFastForward in *AWS CLI Command Reference*.

merge-branches-by-squash

The following code example shows how to use merge-branches-by-squash.

AWS CLI

To merge two branches using the squash merge strategy

The following merge-branches-by-squash example merges the specified source branch with the specified destination branch in a repository named MyDemoRepo.

```
aws codecommit merge-branches-by-squash \
    --source-commit-specifier bugfix-bug1234 \
    --destination-commit-specifier bugfix-bug1233 \
```

```
    --author-name "Maria Garcia" \
    --email "maria_garcia@example.com" \
    --commit-message "Merging two fix branches to prepare for a general patch." \
    --repository-name MyDemoRepo
```

Output:

```
{
    "commitId": "4f178133EXAMPLE",
    "treeId": "389765daEXAMPLE"
}
```

For more information, see Compare and Merge Branches in the *AWS CodeCommit User Guide*.

- For API details, see MergeBranchesBySquash in *AWS CLI Command Reference*.

`merge-branches-by-three-way`

The following code example shows how to use `merge-branches-by-three-way`.

AWS CLI

To merge two branches using the three-way merge strategy

The following `merge-branches-by-three-way` example merges the specified source branch with the specified destination branch in a repository named `MyDemoRepo`.

```
aws codecommit merge-branches-by-three-way \
    --source-commit-specifier main \
    --destination-commit-specifier bugfix-bug1234 \
    --author-name "Jorge Souza" \
    --email "jorge_souza@example.com" \
    --commit-message "Merging changes from main to bugfix branch before additional
 testing." \
    --repository-name MyDemoRepo
```

Output:

```
{
    "commitId": "4f178133EXAMPLE",
    "treeId": "389765daEXAMPLE"
```

```
}
```

For more information, see Compare and Merge Branches in the *AWS CodeCommit User Guide*.

- For API details, see MergeBranchesByThreeWay in *AWS CLI Command Reference*.

`merge-pull-request-by-fast-forward`

The following code example shows how to use `merge-pull-request-by-fast-forward`.

AWS CLI

To merge and close a pull request

The following `merge-pull-request-by-fast-forward` example merges and closes a pull request with the ID of 47 and a source commit ID of 99132ab0EXAMPLE in a repository named MyDemoRepo.

```
aws codecommit merge-pull-request-by-fast-forward \
    --pull-request-id 47 \
    --source-commit-id 99132ab0EXAMPLE \
    --repository-name MyDemoRepo
```

Output:

```
{
    "pullRequest": {
        "approvalRules": [
            {
                "approvalRuleContent": "{\"Version\": \"2018-11-08\",\"Statements\":
 [{\"Type\": \"Approvers\",\"NumberOfApprovalsNeeded\": 1,\"ApprovalPoolMembers\":
 [\"arn:aws:sts::123456789012:assumed-role/CodeCommitReview/*\"]}]}",
                "approvalRuleId": "dd8b17fe-EXAMPLE",
                "approvalRuleName": "I want one approver for this pull request",
                "creationDate": 1571356106.936,
                "lastModifiedDate": 571356106.936,
                "lastModifiedUser": "arn:aws:iam::123456789012:user/Mary_Major",
                "ruleContentSha256": "4711b576EXAMPLE"
            }
        ],
        "authorArn": "arn:aws:iam::123456789012:user/Li_Juan",
        "clientRequestToken": "",
```

```
        "creationDate": 1508530823.142,
        "description": "Review the latest changes and updates to the global
 variables",
        "lastActivityDate": 1508887223.155,
        "pullRequestId": "47",
        "pullRequestStatus": "CLOSED",
        "pullRequestTargets": [
            {
                "destinationCommit": "9f31c968EXAMPLE",
                "destinationReference": "refs/heads/main",
                "mergeMetadata": {
                    "isMerged": true,
                    "mergedBy": "arn:aws:iam::123456789012:user/Mary_Major"
                },
                "repositoryName": "MyDemoRepo",
                "sourceCommit": "99132ab0EXAMPLE",
                "sourceReference": "refs/heads/variables-branch"
            }
        ],
        "title": "Consolidation of global variables"
    }
}
```

For more information, see Merge a Pull Request in the *AWS CodeCommit User Guide*.

- For API details, see MergePullRequestByFastForward in *AWS CLI Command Reference*.

`merge-pull-request-by-squash`

The following code example shows how to use `merge-pull-request-by-squash`.

AWS CLI

To merge a pull request using the squash merge strategy

The following `merge-pull-request-by-squash` example merges and closes the specified pull request using the conflict resolution strategy of ACCEPT_SOURCE in a repository named MyDemoRepo.

```
aws codecommit merge-pull-request-by-squash \
    --pull-request-id 47 \
    --source-commit-id 99132ab0EXAMPLE \
    --repository-name MyDemoRepo \
```

```
    --conflict-detail-level LINE_LEVEL \
    --conflict-resolution-strategy ACCEPT_SOURCE \
    --author-name "Jorge Souza" \
    --email "jorge_souza@example.com" \
    --commit-message "Merging pull request 47 by squash and accepting source in
 merge conflicts"
```

Output:

```
{
    "pullRequest": {
        "approvalRules": [
            {
                "approvalRuleContent": "{\"Version\": \"2018-11-08\",
\"DestinationReferences\": [\"refs/heads/main\"],\"Statements\": [{\"Type
\": \"Approvers\",\"NumberOfApprovalsNeeded\": 2,\"ApprovalPoolMembers\":
 [\"arn:aws:sts::123456789012:assumed-role/CodeCommitReview/*\"]}]}",
                "approvalRuleId": "dd8b17fe-EXAMPLE",
                "approvalRuleName": "2-approver-rule-for-main",
                "creationDate": 1571356106.936,
                "lastModifiedDate": 571356106.936,
                "lastModifiedUser": "arn:aws:iam::123456789012:user/Mary_Major",
                "originApprovalRuleTemplate": {
                    "approvalRuleTemplateId": "dd8b17fe-EXAMPLE",
                    "approvalRuleTemplateName": "2-approver-rule-for-main"
                },
                "ruleContentSha256": "4711b576EXAMPLE"
            }
        ],
        "authorArn": "arn:aws:iam::123456789012:user/Li_Juan",
        "clientRequestToken": "",
        "creationDate": 1508530823.142,
        "description": "Review the latest changes and updates to the global
 variables",
        "lastActivityDate": 1508887223.155,
        "pullRequestId": "47",
        "pullRequestStatus": "CLOSED",
        "pullRequestTargets": [
            {
                "destinationCommit": "9f31c968EXAMPLE",
                "destinationReference": "refs/heads/main",
                "mergeMetadata": {
                    "isMerged": true,
```

```

                },
                "repositoryName": "MyDemoRepo",
                "sourceCommit": "99132ab0EXAMPLE",
                "sourceReference": "refs/heads/variables-branch"
            }
        ],
        "title": "Consolidation of global variables"
    }
}
```

For more information, see Merge a Pull Request in the *AWS CodeCommit User Guide*.

- For API details, see MergePullRequestBySquash in *AWS CLI Command Reference*.

`merge-pull-request-by-three-way`

The following code example shows how to use `merge-pull-request-by-three-way`.

AWS CLI

To merge a pull request using the three-way merge strategy

The following `merge-pull-request-by-three-way` example merges and closes the specified pull request using the default options for conflict detail and conflict resolution strategy in a repository named `MyDemoRepo`.

```
aws codecommit merge-pull-request-by-three-way \
    --pull-request-id 47 \
    --source-commit-id 99132ab0EXAMPLE \
    --repository-name MyDemoRepo \
    --author-name "Maria Garcia" \
    --email "maria_garcia@example.com" \
    --commit-message "Merging pull request 47 by three-way with default options"
```

Output:

```
{
    "pullRequest": {
        "approvalRules": [
            {
```

```
                "approvalRuleContent": "{\"Version\": \"2018-11-08\",
\"DestinationReferences\": [\"refs/heads/main\"],\"Statements\": [{\"Type
\": \"Approvers\",\"NumberOfApprovalsNeeded\": 2,\"ApprovalPoolMembers\":
 [\"arn:aws:sts::123456789012:assumed-role/CodeCommitReview/*\"]}]}",
                "approvalRuleId": "dd8b17fe-EXAMPLE",
                "approvalRuleName": "2-approver-rule-for-main",
                "creationDate": 1571356106.936,
                "lastModifiedDate": 571356106.936,
                "lastModifiedUser": "arn:aws:iam::123456789012:user/Mary_Major",
                "originApprovalRuleTemplate": {
                    "approvalRuleTemplateId": "dd8b17fe-EXAMPLE",
                    "approvalRuleTemplateName": "2-approver-rule-for-main"
                },
                "ruleContentSha256": "4711b576EXAMPLE"
            }
        ],
        "authorArn": "arn:aws:iam::123456789012:user/Li_Juan",
        "clientRequestToken": "",
        "creationDate": 1508530823.142,
        "description": "Review the latest changes and updates to the global
 variables",
        "lastActivityDate": 1508887223.155,
        "pullRequestId": "47",
        "pullRequestStatus": "CLOSED",
        "pullRequestTargets": [
            {
                "destinationCommit": "9f31c968EXAMPLE",
                "destinationReference": "refs/heads/main",
                "mergeMetadata": {
                    "isMerged": true,
                    "mergedBy": "arn:aws:iam::123456789012:user/Mary_Major"
                },
                "repositoryName": "MyDemoRepo",
                "sourceCommit": "99132ab0EXAMPLE",
                "sourceReference": "refs/heads/variables-branch"
            }
        ],
        "title": "Consolidation of global variables"
    }
}
```

For more information, see Merge a Pull Request in the *AWS CodeCommit User Guide*.

- For API details, see MergePullRequestByThreeWay in *AWS CLI Command Reference*.

override-pull-request-approval-rules

The following code example shows how to use override-pull-request-approval-rules.

AWS CLI

To override approval rule requirements on a pull request

The following override-pull-request-approval-rules example overrides approval rules on the specified pull request. To revoke an override instead, set the --override-status parameter value to REVOKE.

```
aws codecommit override-pull-request-approval-rules \
    --pull-request-id 34  \
    --revision-id 927df8d8EXAMPLE \
    --override-status OVERRIDE
```

This command produces no output.

For more information, see Override Approval Rules on a Pull Request in the *AWS CodeCommit User Guide*.

- For API details, see OverridePullRequestApprovalRules in *AWS CLI Command Reference*.

post-comment-for-compared-commit

The following code example shows how to use post-comment-for-compared-commit.

AWS CLI

To create a comment on a commit

The following post-comment-for-compared-commit example adds the comment "Can you add a test case for this?" on the change to the cl_sample.js file in the comparison between two commits in a repository named MyDemoRepo.

```
aws codecommit post-comment-for-compared-commit \
    --repository-name MyDemoRepo \
    --before-commit-id 317f8570EXAMPLE \
    --after-commit-id 5d036259EXAMPLE \
    --client-request-token 123Example \
```

```
    --content "Can you add a test case for this?" \
    --location filePath=cl_sample.js,filePosition=1232,relativeFileVersion=AFTER
```

Output:

```
{
    "afterBlobId": "1f330709EXAMPLE",
    "afterCommitId": "317f8570EXAMPLE",
    "beforeBlobId": "80906a4cEXAMPLE",
    "beforeCommitId": "6e147360EXAMPLE",
    "comment": {
        "authorArn": "arn:aws:iam::123456789012:user/Li_Juan",
        "clientRequestToken": "",
        "commentId": "553b509bEXAMPLE56198325",
        "content": "Can you add a test case for this?",
        "creationDate": 1508369612.203,
        "deleted": false,
        "inReplyTo": "abc123-EXAMPLE",
        "lastModifiedDate": 1508369612.203,
        "callerReactions": [],
        "reactionCounts": {}
    },
    "location": {
        "filePath": "cl_sample.js",
        "filePosition": 1232,
        "relativeFileVersion": "AFTER"
    },
    "repositoryName": "MyDemoRepo"
}
```

For more information, see Comment on a commit in AWS CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see PostCommentForComparedCommit in *AWS CLI Command Reference*.

`post-comment-for-pull-request`

The following code example shows how to use `post-comment-for-pull-request`.

AWS CLI

To add a comment to a pull request

The following `post-comment-for-pull-request` example adds the comment "These don't appear to be used anywhere. Can we remove them?" on the change to the `ahs_count.py` file in a pull request with the ID of 47 in a repository named `MyDemoRepo`.

```
aws codecommit post-comment-for-pull-request \
    --pull-request-id "47" \
    --repository-name MyDemoRepo \
    --before-commit-id 317f8570EXAMPLE \
    --after-commit-id 5d036259EXAMPLE \
    --client-request-token 123Example \
    --content "These don't appear to be used anywhere. Can we remove them?" \
    --location filePath=ahs_count.py,filePosition=367,relativeFileVersion=AFTER
```

Output:

```
{
    "afterBlobId": "1f330709EXAMPLE",
    "afterCommitId": "5d036259EXAMPLE",
    "beforeBlobId": "80906a4cEXAMPLE",
    "beforeCommitId": "317f8570EXAMPLE",
    "comment": {
        "authorArn": "arn:aws:iam::123456789012:user/Saanvi_Sarkar",
        "clientRequestToken": "123Example",

```

For more information, see Review a pull request in the *AWS CodeCommit User Guide*.

- For API details, see PostCommentForPullRequest in *AWS CLI Command Reference*.

post-comment-reply

The following code example shows how to use `post-comment-reply`.

AWS CLI

To reply to a comment on a commit or in a pull request

The following `post-comment-reply` example adds the reply `"Good catch. I'll remove them."` to the comment with the system-generated ID of `abcd1234EXAMPLEb5678efgh`.

```
aws codecommit post-comment-reply \
    --in-reply-to abcd1234EXAMPLEb5678efgh \
    --content "Good catch. I'll remove them." \
    --client-request-token 123Example
```

Output:

```
{
    "comment": {
        "authorArn": "arn:aws:iam::123456789012:user/Li_Juan",
        "clientRequestToken": "123Example",
        "commentId": "442b498bEXAMPLE5756813",
        "content": "Good catch. I'll remove them.",
        "creationDate": 1508369829.136,
        "deleted": false,
        "inReplyTo": "abcd1234EXAMPLEb5678efgh",
        "lastModifiedDate": 150836912.221,
        "callerReactions": [],
        "reactionCounts": {}
    }
}
```

For more information, see Comment on a commit in AWS CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see PostCommentReply in *AWS CLI Command Reference*.

put-comment-reaction

The following code example shows how to use `put-comment-reaction`.

AWS CLI

To reply to a comment on a commit with an emoji

The following `put-comment-reaction` example replies to a comment with the ID of `abcd1234EXAMPLEb5678efgh` with an emoji reaction value of `:thumbsup:`.

```
aws codecommit put-comment-reaction \
    --comment-id abcd1234EXAMPLEb5678efgh \
    --reaction-value :thumbsup:
```

This command produces no output.

For more information, see Comment on a commit in AWS CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see PutCommentReaction in *AWS CLI Command Reference*.

`put-file`

The following code example shows how to use `put-file`.

AWS CLI

To add a file to a repository

The following `put-file` example adds a file named 'ExampleSolution.py' to a repository named 'MyDemoRepo' to a branch named 'feature-randomizationfeature' whose most recent commit has an ID of '4c925148EXAMPLE'.

```
aws codecommit put-file \
    --repository-name MyDemoRepo \
    --branch-name feature-randomizationfeature \
    --file-content fileb://MyDirectory/ExampleSolution.py \
    --file-path /solutions/ExampleSolution.py \
    --parent-commit-id 4c925148EXAMPLE \
    --name "Maria Garcia" \
    --email "maria_garcia@example.com" \
    --commit-message "I added a third randomization routine."
```

Output:

```
{
    "blobId": "2eb4af3bEXAMPLE",
    "commitId": "317f8570EXAMPLE",
    "treeId": "347a3408EXAMPLE"
}
```

For more information, see Create or add a file to an AWS CodeCommit repository in the *AWS CodeCommit User Guide*.

- For API details, see PutFile in *AWS CLI Command Reference*.

`put-repository-triggers`

The following code example shows how to use `put-repository-triggers`.

AWS CLI

To add or update a trigger in a repository

The following `put-repository-triggers` example updates triggers named `MyFirstTrigger` and `MySecondTrigger` using an already-created JSON file (here named `MyTriggers.json`) that contains the structure of all the triggers for a repository named `MyDemoRepo`. To learn how to get the JSON for existing triggers, see the `get-repository-triggers` command.

```
aws codecommit put-repository-triggers \
    --cli-input-json file://MyTriggers.json
```

Contents of `MyTriggers.json`:

```
{
    "repositoryName": "MyDemoRepo",
    "triggers": [
        {
            "destinationArn": "arn:aws:sns:us-
west-2:80398EXAMPLE:MyCodeCommitTopic",
            "branches": [
                "main",
                "preprod"
            ],
            "name": "MyFirstTrigger",
```

```
            "customData": "",
            "events": [
                "all"
            ]
        },
        {
            "destinationArn": "arn:aws:lambda:us-
west-2:123456789012:function:MyCodeCommitPythonFunction",
            "branches": [],
            "name": "MySecondTrigger",
            "customData": "EXAMPLE",
            "events": [
                "all"
            ]
        }
    ]
}
```

Output:

```
{
    "configurationId": "6fa51cd8-35c1-EXAMPLE"
}
```

For more information, see Edit triggers for an AWS CodeCommit repository in the *AWS CodeCommit User Guide*.

- For API details, see PutRepositoryTriggers in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add AWS tags to an existing repository

The following `tag-resource` example tags the specified repository with two tags.

```
aws codecommit tag-resource \
    --resource-arn arn:aws:codecommit:us-west-2:123456789012:MyDemoRepo \
    --tags Status=Secret,Team=Saanvi
```

This command produces no output.

For more information, see Add a Tag to a Repository in the *AWS CodeCommit User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`test-repository-triggers`

The following code example shows how to use `test-repository-triggers`.

AWS CLI

To test triggers in a repository

The following `test-repository-triggers` example tests a trigger named `MyFirstTrigger` in an AWS CodeCommit repository named `MyDemoRepo`. In this example, events in the repository trigger notifications from an Amazon Simple Notification Service (Amazon SNS) topic.

```
aws codecommit test-repository-triggers \
    --repository-name MyDemoRepo \
    --triggers name=MyFirstTrigger,destinationArn=arn:aws:sns:us-
west-2:123456789012:MyCodeCommitTopic,branches=mainline,preprod,events=all
```

Output:

```
{
    "successfulExecutions": [
        "MyFirstTrigger"
    ],
    "failedExecutions": []
}
```

For more information, see Test triggers for an AWS CodeCommit repository in the *AWS CodeCommit User Guide*.

- For API details, see TestRepositoryTriggers in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove AWS tags from a repository

The following `untag-resource` example removes the tag with the specified key from the repository named `MyDemoRepo`.

```
aws codecommit untag-resource \
    --resource-arn arn:aws:codecommit:us-west-2:123456789012:MyDemoRepo \
    --tag-keys Status
```

This command produces no output.

For more information, see Remove a Tag from a Repository in the *AWS CodeCommit User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-approval-rule-template-content`

The following code example shows how to use `update-approval-rule-template-content`.

AWS CLI

To update the content of an approval rule template

The following `update-approval-rule-template-content` example changes the content of the specified approval rule template to redefine the approval pool to users who assume the role of `CodeCommitReview`.

```
aws codecommit update-approval-rule-template-content \
    --approval-rule-template-name 1-approver-rule  \
    --new-rule-content "{\"Version\": \"2018-11-08\",\"DestinationReferences
\": [\"refs/heads/main\"],\"Statements\": [{\"Type\": \"Approvers
\",\"NumberOfApprovalsNeeded\": 2,\"ApprovalPoolMembers\":
 [\"arn:aws:sts::123456789012:assumed-role/CodeCommitReview/*\"]}]}"
```

Output:

```
{
    "approvalRuleTemplate": {
        "creationDate": 1571352720.773,
        "approvalRuleTemplateDescription": "Requires 1 approval for all pull
 requests from the CodeCommitReview pool",
```

```
        "lastModifiedDate": 1571358728.41,
        "approvalRuleTemplateId": "41de97b7-EXAMPLE",
        "approvalRuleTemplateContent": "{\"Version\": \"2018-11-08\",\"Statements\":
 [{\"Type\": \"Approvers\",\"NumberOfApprovalsNeeded\": 1,\"ApprovalPoolMembers\":
 [\"arn:aws:sts::123456789012:assumed-role/CodeCommitReview/*\"]}]}",
        "approvalRuleTemplateName": "1-approver-rule-for-all-pull-requests",
        "ruleContentSha256": "2f6c21a5EXAMPLE",
        "lastModifiedUser": "arn:aws:iam::123456789012:user/Li_Juan"
    }
}
```

For more information, see Manage Approval Rule Templates in the *AWS CodeCommit User Guide*.

- For API details, see UpdateApprovalRuleTemplateContent in *AWS CLI Command Reference*.

`update-approval-rule-template-description`

The following code example shows how to use `update-approval-rule-template-description`.

AWS CLI

To update the description of an approval rule template

The following `update-approval-rule-template-description` example changes the description of the specified approval rule template to `Requires 1 approval for all pull requests from the CodeCommitReview pool`.

```
aws codecommit update-approval-rule-template-description \
    --approval-rule-template-name 1-approver-rule-for-all-pull-requests  \
    --approval-rule-template-description "Requires 1 approval for all pull requests
 from the CodeCommitReview pool"
```

Output:

```
{
    "approvalRuleTemplate": {
        "creationDate": 1571352720.773,
        "approvalRuleTemplateDescription": "Requires 1 approval for all pull
 requests from the CodeCommitReview pool",
        "lastModifiedDate": 1571358728.41,
```

```
        "approvalRuleTemplateId": "41de97b7-EXAMPLE",
        "approvalRuleTemplateContent": "{\"Version\": \"2018-11-08\",\"Statements\":
 [{\"Type\": \"Approvers\",\"NumberOfApprovalsNeeded\": 1,\"ApprovalPoolMembers\":
 [\"arn:aws:sts::123456789012:assumed-role/CodeCommitReview/*\"]}]}",
        "approvalRuleTemplateName": "1-approver-rule-for-all-pull-requests",
        "ruleContentSha256": "2f6c21a5EXAMPLE",
        "lastModifiedUser": "arn:aws:iam::123456789012:user/Li_Juan"
    }
}
```

For more information, see Manage Approval Rule Templates in the *AWS CodeCommit User Guide*.

- For API details, see UpdateApprovalRuleTemplateDescription in *AWS CLI Command Reference*.

`update-approval-rule-template-name`

The following code example shows how to use `update-approval-rule-template-name`.

AWS CLI

To update the name of an approval rule template

The following `update-approval-rule-template-name` example changes the name of an approval rule template from `1-approver-rule` to 1-approver-rule-for-all-pull-requests`.

```
aws codecommit update-approval-rule-template-name \
    --old-approval-rule-template-name 1-approver-rule  \
    --new-approval-rule-template-name 1-approver-rule-for-all-pull-requests
```

Output:

```
{
    "approvalRuleTemplate": {
        "approvalRuleTemplateName": "1-approver-rule-for-all-pull-requests",
        "lastModifiedDate": 1571358241.619,
        "approvalRuleTemplateId": "41de97b7-EXAMPLE",
        "approvalRuleTemplateContent": "{\"Version\": \"2018-11-08\",\"Statements\":
 [{\"Type\": \"Approvers\",\"NumberOfApprovalsNeeded\": 1,\"ApprovalPoolMembers\":
 [\"arn:aws:sts::123456789012:assumed-role/CodeCommitReview/*\"]}]}",
        "creationDate": 1571352720.773,
        "lastModifiedUser": "arn:aws:iam::123456789012:user/Mary_Major",
```

```
        "approvalRuleTemplateDescription": "All pull requests must be approved by
 one developer on the team.",
        "ruleContentSha256": "2f6c21a5cEXAMPLE"
    }
}
```

For more information, see Manage Approval Rule Templates in the *AWS CodeCommit User Guide*.

- For API details, see UpdateApprovalRuleTemplateName in *AWS CLI Command Reference*.

`update-comment`

The following code example shows how to use `update-comment`.

AWS CLI

To update a comment on a commit

The following `update-comment` example adds the content `"Fixed as requested. I'll update the pull request."` to a comment with an ID of `442b498bEXAMPLE5756813`.

```
aws codecommit update-comment \
    --comment-id 442b498bEXAMPLE5756813 \
    --content "Fixed as requested. I'll update the pull request."
```

Output:

```
{
    "comment": {
        "authorArn": "arn:aws:iam::123456789012:user/Li_Juan",
        "clientRequestToken": "",
        "commentId": "442b498bEXAMPLE5756813",
        "content": "Fixed as requested. I'll update the pull request.",
        "creationDate": 1508369929.783,
        "deleted": false,
        "lastModifiedDate": 1508369929.287,
        "callerReactions": [],
        "reactionCounts":
            {
                "THUMBSUP" : 2
            }
```

```
    }
}
```

For more information, see Comment on a commit in AWS CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see UpdateComment in *AWS CLI Command Reference*.

`update-default-branch`

The following code example shows how to use `update-default-branch`.

AWS CLI

To change the default branch for a repository

The following `update-default-branch` example changes the default branch for an AWS CodeCommit repository.

```
aws codecommit update-default-branch \
    --repository-name MyDemoRepo \
    --default-branch-name MyNewBranch
```

This command produces no output.

For more information, see Change branch settings in AWS CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see UpdateDefaultBranch in *AWS CLI Command Reference*.

`update-pull-request-approval-rule-content`

The following code example shows how to use `update-pull-request-approval-rule-content`.

AWS CLI

To edit an approval rule for a pull request

The following `update-pull-request-approval-rule-content` example updates she specified approval rule to require one user approval from an approval pool that includes any IAM user in the 123456789012 AWS account.

```
aws codecommit update-pull-request-approval-rule-content \
    --pull-request-id 27  \
    --approval-rule-name "Require two approved approvers" \
    --new-rule-content "{Version: 2018-11-08, Statements: [{Type:
 \"Approvers\", NumberOfApprovalsNeeded: 1, ApprovalPoolMembers:
[\"CodeCommitApprovers:123456789012:user/*\"]}]}"
```

Output:

```
{
    "approvalRule": {
        "approvalRuleContent": "{Version: 2018-11-08, Statements:
 [{Type: \"Approvers\", NumberOfApprovalsNeeded: 1, ApprovalPoolMembers:
[\"CodeCommitApprovers:123456789012:user/*\"]}]}",
        "approvalRuleId": "aac33506-EXAMPLE",
        "originApprovalRuleTemplate": {},
        "creationDate": 1570752871.932,
        "lastModifiedDate": 1570754058.333,
        "approvalRuleName": "Require two approved approvers",
        "lastModifiedUser": "arn:aws:iam::123456789012:user/Mary_Major",
        "ruleContentSha256": "cd93921cEXAMPLE"
    }
}
```

For more information, see Edit or Delete an Approval Rule in the *AWS CodeCommit User Guide*.

- For API details, see UpdatePullRequestApprovalRuleContent in *AWS CLI Command Reference*.

update-pull-request-approval-state

The following code example shows how to use `update-pull-request-approval-state`.

AWS CLI

To approve or revoke approval for a pull request

The following `update-pull-request-approval-state` example approves a pull request with the ID of 27 and a revision ID of `9f29d167EXAMPLE`. If you wanted to revoke approval instead, then set the `--approval-state` parameter value to `REVOKE`.

```
aws codecommit update-pull-request-approval-state \
```

```
    --pull-request-id 27  \
    --revision-id 9f29d167EXAMPLE  \
    --approval-state "APPROVE"
```

This command produces no output.

For more information, see Review a Pull Request in the *AWS CodeCommit User Guide*.

- For API details, see UpdatePullRequestApprovalState in *AWS CLI Command Reference*.

`update-pull-request-description`

The following code example shows how to use `update-pull-request-description`.

AWS CLI

To change the description of a pull request

The following `update-pull-request-description` example changes the description of a pull request with the ID of 47.

```
aws codecommit update-pull-request-description \
    --pull-request-id 47 \
    --description "Updated the pull request to remove unused global variable."
```

Output:

```
{
    "pullRequest": {
        "authorArn": "arn:aws:iam::123456789012:user/Li_Juan",
        "clientRequestToken": "",
        "creationDate": 1508530823.155,
        "description": "Updated the pull request to remove unused global variable.",
        "lastActivityDate": 1508372423.204,
        "pullRequestId": "47",
        "pullRequestStatus": "OPEN",
        "pullRequestTargets": [
            {
                "destinationCommit": "9f31c968EXAMPLE",
                "destinationReference": "refs/heads/main",
                "mergeMetadata": {
                    "isMerged": false
```

```
                },
                "repositoryName": "MyDemoRepo",
                "sourceCommit": "99132ab0EXAMPLE",
                "sourceReference": "refs/heads/variables-branch"
            }
        ],
        "title": "Consolidation of global variables"
    }
}
```

For more information, see Update a pull request in the *AWS CodeCommit User Guide*.

- For API details, see UpdatePullRequestDescription in *AWS CLI Command Reference*.

`update-pull-request-status`

The following code example shows how to use `update-pull-request-status`.

AWS CLI

To change the status of a pull request

The following `update-pull-request-status` example changes the status of a pull request with the ID of `42` to a status of `CLOSED` in an AWS CodeCommit repository named `MyDemoRepo`.

```
aws codecommit update-pull-request-status \
    --pull-request-id 42 \
    --pull-request-status CLOSED
```

Output:

```
{
    "pullRequest": {
        "approvalRules": [
            {
                "approvalRuleContent": "{\"Version\": \"2018-11-08\",\"Statements\":
 [{\"Type\": \"Approvers\",\"NumberOfApprovalsNeeded\": 2,\"ApprovalPoolMembers\":
 [\"arn:aws:sts::123456789012:assumed-role/CodeCommitReview/*\"]}]}",
                "approvalRuleId": "dd8b17fe-EXAMPLE",
                "approvalRuleName": "2-approvers-needed-for-this-change",
                "creationDate": 1571356106.936,
```

```
                "lastModifiedDate": 571356106.936,
                "lastModifiedUser": "arn:aws:iam::123456789012:user/Mary_Major",
                "ruleContentSha256": "4711b576EXAMPLE"
            }
        ],
        "authorArn": "arn:aws:iam::123456789012:user/Li_Juan",
        "clientRequestToken": "",
        "creationDate": 1508530823.165,
        "description": "Updated the pull request to remove unused global variable.",
        "lastActivityDate": 1508372423.12,
        "pullRequestId": "47",
        "pullRequestStatus": "CLOSED",
        "pullRequestTargets": [
            {
                "destinationCommit": "9f31c968EXAMPLE",
                "destinationReference": "refs/heads/main",
                "mergeMetadata": {
                    "isMerged": false
                },
                "repositoryName": "MyDemoRepo",
                "sourceCommit": "99132ab0EXAMPLE",
                "sourceReference": "refs/heads/variables-branch"
            }
        ],
        "title": "Consolidation of global variables"
    }
}
```

For more information, see Close a pull request in an AWS CodeCommit repository in the *AWS CodeCommit User Guide*.

- For API details, see UpdatePullRequestStatus in *AWS CLI Command Reference*.

`update-pull-request-title`

The following code example shows how to use `update-pull-request-title`.

AWS CLI

To change the title of a pull request

The following `update-pull-request-title` example changes the title of a pull request with the ID of 47.

```
aws codecommit update-pull-request-title \
    --pull-request-id 47 \
    --title "Consolidation of global variables - updated review"
```

Output:

```
{
    "pullRequest": {
        "approvalRules": [
            {
                "approvalRuleContent": "{\"Version\": \"2018-11-08\",
\"DestinationReferences\": [\"refs/heads/main\"],\"Statements\": [{\"Type
\": \"Approvers\",\"NumberOfApprovalsNeeded\": 2,\"ApprovalPoolMembers\":
 [\"arn:aws:sts::123456789012:assumed-role/CodeCommitReview/*\"]}]}",
                "approvalRuleId": "dd8b17fe-EXAMPLE",
                "approvalRuleName": "2-approver-rule-for-main",
                "creationDate": 1571356106.936,
                "lastModifiedDate": 571356106.936,
                "lastModifiedUser": "arn:aws:iam::123456789012:user/Mary_Major",
                "originApprovalRuleTemplate": {
                    "approvalRuleTemplateId": "dd8b26gr-EXAMPLE",

            }
        ],
        "title": "Consolidation of global variables - updated review"
    }
}
```

For more information, see Update a pull request in the *AWS CodeCommit User Guide*.

- For API details, see UpdatePullRequestTitle in *AWS CLI Command Reference*.

`update-repository-description`

The following code example shows how to use `update-repository-description`.

AWS CLI

To change the description for a repository

The following `update-repository-description` example changes the description for an AWS CodeCommit repository.

```
aws codecommit update-repository-description \
    --repository-name MyDemoRepo \
    --repository-description "This description was changed"
```

This command produces no output.

For more information, see Change AWS CodeCommit repository settings in the *AWS CodeCommit User Guide*.

- For API details, see UpdateRepositoryDescription in *AWS CLI Command Reference*.

`update-repository-name`

The following code example shows how to use `update-repository-name`.

AWS CLI

To change the name of a repository

The following `update-repository-name` example changes the name of an AWS CodeCommit repository. Changing the name of the AWS CodeCommit repository will change the SSH and HTTPS URLs that users need to connect to the repository. Users will not be able to connect to this repository until they update their connection settings. Also, because the repository's ARN will change, changing the repository name will invalidate any IAM user policies that rely on this repository's ARN.

```
aws codecommit update-repository-name \
    --old-name MyDemoRepo \
    --new-name MyRenamedDemoRepo
```

This command produces no output.

For more information, see Change AWS CodeCommit repository settings in the *AWS CodeCommit User Guide*.

- For API details, see UpdateRepositoryName in *AWS CLI Command Reference*.

CodeDeploy examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with CodeDeploy.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags-to-on-premises-instances`

The following code example shows how to use `add-tags-to-on-premises-instances`.

AWS CLI

To add tags to on-premises instances

The following `add-tags-to-on-premises-instances` example associates in AWS CodeDeploy the same on-premises instance tag to two on-premises instances. It does not register the on-premises instances with AWS CodeDeploy.

```
aws deploy add-tags-to-on-premises-instances \
    --instance-names AssetTag12010298EX AssetTag23121309EX \
    --tags Key=Name,Value=CodeDeployDemo-OnPrem
```

This command produces no output.

For more information, see Tagging instances for deployment groups in CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see AddTagsToOnPremisesInstances in *AWS CLI Command Reference*.

`batch-get-application-revisions`

The following code example shows how to use `batch-get-application-revisions`.

AWS CLI

To retrieve information about application revisions

The following `batch-get-application-revisions` example retrieves information about the specified revision stored in a GitHub repository.

```
aws deploy batch-get-application-revisions \
    --application-name my-codedeploy-application \
    --revisions "[{\"gitHubLocation\": {\"commitId\":
 \"fa85936EXAMPLEa31736c051f10d77297EXAMPLE\",\"repository\": \"my-github-token/my-
repository\"},\"revisionType\": \"GitHub\"}]"
```

Output:

```
{
    "revisions": [
        {
            "genericRevisionInfo": {
```

```
                "description": "Application revision registered by Deployment ID: d-
A1B2C3111",
                "lastUsedTime": 1556912355.884,
                "registerTime": 1556912355.884,
                "firstUsedTime": 1556912355.884,
                "deploymentGroups": []
            },
            "revisionLocation": {
                "revisionType": "GitHub",
                "gitHubLocation": {
                    "commitId": "fa85936EXAMPLEa31736c051f10d77297EXAMPLE",
                    "repository": "my-github-token/my-repository"
                }
            }
        }
    ],
    "applicationName": "my-codedeploy-application",
    "errorMessage": ""
}
```

For more information, see View application revision details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see BatchGetApplicationRevisions in *AWS CLI Command Reference*.

`batch-get-applications`

The following code example shows how to use `batch-get-applications`.

AWS CLI

To get information about multiple applications

The following `batch-get-applications` example displays information about multiple applications that are associated with the user's AWS account.

```
aws deploy batch-get-applications \
    --application-names WordPress_App MyOther_App
```

Output:

```
{
    "applicationsInfo": [
```

```
        {
            "applicationName": "WordPress_App",
            "applicationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "createTime": 1407878168.078,
            "linkedToGitHub": false
        },
        {
            "applicationName": "MyOther_App",
            "applicationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "createTime": 1407453571.63,
            "linkedToGitHub": false
        }
    ]
}
```

For more information, see View application details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see BatchGetApplications in *AWS CLI Command Reference*.

`batch-get-deployment-groups`

The following code example shows how to use `batch-get-deployment-groups`.

AWS CLI

To retrieve information about one or more deployment groups

The following `batch-get-deployment-groups` example retrieves information about two of the deployment groups that are associated with the specified CodeDeploy application.

```
aws deploy batch-get-deployment-groups \
    --application-name my-codedeploy-application \
    --deployment-group-names "[\"my-deployment-group-1\",\"my-deployment-group-2\"]"
```

Output:

```
{
    "deploymentGroupsInfo": [
        {
            "deploymentStyle": {
                "deploymentOption": "WITHOUT_TRAFFIC_CONTROL",
                "deploymentType": "IN_PLACE"
```

```
            },
            "autoRollbackConfiguration": {
                "enabled": false
            },
            "onPremisesTagSet": {
                "onPremisesTagSetList": []
            },

        }
    ],
    "errorMessage": ""
}
```

For more information, see View deployment group details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see BatchGetDeploymentGroups in *AWS CLI Command Reference*.

`batch-get-deployment-targets`

The following code example shows how to use `batch-get-deployment-targets`.

AWS CLI

To retrieve the targets associated with a deployment

The following `batch-get-deployment-targets` example returns information about one of the targets associated with the specified deployment.

```
aws deploy batch-get-deployment-targets \
```

```
    --deployment-id "d-1A2B3C4D5" \
    --target-ids "i-01a2b3c4d5e6f1111"
```

Output:

```
{
    "deploymentTargets": [
        {
            "deploymentTargetType": "InstanceTarget",
            "instanceTarget": {
                "lifecycleEvents": [
                    {
                        "startTime": 1556918592.162,
                        "lifecycleEventName": "ApplicationStop",
                        "status": "Succeeded",
                        "endTime": 1556918592.247,
                        "diagnostics": {

                "status": "Succeeded"
            }
        }
    ]
}
```

For more information, see View CodeDeploy deployment details in the *AWS CodeDeploy User Guide*.

- For API details, see BatchGetDeploymentTargets in *AWS CLI Command Reference*.

`batch-get-deployments`

The following code example shows how to use `batch-get-deployments`.

AWS CLI

To get information about multiple deployments

The following `batch-get-deployments` example displays information about multiple deployments that are associated with the user's AWS account.

```
aws deploy batch-get-deployments \
    --deployment-ids d-A1B2C3111 d-A1B2C3222
```

Output:

```
{
    "deploymentsInfo": [
        {
            "applicationName": "WordPress_App",
            "status": "Failed",
            "deploymentOverview": {
```

```
                "Failed": 0,
                "InProgress": 0,
                "Skipped": 0,
                "Succeeded": 1,
                "Pending": 0
            },
            "deploymentConfigName": "CodeDeployDefault.OneAtATime",

- For API details, see BatchGetDeployments in *AWS CLI Command Reference*.

`batch-get-on-premises-instances`

The following code example shows how to use `batch-get-on-premises-instances`.

AWS CLI

To get information about one or more on-premises instances

The following `batch-get-on-premises-instances` example gets information about two on-premises instances.

```
aws deploy batch-get-on-premises-instances \
    --instance-names AssetTag12010298EX AssetTag23121309EX
```

Output:

```
{
    "instanceInfos": [
        {
            "iamUserArn": "arn:aws:iam::123456789012:user/AWS/CodeDeploy/
AssetTag12010298EX",
            "tags": [
                {
                    "Value": "CodeDeployDemo-OnPrem",
                    "Key": "Name"
```

```
                }
            ],
            "instanceName": "AssetTag12010298EX",
            "registerTime": 1425579465.228,
            "instanceArn": "arn:aws:codedeploy:us-west-2:123456789012:instance/
AssetTag12010298EX_4IwLNI2Alh"
        },
        {
            "iamUserArn": "arn:aws:iam::123456789012:user/AWS/CodeDeploy/
AssetTag23121309EX",
            "tags": [
                {
                    "Value": "CodeDeployDemo-OnPrem",
                    "Key": "Name"
                }
            ],
            "instanceName": "AssetTag23121309EX",
            "registerTime": 1425595585.988,
            "instanceArn": "arn:aws:codedeploy:us-west-2:80398EXAMPLE:instance/
AssetTag23121309EX_PomUy64Was"
        }
    ]
}
```

For more information, see Get information about multiple on-premises instances in the *AWS CodeDeploy User Guide*.

- For API details, see BatchGetOnPremisesInstances in *AWS CLI Command Reference*.

`continue-deployment`

The following code example shows how to use `continue-deployment`.

AWS CLI

To start rerouting traffic without waiting for a specified wait time to elapse.

The following `continue-deployment` example starts rerouting traffic from instances in the original environment that are ready to start shifting traffic to instances in the replacement environment.

```
aws deploy continue-deployment \
    --deployment-id "d-A1B2C3111" \
```

```
    --deployment-wait-type "READY_WAIT"
```

This command produces no output.

For more information, see Create a deployment group for an EC2/On-Premises blue/green deployment (console) in the *AWS CodeDeploy User Guide*.

- For API details, see ContinueDeployment in *AWS CLI Command Reference*.

`create-application`

The following code example shows how to use `create-application`.

AWS CLI

To create an application

The following `create-application` example creates an application and associates it with the user's AWS account.

```
aws deploy create-application \
    --application-name MyOther_App
```

Output:

```
{
    "applicationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create an application with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see CreateApplication in *AWS CLI Command Reference*.

`create-deployment-config`

The following code example shows how to use `create-deployment-config`.

AWS CLI

To create a custom deployment configuration

The following `create-deployment-config` example creates a custom deployment configuration and associates it with the user's AWS account.

```
aws deploy create-deployment-config \
    --deployment-config-name ThreeQuartersHealthy \
    --minimum-healthy-hosts type=FLEET_PERCENT,value=75
```

Output:

```
{
    "deploymentConfigId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create a deployment configuration with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see CreateDeploymentConfig in *AWS CLI Command Reference*.

`create-deployment-group`

The following code example shows how to use `create-deployment-group`.

AWS CLI

To create a deployment group

The following `create-deployment-group` example creates a deployment group and associates it with the specified application and the user's AWS account.

```
aws deploy create-deployment-group \
    --application-name WordPress_App \
    --auto-scaling-groups CodeDeployDemo-ASG \
    --deployment-config-name CodeDeployDefault.OneAtATime \
    --deployment-group-name WordPress_DG \
    --ec2-tag-filters Key=Name,Value=CodeDeployDemo,Type=KEY_AND_VALUE \
    --service-role-arn arn:aws:iam::123456789012:role/CodeDeployDemoRole
```

Output:

```
{
```

```
    "deploymentGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create a deployment group with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see CreateDeploymentGroup in *AWS CLI Command Reference*.

`create-deployment`

The following code example shows how to use `create-deployment`.

AWS CLI

Example 1: To create a CodeDeploy deployment using the EC2/On-premises compute platform

The following `create-deployment` example creates a deployment and associates it with the user's AWS account.

```
aws deploy create-deployment \
    --application-name WordPress_App \
    --deployment-config-name CodeDeployDefault.OneAtATime \
    --deployment-group-name WordPress_DG \
    --description "My demo deployment" \
    --s3-
location bucket=CodeDeployDemoBucket,bundleType=zip,eTag=dd56cfdEXAMPLE8e768f9d77fEXAMPLE,ke
```

Output:

```
{
    "deploymentId": "d-A1B2C3111"
}
```

For more information, see Create an EC2/On-Premises Compute Platform deployment (CLI) in the *AWS CodeDeploy User Guide*.

Example 2: To create a CodeDeploy deployment using the Amazon ECS compute platform

The following `create-deployment` example deploys an Amazon ECS service by using the settings in the file `create-deployment.json`.

```
aws deploy create-deployment \
    --cli-input-json file://create-deployment.json
```

Contents of `create-deployment.json`:

```
{
    "applicationName": "ecs-deployment",
    "deploymentGroupName": "ecs-deployment-dg",
    "revision": {
        "revisionType": "S3",
        "s3Location": {
            "bucket": "ecs-deployment-bucket",
            "key": "appspec.yaml",
            "bundleType": "YAML"
        }
    }
}
```

That file, in turn, retrieves the following file `appspec.yaml` from an S3 bucket called `ecs-deployment-bucket`.

```
version: 0.0
Resources:
  - TargetService:
      Type: AWS::ECS::Service
      Properties:
        TaskDefinition: "arn:aws:ecs:region:123456789012:task-definition/ecs-task-
def:2"
        LoadBalancerInfo:
          ContainerName: "sample-app"
          ContainerPort: 80
        PlatformVersion: "LATEST"
```

Output:

```
{
    "deploymentId": "d-1234ABCDE"
}
```

For more information, see Create an Amazon ECS Compute Platform deployment (CLI) in the *AWS CodeDeploy User Guide*.

- For API details, see CreateDeployment in *AWS CLI Command Reference*.

`delete-application`

The following code example shows how to use `delete-application`.

AWS CLI

To delete an application

The following `delete-application` example deletes the specified application that is associated with the user's AWS account.

```
aws deploy delete-application \
    --application-name WordPress_App
```

This command produces no output.

For more information, see Delete an application in CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see DeleteApplication in *AWS CLI Command Reference*.

`delete-deployment-config`

The following code example shows how to use `delete-deployment-config`.

AWS CLI

To delete a deployment configuration

The following `delete-deployment-config` example deletes a custom deployment configuration that is associated with the user's AWS account.

```
aws deploy delete-deployment-config \
    --deployment-config-name ThreeQuartersHealthy
```

This command produces no output.

For more information, see Delete a deployment configuration with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see DeleteDeploymentConfig in *AWS CLI Command Reference*.

`delete-deployment-group`

The following code example shows how to use `delete-deployment-group`.

AWS CLI

To delete a deployment group

The following `delete-deployment-group` example deletes a deployment group that is associated with the specified application.

```
aws deploy delete-deployment-group \
    --application-name WordPress_App \
    --deployment-group-name WordPress_DG
```

Output:

```
{
    "hooksNotCleanedUp": []
}
```

For more information, see Delete a deployment group with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see DeleteDeploymentGroup in *AWS CLI Command Reference*.

`delete-git-hub-account-token`

The following code example shows how to use `delete-git-hub-account-token`.

AWS CLI

To deletes a GitHub account connection

The following `delete-git-hub-account-token` example deletes the connection of the specified GitHub account.

```
aws deploy delete-git-hub-account-token \
    --token-name my-github-account
```

Output:

```
{
    "tokenName": "my-github-account"
}
```

For more information, see Integrating CodeDeploy with GitHub in the *AWS CodeDeploy User Guide*.

- For API details, see DeleteGitHubAccountToken in *AWS CLI Command Reference*.

`deregister-on-premises-instance`

The following code example shows how to use `deregister-on-premises-instance`.

AWS CLI

To deregister an on-premises instance

The following `deregister-on-premises-instance` example deregisters an on-premises instance with AWS CodeDeploy, but it does not delete the IAM user associated with the instance, nor does it disassociate in AWS CodeDeploy the on-premises instance tags from the instance. It also does not uninstall the AWS CodeDeploy Agent from the instance nor remove the on-premises configuration file from the instance.

```
aws deploy deregister-on-premises-instance \
    --instance-name AssetTag12010298EX
```

This command produces no output.

For more information, see Manually deregister an on-premises instance in the *AWS CodeDeploy User Guide*.

- For API details, see DeregisterOnPremisesInstance in *AWS CLI Command Reference*.

`deregister`

The following code example shows how to use `deregister`.

AWS CLI

To deregister an on-premises instance

The following `deregister` example deregisters an on-premises instance with AWS CodeDeploy. It does not delete the IAM user that is associated with the instance. It disassociates in AWS CodeDeploy the on-premises tags from the instance. It does not uninstall the AWS CodeDeploy Agent from the instance nor remove the on-premises configuration file from the instance.

```
aws deploy deregister \
    --instance-name AssetTag12010298EX \
    --no-delete-iam-user
```

Output:

```
Retrieving on-premises instance information... DONE
IamUserArn: arn:aws:iam::80398EXAMPLE:user/AWS/CodeDeploy/AssetTag12010298EX
Tags: Key=Name,Value=CodeDeployDemo-OnPrem
Removing tags from the on-premises instance... DONE
Deregistering the on-premises instance... DONE
Run the following command on the on-premises instance to uninstall the codedeploy-
agent:
aws deploy uninstall
```

For more information, see Automatically deregister an on-premises instance in the *AWS CodeDeploy User Guide*.

- For API details, see Deregister in *AWS CLI Command Reference*.

`get-application-revision`

The following code example shows how to use `get-application-revision`.

AWS CLI

To get information about an application revision

The following `get-application-revision` example displays information about an application revision that is associated with the specified application.

```
aws deploy get-application-revision \
    --application-name WordPress_App \
    --s3-
location bucket=CodeDeployDemoBucket,bundleType=zip,eTag=dd56cfdEXAMPLE8e768f9d77fEXAMPLE,ke
```

Output:

```
{
    "applicationName": "WordPress_App",
    "revisionInfo": {
        "description": "Application revision registered by Deployment ID: d-
A1B2C3111",
        "registerTime": 1411076520.009,
        "deploymentGroups": [
            "WordPress_DG"
        ],
        "lastUsedTime": 1411076520.009,
        "firstUsedTime": 1411076520.009
    },
    "revision": {
        "revisionType": "S3",
        "s3Location": {
            "bundleType": "zip",
            "eTag": "dd56cfdEXAMPLE8e768f9d77fEXAMPLE",
            "bucket": "CodeDeployDemoBucket",
            "key": "WordPressApp.zip"
        }
    }
}
```

For more information, see View application revision details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see GetApplicationRevision in *AWS CLI Command Reference*.

`get-application`

The following code example shows how to use `get-application`.

AWS CLI

To get information about an application

The following `get-application` example displays information about an application that is associated with the user's AWS account.

```
aws deploy get-application \
```

```
    --application-name WordPress_App
```

Output:

```
{
    "application": {
        "applicationName": "WordPress_App",
        "applicationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "createTime": 1407878168.078,
        "linkedToGitHub": false
    }
}
```

For more information, see View application details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see GetApplication in *AWS CLI Command Reference*.

`get-deployment-config`

The following code example shows how to use `get-deployment-config`.

AWS CLI

To get information about a deployment configuration

The following `get-deployment-config` example displays information about a deployment configuration that is associated with the user's AWS account.

```
aws deploy get-deployment-config \
    --deployment-config-name ThreeQuartersHealthy
```

Output:

```
{
    "deploymentConfigInfo": {
        "deploymentConfigId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "minimumHealthyHosts": {
            "type": "FLEET_PERCENT",
            "value": 75
        },
        "createTime": 1411081164.379,
```

```
        "deploymentConfigName": "ThreeQuartersHealthy"
    }
}
```

For more information, see View deployment configuration details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see GetDeploymentConfig in *AWS CLI Command Reference*.

`get-deployment-group`

The following code example shows how to use `get-deployment-group`.

AWS CLI

To view information about a deployment group

The following `get-deployment-group` example displays information about a deployment group that is associated with the specified application.

```
aws deploy get-deployment-group \
    --application-name WordPress_App \
    --deployment-group-name WordPress_DG
```

Output:

```
{
    "deploymentGroupInfo": {
        "applicationName": "WordPress_App",
        "autoScalingGroups": [
            {
                "name": "CodeDeployDemo-ASG"
            }
        ],
        "deploymentConfigName": "CodeDeployDefault.OneAtATime",
        "ec2TagFilters": [
            {
                "Type": "KEY_AND_VALUE",
                "Value": "CodeDeployDemo",
                "Key": "Name"
            }
        ],
        "deploymentGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
        "serviceRoleArn": "arn:aws:iam::123456789012:role/CodeDeployDemoRole",
        "deploymentGroupName": "WordPress_DG"
    }
}
```

For more information, see View deployment group details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see GetDeploymentGroup in *AWS CLI Command Reference*.

`get-deployment-instance`

The following code example shows how to use `get-deployment-instance`.

AWS CLI

To get information about a deployment instance

The following `get-deployment-instance` example displays information about a deployment instance that is associated with the specified deployment.

```
aws deploy get-deployment-instance \
    --deployment-id d-QA4G4F9EX \
    --instance-id i-902e9fEX
```

Output:

```
{
    "instanceSummary": {
        "instanceId": "arn:aws:ec2:us-west-2:80398EXAMPLE:instance/i-902e9fEX",
        "lifecycleEvents": [
            {
                "status": "Succeeded",
                "endTime": 1408480726.569,
                "startTime": 1408480726.437,
                "lifecycleEventName": "ApplicationStop"
            },
            {
                "status": "Succeeded",
                "endTime": 1408480728.016,
                "startTime": 1408480727.665,
                "lifecycleEventName": "DownloadBundle"
            },
```

```
            {
                "status": "Succeeded",
                "endTime": 1408480729.744,
                "startTime": 1408480729.125,
                "lifecycleEventName": "BeforeInstall"
            },
            {
                "status": "Succeeded",
                "endTime": 1408480730.979,
                "startTime": 1408480730.844,
                "lifecycleEventName": "Install"
            },
            {
                "status": "Failed",
                "endTime": 1408480732.603,
                "startTime": 1408480732.1,
                "lifecycleEventName": "AfterInstall"
            },
            {
                "status": "Skipped",
                "endTime": 1408480732.606,
                "lifecycleEventName": "ApplicationStart"
            },
            {
                "status": "Skipped",
                "endTime": 1408480732.606,
                "lifecycleEventName": "ValidateService"
            }
        ],
        "deploymentId": "d-QA4G4F9EX",
        "lastUpdatedAt": 1408480733.152,
        "status": "Failed"
    }
}
```

For more information, see View instance details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see GetDeploymentInstance in *AWS CLI Command Reference*.

`get-deployment-target`

The following code example shows how to use `get-deployment-target`.

AWS CLI

To return information about a deployment target

The following `get-deployment-target` example returns information about a deployment target that is associated with the specified deployment.

```
aws deploy get-deployment-target \
    --deployment-id "d-A1B2C3111" \
    --target-id "i-a1b2c3d4e5f611111"
```

Output:

```
{
    "deploymentTarget": {
        "deploymentTargetType": "InstanceTarget",
        "instanceTarget": {
            "lastUpdatedAt": 1556918687.504,
            "targetId": "i-a1b2c3d4e5f611111",
            "targetArn": "arn:aws:ec2:us-west-2:123456789012:instance/i-
a1b2c3d4e5f611111",
            "status": "Succeeded",
            "lifecycleEvents": [
                {
                    "status": "Succeeded",
                    "diagnostics": {
                        "errorCode": "Success",
                        "message": "Succeeded",
                        "logTail": "",
                        "scriptName": ""
                    },
                    "lifecycleEventName": "ApplicationStop",
                    "startTime": 1556918592.162,
                    "endTime": 1556918592.247
                },
                {
                    "status": "Succeeded",
                    "diagnostics": {
                        "errorCode": "Success",
                        "message": "Succeeded",
                        "logTail": "",
                        "scriptName": ""
                    },
```

```

                "scriptName": ""
            },
            "lifecycleEventName": "Install",
            "startTime": 1556918682.696,
            "endTime": 1556918683.005
        },
        {
            "status": "Succeeded",
            "diagnostics": {
                "errorCode": "Success",
                "message": "Succeeded",
                "logTail": "",
                "scriptName": ""
            },
            "lifecycleEventName": "AfterInstall",
            "startTime": 1556918684.135,
            "endTime": 1556918684.216
        },
        {
            "status": "Succeeded",
            "diagnostics": {
                "errorCode": "Success",
```

```
                        "message": "Succeeded",
                        "logTail": "",
                        "scriptName": ""
                    },
                    "lifecycleEventName": "ApplicationStart",
                    "startTime": 1556918685.211,
                    "endTime": 1556918685.295
                },
                {
                    "status": "Succeeded",
                    "diagnostics": {
                        "errorCode": "Success",
                        "message": "Succeeded",
                        "logTail": "",
                        "scriptName": ""
                    },
                    "lifecycleEventName": "ValidateService",
                    "startTime": 1556918686.65,
                    "endTime": 1556918686.747
                }
            ],
            "deploymentId": "d-A1B2C3111"
        }
    }
}
```

For more information, see View instance details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see GetDeploymentTarget in *AWS CLI Command Reference*.

`get-deployment`

The following code example shows how to use `get-deployment`.

AWS CLI

To get information about a deployment

The following `get-deployment` example displays information about a deployment that is associated with the user's AWS account.

```
aws deploy get-deployment \
```

```
    --deployment-id d-A1B2C3123
```

Output:

```
{
    "deploymentInfo": {
        "applicationName": "WordPress_App",
        "status": "Succeeded",
        "deploymentOverview": {
            "Failed": 0,
            "InProgress": 0,
            "Skipped": 0,
            "Succeeded": 1,
            "Pending": 0
        },
        "deploymentConfigName": "CodeDeployDefault.OneAtATime",
        "creator": "user",
        "description": "My WordPress app deployment",
        "revision": {
            "revisionType": "S3",
            "s3Location":  {
            "bundleType": "zip",
            "eTag": "\"dd56cfdEXAMPLE8e768f9d77fEXAMPLE\"",
            "bucket": "CodeDeployDemoBucket",
            "key": "WordPressApp.zip"
            }
        },
        "deploymentId": "d-A1B2C3123",
        "deploymentGroupName": "WordPress_DG",
        "createTime": 1409764576.589,
        "completeTime": 1409764596.101,
        "ignoreApplicationStopFailures": false
    }
}
```

For more information, see View CodeDeploy deployment details in the *AWS CodeDeploy User Guide*.

- For API details, see GetDeployment in *AWS CLI Command Reference*.

`get-on-premises-instance`

The following code example shows how to use `get-on-premises-instance`.

AWS CLI

To get information about an on-premises instance

The following `get-on-premises-instance` example retrieves information about the specified on-premises instance.

```
aws deploy get-on-premises-instance \
    --instance-name AssetTag12010298EX
```

Output:

```
{
    "instanceInfo": {
    "iamUserArn": "arn:aws:iam::123456789012:user/AWS/CodeDeploy/
AssetTag12010298EX",
        "tags": [
        {
            "Value": "CodeDeployDemo-OnPrem",
            "Key": "Name"
        }
        ],
        "instanceName": "AssetTag12010298EX",
        "registerTime": 1425579465.228,
        "instanceArn": "arn:aws:codedeploy:us-west-2:123456789012:instance/
AssetTag12010298EX_4IwLNI2Alh"
    }
}
```

For more information, see Get information about a single on-premises instance in the *AWS CodeDeploy User Guide*.

- For API details, see GetOnPremisesInstance in *AWS CLI Command Reference*.

`install`

The following code example shows how to use `install`.

AWS CLI

To install an on-premises instance

The following `install` example copies the on-premises configuration file from the specified location on the instance to the location on the instance that the AWS CodeDeploy Agent expects to find it. It also installs the AWS CodeDeploy Agent on the instance. It does not create any IAM user, nor register the on-premises instance with AWS CodeDeploy, nor associate any on-premises instance tags in AWS CodeDeploy for the instance.

```
aws deploy install \
    --override-config \
    --config-file C:\temp\codedeploy.onpremises.yml \
    --agent-installer s3://aws-codedeploy-us-west-2/latest/codedeploy-agent.msi
```

Output:

```
Creating the on-premises instance configuration file... DONE
Installing the AWS CodeDeploy Agent... DONE
```

For more information, see Use the register command (IAM user ARN) to register an on-premises instance in the *AWS CodeDeploy User Guide*.

- For API details, see Install in *AWS CLI Command Reference*.

`list-application-revisions`

The following code example shows how to use `list-application-revisions`.

AWS CLI

To get information about application revisions

The following `list-application-revisions` example displays information about all application revisions that are associated with the specified application.

```
aws deploy list-application-revisions \
    --application-name WordPress_App \
    --s3-bucket CodeDeployDemoBucket \
    --deployed exclude \
    --s3-key-prefix WordPress_ \
    --sort-by lastUsedTime \
    --sort-order descending
```

Output:

```
{
    "revisions": [
        {
            "revisionType": "S3",
            "s3Location": {
                "version": "uTecLusvCB_JqHFXtfUcyfV8bEXAMPLE",
                "bucket": "CodeDeployDemoBucket",
                "key": "WordPress_App.zip",
                "bundleType": "zip"
            }
        },
        {
            "revisionType": "S3",
            "s3Location": {
                "version": "tMk.UxgDpMEVb7V187ZM6wVAWEXAMPLE",
                "bucket": "CodeDeployDemoBucket",
                "key": "WordPress_App_2-0.zip",
                "bundleType": "zip"
            }
        }
    ]
}
```

For more information, see View application revision details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see ListApplicationRevisions in *AWS CLI Command Reference*.

`list-applications`

The following code example shows how to use `list-applications`.

AWS CLI

To get information about applications

The following `list-applications` example displays information about all applications that are associated with the user's AWS account.

```
aws deploy list-applications
```

Output:

```
{
    "applications": [
        "WordPress_App",
        "MyOther_App"
    ]
}
```

For more information, see View application details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see ListApplications in *AWS CLI Command Reference*.

`list-deployment-configs`

The following code example shows how to use `list-deployment-configs`.

AWS CLI

To get information about deployment configurations

The following `list-deployment-configs` example displays information about all deployment configurations that are associated with the user's AWS account.

```
aws deploy list-deployment-configs
```

Output:

```
{
    "deploymentConfigsList": [
        "ThreeQuartersHealthy",
        "CodeDeployDefault.AllAtOnce",
        "CodeDeployDefault.HalfAtATime",
        "CodeDeployDefault.OneAtATime"
    ]
}
```

For more information, see View deployment configuration details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see ListDeploymentConfigs in *AWS CLI Command Reference*.

`list-deployment-groups`

The following code example shows how to use `list-deployment-groups`.

AWS CLI

To get information about deployment groups

The following `list-deployment-groups` example displays information about all deployment groups that are associated with the specified application.

```
aws deploy list-deployment-groups \
    --application-name WordPress_App
```

Output:

```
{
    "applicationName": "WordPress_App",
    "deploymentGroups": [
        "WordPress_DG",
        "WordPress_Beta_DG"
    ]
}
```

For more information, see View deployment group details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see ListDeploymentGroups in *AWS CLI Command Reference*.

`list-deployment-instances`

The following code example shows how to use `list-deployment-instances`.

AWS CLI

To get information about deployment instances

The following `list-deployment-instances` example displays information about all deployment instances that are associated with the specified deployment.

```
aws deploy list-deployment-instances \
    --deployment-id d-A1B2C3111 \
```

```
    --instance-status-filter Succeeded
```

Output:

```
{
    "instancesList": [
        "i-EXAMPLE11",
        "i-EXAMPLE22"
    ]
}
```

For more information, see View instance details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see ListDeploymentInstances in *AWS CLI Command Reference*.

`list-deployment-targets`

The following code example shows how to use `list-deployment-targets`.

AWS CLI

To retrieve a list of target IDs that are associated with a deployment

The following `list-deployment-targets` example retrieves a list of target IDs associated with deployments that have a status of "Failed" or "InProgress".

```
aws deploy list-deployment-targets \
    --deployment-id "d-A1B2C3111" \
    --target-filters "{\"TargetStatus\":[\"Failed\",\"InProgress\"]}"
```

Output:

```
{
    "targetIds": [
        "i-0f1558aaf90e5f1f9"
    ]
}
```

For more information, see View instance details with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see ListDeploymentTargets in *AWS CLI Command Reference*.

`list-deployments`

The following code example shows how to use `list-deployments`.

AWS CLI

To get information about deployments

The following `list-deployments` example displays information about all deployments that are associated with the specified application and deployment group.

```
aws deploy list-deployments \
    --application-name WordPress_App \
    --create-time-range start=2014-08-19T00:00:00,end=2014-08-20T00:00:00 \
    --deployment-group-name WordPress_DG \
    --include-only-statuses Failed
```

Output:

```
{
    "deployments": [
        "d-EXAMPLE11",
        "d-EXAMPLE22",
        "d-EXAMPLE33"
    ]
}
```

For more information, see View CodeDeploy deployment details in the *AWS CodeDeploy User Guide*.

- For API details, see ListDeployments in *AWS CLI Command Reference*.

`list-git-hub-account-token-names`

The following code example shows how to use `list-git-hub-account-token-names`.

AWS CLI

To lists the names of stored connections to GitHub accounts

The following `list-git-hub-account-token-names` example lists the names of the stored connections to GitHub accounts for the current AWS user.

```
aws deploy list-git-hub-account-token-names
```

Output:

```
{
    "tokenNameList": [
        "my-first-token",
        "my-second-token",
        "my-third-token"
    ]
}
```

For more information, see Integrating CodeDeploy with GitHub in the *AWS CodeDeploy User Guide*.

- For API details, see ListGitHubAccountTokenNames in *AWS CLI Command Reference*.

`list-on-premises-instances`

The following code example shows how to use `list-on-premises-instances`.

AWS CLI

To get information about one or more on-premises instances

The following `list-on-premises-instances` example retrieves a list of available on-premises instance names for instances that are registered in AWS CodeDeploy and also have the specified on-premises instance tag associated in AWS CodeDeploy with the instance.

```
aws deploy list-on-premises-instances \
    --registration-status Registered \
    --tag-filters Key=Name,Value=CodeDeployDemo-OnPrem,Type=KEY_AND_VALUE
```

Output:

```
{
    "instanceNames": [
```

```
        "AssetTag12010298EX"
    ]
}
```

For more information, see Get information about multiple on-premises instances in the *AWS CodeDeploy User Guide*.

- For API details, see ListOnPremisesInstances in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource (application)

The following `list-tags-for-resource` example lists the tags applied to an application named testApp in CodeDeploy.

```
aws deploy list-tags-for-resource \
    --resource-arn arn:aws:codedeploy:us-west-2:123456789012:application:testApp
```

Output:

```
{
    "Tags": [
        {
            "Key": "Type",
            "Value": "testType"
        },
        {
            "Key": "Name",
            "Value": "testName"
        }
    ]
}
```

For more information, see Tagging instances for deployment groups in CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

push

The following code example shows how to use push.

AWS CLI

To bundle and deploy an AWS CodeDeploy compatible application revision to Amazon S3

The following push example bundles and deploys an application revision to Amazon S3 and then associates the application revision with the specified application.

```
aws deploy push \
    --application-name WordPress_App \
    --description "This is my deployment" \
    --ignore-hidden-files \
    --s3-location s3://CodeDeployDemoBucket/WordPressApp.zip \
    --source /tmp/MyLocalDeploymentFolder/
```

The output describes how to use the `create-deployment` command to create a deployment that uses the uploaded application revision.

Output:

```
To deploy with this revision, run:
aws deploy create-deployment --application-name WordPress_App
 --deployment-config-name <deployment-config-name> --
deployment-group-name <deployment-group-name> --s3-location
 bucket=CodeDeployDemoBucket,key=WordPressApp.zip,bundleType=zip,eTag="cecc9b8EXAMPLE50a6e71
```

For more information, see Push a revision for CodeDeploy to Amazon S3 (EC2/On-Premises deployments only) in the *AWS CodeDeploy User Guide*.

- For API details, see Push in *AWS CLI Command Reference*.

register-application-revision

The following code example shows how to use `register-application-revision`.

AWS CLI

To register information about an already-uploaded application revision

The following `register-application-revision` example registers information about an already-uploaded application revision stored in Amazon S3 with AWS CodeDeploy.

```
aws deploy register-application-revision \
    --application-name WordPress_App \
    --description "Revised WordPress application" \
    --s3-
location bucket=CodeDeployDemoBucket,key=RevisedWordPressApp.zip,bundleType=zip,eTag=cecc9b8
```

This command produces no output.

For more information, see Register an application revision in Amazon S3 with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see RegisterApplicationRevision in *AWS CLI Command Reference*.

`register-on-premises-instance`

The following code example shows how to use `register-on-premises-instance`.

AWS CLI

To register an on-premises instance

The following `register-on-premises-instance` example registers an on-premises instance with AWS CodeDeploy. It does not create the specified IAM user, nor does it associate in AWS CodeDeploy any on-premises instances tags with the registered instance.

```
aws deploy register-on-premises-instance \
    --instance-name AssetTag12010298EX \
    --iam-user-arn arn:aws:iam::80398EXAMPLE:user/CodeDeployDemoUser-OnPrem
```

This command produces no output.

For more information, see Use the register-on-premises-instance command (IAM user ARN) to register an on-premises instance in the *AWS CodeDeploy User Guide*.

- For API details, see RegisterOnPremisesInstance in *AWS CLI Command Reference*.

`register`

The following code example shows how to use `register`.

AWS CLI

To register an on-premises instance

The following `register` example registers an on-premises instance with AWS CodeDeploy, associates in AWS CodeDeploy the specified on-premises instance tag with the registered instance, and creates an on-premises configuration file that can be copied to the instance. It does not create the IAM user, nor does it install the AWS CodeDeploy Agent on the instance.

```
aws deploy register \
    --instance-name AssetTag12010298EX \
    --iam-user-arn arn:aws:iam::80398EXAMPLE:user/CodeDeployUser-OnPrem \
    --tags Key=Name,Value=CodeDeployDemo-OnPrem
```

Output:

```
Registering the on-premises instance... DONE
Adding tags to the on-premises instance... DONE
Copy the on-premises configuration file named codedeploy.onpremises.yml to the on-
premises instance, and run the following command on the on-premises instance to
 install and configure the AWS CodeDeploy Agent:
aws deploy install --config-file codedeploy.onpremises.yml
```

For more information, see Use the register command (IAM user ARN) to register an on-premises instance in the *AWS CodeDeploy User Guide*.

- For API details, see Register in *AWS CLI Command Reference*.

`remove-tags-from-on-premises-instances`

The following code example shows how to use `remove-tags-from-on-premises-instances`.

AWS CLI

To remove tags from one or more on-premises instances

The following `remove-tags-from-on-premises-instances` example disassociates the specified on-premises tags in AWS CodeDeploy from on-premises instances. It does not deregister the on-premises instances in AWS CodeDeploy, nor uninstall the AWS CodeDeploy Agent from the instance, nor remove the on-premises configuration file from the instances, nor delete the IAM users that are associated with the instances.

```
aws deploy remove-tags-from-on-premises-instances \
    --instance-names AssetTag12010298EX AssetTag23121309EX \
    --tags Key=Name,Value=CodeDeployDemo-OnPrem
```

This command produces no output.

For more information, see Manually remove on-premises instance tags from an on-premises instance in the *AWS CodeDeploy User Guide*.

- For API details, see RemoveTagsFromOnPremisesInstances in *AWS CLI Command Reference*.

`stop-deployment`

The following code example shows how to use `stop-deployment`.

AWS CLI

To attempt to stop a deployment

The following `stop-deployment` example attempts to stop an in-progress deployment that is associated with the user's AWS account.

aws deploy stop-deployment --deployment-id d-A1B2C3111

Output:

```
{
    "status": "Succeeded",
    "statusMessage": "No more commands will be scheduled for execution in the
 deployment instances"
}
```

For more information, see Stop a deployment with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see StopDeployment in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource (application)

The following `tag-resource` example adds two tags with keys Name and Type, and values testName and testType to an application named testApp in CodeDeploy.

```
aws deploy tag-resource \
    --resource-arn  arn:aws:codedeploy:us-west-2:123456789012:application:testApp \
    --tags Key=Name,Value=testName Key=Type,Value=testType
```

This command produces no output.

For more information, see Tagging instances for deployment groups in CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`uninstall`

The following code example shows how to use `uninstall`.

AWS CLI

To uninstall an on-premises instance

The following `uninstall` example uninstalls the AWS CodeDeploy Agent from the on-premises instance and removes the on-premises configuration file from the instance. It doesn't deregister the instance in AWS CodeDeploy, nor disassociate any on-premises instance tags in AWS CodeDeploy from the instance, nor delete the IAM user that is associated with the instance.

```
aws deploy uninstall
```

This command produces no output.

For more information, see Automatically uninstall the CodeDeploy agent and remove the configuration file from an on-premises instance in the *AWS CodeDeploy User Guide*.

- For API details, see Uninstall in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource (application)

The following `untag-resource` example removes two tags with keys Name and Type from an application named testApp in CodeDeploy.

```
aws deploy untag-resource \
    --resource-arn  arn:aws:codedeploy:us-west-2:123456789012:application:testApp \
    --tag-keys Name Type
```

This command produces no output.

For more information, see Tagging instances for deployment groups in CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-application`

The following code example shows how to use `update-application`.

AWS CLI

To change details of an application

The following `update-application` example changes the name of an application that is associated with the user's AWS account.

```
aws deploy update-application \
    --application-name WordPress_App \
    --new-application-name My_WordPress_App
```

This command produces no output.

For more information, see Rename a CodeDeploy application in the *AWS CodeDeploy User Guide*.

- For API details, see UpdateApplication in *AWS CLI Command Reference*.

`update-deployment-group`

The following code example shows how to use `update-deployment-group`.

AWS CLI

To change information about a deployment group

The following `update-deployment-group` example changes the settings of a deployment group that is associated with the specified application.

```
aws deploy update-deployment-group \
    --application-name WordPress_App \
    --auto-scaling-groups My_CodeDeployDemo_ASG \
    --current-deployment-group-name WordPress_DG \
    --deployment-config-name CodeDeployDefault.AllAtOnce \
    --ec2-tag-filters Key=Name,Type=KEY_AND_VALUE,Value=My_CodeDeployDemo \
    --new-deployment-group-name My_WordPress_DepGroup \
    --service-role-arn arn:aws:iam::80398EXAMPLE:role/CodeDeployDemo-2
```

This command produces no output.

For more information, see Change deployment group settings with CodeDeploy in the *AWS CodeDeploy User Guide*.

- For API details, see UpdateDeploymentGroup in *AWS CLI Command Reference*.

CodeGuru Reviewer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with CodeGuru Reviewer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`associate-repository`

The following code example shows how to use `associate-repository`.

AWS CLI

Example 1: To create a Bitbucket repository association

The following `associate-repository` example creates a repository association using an existing Bitbucket repository.

```
aws codeguru-reviewer associate-repository \
    --repository 'Bitbucket={Owner=sample-owner, Name=mySampleRepo,
 ConnectionArn=arn:aws:codestar-connections:us-west-2:123456789012:connection/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 }'
```

Output:

```
{
    "RepositoryAssociation": {
        "ProviderType": "Bitbucket",
        "Name": "mySampleRepo",
        "LastUpdatedTimeStamp": 1596216896.979,
        "AssociationId": "association:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "CreatedTimeStamp": 1596216896.979,
        "ConnectionArn": "arn:aws:codestar-connections:us-
west-2:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "State": "Associating",
        "StateReason": "Pending Repository Association",
        "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Owner": "sample-owner"
    }
}
```

For more information, see Create a Bitbucket repository association in Amazon CodeGuru Reviewer in the *Amazon CodeGuru Reviewer User Guide*.

Example 2: To create a GitHub Enterprise repository association

The following `associate-repository` example creates a repository association using an existing GitHub Enterprise repository.

```
aws codeguru-reviewer associate-repository \
    --repository 'GitHubEnterpriseServer={Owner=sample-owner, Name=mySampleRepo,
 ConnectionArn=arn:aws:codestar-connections:us-west-2:123456789012:connection/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 }'
```

Output:

```
{
    "RepositoryAssociation": {
        "ProviderType": "GitHubEnterpriseServer",
        "Name": "mySampleRepo",

    }
}
```

For more information, see Create a GitHub Enterprise Server repository association in Amazon CodeGuru Reviewer in the *Amazon Codeguru Reviewer User Guide*.

Example 3: To create an AWS CodeCommit repository association

The following `associate-repository` example creates a repository association using an existing AWS CodeCommit repository.

```
aws codeguru-reviewer associate-repository \
    --repository CodeCommit={Name=mySampleRepo}
```

Output:

```
{
    "RepositoryAssociation": {
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Name": "My-ecs-beta-repo",
        "LastUpdatedTimeStamp": 1595634764.029,
        "ProviderType": "CodeCommit",
        "CreatedTimeStamp": 1595634764.029,
        "Owner": "123456789012",
        "State": "Associating",
        "StateReason": "Pending Repository Association",
        "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Create an AWS CodeCommit repository association in Amazon CodeGuru Reviewer in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see AssociateRepository in *AWS CLI Command Reference*.

`create-code-review`

The following code example shows how to use `create-code-review`.

AWS CLI

To create a code review.

The following `create-code-review` example creates a review of code in the `mainline` branch of an AWS CodeCommit repository that is named `my-repository-name`.

```
aws codeguru-reviewer create-code-review \
    --name my-code-review \
    --repository-association-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --type '{"RepositoryAnalysis": {"RepositoryHead": {"BranchName": "mainline"}}}'
```

Output:

```
{
    "CodeReview": {
        "Name": "my-code-review",
```

```
        "CodeReviewArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222:code-
review:RepositoryAnalysis-my-code-review",
        "RepositoryName": "my-repository-name",
        "Owner": "123456789012",
        "ProviderType": "CodeCommit",
        "State": "Pending",
        "StateReason": "CodeGuru Reviewer has received the request, and a code
 review is scheduled.",
        "CreatedTimeStamp": 1618873489.195,
        "LastUpdatedTimeStamp": 1618873489.195,
        "Type": "RepositoryAnalysis",
        "SourceCodeType": {
            "RepositoryHead": {
                "BranchName": "mainline"
            }
        },
        "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Create code reviews in Amazon CodeGuru Reviewer in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see CreateCodeReview in *AWS CLI Command Reference*.

`describe-code-review`

The following code example shows how to use `describe-code-review`.

AWS CLI

To list details about a code review

The following `describe-code-review` example lists information about a review of code in the "mainline" branch of an AWS CodeCommit repository that is named "my-repo-name".

```
aws codeguru-reviewer describe-code-review \
    --code-review-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222:code-
review:RepositoryAnalysis-my-repo-name
```

Output:

```
{
    "CodeReview": {
        "Name": "My-ecs-beta-repo-master-xs6di4kfd4j269dz",
        "CodeReviewArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222:code-
review:RepositoryAnalysis-my-repo-name",
        "RepositoryName": "My-ecs-beta-repo",
        "Owner": "123456789012",
        "ProviderType": "CodeCommit",
        "State": "Pending",
        "StateReason": "CodeGuru Reviewer is reviewing the source code.",
        "CreatedTimeStamp": 1618874226.226,
        "LastUpdatedTimeStamp": 1618874233.689,
        "Type": "RepositoryAnalysis",
        "SourceCodeType": {
            "RepositoryHead": {
                "BranchName": "mainline"
            }
        },
        "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see View code review details in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see DescribeCodeReview in *AWS CLI Command Reference*.

`describe-recommendation-feedback`

The following code example shows how to use `describe-recommendation-feedback`.

AWS CLI

To view information about feedback on a recommendation

The following `describe-recommendation-feedback` example displays information about feedback on a recommendation. This recommendation has one ThumbsUp reaction.

```
aws codeguru-reviewer describe-recommendation-feedback \
```

```
    --code-review-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111:code-
review:RepositoryAnalysis-my-repository-name-branch-abcdefgh12345678 \
    --recommendation-
id 3be1b2e5d7ef6e298a06499379ee290c9c596cf688fdcadb08285ddb0dd390eb
```

Output:

```
{
    "RecommendationFeedback": {
        "CodeReviewArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111:code-
review:RepositoryAnalysis-my-repository-name-branch-abcdefgh12345678",
        "RecommendationId":
 "3be1b2e5d7ef6e298a06499379ee290c9c596cf688fdcadb08285ddb0dd390eb",
        "Reactions": [
            "ThumbsUp"
        ],
        "UserId": "aws-user-id",
        "CreatedTimeStamp": 1618877070.313,
        "LastUpdatedTimeStamp": 1618877948.881
    }
}
```

For more information, see View recommendations and provide feedback and Step 4: Provide feedback in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see DescribeRecommendationFeedback in *AWS CLI Command Reference*.

`describe-repository-association`

The following code example shows how to use `describe-repository-association`.

AWS CLI

Example 1: To return information about a GitHub repository association

The following `describe-repository-association` example returns information about a repository association that uses a GitHub Enterprise repository and is in the `Associated` state.

```
aws codeguru-reviewer describe-repository-association \
```

```
    --association-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RepositoryAssociation": {
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Name": "mySampleRepo",
        "LastUpdatedTimeStamp": 1588102637.649,
        "ProviderType": "GitHub",
        "CreatedTimeStamp": 1588102615.636,
        "Owner": "sample-owner",
        "State": "Associated",
        "StateReason": "Pull Request Notification configuration successful",
        "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Create a GitHub Enterprise Server repository association in Amazon CodeGuru Reviewer in the *Amazon CodeGuru Reviewer User Guide*.

Example 2: To return information about a failed repository association

The following `describe-repository-association` example returns information about a repository association that uses a GitHub Enterprise repository and is in the `Failed` state.

```
aws codeguru-reviewer describe-repository-association \
    --association-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RepositoryAssociation": {
        "ProviderType": "GitHubEnterpriseServer",
        "Name": "mySampleRepo",
        "LastUpdatedTimeStamp": 1596217036.892,
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreatedTimeStamp": 1596216896.979,
```

```
        "ConnectionArn": "arn:aws:codestar-connections:us-
west-2:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "State": "Failed",
        "StateReason": "Failed, Please retry.",
        "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Owner": "sample-owner"
    }
}
```

For more information, see Create a GitHub Enterprise Server repository association in Amazon CodeGuru Reviewer in the *Amazon CodeGuru Reviewer User Guide*.

Example 3: To return information about a disassociating repository association

The following `describe-repository-association` example returns information about a repository association that uses a GitHub Enterprise repository and is in the `Disassociating` state.

```
aws codeguru-reviewer describe-repository-association \
    --association-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RepositoryAssociation": {
        "ProviderType": "GitHubEnterpriseServer",
        "Name": "mySampleRepo",
        "LastUpdatedTimeStamp": 1596217036.892,
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreatedTimeStamp": 1596216896.979,
        "ConnectionArn": "arn:aws:codestar-connections:us-
west-2:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "State": "Disassociating",
        "StateReason": "Source code access removal in progress",
        "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Owner": "sample-owner"
    }
}
```

For more information, see Create a GitHub Enterprise Server repository association in Amazon CodeGuru Reviewer in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see DescribeRepositoryAssociation in *AWS CLI Command Reference*.

`disassociate-repository`

The following code example shows how to use `disassociate-repository`.

AWS CLI

To disassociate a repository association

The following `disassociate-repository` example disassociates a repository association that is using an AWS CodeCommit repository.

```
aws codeguru-reviewer disassociate-repository \
    --association-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RepositoryAssociation": {
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Name": "my-repository",
        "Owner": "123456789012",
        "ProviderType": "CodeCommit",
        "State": "Disassociating",
        "LastUpdatedTimeStamp": 1618939174.759,
        "CreatedTimeStamp": 1595636947.096
    },
    "Tags": {
        "Status": "Secret",
        "Team": "Saanvi"
    }
}
```

For more information, see Disassociate a repository in CodeGuru Reviewer in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see DisassociateRepository in *AWS CLI Command Reference*.

`list-code-reviews`

The following code example shows how to use `list-code-reviews`.

AWS CLI

To list code reviews created in your AWS account in the last 90 days.

The following `list-code-reviews` example lists the code reviews created in the last 90 days using pull requests.

```
aws codeguru-reviewer list-code-reviews \
    --type PullRequest
```

Output:

```
{
    "CodeReviewSummaries": [
        {
            "LastUpdatedTimeStamp": 1588897288.054,
            "Name": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ProviderType": "GitHub",
            "PullRequestId": "5",

            "RepositoryName": "sample-repository-name",
            "Type": "PullRequest"
        }
    ]
}
```

For more information, see View all code reviews in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see ListCodeReviews in *AWS CLI Command Reference*.

`list-recommendation-feedback`

The following code example shows how to use `list-recommendation-feedback`.

AWS CLI

To list customer recommendation feedback for a recommendation on an associated repository

The following `list-recommendation-feedback` example lists customer feedback on all recommendations on a code review. This code review has one piece of feedback, a "ThumbsUp", from a customer.

```
aws codeguru-reviewer list-recommendation-feedback \
    --code-review-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111:code-
review:RepositoryAnalysis-my-repository-name-branch-abcdefgh12345678
```

Output:

```
{
    "RecommendationFeedbackSummaries": [
        {
            "RecommendationId":
 "3be1b2e5d7ef6e298a06499379ee290c9c596cf688fdcadb08285ddb0dd390eb",
            "Reactions": [
                "ThumbsUp"
            ],
            "UserId": "aws-user-id"
        }
    ]
}
```

For more information, see Step 4: Provide feedback in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see ListRecommendationFeedback in *AWS CLI Command Reference*.

`list-recommendations`

The following code example shows how to use `list-recommendations`.

AWS CLI

To list the recommendations for a completed code review

The following `list-recommendations` example lists the recommendations for a completed code review. This code review has one recommendations.

```
aws codeguru-reviewer list-recommendations \
    --code-review-arn arn:aws:codeguru-reviewer:us-west-2:123456789012:code-review:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RecommendationSummaries": [
        {
            "Description": "\n\n**Problem**  \n You are using a `ConcurrentHashMap`, but your usage of `containsKey()` and `get()` may not be thread-safe at lines: **63 and 64**. In between the check and the `get()` another thread can remove the key and the `get()` will return `null`. The remove that can remove the key is at line: **59**.\n\n**Fix**  \n Consider calling `get()`, checking instead of your current check if the returned object is `null`, and then using that object only, without calling `get()` again.\n\n**More info**  \n [View an example on GitHub](https://github.com/apache/hadoop/blob/f16cf877e565084c66bc63605659b157c4394dc8/hadoop-tools/hadoop-aws/src/main/java/org/apache/hadoop/fs/s3a/s3guard/S3Guard.java#L302-L304) (external link).",
            "RecommendationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "StartLine": 63,
            "EndLine": 64,
            "FilePath": "src/main/java/com/company/sample/application/CreateOrderThread.java"
        }
    ]
}
```

For more information, see Step 4: Provide feedback in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see ListRecommendations in *AWS CLI Command Reference*.

`list-repository-associations`

The following code example shows how to use `list-repository-associations`.

AWS CLI

To list the repository associations in your AWS account

The following `list-repository-associations` example returns a list of repository association summary objects in your account. You can filter the returned list by `ProviderType`, `Name`, `State`, and `Owner`.

```
aws codeguru-reviewer list-repository-associations
```

Output:

```
{
    "RepositoryAssociationSummaries": [
        {
            "LastUpdatedTimeStamp": 1595886609.616,
            "Name": "test",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Owner": "sample-owner",
            "State": "Associated",
            "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ProviderType": "Bitbucket"
        },
        {
            "LastUpdatedTimeStamp": 1595636969.035,
            "Name": "CodeDeploy-CodePipeline-ECS-Tutorial",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Owner": "123456789012",
            "State": "Associated",
            "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ProviderType": "CodeCommit"
        },
        {
            "LastUpdatedTimeStamp": 1595634785.983,
            "Name": "My-ecs-beta-repo",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Owner": "123456789012",
            "State": "Associated",
            "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
```

```
            "ProviderType": "CodeCommit"
        },
        {
            "LastUpdatedTimeStamp": 1590712811.77,
            "Name": "MyTestCodeCommit",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Owner": "123456789012",

            "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "ProviderType": "CodeCommit"
        },
        {
            "LastUpdatedTimeStamp": 1588102637.649,
            "Name": "aws-codeguru-profiler-sample-application",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
            "Owner": "sample-owner",
            "State": "Associated",
            "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
            "ProviderType": "GitHub"
        },
        {
            "LastUpdatedTimeStamp": 1588028233.995,
            "Name": "codeguru-profiler-demo-app",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE66666",
            "Owner": "sample-owner",
            "State": "Associated",
            "AssociationArn": "arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE66666",
            "ProviderType": "GitHub"
        }
    ]
}
```

For more information, see View all repository associations in CodeGuru Reviewer in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see ListRepositoryAssociations in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags on an associated repository

The following `list-tags-for-resource` example lists the tags on an associated repository. This associated repository has two tags.

```
aws codeguru-reviewer list-tags-for-resource \
    --resource-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Tags": {
        "Status": "Secret",
        "Team": "Saanvi"
    }
}
```

For more information, see View tags for a CodeGuru Reviewer associated repository (AWS CLI) in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-recommendation-feedback`

The following code example shows how to use `put-recommendation-feedback`.

AWS CLI

To add a recommendation to a code review

The following `put-recommendation-feedback` example puts a ThumbsUp recommendation on a code review.

```
aws codeguru-reviewer put-recommendation-feedback \
    --code-review-arn \arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111:code-
review:RepositoryAnalysis-my-repository-name-branch-abcdefgh12345678 \
    --recommendation-
id 3be1b2e5d7ef6e298a06499379ee290c9c596cf688fdcadb08285ddb0dd390eb \
```

```
    --reactions ThumbsUp
```

This command produces no output.

For more information, see Step 4: Provide feedback in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see PutRecommendationFeedback in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to an associated repository

The following `tag-resource` example adds two tags to an associated repository.

```
aws codeguru-reviewer tag-resource \
    --resource-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags Status=Secret,Team=Saanvi
```

This command produces no output.

For more information, see Add a tag to a CodeGuru Reviewer associated repository (AWS CLI) and Add or update tags for a CodeGuru Reviewer associated repository (AWS CLI) in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To untag an associated repository

The following `untag-resource` example removes two tags with keys "Secret" and "Team" from an associated repository.

```
aws codeguru-reviewer untag-resource \
    --resource-arn arn:aws:codeguru-reviewer:us-
west-2:123456789012:association:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tag-keys Status Team
```

This command produces no output.

For more information, see Remove tags from a CodeGuru Reviewer associated repository (AWS CLI) in the *Amazon CodeGuru Reviewer User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

CodePipeline examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with CodePipeline.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`acknowledge-job`

The following code example shows how to use `acknowledge-job`.

AWS CLI

To retrieve information about a specified job

The following `acknowledge-job` example returns information about a specified job, including the status of that job if it exists. This is only used for job workers and custom actions. To determine the value of nonce and the job ID, use aws codepipeline poll-for-jobs.

```
aws codepipeline acknowledge-job \
```

```
    --job-id f4f4ff82-2d11-EXAMPLE \
    --nonce 3
```

Output:

```
{
    "status": "InProgress"
}
```

For more information, see Create and add a custom action in CodePipeline in the *AWS CodePipeline User Guide*.

- For API details, see AcknowledgeJob in *AWS CLI Command Reference*.

`create-custom-action-type`

The following code example shows how to use `create-custom-action-type`.

AWS CLI

To create a custom action

The following `create-custom-action-type` example creates a custom action for AWS CodePipeline using an already-created JSON file (here named MyCustomAction.json) that contains the structure of the custom action.

```
aws codepipeline create-custom-action-type \
    --cli-input-json file://MyCustomAction.json
```

Contents of `MyCustomAction.json`:

```
{
    "category": "Build",
    "provider": "MyJenkinsProviderName",
    "version": "1",
    "settings": {
        "entityUrlTemplate": "https://192.0.2.4/job/{Config:ProjectName}/",
        "executionUrlTemplate": "https://192.0.2.4/job/{Config:ProjectName}/
lastSuccessfulBuild/{ExternalExecutionId}/"
    },
    "configurationProperties": [
        {
```

```
            "name": "MyJenkinsExampleBuildProject",
            "required": true,
            "key": true,
            "secret": false,
            "queryable": false,
            "description": "The name of the build project must be provided when this
 action is added to the pipeline.",
            "type": "String"
        }
    ],
    "inputArtifactDetails": {
        "maximumCount": 1,
        "minimumCount": 0
    },
    "outputArtifactDetails": {
        "maximumCount": 1,
        "minimumCount": 0
    }
}
```

This command returns the structure of the custom action.

Output:

```
{
    "actionType": {
        "id": {
            "category": "Build",
            "owner": "Custom",
            "provider": "MyJenkinsProviderName",
            "version": "1"
        },
        "settings": {
            "entityUrlTemplate": "https://192.0.2.4/job/{Config:ProjectName}/",
            "executionUrlTemplate": "https://192.0.2.4/job/{Config:ProjectName}/
lastSuccessfulBuild/{ExternalExecutionId}/"
        },
        "actionConfigurationProperties": [
            {
                "name": "MyJenkinsExampleBuildProject",
                "required": true,
                "key": true,
                "secret": false,
                "queryable": false,
```

```
                "description": "The name of the build project must be provided when
 this action is added to the pipeline.",
                "type": "String"
            }
        ],
        "inputArtifactDetails": {
            "minimumCount": 0,
            "maximumCount": 1
        },
        "outputArtifactDetails": {
            "minimumCount": 0,
            "maximumCount": 1
        }
    }
}
```

For more information, see Create and add a custom action in CodePipeline in the *AWS CodePipeline User Guide*.

- For API details, see CreateCustomActionType in *AWS CLI Command Reference*.

`create-pipeline`

The following code example shows how to use `create-pipeline`.

AWS CLI

To create a pipeline

The following `create-pipeline` example creates a pipeline in AWS CodePipeline using an already-created JSON file (here named MySecondPipeline.json) that contains the structure of the pipeline.

```
aws codepipeline create-pipeline \
    --cli-input-json file://MySecondPipeline.json
```

Contents of `MySecondPipeline.json`:

```
{
    "pipeline": {
        "roleArn": "arn:aws:iam::123456789012:role/AWS-CodePipeline-Service",
        "stages": [
```

```
            {
                "name": "Source",
                "actions": [
                    {
                        "inputArtifacts": [],
                        "name": "Source",
                        "actionTypeId": {
                            "category": "Source",
                            "owner": "AWS",
                            "version": "1",
                            "provider": "S3"
                        },
                        "outputArtifacts": [
                            {
                                "name": "MyApp"
                            }
                        ],
                        "configuration": {
                            "S3Bucket": "awscodepipeline-demo-bucket",
                            "S3ObjectKey": "aws-codepipeline-s3-aws-
codedeploy_linux.zip"
                        },
                        "runOrder": 1
                    }
                ]
            },
            {
                "name": "Beta",
                "actions": [
                    {
                        "inputArtifacts": [
                            {
                                "name": "MyApp"
                            }
                        ],
                        "name": "CodePipelineDemoFleet",
                        "actionTypeId": {
                            "category": "Deploy",
                            "owner": "AWS",
                            "version": "1",
                            "provider": "CodeDeploy"
                        },
                        "outputArtifacts": [],
                        "configuration": {
```

```
                            "ApplicationName": "CodePipelineDemoApplication",
                            "DeploymentGroupName": "CodePipelineDemoFleet"
                        },
                        "runOrder": 1
                    }
                ]
            }
        ],
        "artifactStore": {
            "type": "S3",
            "location": "codepipeline-us-east-1-11EXAMPLE11"
        },
        "name": "MySecondPipeline",
        "version": 1
    }
}
```

This command returns the structure of the pipeline.

Output:

```
{
    "pipeline": {
        "roleArn": "arn:aws:iam::123456789012:role/AWS-CodePipeline-Service",
        "stages": [
            {
                "name": "Source",
                "actions": [
                    {
                        "inputArtifacts": [],
                        "name": "Source",
                        "actionTypeId": {
                            "category": "Source",
                            "owner": "AWS",
                            "version": "1",
                            "provider": "S3"
                        },
                        "outputArtifacts": [
                            {
                                "name": "MyApp"
                            }
                        ],
                        "configuration": {
                            "S3Bucket": "awscodepipeline-demo-bucket",
```

```
                            "S3ObjectKey": "aws-codepipeline-s3-aws-
codedeploy_linux.zip"
                        },
                        "runOrder": 1
                    }
                ]
            },
            {
                "name": "Beta",
                "actions": [
                    {
                        "inputArtifacts": [
                            {
                                "name": "MyApp"
                            }
                        ],
                        "name": "CodePipelineDemoFleet",
                        "actionTypeId": {
                            "category": "Deploy",
                            "owner": "AWS",
                            "version": "1",
                            "provider": "CodeDeploy"
                        },
                        "outputArtifacts": [],
                        "configuration": {
                            "ApplicationName": "CodePipelineDemoApplication",
                            "DeploymentGroupName": "CodePipelineDemoFleet"
                        },
                        "runOrder": 1
                    }
                ]
            }
        ],
        "artifactStore": {
            "type": "S3",
            "location": "codepipeline-us-east-1-11EXAMPLE11"
        },
        "name": "MySecondPipeline",
        "version": 1
    }
}
```

For more information, see Create a pipeline, stages, and actions in the *AWS CodePipeline User Guide*.

- For API details, see CreatePipeline in *AWS CLI Command Reference*.

`delete-custom-action-type`

The following code example shows how to use `delete-custom-action-type`.

AWS CLI

To delete a custom action

The following `delete-custom-action-type` example deletes a custom action in AWS CodePipeline by using an already-created JSON file (here named DeleteMyCustomAction.json) that contains the action type, provider name, and version number of the action to be deleted. Use the list-action-types command to view the correct values for category, version, and provider.

```
aws codepipeline delete-custom-action-type \
    --cli-input-json file://DeleteMyCustomAction.json
```

Contents of `DeleteMyCustomAction.json`:

```
{
    "category": "Build",
    "version": "1",
    "provider": "MyJenkinsProviderName"
}
```

This command produces no output.

For more information, see Create and add a custom action in CodePipeline in the *AWS CodePipeline User Guide*.

- For API details, see DeleteCustomActionType in *AWS CLI Command Reference*.

`delete-pipeline`

The following code example shows how to use `delete-pipeline`.

AWS CLI

To delete a pipeline

The following `delete-pipeline` example deletes a pipeline named MySecondPipeline from AWS CodePipeline. Use the list-pipelines command to view a list of pipelines associated with your AWS account.

```
aws codepipeline delete-pipeline \
    --name MySecondPipeline
```

This command produces no output.

For more information, see Delete a pipeline in CodePipeline in the *AWS CodePipeline User Guide*.

- For API details, see DeletePipeline in *AWS CLI Command Reference*.

`delete-webhook`

The following code example shows how to use `delete-webhook`.

AWS CLI

To delete a webhook

The following `delete-webhook` example deletes a webhook for a GitHub version 1 source action. You must use the `deregister-webhook-with-third-party` command to deregister the webhook before you delete it.

```
aws codepipeline delete-webhook \
    --name my-webhook
```

This command produces no output.

For more information, see Delete the webhook for your GitHub source in the *AWS CodePipeline User Guide*.

- For API details, see DeleteWebhook in *AWS CLI Command Reference*.

`deregister-webhook-with-third-party`

The following code example shows how to use `deregister-webhook-with-third-party`.

AWS CLI

To deregister a webhook

The following `deregister-webhook-with-third-party` example deletes a webhook for a GitHub version 1 source action. You must deregister the webhook before you delete it.

```
aws codepipeline deregister-webhook-with-third-party \
    --webhook-name my-webhook
```

This command produces no output.

For more information, see Delete the webhook for your GitHub source in the *AWS CodePipeline User Guide*.

- For API details, see DeregisterWebhookWithThirdParty in *AWS CLI Command Reference*.

`disable-stage-transition`

The following code example shows how to use `disable-stage-transition`.

AWS CLI

To disable a transition to a stage in a pipeline

The following `disable-stage-transition` example disables transitions into the Beta stage of the MyFirstPipeline pipeline in AWS CodePipeline.

```
aws codepipeline disable-stage-transition \
    --pipeline-name MyFirstPipeline \
    --stage-name Beta  \
    --transition-type Inbound \
    --reason "An example reason"
```

This command produces no output.

For more information, see Working with stage transitions in CodePipeline in the *AWS CodePipeline User Guide*.

- For API details, see DisableStageTransition in *AWS CLI Command Reference*.

`enable-stage-transition`

The following code example shows how to use `enable-stage-transition`.

AWS CLI

To enable a transition to a stage in a pipeline

The following `enable-stage-transition` example enables transitions into the Beta stage of the MyFirstPipeline pipeline in AWS CodePipeline.

```
aws codepipeline enable-stage-transition \
    --pipeline-name MyFirstPipeline \
    --stage-name Beta \
    --transition-type Inbound
```

This command produces no output.

For more information, see Working with stage transitions in CodePipeline in the *AWS CodePipeline User Guide*.

- For API details, see EnableStageTransition in *AWS CLI Command Reference*.

`get-job-details`

The following code example shows how to use `get-job-details`.

AWS CLI

To get details of a job

The following `get-job-details` example returns details about a job whose ID is represented by f4f4ff82-2d11-EXAMPLE. This command is only used for custom actions. When this command is called, AWS CodePipeline returns temporary credentials for the Amazon S3 bucket used to store artifacts for the pipeline, if required for the custom action. This command will also return any secret values defined for the action, if any are defined.

```
aws codepipeline get-job-details \
    --job-id f4f4ff82-2d11-EXAMPLE
```

Output:

```
{
    "jobDetails": {
        "accountId": "123456789012",
        "data": {
            "actionConfiguration": {
                "configuration": {
                    "ProjectName": "MyJenkinsExampleTestProject"
                }
            },
            "actionTypeId": {
                "category": "Test",
                "owner": "Custom",
                "provider": "MyJenkinsProviderName",
                "version": "1"
            },
            "artifactCredentials": {
                "accessKeyId": "AKIAIOSFODNN7EXAMPLE",

                },
                "pipelineName": "MySecondPipeline",
```

```
                "stage": {
                    "name": "Testing"
                }
            }
        },
        "id": "f4f4ff82-2d11-EXAMPLE"
    }
}
```

For more information, see Create and add a custom action in CodePipeline in the *AWS CodePipeline User Guide*.

- For API details, see GetJobDetails in *AWS CLI Command Reference*.

`get-pipeline-state`

The following code example shows how to use `get-pipeline-state`.

AWS CLI

To get information about the state of a pipeline

The following `get-pipeline-state` example returns the most recent state of a pipeline named MyFirstPipeline.

```
aws codepipeline get-pipeline-state \
    --name MyFirstPipeline
```

Output:

```
{
    "created": 1446137312.204,
    "pipelineName": "MyFirstPipeline",
    "pipelineVersion": 1,
    "stageStates": [
        {
            "actionStates": [
                {
                    "actionName": "Source",
                    "entityUrl": "https://console.aws.amazon.com/s3/home?#",
                    "latestExecution": {
                        "lastStatusChange": 1446137358.328,
```

```
                        "status": "Succeeded"
                    }
                }
            ],
            "stageName": "Source"
        },
        {
            "actionStates": [
                {

    ],
    "updated": 1446137312.204
}
```

For more information, see View pipeline details and history (CLI) in the *AWS CodePipeline User Guide*.

- For API details, see GetPipelineState in *AWS CLI Command Reference*.

`get-pipeline`

The following code example shows how to use `get-pipeline`.

AWS CLI

To view the structure of a pipeline

The following `get-pipeline` example returns the structure of a pipeline named MyFirstPipeline.

```
aws codepipeline get-pipeline \
    --name MyFirstPipeline
```

Output:

```
{
    "pipeline": {
        "roleArn": "arn:aws:iam::123456789012:role/AWS-CodePipeline-Service",
        "stages": [
            {
                "name": "Source",
                "actions": [
                    {
                        "inputArtifacts": [],
                        "name": "Source",
                        "actionTypeId": {
                            "category": "Source",
                            "owner": "AWS",
                            "version": "1",
                            "provider": "S3"
                        },
                        "outputArtifacts": [
                            {
                                "name": "MyApp"
                            }
                        ],
                        "configuration": {
                            "S3Bucket": "awscodepipeline-demo-bucket",

                        },
                        "runOrder": 1
                    }
                ]
            }
        ],
        "artifactStore": {
            "type": "S3",
            "location": "codepipeline-us-east-1-11EXAMPLE11"
        },
        "name": "MyFirstPipeline",
        "version": 1
    }
}
```

For more information, see View pipeline details and history (CLI) in the *AWS CodePipeline User Guide*.

- For API details, see GetPipeline in *AWS CLI Command Reference*.

`list-action-executions`

The following code example shows how to use `list-action-executions`.

AWS CLI

To list action executions

The following `list-action-executions` example views action execution details for a pipeline, such as action execution ID, input artifacts, output artifacts, execution result, and status.

```
aws codepipeline list-action-executions \
    --pipeline-name myPipeline
```

Output:

```
{
    "actionExecutionDetails": [
        {
            "pipelineExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "actionExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "pipelineVersion": 12,
            "stageName": "Deploy",
            "actionName": "Deploy",
            "startTime": 1598572628.6,
            "lastUpdateTime": 1598572661.255,
            "status": "Succeeded",
            "input": {
                "actionTypeId": {
                    "category": "Deploy",

                }
            }
        }
    ]
}
```

For more information, see View action executions (CLI) in the *AWS CodePipeline User Guide*.

- For API details, see ListActionExecutions in *AWS CLI Command Reference*.

`list-action-types`

The following code example shows how to use `list-action-types`.

AWS CLI

To view the action types available

The following `list-action-types` example uses the `--action-owner-filter` option to return only custom actions. Used by itself, the `list-action-types` command returns the structure of all actions available to your AWS account.

```
aws codepipeline list-action-types \
    --action-owner-filter Custom
```

Output:

```
{
    "actionTypes": [
        {
            "inputArtifactDetails": {
                "maximumCount": 5,
                "minimumCount": 0
            },
            "actionConfigurationProperties": [
                {
                    "secret": false,
                    "required": true,
                    "name": "MyJenkinsExampleBuildProject",
                    "key": true,
                    "queryable": true
                }
            ],
            "outputArtifactDetails": {
                "maximumCount": 5,
                "minimumCount": 0
            },
            "id": {
                "category": "Build",
                "owner": "Custom",
                "version": "1",
                "provider": "MyJenkinsProviderName"
            },
            "settings": {
                "entityUrlTemplate": "http://192.0.2.4/job/{Config:ProjectName}",
                "executionUrlTemplate": "http://192.0.2.4/job/{Config:ProjectName}/
{ExternalExecutionId}"
            }
        },
        {
            "inputArtifactDetails": {
```

```
                "maximumCount": 5,
                "minimumCount": 0
            },
            "actionConfigurationProperties": [
                {
                    "secret": false,
                    "required": true,
                    "name": "MyJenkinsExampleTestProject",
                    "key": true,
                    "queryable": true
                }
            ],
            "outputArtifactDetails": {
                "maximumCount": 5,
                "minimumCount": 0
            },
            "id": {
                "category": "Test",
                "owner": "Custom",
                "version": "1",
                "provider": "MyJenkinsProviderName"
            },
            "settings": {
                "entityUrlTemplate": "http://192.0.2.4/job/{Config:ProjectName}",
                "executionUrlTemplate": "http://192.0.2.4/job/{Config:ProjectName}/
{ExternalExecutionId}"
            }
        }
    ]
}
```

For more information, see Use action types, custom actions, and approval actions in the *AWS CodePipeline User Guide*.

- For API details, see ListActionTypes in *AWS CLI Command Reference*.

`list-pipeline-executions`

The following code example shows how to use `list-pipeline-executions`.

AWS CLI

To view pipeline execution history

The following `list-pipeline-executions` example shows the pipeline execution history for a pipeline in your AWS account.

```
aws codepipeline list-pipeline-executions \
    --pipeline-name MyPipeline
```

Output:

```
{
    "pipelineExecutionSummaries": [
        {
            "lastUpdateTime": 1496380678.648,
            "pipelineExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "startTime": 1496380258.243,
            "status": "Succeeded"
        },
        {
            "lastUpdateTime": 1496591045.634,
            "pipelineExecutionId": "3137f7cb-8d494hj4-039j-d84l-d7eu3EXAMPLE",
            "startTime": 1496590401.222,
            "status": "Succeeded"
        },
        {
            "lastUpdateTime": 1496946071.6456,
            "pipelineExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "startTime": 1496945471.5645,
            "status": "Succeeded"
        }
    ]
}
```

For more information, see View execution history in the *AWS CodePipeline User Guide*.

- For API details, see ListPipelineExecutions in *AWS CLI Command Reference*.

`list-pipelines`

The following code example shows how to use `list-pipelines`.

AWS CLI

To view a list of pipelines

The following `list-pipelines` example lists all AWS CodePipeline pipelines associated with the user's AWS account.

```
aws codepipeline list-pipelines
```

Output:

```
{
    "pipelines": [
        {
            "updated": 1439504274.641,
            "version": 1,
            "name": "MyFirstPipeline",
            "created": 1439504274.641
        },
        {
            "updated": 1436461837.992,
            "version": 2,
            "name": "MySecondPipeline",
            "created": 1436460801.381
        }
    ]
}
```

For more information, see View pipeline details and history (CLI) in the *AWS CodePipeline User Guide*.

- For API details, see ListPipelines in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags

The following `list-tags-for-resource` example retrieves a list of all tags attached to the specified pipeline resource.

```
aws codepipeline list-tags-for-resource \
```

```
    --resource-arn arn:aws:codepipeline:us-west-2:123456789012:MyPipeline
```

Output:

```
{
    "tags": [
        {
            "key": "Project",
            "value": "ProjectA"
        },
        {
            "key": "IscontainerBased",
            "value": "true"
        }
    ]
}
```

For more information, see View tags for a pipeline (CLI) in the *AWS CodePipeline User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-webhooks`

The following code example shows how to use `list-webhooks`.

AWS CLI

To list webhooks

The following `list-webhooks` example retrieves a list of all tags attached to the specified pipeline resource.

```
aws codepipeline list-webhooks
```

Output:

```
{
    "webhooks": [
        {
            "definition": {
                "authenticationConfiguration": {
                    "SecretToken": "Secret"
```

```
                },
                "name": "my-webhook",
                "authentication": "GITHUB_HMAC",
                "targetPipeline": "my-Pipeline",
                "targetAction": "Source",
                "filters": [
                    {
                        "jsonPath": "$.ref",
                        "matchEquals": "refs/heads/{Branch}"
                    }
                ]
            },
            "url": "https://webhooks.domain.com/
trigger111111111EXAMPLE1111111111111111",
            "arn": "arn:aws:codepipeline:us-west-2:123456789012:webhook:my-webhook"
        }
    ]
}
```

For more information, see List webhooks in your account in the *AWS CodePipeline User Guide*.

- For API details, see ListWebhooks in *AWS CLI Command Reference*.

`poll-for-jobs`

The following code example shows how to use `poll-for-jobs`.

AWS CLI

To view any available jobs

The following `poll-for-jobs` example returns information about any jobs for a job worker to act upon. This example uses a pre-defined JSON file (MyActionTypeInfo.json) to supply information about the action type for which the job worker processes jobs. This command is only used for custom actions. When this command is called, AWS CodePipeline returns temporary credentials for the Amazon S3 bucket used to store artifacts for the pipeline. This command will also return any secret values defined for the action, if any are defined.

```
aws codepipeline poll-for-jobs \
    --cli-input-json file://MyActionTypeInfo.json
```

Contents of `MyActionTypeInfo.json`:

```
{
    "actionTypeId": {
        "category": "Test",
        "owner": "Custom",
        "provider": "MyJenkinsProviderName",
        "version": "1"
    },
    "maxBatchSize": 5,
    "queryParam": {
        "ProjectName": "MyJenkinsTestProject"
    }
}
```

Output:

```
{
    "jobs": [
        {
            "accountId": "123456789012",
            "data": {
                "actionConfiguration": {
                    "configuration": {
                        "ProjectName": "MyJenkinsExampleTestProject"
                    }
                },
                "actionTypeId": {
                    "category": "Test",
                    "owner": "Custom",
                    "provider": "MyJenkinsProviderName",
                    "version": "1"
                },
                "artifactCredentials": {
                    "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
                    "secretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
                    "sessionToken":

                            "s3Location": {
                                "bucketName": "codepipeline-us-east-1-11EXAMPLE11",
                                "objectKey": "MySecondPipeline/MyAppBuild/EXAMPLE"
                            },
                            "type": "S3"
                        },
                        "name": "MyAppBuild"
                    }
                ],
                "outputArtifacts": [],
                "pipelineContext": {
                    "action": {
                        "name": "MyJenkinsTest-Action"
                    },
                    "pipelineName": "MySecondPipeline",
                    "stage": {
                        "name": "Testing"
                    }
                }
            },
            "id": "ef66c259-64f9-EXAMPLE",
            "nonce": "3"
        }
    ]
}
```

For more information, see Create and add a custom action in CodePipeline in the *AWS CodePipeline User Guide*.

- For API details, see PollForJobs in *AWS CLI Command Reference*.

`put-webhook`

The following code example shows how to use `put-webhook`.

AWS CLI

To create a webhook

The following `put-webhook` example creates a webhook for a GitHub version 1 source action. After you create the webhook, you must use the register-webhook-with-third-party command to register it.

```
aws codepipeline put-webhook \
    --cli-input-json file://webhook_json.json
```

Contents of webhook_json.json:

```
{
    "webhook": {
        "name": "my-webhook",
        "targetPipeline": "pipeline_name",
        "targetAction": "source_action_name",
        "filters": [
            {
                "jsonPath": "$.ref",
                "matchEquals": "refs/heads/{Branch}"
            }
        ],
        "authentication": "GITHUB_HMAC",
        "authenticationConfiguration": {
            "SecretToken": "secret"
        }
    }
}
```

Output:

```
{
    "webhook": {
        "url": "https://webhooks.domain.com/
trigger111111111EXAMPLE1111111111111111",
        "definition": {
            "authenticationConfiguration": {
                "SecretToken": "secret"
            },
            "name": "my-webhook",
            "authentication": "GITHUB_HMAC",
            "targetPipeline": "pipeline_name",
            "targetAction": "Source",
            "filters": [
                {
                    "jsonPath": "$.ref",
                    "matchEquals": "refs/heads/{Branch}"
                }
```

```
            ]
        },
        "arn": "arn:aws:codepipeline:us-west-2:123456789012:webhook:my-webhook"
    }
}
```

For more information, see Create a webhook for a GitHub source in the *AWS CodePipeline User Guide*.

- For API details, see PutWebhook in *AWS CLI Command Reference*.

`retry-stage-execution`

The following code example shows how to use `retry-stage-execution`.

AWS CLI

To retry a failed action

The following `retry-stage-execution` example retries a stage that has a failed action.

```
aws codepipeline retry-stage-execution \
    --pipeline-name MyPipeline \
    --stage-name Deploy \
    --pipeline-execution-id b59babff-5f34-EXAMPLE \
    --retry-mode FAILED_ACTIONS
```

Output:

```
{
    "pipelineExecutionId": "b59babff-5f34-EXAMPLE"
}
```

For more information, see Configuring stage retry for a failed stage or failed actions in the *AWS CodePipeline User Guide*.

- For API details, see RetryStageExecution in *AWS CLI Command Reference*.

`start-pipeline-execution`

The following code example shows how to use `start-pipeline-execution`.

AWS CLI

To run the latest revision through a pipeline

The following `start-pipeline-execution` example runs the latest revision present in the source stage of a pipeline through the pipeline named "MyFirstPipeline".

```
aws codepipeline start-pipeline-execution \
    --name MyFirstPipeline
```

Output:

```
{
    "pipelineExecutionId": "3137f7cb-7cf7-EXAMPLE"
}
```

For more information, see Start a pipeline manually in the *AWS CodePipeline User Guide*.

- For API details, see StartPipelineExecution in *AWS CLI Command Reference*.

`stop-pipeline-execution`

The following code example shows how to use `stop-pipeline-execution`.

AWS CLI

To stop a pipeline execution

The following `stop-pipeline-execution` example defaults to waiting until in-progress actions finish, and then stops the pipeline. You cannot choose to stop and wait if the execution is already in a Stopping state. You can choose to stop and abandon an execution that is already in a Stopping state.

```
aws codepipeline stop-pipeline-execution \
    --pipeline-name MyFirstPipeline \
    --pipeline-execution-id d-EXAMPLE \
    --reason "Stopping pipeline after the build action is done"
```

Output:

```
{
```

```
    "pipelineExecutionId": "d-EXAMPLE"
}
```

For more information, see Stop a pipeline execution (CLI) in the *AWS CodePipeline User Guide*.

- For API details, see StopPipelineExecution in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example associates a set of provided tags with a pipeline. Use this command to add or edit tags.

```
aws codepipeline tag-resource \
    --resource-arn arn:aws:codepipeline:us-west-2:123456789012:MyPipeline \
    --tags key=Project,value=ProjectA key=IscontainerBased,value=true
```

This command produces no output.

For more information, see Add tags to a pipeline (CLI) in the *AWS CodePipeline User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove AWS tags from a connections resource

The following `untag-resource` example removes a tag from the specified resource.

```
aws codepipeline untag-resource \
    --resource-arn arn:aws:codepipeline:us-west-2:123456789012:MyPipeline \
    --tag-keys Project IscontainerBased
```

This command produces no output.

For more information, see Remove tags from a pipeline (CLI) in the *AWS CodePipeline User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-pipeline`

The following code example shows how to use `update-pipeline`.

AWS CLI

To update the structure of a pipeline

The following `update-pipeline` example uses the `--cli-input-json` argument with a pre-defined JSON file (MyFirstPipeline.json) to update the structure of a pipeline. AWS CodePipeline recognizes the pipeline name contained in the JSON file, and then applies any changes from modified fields in the pipeline structure to update the pipeline.

Use the following guidelines when creating the pre-defined JSON file:

If you are working with a pipeline structure retrieved using the get-pipeline command, you must remove the metadata section from the pipeline structure in the JSON file (the "metadata": { } lines and the "created," "pipelineARN," and "updated" fields within).The pipeline name cannot be changed.

Run the following command to update the pipeline.

```
aws codepipeline update-pipeline \
    --cli-input-json file://MyFirstPipeline.json
```

Contents of `MyFirstPipeline.json`:

```
{
    "pipeline": {
        "roleArn": "arn:aws:iam::123456789012:role/AWS-CodePipeline-Service",
        "stages": [
            {
                "name": "Source",
                "actions": [
                    {
                        "inputArtifacts": [],
                        "name": "Source",
```

```
                        "actionTypeId": {
                            "category": "Source",
                            "owner": "AWS",

- For API details, see UpdatePipeline in *AWS CLI Command Reference*.

AWS CodeStar Notifications examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS CodeStar Notifications.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-notification-rule`

The following code example shows how to use `create-notification-rule`.

AWS CLI

To create a notification rule

The following `create-notification-rule` example uses a JSON file named `rule.json` to create a notification rule named `MyNotificationRule` for a repository named `MyDemoRepo` in the specified AWS account. Notifications with the `FULL` detail type are sent to the specified target Amazon SNS topic when branches and tags are created.

```
aws codestar-notifications create-notification-rule \
    --cli-input-json file://rule.json
```

Contents of `rule.json`:

```
{
    "Name": "MyNotificationRule",
    "EventTypeIds": [
        "codecommit-repository-branches-and-tags-created"
    ],
    "Resource": "arn:aws:codecommit:us-west-2:123456789012:MyDemoRepo",
    "Targets": [
        {
            "TargetType": "SNS",
            "TargetAddress": "arn:aws:sns:us-
west-2:123456789012:MyNotificationTopic"
        }
```

```
    ],
    "Status": "ENABLED",
    "DetailType": "FULL"
}
```

Output:

```
{
    "Arn": "arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/
dc82df7a-EXAMPLE"
}
```

For more information, see Create a Notification rule in the *AWS Developer Tools Console User Guide*.

- For API details, see CreateNotificationRule in *AWS CLI Command Reference*.

`delete-notification-rule`

The following code example shows how to use `delete-notification-rule`.

AWS CLI

To delete a notification rule

The following `delete-notification-rule` example deletes the specified notification rule.

```
aws codestar-notifications delete-notification-rule \
    --arn arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/
dc82df7a-EXAMPLE
```

Output:

```
{
    "Arn": "arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/
dc82df7a-EXAMPLE"
}
```

For more information, see Delete a Notification Rule in the *AWS Developer Tools Console User Guide*.

- For API details, see DeleteNotificationRule in *AWS CLI Command Reference*.

`delete-target`

The following code example shows how to use `delete-target`.

AWS CLI

To delete a notification rule target

The following `delete-target` example removes the specified target from all notification rules configured to use it as a target, and then deletes the target.

```
aws codestar-notifications  delete-target \
    --target-address arn:aws:sns:us-west-2:123456789012:MyNotificationTopic \
    --force-unsubscribe-all
```

This command produces no output.

For more information, see Delete a Notification Rule Target in the *AWS Developer Tools Console User Guide*.

- For API details, see DeleteTarget in *AWS CLI Command Reference*.

`describe-notification-rule`

The following code example shows how to use `describe-notification-rule`.

AWS CLI

To retrieve details of a notification rule

The following `describe-notification-rule` example retrieves the details of the specified notification rule.

```
aws codestar-notifications describe-notification-rule \
    --arn arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/
dc82df7a-EXAMPLE
```

Output:

```
{
    "LastModifiedTimestamp": 1569199844.857,
    "EventTypes": [
```

```
        {
            "ServiceName": "CodeCommit",
            "EventTypeName": "Branches and tags: Created",
            "ResourceType": "Repository",
            "EventTypeId": "codecommit-repository-branches-and-tags-created"
        }
    ],
    "Status": "ENABLED",
    "DetailType": "FULL",
    "Resource": "arn:aws:codecommit:us-west-2:123456789012:MyDemoRepo",
    "Arn": "arn:aws:codestar-notifications:us-west-w:123456789012:notificationrule/
dc82df7a-EXAMPLE",
    "Targets": [
        {
            "TargetStatus": "ACTIVE",
            "TargetAddress": "arn:aws:sns:us-
west-2:123456789012:MyNotificationTopic",
            "TargetType": "SNS"
        }
    ],
    "Name": "MyNotificationRule",
    "CreatedTimestamp": 1569199844.857,
    "CreatedBy": "arn:aws:iam::123456789012:user/Mary_Major"
}
```

For more information, see View Notification Rules in the *AWS Developer Tools Console User Guide*.

- For API details, see DescribeNotificationRule in *AWS CLI Command Reference*.

`list-event-types`

The following code example shows how to use `list-event-types`.

AWS CLI

To get a list of event types for a notification rule

The following `list-event-types` example retrieves a filtered list of all available notification event types for CodeDeploy applications. If instead you use no filter, the command returns all notification event types for all resource types.

```
aws codestar-notifications list-event-types \
```

```
    --filters Name=SERVICE_NAME,Value=CodeDeploy
```

Output:

```
{
    "EventTypes": [
        {
            "EventTypeId": "codedeploy-application-deployment-succeeded",
            "ServiceName": "CodeDeploy",
            "EventTypeName": "Deployment: Succeeded",
            "ResourceType": "Application"
        },
        {
            "EventTypeId": "codedeploy-application-deployment-failed",
            "ServiceName": "CodeDeploy",
            "EventTypeName": "Deployment: Failed",
            "ResourceType": "Application"
        },
        {
            "EventTypeId": "codedeploy-application-deployment-started",
            "ServiceName": "CodeDeploy",
            "EventTypeName": "Deployment: Started",
            "ResourceType": "Application"
        }
    ]
}
```

For more information, see Create a Notification Rule in the *AWS Developer Tools Console User Guide*.

- For API details, see ListEventTypes in *AWS CLI Command Reference*.

`list-notification-rules`

The following code example shows how to use `list-notification-rules`.

AWS CLI

To retrieve a list of notification rules

The following `list-notification-rules` example retrieves a list of all notification rules in the current AWS Region.

```
aws codestar-notifications list-notification-rules
```

Output:

```
{
    "NotificationRules": [
        {
            "Id": "dc82df7a-EXAMPLE",
            "Arn": "arn:aws:codestar-notifications:us-
west-2:123456789012:notificationrule/dc82df7a-EXAMPLE"
        },
        {
            "Id": "8d1f0983-EXAMPLE",
            "Arn": "arn:aws:codestar-notifications:us-
west-2:123456789012:notificationrule/8d1f0983-EXAMPLE"
        }
    ]
}
```

For more information, see View Notification Rules in the *AWS Developer Tools Console User Guide*.

- For API details, see ListNotificationRules in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To get a list of tags attached to a notification rule

The following `list-tags-for-resource` example retrieves a list of all tags attached to the specified notification rule. In this example, the notification rule currently has no tags associated with it.

```
aws codestar-notifications list-tags-for-resource \
    --arn arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/
fe1efd35-EXAMPLE
```

Output:

```
{
    "Tags": {}
}
```

For more information, see Create a Notification Rule in the *AWS Developer Tools Console User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-targets`

The following code example shows how to use `list-targets`.

AWS CLI

To retrieve a list of notification rule targets

The following `list-targets` example retrieves a list of all notification rule targets in the current AWS Region.

```
aws codestar-notifications list-targets
```

Output:

```
{
    "Targets": [
        {
            "TargetAddress": "arn:aws:sns:us-
west-2:123456789012:MySNSTopicForNotificationRules",
            "TargetType": "SNS",
            "TargetStatus": "ACTIVE"
        },
        {
            "TargetAddress": "arn:aws:sns:us-
west-2:123456789012:MySNSTopicForNotificationsAboutMyDemoRepo",
            "TargetType": "SNS",
            "TargetStatus": "ACTIVE"
        }
    ]
}
```

For more information, see View Notification Rule Targets in the *AWS Developer Tools Console User Guide*.

- For API details, see ListTargets in *AWS CLI Command Reference*.

`subscribe`

The following code example shows how to use `subscribe`.

AWS CLI

To add a target to a notification rule

The following `subscribe` example adds an Amazon SNS topic as a target for the specified notification rule.

```
aws codestar-notifications subscribe \
    --arn arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/dc82df7a-EXAMPLE \
    --target TargetType=SNS,TargetAddress=arn:aws:sns:us-west-2:123456789012:MyNotificationTopic
```

Output:

```
{
    "Arn": "arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/dc82df7a-EXAMPLE"
}
```

For more information, see Add or Remove an Amazon SNS Topic as a Target for a Notification Rule in the *AWS Developer Tools Console User Guide*.

- For API details, see Subscribe in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a notification rule

The following `tag-resource` example adds a tag with the key name of `Team` and the value of `Li_Juan` to the specified notification rule.

```
aws codestar-notifications tag-resource \
    --arn arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/
fe1efd35-EXAMPLE \
    --tags Team=Li_Juan
```

Output:

```
{
    "Tags": {
        "Team": "Li_Juan"
    }
}
```

For more information, see Create a Notification Rule in the *AWS Developer Tools Console User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`unsubscribe`

The following code example shows how to use `unsubscribe`.

AWS CLI

To remove a target from a notification rule

The following `unsubscribe` example removes an Amazon SNS topic as a target from the specified notification rule.

```
aws codestar-notifications unsubscribe \
    --arn arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/
dc82df7a-EXAMPLE \
    --target-address TargetType=SNS,TargetAddress=arn:aws:sns:us-
west-2:123456789012:MyNotificationTopic
```

Output:

```
{
```

```
    "Arn": "arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/
dc82df7a-EXAMPLE"
}
```

For more information, see Add or Remove an Amazon SNS Topic as a Target for a Notification Rule in the *AWS Developer Tools Console User Guide*.

- For API details, see Unsubscribe in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a notification rule

The following `untag-resource` example removes the tag with the key name `Team` from the specified notification rule.

```
aws codestar-notifications untag-resource \
    --arn arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/
fe1efd35-EXAMPLE \
    --tag-keys Team
```

This command produces no output.

For more information, see Edit a Notification Rule in the *AWS Developer Tools Console User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-notification-rule`

The following code example shows how to use `update-notification-rule`.

AWS CLI

To update a notification rule

The following `update-notification-rule` example updates a notification rule named `MyNotificationRule` in the AWS account `123456789012` using a JSON file named `update.json`.

```
aws codestar-notifications update-notification-rule \
    --cli-input-json file://update.json
```

Contents of `update.json`:

```
{
    "Arn": "arn:aws:codestar-notifications:us-west-2:123456789012:notificationrule/
dc82df7a-EXAMPLE",
    "Name": "MyUpdatedNotificationRule",
    "EventTypeIds": [
        "codecommit-repository-branches-and-tags-created"
    ],
    "Targets": [
        {
            "TargetType": "SNS",
            "TargetAddress": "arn:aws:sns:us-
west-2:123456789012:MyNotificationTopic"
        }
    ],
    "Status": "ENABLED",
    "DetailType": "FULL"
}
```

This command produces no output.

For more information, see Edit a notification rule in the *AWS Developer Tools Console User Guide*.

- For API details, see UpdateNotificationRule in *AWS CLI Command Reference*.

AWS CodeConnections examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS CodeConnections.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`create-connection`

The following code example shows how to use `create-connection`.

AWS CLI

To create a connection

The following `create-connection` example shows how to create a connection to a third-party repository. This example creates a connection where the third-party provider is Bitbucket.

A connection created through the AWS CLI or AWS CloudFormation is in Pending status by default. After you create a connection with the CLI or AWS CloudFormation, use the console to edit the connection to make its status Available.

```
aws codestar-connections create-connection \
    --provider-type Bitbucket \
    --connection-name MyConnection
```

Output:

```
{
    "ConnectionArn": "arn:aws:codestar-connections:us-
west-2:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create a connection in the *Developer Tools console User Guide*.

- For API details, see CreateConnection in *AWS CLI Command Reference*.

`create-host`

The following code example shows how to use `create-host`.

AWS CLI

To create a host

The following `create-host` example shows how to create a host to represent the endpoint for the infrastructure where your third-party provider is installed. This example creates a host where the third-party installed provider is GitHub Enterprise Server.

A host created through the AWS CLI is in Pending status by default. After you create a host with the CLI, use the console or the CLI to set up the host to make its status Available.

```
aws codestar-connections create-host \
    --name MyHost \
    --provider-type GitHubEnterpriseServer \
    --provider-endpoint "https://my-instance.dev"
```

Output:

```
{
    "HostArn": "arn:aws:codestar-connections:us-west-2:123456789012:host/My-
Host-28aef605"
}
```

For more information, see Create a host (CLI) in the *Developer Tools console User Guide*.

- For API details, see CreateHost in *AWS CLI Command Reference*.

`delete-connection`

The following code example shows how to use `delete-connection`.

AWS CLI

To delete a connection

The following `delete-connection` example shows how to delete a connection.

```
aws codestar-connections delete-connection \
    --connection-arn arn:aws:codestar-connections:us-west-2:123456789012:connection/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Delete a connection (CLI) in the *Developer Tools console User Guide*.

- For API details, see DeleteConnection in *AWS CLI Command Reference*.

`delete-host`

The following code example shows how to use `delete-host`.

AWS CLI

To delete a host

The following `delete-host` example shows how to delete a host. Before you can delete a host, you must delete all connections associated with the host.

```
aws codestar-connections delete-host \
    --host-arn "arn:aws:codestar-connections:us-west-2 :123456789012:host/My-Host-28aef605"
```

This command produces no output.

For more information, see Delete a host (CLI) in the *Developer Tools console User Guide*.

- For API details, see DeleteHost in *AWS CLI Command Reference*.

`get-connection`

The following code example shows how to use `get-connection`.

AWS CLI

To get information about a connection

The following `get-connection` example shows details about a connection.

```
aws codestar-connections get-connection \
    --connection-arn arn:aws:codestar-connections:us-west-2:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Connection": {
        "ConnectionName": "MyConnection",
        "ConnectionArn": "arn:aws:codestar-connections:us-west-2:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "ProviderType": "Bitbucket",
```

```
        "OwnerAccountId": "123456789012",
        "ConnectionStatus": "AVAILABLE"
    }
}
```

For more information, see View connection details in the *Developer Tools console User Guide*.

- For API details, see GetConnection in *AWS CLI Command Reference*.

`get-host`

The following code example shows how to use `get-host`.

AWS CLI

To get information about a host

The following `get-host` example shows details about a host.

```
aws codestar-connections get-host \
    --host-arn arn:aws:codestar-connections:us-west-2:123456789012:host/
MyHost-28aef605
```

Output:

```
{
    "Name": "MyHost",
    "Status": "AVAILABLE",
    "ProviderType": "GitHubEnterpriseServer",
    "ProviderEndpoint": "https://test-instance-1.dev/"
}
```

For more information, see View host details (CLI) in the *Developer Tools console User Guide*.

- For API details, see GetHost in *AWS CLI Command Reference*.

`list-connections`

The following code example shows how to use `list-connections`.

AWS CLI

To list connections

The following `list-connections` example retrieves a list of all connections in your account for the Bitbucket provider type.

```
aws codestar-connections list-connections \
    --provider-type-filter Bitbucket \
    --max-results 5 \
    --next-token next-token
```

Output:

```
{
    "Connections": [
        {
            "ConnectionName": "my-connection",
            "ProviderType": "Bitbucket",
            "ConnectionStatus": "PENDING",
            "ConnectionArn": "arn:aws:codestar-connections:us-
west-2:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "OwnerAccountId": "123456789012"
        },
        {
            "ConnectionName": "my-other-connection",
            "ProviderType": "Bitbucket",
            "ConnectionStatus": "AVAILABLE",
            "ConnectionArn": "arn:aws:codestar-connections:us-
west-2:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "OwnerAccountId": "123456789012"
        }
    ],
    "NextToken": "next-token"
}
```

For more information, see List connections (CLI) in the *Developer Tools console User Guide*.

- For API details, see ListConnections in *AWS CLI Command Reference*.

`list-hosts`

The following code example shows how to use `list-hosts`.

AWS CLI

To list hosts

The following `list-hosts` example retrieves a list of all hosts in your account.

```
aws codestar-connections list-hosts
```

Output:

```
{
    "Hosts": [
        {
            "Name": "My-Host",
            "HostArn": "arn:aws:codestar-connections:us-west-2:123456789012:host/My-
Host-28aef605",
            "ProviderType": "GitHubEnterpriseServer",
            "ProviderEndpoint": "https://my-instance.test.dev",
            "Status": "AVAILABLE"
        }
    ]
}
```

For more information, see List hosts (CLI) in the *Developer Tools console User Guide*.

- For API details, see ListHosts in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags

The following `list-tags-for-resource` example retrieves a list of all tags attached to the specified connections resource.

```
aws codestar-connections list-tags-for-resource \
    --resource-arn arn:aws:codestar-connections:us-west-2:123456789012:connection/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Tags": [
```

```
        {
            "Key": "Project",
            "Value": "ProjectA"
        },
        {
            "Key": "ReadOnly",
            "Value": "true"
        }
    ]
}
```

For more information, see View tags for a connections resource in the *Developer Tools console User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example associates a set of provided tags with a connection. Use this command to add or edit tags.

```
aws codestar-connections tag-resource \
    --resource-arn arn:aws:codestar-connections:us-west-2:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags Key=Project,Value=ProjectA Key=IscontainerBased,Value=true
```

This command produces no output.

For more information, see Add tags to a connections resource in the *Developer Tools console User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove AWS tags from a connections resource

The following `untag-resource` example removes a tag from the specified resource.

```
aws codestar-connections untag-resource \
    --resource-arn arn:aws:codestar-connections:us-west-2:123456789012:connection/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tag-keys Project ReadOnly
```

This command produces no output.

For more information, see Remove tags from a connections resource in the *Developer Tools console User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Amazon Cognito Identity examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Cognito Identity.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-identity-pool`

The following code example shows how to use `create-identity-pool`.

AWS CLI

To create an identity pool with Cognito identity pool provider

The following `create-identity-pool` example creates an identity pool named MyIdentityPool. It has a Cognito identity pool provider. Unauthenticated identities are not allowed.

```
aws cognito-identity create-identity-pool \
    --identity-pool-name MyIdentityPool \
    --no-allow-unauthenticated-identities \
    --cognito-identity-providers ProviderName="cognito-idp.us-west-2.amazonaws.com/
us-
west-2_aaaaaaaaa",ClientId="3n4b5urk1ft4fl3mg5e62d9ado",ServerSideTokenCheck=false
```

Output:

```
{
    "IdentityPoolId": "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "IdentityPoolName": "MyIdentityPool",
    "AllowUnauthenticatedIdentities": false,
    "CognitoIdentityProviders": [
        {
            "ProviderName": "cognito-idp.us-west-2.amazonaws.com/us-
west-2_111111111",
            "ClientId": "3n4b5urk1ft4fl3mg5e62d9ado",
            "ServerSideTokenCheck": false
        }
    ]
}
```

For more information, see Getting started with Amazon Cognito identity pools in the *Amazon Cognito Developer Guide*.

- For API details, see CreateIdentityPool in *AWS CLI Command Reference*.

`delete-identities`

The following code example shows how to use `delete-identities`.

AWS CLI

To delete identity pool

The following `delete-identities` example deletes the specified identity.

```
aws cognito-identity delete-identities \
    --identity-ids-to-delete "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "UnprocessedIdentityIds": []
}
```

For more information, see Amazon Cognito identity pools in the *Amazon Cognito Developer Guide*.

- For API details, see DeleteIdentities in *AWS CLI Command Reference*.

`delete-identity-pool`

The following code example shows how to use `delete-identity-pool`.

AWS CLI

To delete identity pool

The following `delete-identity-pool` example deletes the specified identity pool.

```
aws cognito-identity delete-identity-pool \
    --identity-pool-id "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Amazon Cognito identity pools in the *Amazon Cognito Developer Guide*.

- For API details, see DeleteIdentityPool in *AWS CLI Command Reference*.

`describe-identity-pool`

The following code example shows how to use `describe-identity-pool`.

AWS CLI

To describe an identity pool

The following `describe-identity-pool` example describes the specified identity pool.

```
aws cognito-identity describe-identity-pool \
    --identity-pool-id "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "IdentityPoolId": "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "IdentityPoolName": "MyIdentityPool",
    "AllowUnauthenticatedIdentities": false,
    "CognitoIdentityProviders": [
        {
            "ProviderName": "cognito-idp.us-west-2.amazonaws.com/us-
west-2_111111111",
            "ClientId": "3n4b5urk1ft4fl3mg5e62d9ado",
            "ServerSideTokenCheck": false
        }
    ]
}
```

For more information, see Amazon Cognito identity pools in the *Amazon Cognito Developer Guide*.

- For API details, see DescribeIdentityPool in *AWS CLI Command Reference*.

`get-identity-pool-roles`

The following code example shows how to use `get-identity-pool-roles`.

AWS CLI

To get identity pool roles

The following `get-identity-pool-roles` example gets the roles for the specified identity pool.

```
aws cognito-identity get-identity-pool-roles \
    --identity-pool-id "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "IdentityPoolId": "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Roles": {
        "authenticated": "arn:aws:iam::123456789012:role/
Cognito_MyIdentityPoolAuth_Role",
        "unauthenticated": "arn:aws:iam::123456789012:role/
Cognito_MyIdentityPoolUnauth_Role"
    }
}
```

For more information, see IAM roles in the *Amazon Cognito Developer Guide*.

- For API details, see GetIdentityPoolRoles in *AWS CLI Command Reference*.

`list-identity-pools`

The following code example shows how to use `list-identity-pools`.

AWS CLI

To list identity pools

The following `list-identity-pools` example lists identity pools. A maximum of 20 identity pools are listed.

```
aws cognito-identity list-identity-pools \
    --max-results 20
```

Output:

```
{
    "IdentityPools": [
        {
            "IdentityPoolId": "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "IdentityPoolName": "MyIdentityPool"
        },
        {
            "IdentityPoolId": "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "IdentityPoolName": "AnotherIdentityPool"
        },
        {
            "IdentityPoolId": "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
```

```
            "IdentityPoolName": "IdentityPoolRegionA"
        }
    ]
}
```

For more information, see Amazon Cognito identity pools in the *Amazon Cognito Developer Guide*.

- For API details, see ListIdentityPools in *AWS CLI Command Reference*.

`set-identity-pool-roles`

The following code example shows how to use `set-identity-pool-roles`.

AWS CLI

To set identity pool roles

The following `set-identity-pool-roles` example sets an identity pool role.

```
aws cognito-identity set-identity-pool-roles \
    --identity-pool-id "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --roles authenticated="arn:aws:iam::123456789012:role/
Cognito_MyIdentityPoolAuth_Role"
```

This command produces no output.

For more information, see IAM roles in the *Amazon Cognito Developer Guide*.

- For API details, see SetIdentityPoolRoles in *AWS CLI Command Reference*.

`update-identity-pool`

The following code example shows how to use `update-identity-pool`.

AWS CLI

To update an identity pool

The following `update-identity-pool` example updates an identity pool. It sets the name to MyIdentityPool. It adds Cognito as an identity provider. It disallows unauthenticated identities.

```
aws cognito-identity update-identity-pool \
```

```
    --identity-pool-id "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --identity-pool-name "MyIdentityPool" \
    --no-allow-unauthenticated-identities \
    --cognito-identity-providers ProviderName="cognito-idp.us-west-2.amazonaws.com/
us-
west-2_111111111",ClientId="3n4b5urk1ft4fl3mg5e62d9ado",ServerSideTokenCheck=false
```

Output:

```
{
    "IdentityPoolId": "us-west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "IdentityPoolName": "MyIdentityPool",
    "AllowUnauthenticatedIdentities": false,
    "CognitoIdentityProviders": [
        {
            "ProviderName": "cognito-idp.us-west-2.amazonaws.com/us-
west-2_111111111",
            "ClientId": "3n4b5urk1ft4fl3mg5e62d9ado",
            "ServerSideTokenCheck": false
        }
    ]
}
```

For more information, see Amazon Cognito identity pools in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateIdentityPool in *AWS CLI Command Reference*.

Amazon Cognito Identity Provider examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Cognito Identity Provider.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-custom-attributes`

The following code example shows how to use `add-custom-attributes`.

AWS CLI

To add a custom attribute

The following `add-custom-attributes` example adds a custom attribute CustomAttr1 to a user pool. It is a String type, and requires a minimum of 1 character and a maximum of 15. It is not required.

```
aws cognito-idp add-custom-attributes \
    --user-pool-id us-west-2_aaaaaaaaa \
    --custom-attributes
 Name="CustomAttr1",AttributeDataType="String",DeveloperOnlyAttribute=false,Required=false,S
```

This command produces no output.

For more information, see Working with user attributes in the *Amazon Cognito Developer Guide*.

- For API details, see AddCustomAttributes in *AWS CLI Command Reference*.

`admin-add-user-to-group`

The following code example shows how to use `admin-add-user-to-group`.

AWS CLI

To add a user to a group

The following `admin-add-user-to-group` example adds user Jane to group MyGroup.

```
aws cognito-idp admin-add-user-to-group \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username Jane \
    --group-name MyGroup
```

This command produces no output.

For more information, see Adding groups to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see AdminAddUserToGroup in *AWS CLI Command Reference*.

`admin-confirm-sign-up`

The following code example shows how to use `admin-confirm-sign-up`.

AWS CLI

To confirm user registration

The following `admin-confirm-sign-up` example confirms user jane@example.com.

```
aws cognito-idp admin-confirm-sign-up \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username jane@example.com
```

This command produces no output.

For more information, see Signing up and confirming user accounts in the *Amazon Cognito Developer Guide*.

- For API details, see AdminConfirmSignUp in *AWS CLI Command Reference*.

`admin-create-user`

The following code example shows how to use `admin-create-user`.

AWS CLI

To create a user

The following `admin-create-user` example creates a user with the specified settings email address and phone number.

```
aws cognito-idp admin-create-user \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username diego \
    --user-attributes Name=email,Value=diego@example.com
 Name=phone_number,Value="+15555551212" \
    --message-action SUPPRESS
```

Output:

```
{
    "User": {
        "Username": "diego",
        "Attributes": [
            {
                "Name": "sub",
                "Value": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            },
            {
                "Name": "phone_number",
                "Value": "+15555551212"
            },
            {
                "Name": "email",
                "Value": "diego@example.com"
            }
        ],
        "UserCreateDate": 1548099495.428,
        "UserLastModifiedDate": 1548099495.428,
        "Enabled": true,
        "UserStatus": "FORCE_CHANGE_PASSWORD"
    }
}
```

For more information, see Creating user accounts as administrator in the *Amazon Cognito Developer Guide*.

- For API details, see AdminCreateUser in *AWS CLI Command Reference*.

`admin-delete-user-attributes`

The following code example shows how to use `admin-delete-user-attributes`.

AWS CLI

To delete a user attribute

The following `admin-delete-user-attributes` example deletes a custom attribute CustomAttr1 for user diego@example.com.

```
aws cognito-idp admin-delete-user-attributes \
```

```
    --user-pool-id us-west-2_aaaaaaaaa \
    --username diego@example.com \
    --user-attribute-names "custom:CustomAttr1"
```

This command produces no output.

For more information, see Working with user attributes in the *Amazon Cognito Developer Guide*.

- For API details, see AdminDeleteUserAttributes in *AWS CLI Command Reference*.

`admin-delete-user`

The following code example shows how to use `admin-delete-user`.

AWS CLI

To delete a user

The following `admin-delete-user` example deletes a user.

```
aws cognito-idp admin-delete-user \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username diego@example.com
```

This command produces no output.

For more information, see Managing and searching for user accounts in the *Amazon Cognito Developer Guide*.

- For API details, see AdminDeleteUser in *AWS CLI Command Reference*.

`admin-disable-provider-for-user`

The following code example shows how to use `admin-disable-provider-for-user`.

AWS CLI

To unlink a federated user from a local user profile

The following `admin-disable-provider-for-user` example disconnects a Google user from their linked local profile.

```
aws cognito-idp admin-disable-provider-for-user \
    --user-pool-id us-west-2_EXAMPLE \
    --
user ProviderAttributeName=Cognito_Subject,ProviderAttributeValue=0000000000000000,ProviderN
```

This command produces no output.

For more information, see Linking federated users to an existing user profile in the *Amazon Cognito Developer Guide*.

- For API details, see AdminDisableProviderForUser in *AWS CLI Command Reference*.

`admin-disable-user`

The following code example shows how to use `admin-disable-user`.

AWS CLI

To prevent sign-in by a user

The following `admin-disable-user` example prevents sign-in by the user `diego@example.com`.

```
aws cognito-idp admin-disable-user \
    --user-pool-id us-west-2_EXAMPLE \
    --username diego@example.com
```

This command produces no output.

For more information, see Managing users in the *Amazon Cognito Developer Guide*.

- For API details, see AdminDisableUser in *AWS CLI Command Reference*.

`admin-enable-user`

The following code example shows how to use `admin-enable-user`.

AWS CLI

To enable sign-in by a user

The following `admin-enable-user` example enables sign-in by the user diego@example.com.

```
aws cognito-idp admin-enable-user \
    --user-pool-id us-west-2_EXAMPLE \
    --username diego@example.com
```

This command produces no output.

For more information, see Managing users in the *Amazon Cognito Developer Guide*.

- For API details, see AdminEnableUser in *AWS CLI Command Reference*.

`admin-forget-device`

The following code example shows how to use `admin-forget-device`.

AWS CLI

To forget a device

The following `admin-forget-device` example forgets a device for username jane@example.com.

```
aws cognito-idp admin-forget-device \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username jane@example.com \
    --device-key us-west-2_abcd_1234-5678
```

This command produces no output.

For more information, see Working with user devices in your user pool in the *Amazon Cognito Developer Guide*.

- For API details, see AdminForgetDevice in *AWS CLI Command Reference*.

`admin-get-device`

The following code example shows how to use `admin-get-device`.

AWS CLI

To get a device

The following `admin-get-device` example displays one device for the user `diego`.

```
aws cognito-idp admin-get-device \
    --user-pool-id us-west-2_EXAMPLE \
    --username diego \
    --device-key us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Device": {
        "DeviceKey": "us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DeviceAttributes": [
            {

    }
}
```

For more information, see Working with user devices in your user pool in the *Amazon Cognito Developer Guide*.

- For API details, see AdminGetDevice in *AWS CLI Command Reference*.

`admin-get-user`

The following code example shows how to use `admin-get-user`.

AWS CLI

To get a user

The following `admin-get-user` example gets information about username jane@example.com.

```
aws cognito-idp admin-get-user \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username jane@example.com
```

Output:

```
{
    "Username": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Enabled": true,
    "UserStatus": "FORCE_CHANGE_PASSWORD",
    "UserCreateDate": 1548108509.537,
    "UserAttributes": [
        {
            "Name": "sub",
            "Value": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "Name": "email_verified",
            "Value": "true"
        },
```

```
        {
            "Name": "phone_number_verified",
            "Value": "true"
        },
        {
            "Name": "phone_number",
            "Value": "+01115551212"
        },
        {
            "Name": "email",
            "Value": "jane@example.com"
        }
    ],
    "UserLastModifiedDate": 1548108509.537
}
```

For more information, see Managing and searching for user accounts in the *Amazon Cognito Developer Guide*.

- For API details, see AdminGetUser in *AWS CLI Command Reference*.

`admin-initiate-auth`

The following code example shows how to use `admin-initiate-auth`.

AWS CLI

To sign in a user as an admin

The following `admin-initiate-auth` example signs in the user diego@example.com. This example also includes metadata for threat protection and ClientMetadata for Lambda triggers. The user is configured for TOTP MFA and receives a challenge to provide a code from their authenticator app before they can complete authentication.

```
aws cognito-idp admin-initiate-auth \
    --user-pool-id us-west-2_EXAMPLE \
    --client-id 1example23456789 \
    --auth-flow ADMIN_USER_PASSWORD_AUTH \
    --auth-parameters USERNAME=diego@example.com,PASSWORD="My@Example
$Password3!",SECRET_HASH=ExampleEncodedClientIdSecretAndUsername= \
    --context-data="{\"EncodedData\":\"abc123example\",\"HttpHeaders\":
[{\"headerName\":\"UserAgent\",\"headerValue\":\"Mozilla/5.0 (Windows NT 6.1;
```

```
 Win64; x64; rv:47.0) Gecko/20100101 Firefox/47.0\"}],\"IpAddress\":\"192.0.2.1\",
\"ServerName\":\"example.com\",\"ServerPath\":\"/login\"}" \
    --client-metadata="{\"MyExampleKey\": \"MyExampleValue\"}"
```

Output:

```
{
    "ChallengeName": "SOFTWARE_TOKEN_MFA",
    "Session": "AYABeExample...",
    "ChallengeParameters": {
        "FRIENDLY_DEVICE_NAME": "MyAuthenticatorApp",
        "USER_ID_FOR_SRP": "diego@example.com"
    }
}
```

For more information, see Admin authentication flow in the *Amazon Cognito Developer Guide*.

- For API details, see AdminInitiateAuth in *AWS CLI Command Reference*.

`admin-link-provider-for-user`

The following code example shows how to use `admin-link-provider-for-user`.

AWS CLI

To link a local user to a federated user

The following `admin-link-provider-for-user` example links the local user diego to a user who will do federated sign-in with Google.

```
aws cognito-idp admin-link-provider-for-user \
    --user-pool-id us-west-2_EXAMPLE \
    --destination-user ProviderName=Cognito,ProviderAttributeValue=diego \
    --source-
user ProviderAttributeName=Cognito_Subject,ProviderAttributeValue=0000000000000000,ProviderN
```

This command produces no output.

For more information, see Linking federated users to an existing user profile in the *Amazon Cognito Developer Guide*.

- For API details, see AdminLinkProviderForUser in *AWS CLI Command Reference*.

admin-list-devices

The following code example shows how to use admin-list-devices.

AWS CLI

To list devices for a user

The following admin-list-devices example lists devices for the user diego.

```
aws cognito-idp admin-list-devices \
    --user-pool-id us-west-2_EXAMPLE \
    --username diego \
    --limit 1
```

Output:

```
{
    "Devices": [
        {
            "DeviceKey": "us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DeviceAttributes": [
                {
                    "Name": "device_status",
                    "Value": "valid"
                },
                {
                    "Name": "device_name",
                    "Value": "MyDevice"
                },
                {
                    "Name": "dev:device_arn",
                    "Value": "arn:aws:cognito-idp:us-west-2:123456789012:owner/
diego.us-west-2_EXAMPLE/device/us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                },
                {
                    "Name": "dev:device_owner",
                    "Value": "diego.us-west-2_EXAMPLE"
                },
                {
                    "Name": "last_ip_used",
                    "Value": "192.0.2.1"
                },
```

```
                {
                    "Name": "dev:device_remembered_status",
                    "Value": "remembered"
                },
                {
                    "Name": "dev:device_sdk",
                    "Value": "aws-sdk"
                }
            ],
            "DeviceCreateDate": 1715100742.022,
            "DeviceLastModifiedDate": 1723233651.167,
            "DeviceLastAuthenticatedDate": 1715100742.0
        }
    ]
}
```

For more information, see Working with user devices in your user pool in the *Amazon Cognito Developer Guide*.

- For API details, see AdminListDevices in *AWS CLI Command Reference*.

`admin-list-groups-for-user`

The following code example shows how to use `admin-list-groups-for-user`.

AWS CLI

To list groups for a user

The following `admin-list-groups-for-user` example lists groups for username diego@example.com.

```
aws cognito-idp admin-list-groups-for-user \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username diego@example.com
```

Output:

```
{
    "Groups": [
        {
            "Description": "Sample group",
```

```
            "Precedence": 1,
            "LastModifiedDate": 1548097827.125,
            "RoleArn": "arn:aws:iam::123456789012:role/SampleRole",
            "GroupName": "SampleGroup",
            "UserPoolId": "us-west-2_aaaaaaaaa",
            "CreationDate": 1548097827.125
        }
    ]
}
```

For more information, see Adding groups to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see AdminListGroupsForUser in *AWS CLI Command Reference*.

`admin-list-user-auth-events`

The following code example shows how to use `admin-list-user-auth-events`.

AWS CLI

To list authorization events for a user

The following `admin-list-user-auth-events` example lists the most recent user activity log event for the user diego.

```
aws cognito-idp admin-list-user-auth-events \
    --user-pool-id us-west-2_ywDJHlIfU \
    --username brcotter+050123 \
    --max-results 1
```

Output:

```
{
    "AuthEvents": [
        {
            "EventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "EventType": "SignIn",
            "CreationDate": 1726694203.495,
            "EventResponse": "InProgress",
            "EventRisk": {
                "RiskDecision": "AccountTakeover",
                "RiskLevel": "Medium",
                "CompromisedCredentialsDetected": false
```

```
            },
            "ChallengeResponses": [
                {
                    "ChallengeName": "Password",
                    "ChallengeResponse": "Success"
                }
            ],
            "EventContextData": {
                "IpAddress": "192.0.2.1",
                "City": "Seattle",
                "Country": "United States"
            }
        }
    ],
    "NextToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222#2024-09-18T21:16:43.495Z"
}
```

For more information, see Viewing and exporting user event history in the *Amazon Cognito Developer Guide*.

- For API details, see AdminListUserAuthEvents in *AWS CLI Command Reference*.

`admin-remove-user-from-group`

The following code example shows how to use `admin-remove-user-from-group`.

AWS CLI

To remove a user from a group

The following `admin-remove-user-from-group` example removes jane@example.com from SampleGroup.

```
aws cognito-idp admin-remove-user-from-group \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username jane@example.com \
    --group-name SampleGroup
```

This command produces no output.

For more information, see Adding groups to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see AdminRemoveUserFromGroup in *AWS CLI Command Reference*.

admin-reset-user-password

The following code example shows how to use admin-reset-user-password.

AWS CLI

To reset a user password

The following admin-reset-user-password example resets the password for diego@example.com.

```
aws cognito-idp admin-reset-user-password \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username diego@example.com
```

This command produces no output.

For more information, see Passwords, account recovery, and password policies in the *Amazon Cognito Developer Guide*.

- For API details, see AdminResetUserPassword in *AWS CLI Command Reference*.

admin-respond-to-auth-challenge

The following code example shows how to use admin-respond-to-auth-challenge.

AWS CLI

To respond to an authentication challenge

The following admin-respond-to-auth-challenge example provides a TOTP MFA code for diego@example.com and completes sign-in. This user pool has device remembering turned on, so the authentication result also returns a new device key. There are many ways to respond to different authentication challenges, depending on your authentication flow, user pool configuration, and user settings.

```
aws cognito-idp admin-respond-to-auth-challenge \
    --user-pool-id us-west-2_EXAMPLE \
    --client-id 1example23456789 \
    --challenge-name SOFTWARE_TOKEN_MFA \
    --challenge-responses USERNAME=diego@example.com,SOFTWARE_TOKEN_MFA_CODE=000000
 \
```

```
    --session AYABeEXAMPLEsessionToken
```

Output:

```
{
    "ChallengeParameters": {},
    "AuthenticationResult": {
        "AccessToken": "eyJra456defEXAMPLE",
        "ExpiresIn": 3600,
        "TokenType": "Bearer",
        "RefreshToken": "eyJra123abcEXAMPLE",
        "IdToken": "eyJra789ghiEXAMPLE",
        "NewDeviceMetadata": {
            "DeviceKey": "us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DeviceGroupKey": "-ExAmPlE1"
        }
    }
}
```

For more information, see Admin authentication flow in the *Amazon Cognito Developer Guide*.

- For API details, see AdminRespondToAuthChallenge in *AWS CLI Command Reference*.

`admin-set-user-mfa-preference`

The following code example shows how to use `admin-set-user-mfa-preference`.

AWS CLI

To set the user MFA preference

The following `admin-set-user-mfa-preference` example sets the SMS MFA preference for username diego@example.com.

```
aws cognito-idp admin-set-user-mfa-preference \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username diego@example.com \
    --sms-mfa-settings Enabled=false,PreferredMfa=false
```

This command produces no output.

For more information, see Adding MFA to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see AdminSetUserMfaPreference in *AWS CLI Command Reference*.

`admin-set-user-password`

The following code example shows how to use `admin-set-user-password`.

AWS CLI

To set a user password as an admin

The following `admin-set-user-password` example permanently sets the password for diego@example.com.

```
aws cognito-idp admin-set-user-password \
    --user-pool-id us-west-2_EXAMPLE \
    --username diego@example.com \
    --password MyExamplePassword1! \
    --permanent
```

This command produces no output.

For more information, see Passwords, password recovery, and password policies in the *Amazon Cognito Developer Guide*.

- For API details, see AdminSetUserPassword in *AWS CLI Command Reference*.

`admin-set-user-settings`

The following code example shows how to use `admin-set-user-settings`.

AWS CLI

To set user settings

The following `admin-set-user-settings` example sets the MFA delivery preference for username diego@example.com to EMAIL.

```
aws cognito-idp admin-set-user-settings \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username diego@example.com \
    --mfa-options DeliveryMedium=EMAIL
```

This command produces no output.

For more information, see Adding MFA to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see AdminSetUserSettings in *AWS CLI Command Reference*.

`admin-update-auth-event-feedback`

The following code example shows how to use `admin-update-auth-event-feedback`.

AWS CLI

To provide feedback for an authorization event

The following `admin-update-auth-event-feedback` example sets the feedback value for an authorization event identified by event-id to Valid.

```
aws cognito-idp admin-update-auth-event-feedback \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username diego@example.com \
    --event-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --feedback-value Valid
```

This command produces no output.

For more information, see Working with adaptive authentication in the *Amazon Cognito Developer Guide*.

- For API details, see AdminUpdateAuthEventFeedback in *AWS CLI Command Reference*.

`admin-update-device-status`

The following code example shows how to use `admin-update-device-status`.

AWS CLI

To update device status

The following `admin-update-device-status` example sets the device remembered status for the device identified by device-key to not_remembered.

```
aws cognito-idp admin-update-device-status \
    --user-pool-id us-west-2_aaaaaaaaa \
```

```
    --username diego@example.com \
    --device-key xxxx \
    --device-remembered-status not_remembered
```

This command produces no output.

For more information, see Working with user devices in your user pool in the *Amazon Cognito Developer Guide*.

- For API details, see AdminUpdateDeviceStatus in *AWS CLI Command Reference*.

`admin-update-user-attributes`

The following code example shows how to use `admin-update-user-attributes`.

AWS CLI

To update user attributes

The following `admin-update-user-attributes` example updates a custom user attribute CustomAttr1 for user diego@example.com.

```
aws cognito-idp admin-update-user-attributes \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username diego@example.com \
    --user-attributes Name="custom:CustomAttr1",Value="Purple"
```

This command produces no output.

For more information, see Working with user attributes in the *Amazon Cognito Developer Guide*.

- For API details, see AdminUpdateUserAttributes in *AWS CLI Command Reference*.

`admin-user-global-sign-out`

The following code example shows how to use `admin-user-global-sign-out`.

AWS CLI

To sign out a user as an admin

The following `admin-user-global-sign-out` example signs out the user diego@example.com.

```
aws cognito-idp admin-user-global-sign-out \
    --user-pool-id us-west-2_EXAMPLE \
    --username diego@example.com
```

This command produces no output.

For more information, see Authentication with a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see AdminUserGlobalSignOut in *AWS CLI Command Reference*.

`associate-software-token`

The following code example shows how to use `associate-software-token`.

AWS CLI

To generate a secret key for an MFA authenticator app

The following `associate-software-token` example generates a TOTP private key for a user who has signed in and received an access token. The resulting private key can be manually entered into an authenticator app, or applications can render it as a QR code that the user can scan.

```
aws cognito-idp associate-software-token \
    --access-token eyJra456defEXAMPLE
```

Output:

```
{
    "SecretCode": "QWERTYUIOP123456EXAMPLE"
}
```

For more information, see TOTP software token MFA in the *Amazon Cognito Developer Guide*.

- For API details, see AssociateSoftwareToken in *AWS CLI Command Reference*.

`change-password`

The following code example shows how to use `change-password`.

AWS CLI

To change a password

The following `change-password` example changes a password.

```
aws cognito-idp change-password \
    --previous-password OldPassword \
    --proposed-password NewPassword \
    --access-token ACCESS_TOKEN
```

This command produces no output.

For more information, see Passwords, account recovery, and password policies in the *Amazon Cognito Developer Guide*.

- For API details, see ChangePassword in *AWS CLI Command Reference*.

`confirm-device`

The following code example shows how to use `confirm-device`.

AWS CLI

To confirm a user device

The following `confirm-device` example adds a new remembered device for the current user.

```
aws cognito-idp confirm-device \
    --access-token eyJra456defEXAMPLE \
    --device-key us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --device-secret-verifier-
config PasswordVerifier=TXlWZXJpZmllclN0cmluZw,Salt=TXlTUlBTYWx0
```

Output:

```
{
    "UserConfirmationNecessary": false
}
```

For more information, see Working with user devices in your user pool in the *Amazon Cognito Developer Guide*.

- For API details, see ConfirmDevice in *AWS CLI Command Reference*.

`confirm-forgot-password`

The following code example shows how to use `confirm-forgot-password`.

AWS CLI

To confirm a forgotten password

The following `confirm-forgot-password` example confirms a forgotten password for username diego@example.com.

```
aws cognito-idp confirm-forgot-password \
    --client-id 3n4b5urk1ft4fl3mg5e62d9ado \
    --username diego@example.com \
    --password PASSWORD \
    --confirmation-code CONF_CODE
```

This command produces no output.

For more information, see Passwords, account recovery, and password policies in the *Amazon Cognito Developer Guide*.

- For API details, see ConfirmForgotPassword in *AWS CLI Command Reference*.

`confirm-sign-up`

The following code example shows how to use `confirm-sign-up`.

AWS CLI

To confirm sign-up

The following `confirm-sign-up` example confirms sign-up for username diego@example.com.

```
aws cognito-idp confirm-sign-up \
    --client-id 3n4b5urk1ft4fl3mg5e62d9ado \
    --username diego@example.com \
    --confirmation-code CONF_CODE
```

Output:

```
{
    "Session": "AYABeEXAMPLEhLPy6WfPnN0bJ3VYeUg7Ryh2mB1xOCy2CFvpZx5jSEXAMPLE"
}
```

For more information, see Signing up and confirming user accounts in the *Amazon Cognito Developer Guide*.

- For API details, see ConfirmSignUp in *AWS CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

Example 1: To create a group

The following `create-group` example creates a group with a description.

```
aws cognito-idp create-group \
    --user-pool-id us-west-2_aaaaaaaaa \
    --group-name MyNewGroup \
    --description "New group."
```

Output:

```
{
    "Group": {
        "GroupName": "MyNewGroup",
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "Description": "New group.",
        "LastModifiedDate": 1548270073.795,
        "CreationDate": 1548270073.795
    }
}
```

For more information, see Adding groups to a user pool in the *Amazon Cognito Developer Guide*.

Example 2: To create a group with a role and precedence

The following `create-group` example creates a group with a description. It also includes a role and precedence.

```
aws cognito-idp create-group \
    --user-pool-id us-west-2_aaaaaaaaa \
    --group-name MyNewGroupWithRole \
    --description "New group with a role." \
    --role-arn arn:aws:iam::123456789012:role/MyNewGroupRole \
    --precedence 2
```

Output:

```
{
    "Group": {
        "GroupName": "MyNewGroupWithRole",
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "Description": "New group with a role.",
        "RoleArn": "arn:aws:iam::123456789012:role/MyNewGroupRole",
        "Precedence": 2,
        "LastModifiedDate": 1548270211.761,
        "CreationDate": 1548270211.761
    }
}
```

For more information, see Adding groups to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`create-identity-provider`

The following code example shows how to use `create-identity-provider`.

AWS CLI

Example 1: To create a user pool SAML identity provider (IdP) with a metadata URL

The following `create-identity-provider` example creates a new SAML IdP with metadata from a public URL, attribute mapping, and two identifiers.

```
aws cognito-idp create-identity-provider \
    --user-pool-id us-west-2_EXAMPLE \
    --provider-name MySAML \
```

```
    --provider-type SAML \
    --provider-
details IDPInit=true,IDPSignout=true,EncryptedResponses=true,MetadataURL=https://
auth.example.com/sso/saml/metadata,RequestSigningAlgorithm=rsa-sha256 \
    --attribute-mapping email=emailaddress,phone_number=phone,custom:111=department
 \
    --idp-identifiers CorpSAML WestSAML
```

Output:

```
{
    "IdentityProvider": {
        "UserPoolId": "us-west-2_EXAMPLE",
        "ProviderName": "MySAML",
        "ProviderType": "SAML",
        "ProviderDetails": {
            "ActiveEncryptionCertificate": "MIICvTCCAaEXAMPLE",
            "EncryptedResponses": "true",
            "IDPInit": "true",
            "IDPSignout": "true",
            "MetadataURL": "https://auth.example.com/sso/saml/metadata",
            "RequestSigningAlgorithm": "rsa-sha256",
            "SLORedirectBindingURI": "https://auth.example.com/slo/saml",
            "SSORedirectBindingURI": "https://auth.example.com/sso/saml"
        },
        "AttributeMapping": {
            "custom:111": "department",
            "emailaddress": "email",
            "phone": "phone_number"
        },
        "IdpIdentifiers": [
            "CorpSAML",
            "WestSAML"
        ],
        "LastModifiedDate": 1726853833.977,
        "CreationDate": 1726853833.977
    }
}
```

For more information, see Adding user pool sign-in through a third party in the *Amazon Cognito Developer Guide*.

Example 2: To create a user pool SAML identity provider (IdP) with a metadata file

The following `create-identity-provider` example creates a new SAML IdP with metadata from a file, attribute mapping, and two identifiers. File syntax can differ between operating systems in the `--provider-details` parameter. It's easiest to create a JSON input file for this operation.

```
aws cognito-idp create-identity-provider \
    --cli-input-json file://SAML-identity-provider.json
```

Contents of `SAML-identity-provider.json`:

```
{
    "AttributeMapping": {
        "email" : "idp_email",
        "email_verified" : "idp_email_verified"
    },
    "IdpIdentifiers": [ "platform" ],
    "ProviderDetails": {

    }
}
```

For more information, see Adding user pool sign-in through a third party in the *Amazon Cognito Developer Guide*.

- For API details, see CreateIdentityProvider in *AWS CLI Command Reference*.

`create-resource-server`

The following code example shows how to use `create-resource-server`.

AWS CLI

To create a user pool client

The following `create-resource-server` example creates a new resource server with custom scopes.

```
aws cognito-idp create-resource-server \
    --user-pool-id us-west-2_EXAMPLE \
    --identifier solar-system-data \
    --name "Solar system object tracker" \
    --scopes ScopeName=sunproximity.read,ScopeDescription="Distance in AU from Sol"
 ScopeName=asteroids.add,ScopeDescription="Enter a new asteroid"
```

Output:

```
{
    "ResourceServer": {
        "UserPoolId": "us-west-2_EXAMPLE",
        "Identifier": "solar-system-data",
        "Name": "Solar system object tracker",
        "Scopes": [
            {
                "ScopeName": "sunproximity.read",
```

```
                "ScopeDescription": "Distance in AU from Sol"
            },
            {
                "ScopeName": "asteroids.add",
                "ScopeDescription": "Enter a new asteroid"
            }
        ]
    }
}
```

For more information, see Scopes, M2M, and APIs with resource servers in the *Amazon Cognito Developer Guide*.

- For API details, see CreateResourceServer in *AWS CLI Command Reference*.

`create-user-import-job`

The following code example shows how to use `create-user-import-job`.

AWS CLI

To create a user import job

The following `create-user-import-job` example creates a user import job named MyImportJob.

```
aws cognito-idp create-user-import-job \
    --user-pool-id us-west-2_aaaaaaaaa \
    --job-name MyImportJob \
    --cloud-watch-logs-role-arn arn:aws:iam::123456789012:role/
CognitoCloudWatchLogsRole
```

Output:

```
{
    "UserImportJob": {
        "JobName": "MyImportJob",
        "JobId": "import-qQ0DCt2fRh",
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "PreSignedUrl": "PRE_SIGNED_URL",
        "CreationDate": 1548271795.471,
        "Status": "Created",
```

```
        "CloudWatchLogsRoleArn": "arn:aws:iam::123456789012:role/
CognitoCloudWatchLogsRole",
        "ImportedUsers": 0,
        "SkippedUsers": 0,
        "FailedUsers": 0
    }
}
```

Upload the .csv file with curl using the pre-signed URL.

```
curl -v -T "PATH_TO_CSV_FILE" -H "x-amz-server-side-encryption:aws:kms"
 "PRE_SIGNED_URL"
```

For more information, see Importing users into user pools from a CSV file in the *Amazon Cognito Developer Guide*.

- For API details, see CreateUserImportJob in *AWS CLI Command Reference*.

`create-user-pool-client`

The following code example shows how to use `create-user-pool-client`.

AWS CLI

To create a user pool client

The following `create-user-pool-client` example creates a new user pool client with a client secret, explicit read and write attributes, sign in with username-password and SRP flows, sign-in with three IdPs, access to a subset of OAuth scopes, PinPoint analytics, and an extended authentication session validity.

```
aws cognito-idp create-user-pool-client \
    --user-pool-id us-west-2_EXAMPLE \
    --client-name MyTestClient \
    --generate-secret \
    --refresh-token-validity 10 \
    --access-token-validity 60 \
    --id-token-validity 60 \
    --token-validity-units AccessToken=minutes,IdToken=minutes,RefreshToken=days \
    --read-attributes email phone_number email_verified phone_number_verified \
    --write-attributes email phone_number \
```

```
    --explicit-auth-
flows ALLOW_USER_PASSWORD_AUTH ALLOW_USER_SRP_AUTH ALLOW_REFRESH_TOKEN_AUTH \
    --supported-identity-providers Google Facebook MyOIDC \
    --callback-urls https://www.amazon.com https://example.com http://
localhost:8001 myapp://example \
    --allowed-o-auth-flows code implicit \
    --allowed-o-auth-scopes openid profile aws.cognito.signin.user.admin solar-
system-data/asteroids.add \
    --allowed-o-auth-flows-user-pool-client \
    --analytics-configuration ApplicationArn=arn:aws:mobiletargeting:us-
west-2:123456789012:apps/thisisanexamplepinpointapplicationid,UserDataShared=TRUE \
    --prevent-user-existence-errors ENABLED \
    --enable-token-revocation \
    --enable-propagate-additional-user-context-data \
    --auth-session-validity 4
```

Output:

```
{
    "UserPoolClient": {
        "UserPoolId": "us-west-2_EXAMPLE",
        "ClientName": "MyTestClient",
        "ClientId": "123abc456defEXAMPLE",
        "ClientSecret": "this1234is5678my91011example1213client1415secret",

        "EnableTokenRevocation": true,
        "EnablePropagateAdditionalUserContextData": true,
        "AuthSessionValidity": 4
    }
}
```

For more information, see Application-specific settings with app clients in the *Amazon Cognito Developer Guide*.

- For API details, see CreateUserPoolClient in *AWS CLI Command Reference*.

`create-user-pool-domain`

The following code example shows how to use `create-user-pool-domain`.

AWS CLI

Example 1: To create a user pool domain

The following `create-user-pool-domain` example creates a new custom domain.

```
aws cognito-idp create-user-pool-domain \
    --user-pool-id us-west-2_EXAMPLE \
    --domain auth.example.com \
    --custom-domain-config CertificateArn=arn:aws:acm:us-
east-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "CloudFrontDomain": "example1domain.cloudfront.net"
}
```

For more information, see Configuring a user pool domain in the *Amazon Cognito Developer Guide*.

Example 2: To create a user pool domain

The following `create-user-pool-domain` example creates a new domain with a service-owned prefix.

```
aws cognito-idp create-user-pool-domain \
    --user-pool-id us-west-2_EXAMPLE2 \
    --domain mydomainprefix
```

Output:

```
{
```

```
    "ManagedLoginVersion": 1
}
```

For more information, see Configuring a user pool domain in the *Amazon Cognito Developer Guide*.

- For API details, see CreateUserPoolDomain in *AWS CLI Command Reference*.

`create-user-pool`

The following code example shows how to use `create-user-pool`.

AWS CLI

Example 1: To create a minimally configured user pool

The following `create-user-pool` example creates a user pool named MyUserPool using default values. There are no required attributes and no application clients. MFA and advanced security is disabled.

```
aws cognito-idp create-user-pool \
    --pool-name MyUserPool
```

Output:

```
{
    "UserPool": {
        "SchemaAttributes": [
            {
                "Name": "sub",
                "StringAttributeConstraints": {
                    "MinLength": "1",
                    "MaxLength": "2048"
                },
                "DeveloperOnlyAttribute": false,
                "Required": true,
                "AttributeDataType": "String",
                "Mutable": false
            },
            {
                "Name": "name",
                "StringAttributeConstraints": {
                    "MinLength": "0",
```

```
                    "MaxLength": "2048"
                },
                "DeveloperOnlyAttribute": false,
                "Required": false,
                "AttributeDataType": "String",
                "Mutable": true
            },
            {

For more information, see Authenticating users with Amazon Cognito user pools in the *Amazon Cognito Developer Guide*.

Example 2: To create a user pool with two required attributes

The following `create-user-pool` example creates a user pool MyUserPool. The pool is configured to accept email as a username attribute. It also sets the email source address to a validated address using Amazon Simple Email Service.

```
aws cognito-idp create-user-pool \
    --pool-name MyUserPool \
    --username-attributes "email" \
    --email-configuration SourceArn="arn:aws:ses:us-west-2:123456789012:identity/
jane@example.com",ReplyToEmailAddress="jane@example.com"
```

Output:

```
{
    "UserPool": {
        "SchemaAttributes": [
            {
                "Name": "sub",

                "MinimumLength": 8,
                "RequireUppercase": true
            }
        },
        "UsernameAttributes": [
            "email"
        ],
        "CreationDate": 1547837788.189,
        "EstimatedNumberOfUsers": 0,
        "Id": "us-west-2_aaaaaaaaa",
        "LambdaConfig": {}
    }
```

```
}
```

For more information, see Authenticating users with Amazon Cognito user pools in the *Amazon Cognito Developer Guide*.

- For API details, see CreateUserPool in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To delete a group

The following `delete-group` example deletes a group.

```
aws cognito-idp delete-group \
    --user-pool-id us-west-2_aaaaaaaaa \
    --group-name MyGroupName
```

This command produces no output.

For more information, see Adding groups to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

`delete-identity-provider`

The following code example shows how to use `delete-identity-provider`.

AWS CLI

To delete an identity provider

The following `delete-identity-provider` example deletes an identity provider.

```
aws cognito-idp delete-identity-provider \
    --user-pool-id us-west-2_aaaaaaaaa \
    --provider-name Facebook
```

This command produces no output.

For more information, see User pool sign-in with third party identity providers in the *Amazon Cognito Developer Guide*.

- For API details, see DeleteIdentityProvider in *AWS CLI Command Reference*.

`delete-resource-server`

The following code example shows how to use `delete-resource-server`.

AWS CLI

To delete a resource server

The following `delete-resource-server` example deletes a resource server named weather.example.com.

```
aws cognito-idp delete-resource-server \
    --user-pool-id us-west-2_aaaaaaaaa \
    --identifier weather.example.com
```

This command produces no output.

For more information, see Scopes, M2M, and resource servers in the *Amazon Cognito Developer Guide*.

- For API details, see DeleteResourceServer in *AWS CLI Command Reference*.

`delete-user-attributes`

The following code example shows how to use `delete-user-attributes`.

AWS CLI

To delete a user attribute

The following `delete-user-attributes` example deletes the custom attribute "custom:attribute" from the currently signed-in user.

```
aws cognito-idp delete-user-attributes \
    --access-token ACCESS_TOKEN \
    --user-attribute-names "custom:department"
```

This command produces no output.

For more information, see Working with user attributes in the *Amazon Cognito Developer Guide*.

- For API details, see DeleteUserAttributes in *AWS CLI Command Reference*.

`delete-user-pool-client`

The following code example shows how to use `delete-user-pool-client`.

AWS CLI

To delete a user pool client

The following `delete-user-pool-client` example deletes a user pool client.

```
aws cognito-idp delete-user-pool-client \
    --user-pool-id us-west-2_aaaaaaaaa \
    --client-id 38fjsnc484p94kpqsnet7mpld0
```

This command produces no output.

For more information, see Application-specific settings with app clients in the *Amazon Cognito Developer Guide*.

- For API details, see DeleteUserPoolClient in *AWS CLI Command Reference*.

`delete-user-pool-domain`

The following code example shows how to use `delete-user-pool-domain`.

AWS CLI

To delete a user pool domain

The following `delete-user-pool-domain` example deletes a user pool domain named `my-domain`.

```
aws cognito-idp delete-user-pool-domain \
    --user-pool-id us-west-2_aaaaaaaaa \
    --domain my-domain
```

This command produces no output.

For more information, see Configuring a user pool domain in the *Amazon Cognito Developer Guide*.

- For API details, see DeleteUserPoolDomain in *AWS CLI Command Reference*.

`delete-user-pool`

The following code example shows how to use `delete-user-pool`.

AWS CLI

To delete a user pool

The following `delete-user-pool` example deletes a user pool using the user pool id, us-west-2_aaaaaaaaa.

```
aws cognito-idp delete-user-pool \
    --user-pool-id us-west-2_aaaaaaaaa
```

This command produces no output.

For more information, see Authenticating users with Amazon Cognito user pools in the *Amazon Cognito Developer Guide*.

- For API details, see DeleteUserPool in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes a user.

```
aws cognito-idp delete-user \
    --access-token ACCESS_TOKEN
```

This command produces no output.

For more information, see Managing users in your user pool in the *Amazon Cognito Developer Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`describe-identity-provider`

The following code example shows how to use `describe-identity-provider`.

AWS CLI

To describe an identity provider

The following `describe-identity-provider` example describes an identity provider named Facebook.

```
aws cognito-idp describe-identity-provider \
    --user-pool-id us-west-2_aaaaaaaaa \
    --provider-name Facebook
```

Output:

```
{
    "IdentityProvider": {
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "ProviderName": "Facebook",
        "ProviderType": "Facebook",
        "ProviderDetails": {
            "attributes_url": "https://graph.facebook.com/me?fields=",
            "attributes_url_add_attributes": "true",
        "authorize_scopes": "myscope",
            "authorize_url": "https://www.facebook.com/v2.9/dialog/oauth",
            "client_id": "11111",
            "client_secret": "11111",
            "token_request_method": "GET",
            "token_url": "https://graph.facebook.com/v2.9/oauth/access_token"
        },
        "AttributeMapping": {
            "username": "id"
        },
        "IdpIdentifiers": [],
        "LastModifiedDate": 1548105901.736,
        "CreationDate": 1548105901.736
    }
}
```

For more information, see User pool sign-in with third party identity providers in the *Amazon Cognito Developer Guide*.

- For API details, see DescribeIdentityProvider in *AWS CLI Command Reference*.

`describe-resource-server`

The following code example shows how to use `describe-resource-server`.

AWS CLI

To describe a resource server

The following `describe-resource-server` example describes the resource server weather.example.com.

```
aws cognito-idp describe-resource-server \
    --user-pool-id us-west-2_aaaaaaaaa \
    --identifier weather.example.com
```

Output:

```
{
    "ResourceServer": {
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "Identifier": "weather.example.com",
        "Name": "Weather",
        "Scopes": [
            {
                "ScopeName": "weather.update",
                "ScopeDescription": "Update weather forecast"
            },
            {
                "ScopeName": "weather.read",
                "ScopeDescription": "Read weather forecasts"
            },
            {
                "ScopeName": "weather.delete",
                "ScopeDescription": "Delete a weather forecast"
            }
        ]
    }
```

```
}
```

For more information, see Scopes, M2M, and resource servers in the *Amazon Cognito Developer Guide*.

- For API details, see DescribeResourceServer in *AWS CLI Command Reference*.

`describe-risk-configuration`

The following code example shows how to use `describe-risk-configuration`.

AWS CLI

To describe a risk configuration

The following `describe-risk-configuration` example describes the risk configuration associated with pool us-west-2_aaaaaaaaa.

```
aws cognito-idp describe-risk-configuration \
    --user-pool-id us-west-2_aaaaaaaaa
```

Output:

```
{
    "RiskConfiguration": {
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "CompromisedCredentialsRiskConfiguration": {
            "EventFilter": [
                "SIGN_IN",
                "SIGN_UP",
                "PASSWORD_CHANGE"
            ],
            "Actions": {
                "EventAction": "BLOCK"
            }
        },
        "AccountTakeoverRiskConfiguration": {
            "NotifyConfiguration": {
                "From": "diego@example.com",
                "ReplyTo": "diego@example.com",
                "SourceArn": "arn:aws:ses:us-west-2:123456789012:identity/

                    "EventAction": "MFA_IF_CONFIGURED"
                }
            }
        }
    }
}
```

For more information, see Advanced security with threat protection in the *Amazon Cognito Developer Guide*.

- For API details, see DescribeRiskConfiguration in *AWS CLI Command Reference*.

`describe-user-import-job`

The following code example shows how to use `describe-user-import-job`.

AWS CLI

To describe a user import job

The following `describe-user-import-job` example describes a user import job.

```
aws cognito-idp describe-user-import-job \
    --user-pool-id us-west-2_aaaaaaaaa \
    --job-id import-TZqNQvDRnW
```

Output:

```
{
    "UserImportJob": {
        "JobName": "import-Test1",
        "JobId": "import-TZqNQvDRnW",
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "PreSignedUrl": "PRE_SIGNED URL",
        "CreationDate": 1548271708.512,
        "Status": "Created",
        "CloudWatchLogsRoleArn": "arn:aws:iam::123456789012:role/
CognitoCloudWatchLogsRole",
        "ImportedUsers": 0,
        "SkippedUsers": 0,
        "FailedUsers": 0
    }
}
```

For more information, see Importing users into user pools from a CSV file in the *Amazon Cognito Developer Guide*.

- For API details, see DescribeUserImportJob in *AWS CLI Command Reference*.

`describe-user-pool-client`

The following code example shows how to use `describe-user-pool-client`.

AWS CLI

To describe a user pool client

The following `describe-user-pool-client` example describes a user pool client.

```
aws cognito-idp describe-user-pool-client \
    --user-pool-id us-west-2_aaaaaaaaa \
    --client-id 38fjsnc484p94kpqsnet7mpld0
```

Output:

```
{
    "UserPoolClient": {
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "ClientName": "MyApp",
        "ClientId": "38fjsnc484p94kpqsnet7mpld0",
```

```
        "ClientSecret": "CLIENT_SECRET",
        "LastModifiedDate": 1548108676.163,
        "CreationDate": 1548108676.163,
        "RefreshTokenValidity": 30,
        "ReadAttributes": [
            "address",
            "birthdate",
            "custom:CustomAttr1",
            "custom:CustomAttr2",
            "email",
            "email_verified",
            "family_name",
            "gender",
            "given_name",
            "locale",
            "middle_name",
            "name",
            "nickname",

    }
}
```

For more information, see Application-specific settings with app clients in the *Amazon Cognito Developer Guide*.

- For API details, see DescribeUserPoolClient in *AWS CLI Command Reference*.

`describe-user-pool-domain`

The following code example shows how to use `describe-user-pool-domain`.

AWS CLI

To describe a user pool client

The following `describe-user-pool-domain` example describes a user pool domain named my-domain.

```
aws cognito-idp describe-user-pool-domain \
    --domain my-domain
```

Output:

```
{
    "DomainDescription": {
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "AWSAccountId": "123456789012",

        "Version": "20190128175402",
        "Status": "ACTIVE",
        "CustomDomainConfig": {}
```

```
    }
}
```

For more information, see Configuring a user pool domain in the *Amazon Cognito Developer Guide*.

- For API details, see DescribeUserPoolDomain in *AWS CLI Command Reference*.

`describe-user-pool`

The following code example shows how to use `describe-user-pool`.

AWS CLI

To describe a user pool

The following `describe-user-pool` example describes a user pool with the user pool id us-west-2_EXAMPLE.

```
aws cognito-idp describe-user-pool \
    --user-pool-id us-west-2_EXAMPLE
```

Output:

```
{
    "UserPool": {
        "Id": "us-west-2_EXAMPLE",
        "Name": "MyUserPool",
        "Policies": {

    }
}
```

For more information, see Amazon Cognito user pools in the *Amazon Cognito Developer Guide*.

- For API details, see DescribeUserPool in *AWS CLI Command Reference*.

`forget-device`

The following code example shows how to use `forget-device`.

AWS CLI

To forget a device

The following `forget-device` example forgets a device.

```
aws cognito-idp forget-device \
    --device-key us-west-2_abcd_1234-5678
```

This command produces no output.

For more information, see Working with user devices in your user pool in the *Amazon Cognito Developer Guide*.

- For API details, see ForgetDevice in *AWS CLI Command Reference*.

`forgot-password`

The following code example shows how to use `forgot-password`.

AWS CLI

To force a password change

The following `forgot-password` example sends a message to jane@example.com to change their password.

```
aws cognito-idp forgot-password \
    --client-id 38fjsnc484p94kpqsnet7mpld0 \
    --username jane@example.com
```

Output:

```
{
    "CodeDeliveryDetails": {
        "Destination": "j***@e***.com",
        "DeliveryMedium": "EMAIL",
        "AttributeName": "email"
    }
}
```

For more information, see Passwords, account recovery, and password policies in the *Amazon Cognito Developer Guide*.

- For API details, see ForgotPassword in *AWS CLI Command Reference*.

`get-csv-header`

The following code example shows how to use `get-csv-header`.

AWS CLI

To create a csv header

The following `get-csv-header` example gets the CSV header for a user pool.

```
aws cognito-idp get-csv-header \
    --user-pool-id us-west-2_aaaaaaaaa
```

Output:

```
{
```

```
    "UserPoolId": "us-west-2_aaaaaaaaa",
    "CSVHeader": [
        "name",
        "given_name",
        "family_name",
        "middle_name",
        "nickname",
        "preferred_username",
        "profile",
        "picture",
        "website",
        "email",
        "email_verified",
        "gender",
        "birthdate",
        "zoneinfo",
        "locale",
        "phone_number",
        "phone_number_verified",
        "address",
        "updated_at",
        "cognito:mfa_enabled",
        "cognito:username"
    ]
}
```

For more information, see Importing users into user pools from a CSV file in the *Amazon Cognito Developer Guide*.

- For API details, see GetCsvHeader in *AWS CLI Command Reference*.

`get-device`

The following code example shows how to use `get-device`.

AWS CLI

To get a device

The following `get-device` example displays one device for currently signed-in user.

```
aws cognito-idp get-device \
    --access-token eyJra456defEXAMPLE \
```

```
    --device-key us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Device": {
        "DeviceKey": "us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DeviceAttributes": [
            {
                "Name": "device_status",
                "Value": "valid"
            },
            {
                "Name": "device_name",
                "Value": "MyDevice"
            },
            {
                "Name": "dev:device_arn",
                "Value": "arn:aws:cognito-idp:us-west-2:123456789012:owner/diego.us-
west-2_EXAMPLE/device/us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            },
            {
                "Name": "dev:device_owner",
                "Value": "diego.us-west-2_EXAMPLE"
            },
            {
                "Name": "last_ip_used",
                "Value": "192.0.2.1"
            },
            {
                "Name": "dev:device_remembered_status",
                "Value": "remembered"
            },
            {
                "Name": "dev:device_sdk",
                "Value": "aws-sdk"
            }
        ],
        "DeviceCreateDate": 1715100742.022,
        "DeviceLastModifiedDate": 1723233651.167,
        "DeviceLastAuthenticatedDate": 1715100742.0
    }
}
```

For more information, see Working with user devices in your user pool in the *Amazon Cognito Developer Guide*.

- For API details, see GetDevice in *AWS CLI Command Reference*.

`get-group`

The following code example shows how to use `get-group`.

AWS CLI

To get information about a group

The following `get-group` example lists the properties of the user group named `MyGroup`. This group has a precedence and an IAM role associated with it.

```
aws cognito-idp get-group \
    --user-pool-id us-west-2_EXAMPLE \
    --group-name MyGroup
```

Output:

```
{
    "Group": {
        "GroupName": "MyGroup",
        "UserPoolId": "us-west-2_EXAMPLE",
        "RoleArn": "arn:aws:iam::123456789012:role/example-cognito-role",
        "Precedence": 7,
        "LastModifiedDate": 1697211218.305,
        "CreationDate": 1611685503.954
    }
}
```

For more information, see Adding groups to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see GetGroup in *AWS CLI Command Reference*.

`get-identity-provider-by-identifier`

The following code example shows how to use `get-identity-provider-by-identifier`.

AWS CLI

To get the configuration of an identity provider from the IdP identifier

The following `get-identity-provider-by-identifier` example returns the configuration of the identity provider with the identifier `mysso`.

```
aws cognito-idp get-identity-provider-by-identifier \
    --user-pool-id us-west-2_EXAMPLE \
    --idp-identifier mysso
```

Output:

```
{
    "IdentityProvider": {
        "UserPoolId": "us-west-2_EXAMPLE",
        "ProviderName": "MYSAML",
        "ProviderType": "SAML",
        "ProviderDetails": {
            "ActiveEncryptionCertificate": "[Certificate contents]",
            "IDPSignout": "false",
            "MetadataURL": "https://auth.example.com/saml/metadata/",
            "SLORedirectBindingURI": "https://auth.example.com/saml/logout/",
            "SSORedirectBindingURI": "https://auth.example.com/saml/assertion/"
        },
        "AttributeMapping": {
            "email": "email"
        },
        "IdpIdentifiers": [
            "mysso",
            "mysamlsso"
        ],
        "LastModifiedDate": 1705616729.188,
        "CreationDate": 1643734622.919
    }
}
```

For more information, see Third-party IdP sign-in in the *Amazon Cognito Developer Guide*.

- For API details, see GetIdentityProviderByIdentifier in *AWS CLI Command Reference*.

`get-log-delivery-configuration`

The following code example shows how to use `get-log-delivery-configuration`.

AWS CLI

To display the log delivery configuration

The following `get-log-delivery-configuration` example displays the log export settings of the requested user pool.

```
aws cognito-idp get-log-delivery-configuration \
    --user-pool-id us-west-2_EXAMPLE
```

Output:

```
{
    "LogDeliveryConfiguration": {
        "UserPoolId": "us-west-2_EXAMPLE",
        "LogConfigurations": [
            {
                "LogLevel": "INFO",
                "EventSource": "userAuthEvents",
                "FirehoseConfiguration": {
                    "StreamArn": "arn:aws:firehose:us-
west-2:123456789012:deliverystream/my-test-deliverystream"
                }
            },
            {
                "LogLevel": "ERROR",
                "EventSource": "userNotification",
                "CloudWatchLogsConfiguration": {
                    "LogGroupArn": "arn:aws:logs:us-west-2:123456789012:log-
group:my-message-delivery-logs"
                }
            }
        ]
    }
}
```

For more information, see Exporting user pool logs in the *Amazon Cognito Developer Guide*.

- For API details, see GetLogDeliveryConfiguration in *AWS CLI Command Reference*.

`get-signing-certificate`

The following code example shows how to use `get-signing-certificate`.

AWS CLI

To display the SAML signing certificate

The following `get-signing-certificate` example displays the SAML 2.0 signing certificate for the request user pool.

```
aws cognito-idp get-signing-certificate \
    --user-pool-id us-west-2_EXAMPLE
```

Output:

```
{
    "Certificate": "[Certificate content]"
}
```

For more information, see SAML signing and encryption in the *Amazon Cognito Developer Guide*.

- For API details, see GetSigningCertificate in *AWS CLI Command Reference*.

`get-ui-customization`

The following code example shows how to use `get-ui-customization`.

AWS CLI

To display the classic hosted UI customization settings for an app client

The following `get-ui-customization` example displays the classic hosted UI customization settings for an app client that doesn't inherit settings from the user pool.

```
aws cognito-idp get-ui-customization \
    --user-pool-id us-west-2_EXAMPLE \
    --client-id 1example23456789
```

Output:

```
{
```

```
    "UICustomization": {
        "UserPoolId": "us-west-2_EXAMPLE",
        "ClientId": "1example23456789",
        "ImageUrl": "https://example.cloudfront.net/us-
west-2_EXAMPLE/1example23456789/20250115191928/assets/images/image.jpg",
        "CSS": "\n.logo-customizable {\n  max-width: 80%;\n  max-height: 30%;

        "CSSVersion": "20250115191928"
    }
}
```

For more information, see Hosted UI (classic) branding in the *Amazon Cognito Developer Guide*.

- For API details, see GetUiCustomization in *AWS CLI Command Reference*.

`get-user-attribute-verification-code`

The following code example shows how to use `get-user-attribute-verification-code`.

AWS CLI

To send an attribute verification code to the current user

The following `get-user-attribute-verification-code` example sends an attribute verification code to the currently signed-in user's email address.

```
aws cognito-idp get-user-attribute-verification-code \
    --access-token eyJra456defEXAMPLE \
    --attribute-name email
```

Output:

```
{
    "CodeDeliveryDetails": {
        "Destination": "a***@e***",
        "DeliveryMedium": "EMAIL",
        "AttributeName": "email"
    }
}
```

For more information, see Signing up and confirming user accounts in the *Amazon Cognito Developer Guide*.

- For API details, see GetUserAttributeVerificationCode in *AWS CLI Command Reference*.

`get-user-auth-factors`

The following code example shows how to use `get-user-auth-factors`.

AWS CLI

To list the authentication factors available to the current user

The following `get-user-auth-factors` example lists the available authentication factors for the currently signed-in user.

```
aws cognito-idp get-user-auth-factors \
    --access-token eyJra456defEXAMPLE
```

Output:

```
{
    "Username": "testuser",
    "ConfiguredUserAuthFactors": [
        "PASSWORD",
```

```
        "EMAIL_OTP",
        "SMS_OTP",
        "WEB_AUTHN"
    ]
}
```

For more information, see Authentication in the *Amazon Cognito Developer Guide*.

- For API details, see GetUserAuthFactors in *AWS CLI Command Reference*.

`get-user-pool-mfa-config`

The following code example shows how to use `get-user-pool-mfa-config`.

AWS CLI

To display the multi-factor authentication and WebAuthn settings of a user pool

The following `get-user-pool-mfa-config` example displays the MFA and WebAuthn configuration of the requested user pool.

```
aws cognito-idp get-user-pool-mfa-config \
    --user-pool-id us-west-2_EXAMPLE
```

Output:

```
{
    "SmsMfaConfiguration": {
        "SmsAuthenticationMessage": "Your OTP for MFA or sign-in: use {####}.",
        "SmsConfiguration": {
            "SnsCallerArn": "arn:aws:iam::123456789012:role/service-role/my-SMS-
Role",
            "ExternalId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "SnsRegion": "us-west-2"
        }
    },
    "SoftwareTokenMfaConfiguration": {
        "Enabled": true
    },
    "EmailMfaConfiguration": {
        "Message": "Your OTP for MFA or sign-in: use {####}",
        "Subject": "OTP test"
    },
```

```
    "MfaConfiguration": "OPTIONAL",
    "WebAuthnConfiguration": {
        "RelyingPartyId": "auth.example.com",
        "UserVerification": "preferred"
    }
}
```

For more information, see Adding MFA in the *Amazon Cognito Developer Guide*.

- For API details, see GetUserPoolMfaConfig in *AWS CLI Command Reference*.

`get-user`

The following code example shows how to use `get-user`.

AWS CLI

To get the details of the current user

The following `get-user` example displays the profile of the currently signed-in user.

```
aws cognito-idp get-user \
    --access-token eyJra456defEXAMPLE
```

Output:

```
{
    "Username": "johndoe",
    "UserAttributes": [
        {
            "Name": "sub",
            "Value": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "Name": "identities",
            "Value": "[{\"userId\":\"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222\",
\"providerName\":\"SignInWithApple\",\"providerType\":\"SignInWithApple\",\"issuer
\":null,\"primary\":false,\"dateCreated\":1701125599632}]"
        },
        {
            "Name": "email_verified",
            "Value": "true"
        },
```

```
        {
            "Name": "custom:state",
            "Value": "Maine"
        },
        {
            "Name": "name",
            "Value": "John Doe"
        },
        {
            "Name": "phone_number_verified",
            "Value": "true"
        },
        {
            "Name": "phone_number",
            "Value": "+12065551212"
        },
        {
            "Name": "preferred_username",
            "Value": "jamesdoe"
        },
        {
            "Name": "locale",
            "Value": "EMEA"
        },
        {
            "Name": "email",
            "Value": "jamesdoe@example.com"
        }
    ]
}
```

For more information, see Managing users in the *Amazon Cognito Developer Guide*.

- For API details, see GetUser in *AWS CLI Command Reference*.

`global-sign-out`

The following code example shows how to use `global-sign-out`.

AWS CLI

To sign out the current user

The following `global-sign-out` example signs out the current user.

```
aws cognito-idp global-sign-out \
    --access-token eyJra456defEXAMPLE
```

This command produces no output.

For more information, see Managing users in the *Amazon Cognito Developer Guide*.

- For API details, see GlobalSignOut in *AWS CLI Command Reference*.

`initiate-auth`

The following code example shows how to use `initiate-auth`.

AWS CLI

To sign in a user

The following `initiate-auth` example signs in a user with the basic username-password flow and no additional challenges.

```
aws cognito-idp initiate-auth \
    --auth-flow USER_PASSWORD_AUTH \
    --client-id 1example23456789 \
    --analytics-metadata AnalyticsEndpointId=d70b2ba36a8c4dc5a04a0451aEXAMPLE \
    --auth-parameters USERNAME=testuser,PASSWORD=ExamplePassword1! \
    --user-context-data EncodedData=mycontextdata \
    --client-metadata MyTestKey=MyTestValue
```

Output:

```
{
    "AuthenticationResult": {
        "AccessToken": "eyJra456defEXAMPLE",
        "ExpiresIn": 3600,
        "TokenType": "Bearer",
        "RefreshToken": "eyJra123abcEXAMPLE",
        "IdToken": "eyJra789ghiEXAMPLE",
        "NewDeviceMetadata": {
            "DeviceKey": "us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DeviceGroupKey": "-v7w9UcY6"
        }
    }
```

```
}
```

For more information, see Authentication in the *Amazon Cognito Developer Guide*.

- For API details, see InitiateAuth in *AWS CLI Command Reference*.

`list-devices`

The following code example shows how to use `list-devices`.

AWS CLI

To list a user's devices

The following `list-devices` example lists the devices that the current user has registered.

```
aws cognito-idp list-devices \
    --access-token eyJra456defEXAMPLE
```

Output:

```
{
    "Devices": [
        {
            "DeviceAttributes": [
                {
                    "Name": "device_status",
                    "Value": "valid"
                },
                {
                    "Name": "device_name",
                    "Value": "Dart-device"
                },
                {
                    "Name": "last_ip_used",
                    "Value": "192.0.2.1"
                }
            ],
            "DeviceCreateDate": 1715100742.022,
            "DeviceKey": "us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DeviceLastAuthenticatedDate": 1715100742.0,
            "DeviceLastModifiedDate": 1723233651.167
        },
```

```
        {
            "DeviceAttributes": [
                {
                    "Name": "device_status",
                    "Value": "valid"
                },
                {
                    "Name": "last_ip_used",
                    "Value": "192.0.2.2"
                }
            ],
            "DeviceCreateDate": 1726856147.993,
            "DeviceKey": "us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "DeviceLastAuthenticatedDate": 1726856147.0,
            "DeviceLastModifiedDate": 1726856147.993
        }
    ]
}
```

For more information, see Working with devices in the *Amazon Cognito Developer Guide*.

- For API details, see ListDevices in *AWS CLI Command Reference*.

`list-groups`

The following code example shows how to use `list-groups`.

AWS CLI

To list the groups in a user pool

The following `list-groups` example lists the first two groups in the requested user pool.

```
aws cognito-idp list-groups \
    --user-pool-id us-west-2_EXAMPLE \
    --max-items 2
```

Output:

```
{
    "Groups": [
        {
            "CreationDate": 1681760899.633,
```

```
            "Description": "My test group",
            "GroupName": "testgroup",
            "LastModifiedDate": 1681760899.633,
            "Precedence": 1,
            "UserPoolId": "us-west-2_EXAMPLE"
        },
        {
            "CreationDate": 1642632749.051,
            "Description": "Autogenerated group for users who sign in using
 Facebook",
            "GroupName": "us-west-2_EXAMPLE_Facebook",
            "LastModifiedDate": 1642632749.051,
            "UserPoolId": "us-west-2_EXAMPLE"
        }
    ],
    "NextToken": "[Pagination token]"
}
```

For more information, see Adding groups to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see ListGroups in *AWS CLI Command Reference*.

`list-identity-providers`

The following code example shows how to use `list-identity-providers`.

AWS CLI

To list identity providers

The following `list-identity-providers` example lists the first two identity providers in the requested user pool.

```
aws cognito-idp list-identity-providers \
    --user-pool-id us-west-2_EXAMPLE \
    --max-items 2
```

Output:

```
{
    "Providers": [
        {
            "CreationDate": 1619477386.504,
```

```
            "LastModifiedDate": 1703798328.142,
            "ProviderName": "Azure",
            "ProviderType": "SAML"
        },
        {
            "CreationDate": 1642698776.175,
            "LastModifiedDate": 1642699086.453,
            "ProviderName": "LoginWithAmazon",
            "ProviderType": "LoginWithAmazon"
        }
    ],
    "NextToken": "[Pagination token]"
}
```

For more information, see Third-party IdP sign-in in the *Amazon Cognito Developer Guide*.

- For API details, see ListIdentityProviders in *AWS CLI Command Reference*.

`list-resource-servers`

The following code example shows how to use `list-resource-servers`.

AWS CLI

To list resource servers

The following `list-resource-servers` example lists the first two resource servers in the requested user pool.

```
aws cognito-idp list-resource-servers \
    --user-pool-id us-west-2_EXAMPLE \
    --max-results 2
```

Output:

```
{
    "ResourceServers": [
        {
            "Identifier": "myapi.example.com",
            "Name": "Example API with custom access control scopes",
            "Scopes": [
                {
                    "ScopeDescription": "International customers",
```

```
                    "ScopeName": "international.read"
                },
                {
                    "ScopeDescription": "Domestic customers",
                    "ScopeName": "domestic.read"
                }
            ],
            "UserPoolId": "us-west-2_EXAMPLE"
        },
        {
            "Identifier": "myapi2.example.com",
            "Name": "Another example API for access control",
            "Scopes": [
                {
                    "ScopeDescription": "B2B customers",
                    "ScopeName": "b2b.read"
                }
            ],
            "UserPoolId": "us-west-2_EXAMPLE"
        }
    ],
    "NextToken": "[Pagination token]"
}
```

For more information, see Access control with resource servers in the *Amazon Cognito Developer Guide*.

- For API details, see ListResourceServers in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list user pool tags

The following `list-tags-for-resource` example lists the tags assigned to the user pool with the requested ARN.

```
aws cognito-idp list-tags-for-resource \
    --resource-arn arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-west-2_EXAMPLE
```

Output:

```
{
    "Tags": {
        "administrator": "Jie",
        "tenant": "ExampleCorp"
    }
}
```

For more information, see Tagging Amazon Cognito resources in the *Amazon Cognito Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-user-import-jobs`

The following code example shows how to use `list-user-import-jobs`.

AWS CLI

To list user import jobs and statuses

The following `list-user-import-jobs` example lists first three user import jobs and their details in the requested user pool.

```
aws cognito-idp list-user-import-jobs \
    --user-pool-id us-west-2_EXAMPLE \
    --max-results 3
```

Output:

```
{
    "PaginationToken": "us-west-2_EXAMPLE#import-example3#1667948397084",
    "UserImportJobs": [
        {
            "CloudWatchLogsRoleArn": "arn:aws:iam::123456789012:role/service-role/
Cognito-UserImport-Role",
            "CompletionDate": 1735329786.142,
            "CompletionMessage": "The user import job has expired.",
            "CreationDate": 1735241621.022,
            "FailedUsers": 0,
            "ImportedUsers": 0,
```

```
            "JobId": "import-example1",
            "JobName": "Test-import-job-1",
            "PreSignedUrl": "https://aws-cognito-idp-user-import-pdx.s3.us-

        }
    ]
}
```

For more information, see Importing users from a CSV file in the *Amazon Cognito Developer Guide*.

- For API details, see ListUserImportJobs in *AWS CLI Command Reference*.

`list-user-pool-clients`

The following code example shows how to use `list-user-pool-clients`.

AWS CLI

To list app clients

The following `list-user-pool-clients` example lists the first three app clients in the requested user pool.

```
aws cognito-idp list-user-pool-clients \
    --user-pool-id us-west-2_EXAMPLE \
    --max-results 3
```

Output:

```
{
    "NextToken": "[Pagination token]",
    "UserPoolClients": [
        {
            "ClientId": "1example23456789",
            "ClientName": "app-client-1",
            "UserPoolId": "us-west-2_EXAMPLE"
        },
        {
```

```
            "ClientId": "2example34567890",
            "ClientName": "app-client-2",
            "UserPoolId": "us-west-2_EXAMPLE"
        },
        {
            "ClientId": "3example45678901",
            "ClientName": "app-client-3",
            "UserPoolId": "us-west-2_EXAMPLE"
        }
    ]
}
```

For more information, see App clients in the *Amazon Cognito Developer Guide*.

- For API details, see ListUserPoolClients in *AWS CLI Command Reference*.

`list-user-pools`

The following code example shows how to use `list-user-pools`.

AWS CLI

To list user pools

The following `list-user-pools` example lists 3 of the available user pools in the AWS account of the current CLI credentials.

```
aws cognito-idp list-user-pools \
    --max-results 3
```

Output:

```
{
    "NextToken": "[Pagination token]",
    "UserPools": [
        {
            "CreationDate": 1681502497.741,

        }
    ]
}
```

For more information, see Amazon Cognito user pools in the *Amazon Cognito Developer Guide*.

- For API details, see ListUserPools in *AWS CLI Command Reference*.

`list-users-in-group`

The following code example shows how to use `list-users-in-group`.

AWS CLI

To list users in a group

The following `list-users-in-group` example lists users in group MyGroup.

```
aws cognito-idp list-users-in-group \
    --user-pool-id us-west-2_aaaaaaaaa \
    --group-name MyGroup
```

Output:

```
{
    "Users": [
        {
            "Username": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Attributes": [
                {

            "Enabled": true,
            "UserStatus": "FORCE_CHANGE_PASSWORD"
        }
    ]
}
```

For more information, see Adding groups to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see ListUsersInGroup in *AWS CLI Command Reference*.

`list-users`

The following code example shows how to use `list-users`.

AWS CLI

Example 1: To list users with a server-side filter

The following `list-users` example lists 3 users in the requested user pool whose email addresses begin with `testuser`.

```
aws cognito-idp list-users \
    --user-pool-id us-west-2_EXAMPLE \
    --filter email^=\"testuser\" \
    --max-items 3
```

Output:

```
{
    "PaginationToken": "efgh5678EXAMPLE",
    "Users": [
        {
            "Attributes": [
                {
                    "Name": "sub",
                    "Value": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                },
```

```
                {
                    "Name": "email",
                    "Value": "testuser@example.com"
                }
            ],
            "Enabled": true,
            "UserCreateDate": 1682955829.578,
            "UserLastModifiedDate": 1689030181.63,
            "UserStatus": "CONFIRMED",
            "Username": "testuser"
        },
        {
            "Attributes": [
                {
                    "Name": "sub",
                    "Value": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                },
                {
                    "Name": "email",
                    "Value": "testuser2@example.com"
                }
            ],
            "Enabled": true,
            "UserCreateDate": 1684427979.201,
            "UserLastModifiedDate": 1684427979.201,
            "UserStatus": "UNCONFIRMED",
            "Username": "testuser2"
        },
        {
            "Attributes": [
                {
                    "Name": "sub",
                    "Value": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
                },
                {
                    "Name": "email",
                    "Value": "testuser3@example.com"
                }
            ],
            "Enabled": true,
            "UserCreateDate": 1684427823.641,
            "UserLastModifiedDate": 1684427823.641,
            "UserStatus": "UNCONFIRMED",
            "Username": "testuser3@example.com"
```

```
        }
    ]
}
```

For more information, see Managing and searching for users in the *Amazon Cognito Developer Guide*.

Example 2: To list users with a client-side filter

The following `list-users` example lists the attributes of three users who have an attribute, in this case their email address, that contains the email domain "@example.com". If other attributes contained this string, they would also be displayed. The second user has no attributes that match the query and is excluded from the displayed output, but not from the server response.

```
aws cognito-idp list-users \
    --user-pool-id us-west-2_EXAMPLE \
    --max-items 3 \
    --query Users\[\*\].Attributes\[\?Value\.contains\(\@\,\'@example.com\'\)\]
```

Output:

```
[
    [
        {
            "Name": "email",
            "Value": "admin@example.com"
        }
    ],
    [],
    [
        {
            "Name": "email",
            "Value": "operator@example.com"
        }
    ]
]
```

For more information, see Managing and searching for users in the *Amazon Cognito Developer Guide*.

- For API details, see ListUsers in *AWS CLI Command Reference*.

`list-web-authn-credentials`

The following code example shows how to use `list-web-authn-credentials`.

AWS CLI

To list passkey credentials

The following `list-web-authn-credentials` example lists passkey, or WebAuthn, credentials for the current user. They have one registered device.

```
aws cognito-idp list-web-authn-credentials \
    --access-token eyJra456defEXAMPLE
```

Output:

```
{
    "Credentials": [
        {
            "AuthenticatorAttachment": "cross-platform",
            "CreatedAt": 1736293876.115,
            "CredentialId": "8LApgk4-lNUFHbhm2w6Und7-
uxcc8coJGsPxiogvHoItc64xWQc3r4CEXAMPLE",
            "FriendlyCredentialName": "Roaming passkey",
            "RelyingPartyId": "auth.example.com"
        }
    ]
}
```

For more information, see Passkey sign-in in the *Amazon Cognito Developer Guide*.

- For API details, see ListWebAuthnCredentials in *AWS CLI Command Reference*.

`resend-confirmation-code`

The following code example shows how to use `resend-confirmation-code`.

AWS CLI

To resend a confirmation code

The following `resend-confirmation-code` example sends a confirmation code to the user `jane`.

```
aws cognito-idp resend-confirmation-code \
    --client-id 12a3b456c7de890f11g123hijk \
    --username jane
```

Output:

```
{
    "CodeDeliveryDetails": {
        "Destination": "j***@e***.com",
        "DeliveryMedium": "EMAIL",
        "AttributeName": "email"
    }
}
```

For more information, see Signing up and confirming user accounts in the *Amazon Cognito Developer Guide*.

- For API details, see ResendConfirmationCode in *AWS CLI Command Reference*.

`respond-to-auth-challenge`

The following code example shows how to use `respond-to-auth-challenge`.

AWS CLI

Example 1: To respond to a NEW_PASSWORD_REQUIRED challenge

The following `respond-to-auth-challenge` example responds to a NEW_PASSWORD_REQUIRED challenge that initiate-auth returned. It sets a password for the user `jane@example.com`.

```
aws cognito-idp respond-to-auth-challenge \
    --client-id 1example23456789 \
    --challenge-name NEW_PASSWORD_REQUIRED \
    --challenge-responses USERNAME=jane@example.com,NEW_PASSWORD=ExamplePassword1! \
    --session AYABeEv5HklEXAMPLEsession
```

Output:

```
{
    "ChallengeParameters": {},
```

```
    "AuthenticationResult": {
        "AccessToken": "ACCESS_TOKEN",
        "ExpiresIn": 3600,
        "TokenType": "Bearer",
        "RefreshToken": "REFRESH_TOKEN",
        "IdToken": "ID_TOKEN",
        "NewDeviceMetadata": {
            "DeviceKey": "us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DeviceGroupKey": "-wt2ha1Zd"
        }
    }
}
```

For more information, see Authentication in the *Amazon Cognito Developer Guide*.

Example 2: To respond to a SELECT_MFA_TYPE challenge

The following `respond-to-auth-challenge` example chooses TOTP MFA as the MFA option for the current user. The user was prompted to select an MFA type and will next be prompted to enter their MFA code.

```
aws cognito-idp respond-to-auth-challenge \
    --client-id 1example23456789 \
    --session AYABeEv5HklEXAMPLEsession \
    --challenge-name SELECT_MFA_TYPE \
    --challenge-responses USERNAME=testuser,ANSWER=SOFTWARE_TOKEN_MFA
```

Output:

```
{
    "ChallengeName": "SOFTWARE_TOKEN_MFA",
    "Session": "AYABeEv5HklEXAMPLEsession",
    "ChallengeParameters": {
        "FRIENDLY_DEVICE_NAME": "transparent"
    }
}
```

For more information, see Adding MFA in the *Amazon Cognito Developer Guide*.

Example 3: To respond to a SOFTWARE_TOKEN_MFA challenge

The following `respond-to-auth-challenge` example provides a TOTP MFA code and completes sign-in.

```
aws cognito-idp respond-to-auth-challenge \
    --client-id 1example23456789 \
    --session AYABeEv5HklEXAMPLEsession \
    --challenge-name SOFTWARE_TOKEN_MFA \
    --challenge-responses USERNAME=testuser,SOFTWARE_TOKEN_MFA_CODE=123456
```

Output:

```
{
    "AuthenticationResult": {
        "AccessToken": "eyJra456defEXAMPLE",
        "ExpiresIn": 3600,
        "TokenType": "Bearer",
        "RefreshToken": "eyJra123abcEXAMPLE",
        "IdToken": "eyJra789ghiEXAMPLE",
        "NewDeviceMetadata": {
            "DeviceKey": "us-west-2_a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DeviceGroupKey": "-v7w9UcY6"
        }
    }
}
```

For more information, see Adding MFA in the *Amazon Cognito Developer Guide*.

- For API details, see RespondToAuthChallenge in *AWS CLI Command Reference*.

`revoke-token`

The following code example shows how to use `revoke-token`.

AWS CLI

To revoke a refresh token

The following `revoke-token` example revokes the requested refresh token and associated access tokens.

```
aws cognito-idp revoke-token \
    --token eyJjd123abcEXAMPLE \
    --client-id 1example23456789
```

This command produces no output.

For more information, see Revoking tokens in the *Amazon Cognito Developer Guide*.

- For API details, see RevokeToken in *AWS CLI Command Reference*.

`set-log-delivery-configuration`

The following code example shows how to use `set-log-delivery-configuration`.

AWS CLI

To set up log export from a user pool

The following `set-log-delivery-configuration` example configures the requested user pool with user-notification error logging to a log group and user-authentication info logging to an S3 bucket.

```
aws cognito-idp set-log-delivery-configuration \
    --user-pool-id us-west-2_EXAMPLE \
    --log-
configurations LogLevel=ERROR,EventSource=userNotification,CloudWatchLogsConfiguration={LogG
west-2:123456789012:log-group:cognito-
exported} LogLevel=INFO,EventSource=userAuthEvents,S3Configuration={BucketArn=arn:aws:s3:::a
s3-demo-bucket1}
```

Output:

```
{
    "LogDeliveryConfiguration": {
        "LogConfigurations": [
            {
                "CloudWatchLogsConfiguration": {
                    "LogGroupArn": "arn:aws:logs:us-west-2:123456789012:log-
group:cognito-exported"
                },
                "EventSource": "userNotification",
                "LogLevel": "ERROR"
            },
            {
                "EventSource": "userAuthEvents",
                "LogLevel": "INFO",
                "S3Configuration": {
                    "BucketArn": "arn:aws:s3:::amzn-s3-demo-bucket1"
                }
```

```
            }
        ],
        "UserPoolId": "us-west-2_EXAMPLE"
    }
}
```

For more information, see Exporting user pool logs in the *Amazon Cognito Developer Guide*.

- For API details, see SetLogDeliveryConfiguration in *AWS CLI Command Reference*.

`set-risk-configuration`

The following code example shows how to use `set-risk-configuration`.

AWS CLI

To set the threat protection risk configuration

The following `set-risk-configuration` example configures threat protection messages and actions, compromised credentials, and IP address exceptions in the requested app client. Because of the complexity of the NotifyConfiguration object, JSON input is a best practice for this command.

```
aws cognito-idp set-risk-configuration \
    --cli-input-json file://set-risk-configuration.json
```

Contents of `set-risk-configuration.json`:

```
{
    "AccountTakeoverRiskConfiguration": {
        "Actions": {
            "HighAction": {
                "EventAction": "MFA_REQUIRED",
                "Notify": true
            },
            "LowAction": {
                "EventAction": "NO_ACTION",
                "Notify": true
            },
            "MediumAction": {
                "EventAction": "MFA_IF_CONFIGURED",
                "Notify": true
```

```
            }
        },
        "NotifyConfiguration": {
            "BlockEmail": {

```

```
            ]
        },
        "UserPoolId": "us-west-2_EXAMPLE"
    }
}
```

For more information, see Threat protection in the *Amazon Cognito Developer Guide*.

- For API details, see SetRiskConfiguration in *AWS CLI Command Reference*.

`set-ui-customization`

The following code example shows how to use `set-ui-customization`.

AWS CLI

Example 1: To customize the classic hosted UI for an app client

The following `set-ui-customization` example configures the requested app client with some custom CSS and with the Amazon Cognito logo as the application logo.

```
aws cognito-idp set-ui-customization \
    --user-pool-id us-west-2_ywDJHlIfU \
    --client-id 14pq32c5q2uq2q7keorloqvb23 \
    --css ".logo-customizable {\n\tmax-width: 60%;\n\tmax-height: 30%;\n}\n.banner-
customizable {\n\tpadding: 25px 0px 25px 0px;\n\tbackground-color: lightgray;
\n}\n.label-customizable {\n\tfont-weight: 400;\n}\n.textDescription-customizable
 {\n\tpadding-top: 10px;\n\tpadding-bottom: 10px;\n\tdisplay: block;\n\tfont-
size: 16px;\n}\n.idpDescription-customizable {\n\tpadding-top: 10px;\n\tpadding-
bottom: 10px;\n\tdisplay: block;\n\tfont-size: 16px;\n}\n.legalText-customizable
 {\n\tcolor: #747474;\n\tfont-size: 11px;\n}\n.submitButton-customizable {\n\tfont-
size: 11px;\n\tfont-weight: normal;\n\tmargin: 20px -15px 10px -13px;\n\theight:
 40px;\n\twidth: 108%;\n\tcolor: #fff;\n\tbackground-color: #337ab7;\n\ttext-align:
 center;\n}\n.submitButton-customizable:hover {\n\tcolor: #fff;\n\tbackground-color:
 #286090;\n}\n.errorMessage-customizable {\n\tpadding: 5px;\n\tfont-size: 14px;
\n\twidth: 100%;\n\tbackground: #F5F5F5;\n\tborder: 2px solid #D64958;\n\tcolor:
 #D64958;\n}\n.inputField-customizable {\n\twidth: 100%;\n\theight: 34px;\n\tcolor:
 #555;\n\tbackground-color: #fff;\n\tborder: 1px solid #ccc;\n\tborder-radius:
 0px;\n}\n.inputField-customizable:focus {\n\tborder-color: #66afe9;\n\toutline:
 0;\n}\n.idpButton-customizable {\n\theight: 40px;\n\twidth: 100%;\n\twidth: 100%;

    }
}
```

Example 2: To set the default UI customization for all app clients

The following `set-ui-customization` example configures the requested user pool for all app clients that don't have a client-specific configuration. The command applies some custom CSS and with the Amazon Cognito logo as the application logo.

```
aws cognito-idp set-ui-customization \
    --user-pool-id us-west-2_ywDJHlIfU \
    --client-id ALL \
    --css ".logo-customizable {\n\tmax-width: 60%;\n\tmax-height: 30%;\n}\n.banner-
customizable {\n\tpadding: 25px 0px 25px 0px;\n\tbackground-color: lightgray;
\n}\n.label-customizable {\n\tfont-weight: 400;\n}\n.textDescription-customizable
 {\n\tpadding-top: 10px;\n\tpadding-bottom: 10px;\n\tdisplay: block;\n\tfont-
size: 16px;\n}\n.idpDescription-customizable {\n\tpadding-top: 10px;\n\tpadding-
bottom: 10px;\n\tdisplay: block;\n\tfont-size: 16px;\n}\n.legalText-customizable
 {\n\tcolor: #747474;\n\tfont-size: 11px;\n}\n.submitButton-customizable {\n\tfont-
size: 11px;\n\tfont-weight: normal;\n\tmargin: 20px -15px 10px -13px;\n\theight:
 40px;\n\twidth: 108%;\n\tcolor: #fff;\n\tbackground-color: #337ab7;\n\ttext-align:
 center;\n}\n.submitButton-customizable:hover {\n\tcolor: #fff;\n\tbackground-color:
 #286090;\n}\n.errorMessage-customizable {\n\tpadding: 5px;\n\tfont-size: 14px;
\n\twidth: 100%;\n\tbackground: #F5F5F5;\n\tborder: 2px solid #D64958;\n\tcolor:
 #D64958;\n}\n.inputField-customizable {\n\twidth: 100%;\n\theight: 34px;\n\tcolor:

    }
}
```

For more information, see Hosted UI (classic) branding in the *Amazon Cognito Developer Guide*.

- For API details, see SetUiCustomization in *AWS CLI Command Reference*.

`set-user-mfa-preference`

The following code example shows how to use `set-user-mfa-preference`.

AWS CLI

To set a user's MFA preference

The following `set-user-mfa-preference` example configures the current user to use TOTP MFA and disables all other MFA factors.

```
aws cognito-idp set-user-mfa-preference \
    --access-token eyJra456defEXAMPLE \
    --software-token-mfa-settings Enabled=true,PreferredMfa=true \
    --sms-mfa-settings Enabled=false,PreferredMfa=false \
    --email-mfa-settings Enabled=false,PreferredMfa=false
```

This command produces no output.

For more information, see Adding MFA in the *Amazon Cognito Developer Guide*.

- For API details, see SetUserMfaPreference in *AWS CLI Command Reference*.

`set-user-pool-mfa-config`

The following code example shows how to use `set-user-pool-mfa-config`.

AWS CLI

To configure user pool MFA and WebAuthn

The following `set-user-pool-mfa-config` example configures the requested user pool with optional MFA with all available MFA methods, and sets the WebAuthn configuration.

```
aws cognito-idp set-user-pool-mfa-config \
    --user-pool-id us-west-2_EXAMPLE \
    --sms-mfa-configuration "SmsAuthenticationMessage=\"Your OTP for MFA or sign-
in: use {####}.\",SmsConfiguration={SnsCallerArn=arn:aws:iam::123456789012:role/
service-role/test-SMS-Role,ExternalId=a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111,SnsRegion=us-west-2}" \
    --software-token-mfa-configuration Enabled=true \
    --email-mfa-configuration "Message=\"Your OTP for MFA or sign-in: use
 {####}\",Subject=\"OTP test\"" \
    --mfa-configuration OPTIONAL \
    --web-authn-
configuration RelyingPartyId=auth.example.com,UserVerification=preferred
```

Output:

```
{
    "EmailMfaConfiguration": {
        "Message": "Your OTP for MFA or sign-in: use {####}",
        "Subject": "OTP test"
    },
    "MfaConfiguration": "OPTIONAL",
    "SmsMfaConfiguration": {
        "SmsAuthenticationMessage": "Your OTP for MFA or sign-in: use {####}.",
        "SmsConfiguration": {
            "ExternalId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "SnsCallerArn": "arn:aws:iam::123456789012:role/service-role/test-SMS-
Role",
            "SnsRegion": "us-west-2"
        }
```

```
    },
    "SoftwareTokenMfaConfiguration": {
        "Enabled": true
    },
    "WebAuthnConfiguration": {
        "RelyingPartyId": "auth.example.com",
        "UserVerification": "preferred"
    }
}
```

For more information, see Adding MFA and Passkey sign-in in the *Amazon Cognito Developer Guide*.

- For API details, see SetUserPoolMfaConfig in *AWS CLI Command Reference*.

`set-user-settings`

The following code example shows how to use `set-user-settings`.

AWS CLI

To set user settings

The following `set-user-settings` example sets the MFA delivery preference to EMAIL.

```
aws cognito-idp set-user-settings \
    --access-token ACCESS_TOKEN \
    --mfa-options DeliveryMedium=EMAIL
```

This command produces no output.

For more information, see Adding MFA to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see SetUserSettings in *AWS CLI Command Reference*.

`sign-up`

The following code example shows how to use `sign-up`.

AWS CLI

To sign up a user

The following `sign-up` example signs up jane@example.com.

```
aws cognito-idp sign-up \
    --client-id 3n4b5urk1ft4fl3mg5e62d9ado \
    --username jane@example.com \
    --password PASSWORD \
    --user-attributes Name="email",Value="jane@example.com" Name="name",Value="Jane"
```

Output:

```
{
    "UserConfirmed": false,
    "UserSub": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Signing up and confirming user accounts in the *Amazon Cognito Developer Guide*.

- For API details, see SignUp in *AWS CLI Command Reference*.

`start-user-import-job`

The following code example shows how to use `start-user-import-job`.

AWS CLI

To start an import job

The following `start-user-import-job` example starts the requested import job in the requested user pool.

```
aws cognito-idp start-user-import-job \
    --user-pool-id us-west-2_EXAMPLE \
    --job-id import-mAgUtd8PMm
```

Output:

```
{
    "UserImportJob": {
        "CloudWatchLogsRoleArn": "arn:aws:iam::123456789012:role/example-cloudwatch-
logs-role",
        "CreationDate": 1736442975.904,
```

```
        "FailedUsers": 0,
        "ImportedUsers": 0,
        "JobId": "import-mAgUtd8PMm",

    }
}
```

For more information, see Importing users into a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see StartUserImportJob in *AWS CLI Command Reference*.

`start-web-authn-registration`

The following code example shows how to use `start-web-authn-registration`.

AWS CLI

To get passkey registration information for a signed-in user

The following `start-web-authn-registration` example generates WebAuthn registration options for the current user.

```
aws cognito-idp start-web-authn-registration \
    --access-token eyJra456defEXAMPLE
```

Output:

```
{
    "CredentialCreationOptions": {
        "authenticatorSelection": {
            "requireResidentKey": true,
            "residentKey": "required",
            "userVerification": "preferred"
```

```
        },

            "name": "auth.example.com"
        },
        "timeout": 60000,
        "user": {
            "displayName": "testuser",
            "id": "ZWFhZDAyMTktMjExNy00MzlmLThkNDYtNGRiMjBlNEXAMPLE",
            "name": "testuser"
        }
    }
}
```

For more information, see Passkey sign-in in the *Amazon Cognito Developer Guide*.

- For API details, see StartWebAuthnRegistration in *AWS CLI Command Reference*.

`stop-user-import-job`

The following code example shows how to use `stop-user-import-job`.

AWS CLI

To stop an import job

The following `stop-user-import-job` example stops the requested running user import job in the requested user pool.

```
aws cognito-idp stop-user-import-job \
    --user-pool-id us-west-2_EXAMPLE \
    --job-id import-mAgUtd8PMm
```

Output:

```
{
    "UserImportJob": {
        "CloudWatchLogsRoleArn": "arn:aws:iam::123456789012:role/example-cloudwatch-
logs-role",
        "CompletionDate": 1736443496.379,
        "CompletionMessage": "The Import Job was stopped by the developer.",
        "CreationDate": 1736443471.781,

        "StartDate": 1736443494.154,
        "Status": "Stopped",
        "UserPoolId": "us-west-2_EXAMPLE"
    }
}
```

For more information, see Importing users into a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see StopUserImportJob in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a user pool

The following `tag-resource` example applies `administrator` and `department` tags to the requested user pool.

```
aws cognito-idp tag-resource \
    --resource-arn arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-west-2_EXAMPLE \
    --tags administrator=Jie,tenant=ExampleCorp
```

This command produces no output.

For more information, see Tagging Amazon Cognito resources in the *Amazon Cognito Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a user pool

The following `untag-resource` example removes `administrator` and `department` tags from the requested user pool.

```
aws cognito-idp untag-resource \
    --resource-arn arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-west-2_l5cxwdm2K \
    --tag-keys administrator tenant
```

This command produces no output.

For more information, see Tagging Amazon Cognito resources in the *Amazon Cognito Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-auth-event-feedback`

The following code example shows how to use `update-auth-event-feedback`.

AWS CLI

To update auth event feedback

The following `update-auth-event-feedback` example updates authorization event feedback. It marks the event "Valid".

```
aws cognito-idp update-auth-event-feedback \
    --user-pool-id us-west-2_aaaaaaaaa \
    --username diego@example.com \
    --event-id EVENT_ID \
    --feedback-token FEEDBACK_TOKEN \
    --feedback-value "Valid"
```

This command produces no output.

For more information, see Working with adaptive authentication in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateAuthEventFeedback in *AWS CLI Command Reference*.

`update-device-status`

The following code example shows how to use `update-device-status`.

AWS CLI

To update device status

The following `update-device-status` example updates the status for a device to "not_remembered".

```
aws cognito-idp update-device-status \
    --access-token ACCESS_TOKEN \
    --device-key DEVICE_KEY \
    --device-remembered-status "not_remembered"
```

This command produces no output.

For more information, see Working with user devices in your user pool in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateDeviceStatus in *AWS CLI Command Reference*.

`update-group`

The following code example shows how to use `update-group`.

AWS CLI

To update a group

The following `update-group` example updates the description and precedence for MyGroup.

```
aws cognito-idp update-group \
    --user-pool-id us-west-2_aaaaaaaaa \
    --group-name MyGroup \
    --description "New description" \
    --precedence 2
```

Output:

```
{
    "Group": {
        "GroupName": "MyGroup",
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "Description": "New description",
        "RoleArn": "arn:aws:iam::123456789012:role/MyRole",
        "Precedence": 2,
        "LastModifiedDate": 1548800862.812,
        "CreationDate": 1548097827.125
    }
}
```

For more information, see Adding groups to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

`update-identity-provider`

The following code example shows how to use `update-identity-provider`.

AWS CLI

To update a user pool identity provider

The following `update-identity-provider` example updates the OIDC provider "MyOIDCIdP" in the requested user pool.

```
aws cognito-idp update-identity-provider \
    --cli-input-json file://update-identity-provider.json
```

            },
            "UseCognitoProvidedValues": false,
            "UserPoolId": "us-west-2_EXAMPLE"
    }
}
```

For more information, see Apply branding to managed login pages in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateManagedLoginBranding in *AWS CLI Command Reference*.

`update-resource-server`

The following code example shows how to use `update-resource-server`.

AWS CLI

To update a resource server

The following `update-resource-server` example updates the resource server Weather. It adds a new scope.

```
aws cognito-idp update-resource-server \
    --user-pool-id us-west-2_aaaaaaaaa \
    --identifier weather.example.com \
    --name Weather \
    --scopes ScopeName=NewScope,ScopeDescription="New scope description"
```

Output:

```
{
    "ResourceServer": {
        "UserPoolId": "us-west-2_aaaaaaaaa",
        "Identifier": "weather.example.com",
        "Name": "Happy",
        "Scopes": [
            {
                "ScopeName": "NewScope",
                "ScopeDescription": "New scope description"
            }
        ]
    }
}
```

For more information, see Scopes, M2M, and resource servers in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateResourceServer in *AWS CLI Command Reference*.

`update-user-attributes`

The following code example shows how to use `update-user-attributes`.

AWS CLI

To update user attributes

The following `update-user-attributes` example updates the user attribute "nickname".

```
aws cognito-idp update-user-attributes \
    --access-token ACCESS_TOKEN \
```

```
    --user-attributes Name="nickname",Value="Dan"
```

Output:

```
{
    "CodeDeliveryDetailsList": []
}
```

For more information, see Working with user attributes in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateUserAttributes in *AWS CLI Command Reference*.

`update-user-pool-client`

The following code example shows how to use `update-user-pool-client`.

AWS CLI

To update an app client

The following `update-user-pool-client` example updates the configuration of the requested app client.

```
aws cognito-idp update-user-pool-client \
    --user-pool-id us-west-2_EXAMPLE \
    --client-id 1example23456789 \
    --client-name my-test-app \
    --refresh-token-validity 30 \
    --access-token-validity 60 \
    --id-token-validity 60 \
    --token-validity-units AccessToken=minutes,IdToken=minutes,RefreshToken=days \
    --read-
attributes "address" "birthdate" "email" "email_verified" "family_name" "gender" "locale" "m
 \
    --write-
attributes "address" "birthdate" "email" "family_name" "gender" "locale" "middle_name" "name
 \
    --explicit-auth-
flows "ALLOW_ADMIN_USER_PASSWORD_AUTH" "ALLOW_CUSTOM_AUTH" "ALLOW_REFRESH_TOKEN_AUTH" "ALLOW
 \
    --supported-identity-providers "MySAML" "COGNITO" "Google" \
    --callback-urls "https://www.example.com" "https://app2.example.com" \
```

```
    --logout-urls "https://auth.example.com/login?
client_id=1example23456789&response_type=code&redirect_uri=https%3A%2F
%2Fwww.example.com" "https://example.com/logout" \
    --default-redirect-uri "https://www.example.com" \
    --allowed-o-auth-flows "code" "implicit" \
    --allowed-o-auth-scopes "openid" "profile" "aws.cognito.signin.user.admin" \
    --allowed-o-auth-flows-user-pool-client \
    --prevent-user-existence-errors ENABLED \
    --enable-token-revocation \
    --no-enable-propagate-additional-user-context-data \
    --auth-session-validity 3
```

Output:

```

}
```

For more information, see Application-specific settings with app clients in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateUserPoolClient in *AWS CLI Command Reference*.

`update-user-pool-domain`

The following code example shows how to use `update-user-pool-domain`.

AWS CLI

To update a custom domain

The following `update-user-pool-domain` example configures the branding version and certificate for the custom domain the requested user pool.

```
aws cognito-idp update-user-pool-domain \
    --user-pool-id us-west-2_EXAMPLE \
    --domain auth.example.com \
    --managed-login-version 2 \
```

```
    --custom-domain-config CertificateArn=arn:aws:acm:us-
east-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "CloudFrontDomain": "example.cloudfront.net",
    "ManagedLoginVersion": 2
}
```

For more information, see Managed login and Configuring a domain in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateUserPoolDomain in *AWS CLI Command Reference*.

update-user-pool

The following code example shows how to use `update-user-pool`.

AWS CLI

To update a user pool

The following `update-user-pool` example modifies a user pool with example syntax for each of the available configuration options. To update a user pool, you must specify all previously-configured options or they will reset to a default value.

```
aws cognito-idp update-user-pool \
    --user-pool-id us-west-2_EXAMPLE \
    --policies PasswordPolicy=
\{MinimumLength=6,RequireUppercase=true,RequireLowercase=true,RequireNumbers=true,RequireSym
 \
    --deletion-protection ACTIVE \
    --lambda-config PreSignUp="arn:aws:lambda:us-
west-2:123456789012:function:cognito-test-presignup-
function",PreTokenGeneration="arn:aws:lambda:us-
west-2:123456789012:function:cognito-test-pretoken-function" \
    --auto-verified-attributes "phone_number" "email" \
    --verification-message-template \{\"SmsMessage\":\""Your code is
 {####}"\",\"EmailMessage\":\""Your code is {####}"\",\"EmailSubject\":\""Your
 verification code"\",\"EmailMessageByLink\":\""Click {##here##} to verify
 your email address."\",\"EmailSubjectByLink\":\""Your verification link"\",
\"DefaultEmailOption\":\"CONFIRM_WITH_LINK\"\} \
```

```
    --sms-authentication-message "Your code is {####}" \
    --user-attribute-update-settings
 AttributesRequireVerificationBeforeUpdate="email","phone_number" \
    --mfa-configuration "OPTIONAL" \
    --device-
configuration ChallengeRequiredOnNewDevice=true,DeviceOnlyRememberedOnUserPrompt=true
 \
    --email-configuration SourceArn="arn:aws:ses:us-
west-2:123456789012:identity/admin@example.com",ReplyToEmailAddress="amdin
+noreply@example.com",EmailSendingAccount=DEVELOPER,From="admin@amazon.com",ConfigurationSet
configuration-set" \
    --sms-configuration SnsCallerArn="arn:aws:iam::123456789012:role/service-role/
SNS-SMS-Role",ExternalId="12345",SnsRegion="us-west-2" \
    --admin-create-user-config AllowAdminCreateUserOnly=false,InviteMessageTemplate=
\{SMSMessage=\""Welcome {username}. Your confirmation code is
 {####}"\",EmailMessage=\""Welcome {username}. Your confirmation code is
 {####}"\",EmailSubject=\""Welcome to MyMobileGame"\"\} \
    --user-pool-tags "Function"="MyMobileGame","Developers"="Berlin" \
    --admin-create-user-config AllowAdminCreateUserOnly=false,InviteMessageTemplate=
\{SMSMessage=\""Welcome {username}. Your confirmation code is
 {####}"\",EmailMessage=\""Welcome {username}. Your confirmation code is
 {####}"\",EmailSubject=\""Welcome to MyMobileGame"\"\} \
    --user-pool-add-ons AdvancedSecurityMode="AUDIT" \
    --account-recovery-setting RecoveryMechanisms=
\[\{Priority=1,Name="verified_email"\},\{Priority=2,Name="verified_phone_number"\}\]
```

This command produces no output.

For more information, see Updating user pool configuration in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateUserPool in *AWS CLI Command Reference*.

`verify-software-token`

The following code example shows how to use `verify-software-token`.

AWS CLI

To confirm registration of a TOTP authenticator

The following `verify-software-token` example completes TOTP registration for the current user.

```
aws cognito-idp verify-software-token \
    --access-token eyJra456defEXAMPLE \
    --user-code 123456
```

Output:

```
{
    "Status": "SUCCESS"
}
```

For more information, see Adding MFA to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see VerifySoftwareToken in *AWS CLI Command Reference*.

`verify-user-attribute`

The following code example shows how to use `verify-user-attribute`.

AWS CLI

To verify an attribute change

The following `verify-user-attribute` example verifies a change to the current user's email attribute.

```
aws cognito-idp verify-user-attribute \
    --access-token eyJra456defEXAMPLE \
    --attribute-name email \
    --code 123456
```

This command produces no output.

For more information, see Configuring email or phone verification in the *Amazon Cognito Developer Guide*.

- For API details, see VerifyUserAttribute in *AWS CLI Command Reference*.

Amazon Comprehend examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Comprehend.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`batch-detect-dominant-language`

The following code example shows how to use `batch-detect-dominant-language`.

AWS CLI

To detect the dominant language of multiple input texts

The following `batch-detect-dominant-language` example analyzes multiple input texts and returns the dominant language of each. The pre-trained models confidence score is also output for each prediction.

```
aws comprehend batch-detect-dominant-language \
    --text-list "Physics is the natural science that involves the study of matter
 and its motion and behavior through space and time, along with related concepts
 such as energy and force."
```

Output:

```
{
    "ResultList": [
        {
            "Index": 0,
            "Languages": [
                {
                    "LanguageCode": "en",
                    "Score": 0.9986501932144165
                }
            ]
        }
    ],
```

```
    "ErrorList": []
}
```

For more information, see Dominant Language in the *Amazon Comprehend Developer Guide*.

- For API details, see BatchDetectDominantLanguage in *AWS CLI Command Reference*.

`batch-detect-entities`

The following code example shows how to use `batch-detect-entities`.

AWS CLI

To detect entities from multiple input texts

The following `batch-detect-entities` example analyzes multiple input texts and returns the named entities of each. The pre-trained model's confidence score is also output for each prediction.

```
aws comprehend batch-detect-entities \
    --language-code en \
    --text-list "Dear Jane, Your AnyCompany Financial Services LLC credit card account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by July 31st." "Please send customer feedback to Sunshine Spa, 123 Main St, Anywhere or to Alice at AnySpa@example.com."
```

Output:

```
{
    "ResultList": [
        {
            "Index": 0,

`batch-detect-key-phrases`

The following code example shows how to use `batch-detect-key-phrases`.

AWS CLI

To detect key phrases of multiple text inputs

The following `batch-detect-key-phrases` example analyzes multiple input texts and returns the key noun phrases of each. The pre-trained model's confidence score for each prediction is also output.

```
aws comprehend batch-detect-key-phrases \
    --language-code en \
    --text-list "Hello Zhang Wei, I am John, writing to you about the trip for next Saturday." "Dear Jane, Your AnyCompany Financial Services LLC credit card account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by July 31st." "Please send customer feedback to Sunshine Spa, 123 Main St, Anywhere or to Alice at AnySpa@example.com."
```

Output:

```

`batch-detect-targeted-sentiment`

The following code example shows how to use `batch-detect-targeted-sentiment`.

AWS CLI

To detect the sentiment and each named entity for multiple input texts

The following `batch-detect-targeted-sentiment` example analyzes multiple input texts and returns the named entities along with the prevailing sentiment attached to each entity. The pre-trained model's confidence score is also output for each prediction.

```
aws comprehend batch-detect-targeted-sentiment \
    --language-code en \
    --text-list "That movie was really boring, the original was way more
 entertaining" "The trail is extra beautiful today." "My meal was just okay."
```

Output:

```

`classify-document`

The following code example shows how to use `classify-document`.

AWS CLI

To classify document with model-specific endpoint

The following `classify-document` example classifies a document with an endpoint of a custom model. The model in this example was trained on a dataset containing sms messages labeled as spam or non-spam, or, "ham".

```
aws comprehend classify-document \
    --endpoint-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier-endpoint/example-classifier-endpoint \
    --text "CONGRATULATIONS! TXT 1235550100 to win $5000"
```

Output:

```
{
    "Classes": [
        {
            "Name": "spam",

- For API details, see ClassifyDocument in *AWS CLI Command Reference*.

`contains-pii-entities`

The following code example shows how to use `contains-pii-entities`.

AWS CLI

To analyze the input text for the presence of PII information

The following `contains-pii-entities` example analyzes the input text for the presence of personally identifiable information (PII) and returns the labels of identified PII entity types such as name, address, bank account number, or phone number.

```
aws comprehend contains-pii-entities \
    --language-code en \
    --text "Hello Zhang Wei, I am John. Your AnyCompany Financial Services, LLC
 credit card
       account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by
 July 31st. Based on your autopay settings,
       we will withdraw your payment on the due date from your bank account number
 XXXXXX1111 with the routing number XXXXX0000.
       Customer feedback for Sunshine Spa, 100 Main St, Anywhere. Send comments to
 Alice at AnySpa@example.com."
```

Output:

```
{
    "Labels": [
        {
            "Name": "NAME",
            "Score": 1.0
        },
```

```
        {
            "Name": "EMAIL",
            "Score": 1.0

        {
            "Name": "CREDIT_DEBIT_NUMBER",
            "Score": 1.0
        }
    ]
}
```

For more information, see Personally Identifiable Information (PII) in the *Amazon Comprehend Developer Guide*.

- For API details, see ContainsPiiEntities in *AWS CLI Command Reference*.

`create-dataset`

The following code example shows how to use `create-dataset`.

AWS CLI

To create a flywheel dataset

The following `create-dataset` example creates a dataset for a flywheel. This dataset will be used as additional training data as specified by the `--dataset-type` tag.

```
aws comprehend create-dataset \
    --flywheel-arn arn:aws:comprehend:us-west-2:123456789012:flywheel/flywheel-entity \
    --dataset-name example-dataset \
    --dataset-type "TRAIN" \
    --input-data-config file://inputConfig.json
```

Contents of `file://inputConfig.json`:

```
{
    "DataFormat": "COMPREHEND_CSV",
    "DocumentClassifierInputDataConfig": {
        "S3Uri": "s3://amzn-s3-demo-bucket/training-data.csv"
    }
}
```

Output:

```
{
    "DatasetArn": "arn:aws:comprehend:us-west-2:123456789012:flywheel/flywheel-
entity/dataset/example-dataset"
}
```

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see CreateDataset in *AWS CLI Command Reference*.

`create-document-classifier`

The following code example shows how to use `create-document-classifier`.

AWS CLI

To create a document classifier to categorize documents

The following `create-document-classifier` example begins the training process for a document classifier model. The training data file, `training.csv`, is located at the `--input-data-config` tag. `training.csv` is a two column document where the labels, or, classifications are provided in the first column and the documents are provided in the second column.

```
aws comprehend create-document-classifier \
    --document-classifier-name example-classifier \
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket/" \
    --language-code en
```

Output:

```
{
    "DocumentClassifierArn": "arn:aws:comprehend:us-west-2:123456789012:document-
classifier/example-classifier"
}
```

For more information, see Custom Classification in the *Amazon Comprehend Developer Guide*.

- For API details, see CreateDocumentClassifier in *AWS CLI Command Reference*.

`create-endpoint`

The following code example shows how to use `create-endpoint`.

AWS CLI

To create an endpoint for a custom model

The following `create-endpoint` example creates an endpoint for synchronous inference for a previously trained custom model.

```
aws comprehend create-endpoint \
    --endpoint-name example-classifier-endpoint-1 \
    --model-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/
example-classifier \
    --desired-inference-units 1
```

Output:

```
{
    "EndpointArn": "arn:aws:comprehend:us-west-2:123456789012:document-classifier-
endpoint/example-classifier-endpoint-1"
}
```

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see CreateEndpoint in *AWS CLI Command Reference*.

`create-entity-recognizer`

The following code example shows how to use `create-entity-recognizer`.

AWS CLI

To create a custom entity recognizer

The following `create-entity-recognizer` example begins the training process for a custom entity recognizer model. This example uses a CSV file containing training documents, `raw_text.csv`, and a CSV entity list, `entity_list.csv` to train the model. `entity-list.csv` contains the following columns: text and type.

```
aws comprehend create-entity-recognizer \
    --recognizer-name example-entity-recognizer \
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role \
    --input-data-config "EntityTypes=[{Type=DEVICE}],Documents={S3Uri=s3://amzn-s3-
demo-bucket/trainingdata/raw_text.csv},EntityList={S3Uri=s3://amzn-s3-demo-bucket/
trainingdata/entity_list.csv}" \
    --language-code en
```

Output:

```
{
    "EntityRecognizerArn": "arn:aws:comprehend:us-west-2:123456789012:example-
entity-recognizer/entityrecognizer1"
}
```

For more information, see Custom entity recognition in the *Amazon Comprehend Developer Guide*.

- For API details, see CreateEntityRecognizer in *AWS CLI Command Reference*.

`create-flywheel`

The following code example shows how to use `create-flywheel`.

AWS CLI

To create a flywheel

The following `create-flywheel` example creates a flywheel to orchestrate the ongoing training of either a document classification or entity recognition model. The flywheel in this

example is created to manage an existing trained model specified by the `--active-model-arn` tag. When the flywheel is created, a data lake is created at the `--input-data-lake` tag.

```
aws comprehend create-flywheel \
    --flywheel-name example-flywheel \
    --active-model-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/example-model/version/1 \
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/AmazonComprehendServiceRole-example-role \
    --data-lake-s3-uri "s3://amzn-s3-demo-bucket"
```

Output:

```
{
    "FlywheelArn": "arn:aws:comprehend:us-west-2:123456789012:flywheel/example-flywheel"
}
```

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see CreateFlywheel in *AWS CLI Command Reference*.

`delete-document-classifier`

The following code example shows how to use `delete-document-classifier`.

AWS CLI

To delete a custom document classifier

The following `delete-document-classifier` example deletes a custom document classifier model.

```
aws comprehend delete-document-classifier \
    --document-classifier-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/example-classifier-1
```

This command produces no output.

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see DeleteDocumentClassifier in *AWS CLI Command Reference*.

`delete-endpoint`

The following code example shows how to use `delete-endpoint`.

AWS CLI

To delete an endpoint for a custom model

The following `delete-endpoint` example deletes a model-specific endpoint. All endpoints must be deleted in order for the model to be deleted.

```
aws comprehend delete-endpoint \
    --endpoint-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier-endpoint/example-classifier-endpoint-1
```

This command produces no output.

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see DeleteEndpoint in *AWS CLI Command Reference*.

`delete-entity-recognizer`

The following code example shows how to use `delete-entity-recognizer`.

AWS CLI

To delete a custom entity recognizer model

The following `delete-entity-recognizer` example deletes a custom entity recognizer model.

```
aws comprehend delete-entity-recognizer \
    --entity-recognizer-arn arn:aws:comprehend:us-west-2:123456789012:entity-recognizer/example-entity-recognizer-1
```

This command produces no output.

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see DeleteEntityRecognizer in *AWS CLI Command Reference*.

`delete-flywheel`

The following code example shows how to use `delete-flywheel`.

AWS CLI

To delete a flywheel

The following `delete-flywheel` example deletes a flywheel. The data lake or the model associated with the flywheel is not deleted.

```
aws comprehend delete-flywheel \
    --flywheel-arn arn:aws:comprehend:us-west-2:123456789012:flywheel/example-flywheel-1
```

This command produces no output.

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see DeleteFlywheel in *AWS CLI Command Reference*.

`delete-resource-policy`

The following code example shows how to use `delete-resource-policy`.

AWS CLI

To delete a resource-based policy

The following `delete-resource-policy` example deletes a resource-based policy from an Amazon Comprehend resource.

```
aws comprehend delete-resource-policy \
    --resource-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/example-classifier-1/version/1
```

This command produces no output.

For more information, see Copying custom models between AWS accounts in the *Amazon Comprehend Developer Guide*.

- For API details, see DeleteResourcePolicy in *AWS CLI Command Reference*.

`describe-dataset`

The following code example shows how to use `describe-dataset`.

AWS CLI

To describe a flywheel dataset

The following `describe-dataset` example gets the properties of a flywheel dataset.

```
aws comprehend describe-dataset \
    --dataset-arn arn:aws:comprehend:us-west-2:123456789012:flywheel/flywheel-entity/dataset/example-dataset
```

Output:

```
{
    "DatasetProperties": {
        "DatasetArn": "arn:aws:comprehend:us-west-2:123456789012:flywheel/flywheel-entity/dataset/example-dataset",
        "DatasetName": "example-dataset",
        "DatasetType": "TRAIN",
        "DatasetS3Uri": "s3://amzn-s3-demo-bucket/flywheel-entity/schemaVersion=1/12345678A123456Z/datasets/example-dataset/20230616T203710Z/",
        "Status": "CREATING",
        "CreationTime": "2023-06-16T20:37:10.400000+00:00"
    }
}
```

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeDataset in *AWS CLI Command Reference*.

`describe-document-classification-job`

The following code example shows how to use `describe-document-classification-job`.

AWS CLI

To describe a document classification job

The following `describe-document-classification-job` example gets the properties of an asynchronous document classification job.

```
aws comprehend describe-document-classification-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "DocumentClassificationJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:123456789012:document-

        },
        "DataAccessRoleArn": "arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-servicerole"
    }
}
```

For more information, see Custom Classification in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeDocumentClassificationJob in *AWS CLI Command Reference*.

`describe-document-classifier`

The following code example shows how to use `describe-document-classifier`.

AWS CLI

To describe a document classifier

The following `describe-document-classifier` example gets the properties of a custom document classifier model.

```
aws comprehend describe-document-classifier \
    --document-classifier-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/example-classifier-1

`describe-dominant-language-detection-job`

The following code example shows how to use `describe-dominant-language-detection-job`.

AWS CLI

To describe a dominant language detection detection job.

The following `describe-dominant-language-detection-job` example gets the properties of an asynchronous dominant language detection job.

```
aws comprehend describe-dominant-language-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```

```

```
    }
}
```

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeEndpoint in *AWS CLI Command Reference*.

`describe-entities-detection-job`

The following code example shows how to use `describe-entities-detection-job`.

AWS CLI

To describe an entities detection job

The following `describe-entities-detection-job` example gets the properties of an asynchronous entities detection job.

```
aws comprehend describe-entities-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "EntitiesDetectionJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:123456789012:entities-detection-

        },
        "LanguageCode": "en",
```

```
        "DataAccessRoleArn": "arn:aws:iam::12345678012:role/service-role/
AmazonComprehendServiceRole-example-role"
    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeEntitiesDetectionJob in *AWS CLI Command Reference*.

`describe-entity-recognizer`

The following code example shows how to use `describe-entity-recognizer`.

AWS CLI

To describe an entity recognizer

The following `describe-entity-recognizer` example gets the properties of a custom entity recognizer model.

```
aws comprehend describe-entity-recognizer \
    --entity-recognizer-arn arn:aws:comprehend:us-west-2:123456789012:entity-
recognizer/business-recongizer-1/version/1
```

Output:

```
{
    "EntityRecognizerProperties": {
        "EntityRecognizerArn": "arn:aws:comprehend:us-west-2:123456789012:entity-
recognizer/business-recongizer-1/version/1",
        "LanguageCode": "en",
        "Status": "TRAINED",

`describe-events-detection-job`

The following code example shows how to use `describe-events-detection-job`.

AWS CLI

To describe an events detection job.

The following `describe-events-detection-job` example gets the properties of an asynchronous events detection job.

```
aws comprehend describe-events-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "EventsDetectionJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:123456789012:events-detection-

- For API details, see DescribeFlywheelIteration in *AWS CLI Command Reference*.

`describe-flywheel`

The following code example shows how to use `describe-flywheel`.

AWS CLI

To describe a flywheel

The following `describe-flywheel` example gets the properties of a flywheel. In this example, the model associated with the flywheel is a custom classifier model that is trained to classify documents as either spam or nonspam, or, "ham".

```
aws comprehend describe-flywheel \
    --flywheel-arn arn:aws:comprehend:us-west-2:123456789012:flywheel/example-
flywheel
```

Output:

```
{
    "FlywheelProperties": {
        "FlywheelArn": "arn:aws:comprehend:us-west-2:123456789012:flywheel/example-
flywheel",
        "ActiveModelArn": "arn:aws:comprehend:us-west-2:123456789012:document-
classifier/example-model/version/1",
        "DataAccessRoleArn": "arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role",
        "TaskConfig": {
            "LanguageCode": "en",
            "DocumentClassificationConfig": {
                "Mode": "MULTI_CLASS",
```

```
                "Labels": [
                    "ham",
                    "spam"
                ]
            }
        },
        "DataLakeS3Uri": "s3://amzn-s3-demo-bucket/example-flywheel/
schemaVersion=1/20230616T200543Z/",
        "DataSecurityConfig": {},
        "Status": "ACTIVE",
        "ModelType": "DOCUMENT_CLASSIFIER",

        "LastModifiedTime": "2023-06-16T20:21:43.567000+00:00"
    }
}
```

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeFlywheel in *AWS CLI Command Reference*.

`describe-key-phrases-detection-job`

The following code example shows how to use `describe-key-phrases-detection-job`.

AWS CLI

To describe a key phrases detection job

The following `describe-key-phrases-detection-job` example gets the properties of an asynchronous key phrases detection job.

```
aws comprehend describe-key-phrases-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "KeyPhrasesDetectionJobProperties": {
        "JobId": "69aa080c00fc68934a6a98f10EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:123456789012:key-phrases-detection-
job/69aa080c00fc68934a6a98f10EXAMPLE",
        "JobName": "example-key-phrases-detection-job",
        "JobStatus": "COMPLETED",
```

```
        "SubmitTime": 1686606439.177,
        "EndTime": 1686606806.157,

    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeKeyPhrasesDetectionJob in *AWS CLI Command Reference*.

`describe-pii-entities-detection-job`

The following code example shows how to use `describe-pii-entities-detection-job`.

AWS CLI

To describe a PII entities detection job

The following `describe-pii-entities-detection-job` example gets the properties of an asynchronous pii entities detection job.

```
aws comprehend describe-pii-entities-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "PiiEntitiesDetectionJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:123456789012:pii-entities-detection-
job/123456abcdeb0e11022f22a11EXAMPLE",
        "JobName": "example-pii-entities-job",
```

```
        "JobStatus": "IN_PROGRESS",
        "SubmitTime": "2023-06-08T21:30:15.323000+00:00",
        "EndTime": "2023-06-08T21:40:23.509000+00:00",
        "InputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-bucket/AsyncBatchJobs/",
            "InputFormat": "ONE_DOC_PER_LINE"
        },
        "OutputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-bucket/thefolder/123456789012-
NER-123456abcdeb0e11022f22a11EXAMPLE/output/output.tar.gz"
        },
        "LanguageCode": "en",
        "DataAccessRoleArn": "arn:aws:iam::12345678012:role/service-role/

    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribePiiEntitiesDetectionJob in *AWS CLI Command Reference*.

`describe-resource-policy`

The following code example shows how to use `describe-resource-policy`.

AWS CLI

To describe a resource policy attached to a model

The following `describe-resource-policy` example gets the properties of a resource-based policy attached to a model.

```
aws comprehend describe-resource-policy \
    --resource-arn arn:aws:comprehend:us-west-2:123456789111:document-classifier/
example-classifier/version/1
```

Output:

```
{
    "ResourcePolicy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":
\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789222:root\"},\"Action\":
\"comprehend:ImportModel\",\"Resource\":\"*\"}]}",
```

```
    "CreationTime": "2023-06-19T18:44:26.028000+00:00",
    "LastModifiedTime": "2023-06-19T18:53:02.002000+00:00",
    "PolicyRevisionId": "baa675d069d07afaa2aa3106ae280f61"
}
```

For more information, see Copying custom models between AWS accounts in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeResourcePolicy in *AWS CLI Command Reference*.

`describe-sentiment-detection-job`

The following code example shows how to use `describe-sentiment-detection-job`.

AWS CLI

To describe a sentiment detection job

The following `describe-sentiment-detection-job` example gets the properties of an asynchronous sentiment detection job.

```
aws comprehend describe-sentiment-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "SentimentDetectionJobProperties": {

    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeSentimentDetectionJob in *AWS CLI Command Reference*.

`describe-targeted-sentiment-detection-job`

The following code example shows how to use `describe-targeted-sentiment-detection-job`.

AWS CLI

To describe a targeted sentiment detection job

The following `describe-targeted-sentiment-detection-job` example gets the properties of an asynchronous targeted sentiment detection job.

```
aws comprehend describe-targeted-sentiment-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "TargetedSentimentDetectionJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:123456789012:targeted-sentiment-
detection-job/123456abcdeb0e11022f22a11EXAMPLE",
        "JobName": "movie_review_analysis",
        "JobStatus": "IN_PROGRESS",
        "SubmitTime": "2023-06-09T23:16:15.956000+00:00",
        "InputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-bucket1/MovieData",
            "InputFormat": "ONE_DOC_PER_LINE"
        },
        "OutputDataConfig": {
```

```
            "S3Uri": "s3://amzn-s3-demo-bucket2/testfolder/123456789012-

    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeTargetedSentimentDetectionJob in *AWS CLI Command Reference*.

`describe-topics-detection-job`

The following code example shows how to use `describe-topics-detection-job`.

AWS CLI

To describe a topics detection job

The following `describe-topics-detection-job` example gets the properties of an asynchronous topics detection job.

```
aws comprehend describe-topics-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "TopicsDetectionJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:123456789012:topics-detection-

    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeTopicsDetectionJob in *AWS CLI Command Reference*.

`detect-dominant-language`

The following code example shows how to use `detect-dominant-language`.

AWS CLI

To detect the dominant language of input text

The following `detect-dominant-language` example analyzes the input text and identifies the dominant language. The pre-trained model's confidence score is also output.

```
aws comprehend detect-dominant-language \
    --text "It is a beautiful day in Seattle."
```

Output:

```
{
    "Languages": [
        {
            "LanguageCode": "en",
            "Score": 0.9877256155014038
        }
    ]
}
```

For more information, see Dominant Language in the *Amazon Comprehend Developer Guide*.

- For API details, see DetectDominantLanguage in *AWS CLI Command Reference*.

detect-entities

The following code example shows how to use `detect-entities`.

AWS CLI

To detect named entities in input text

The following `detect-entities` example analyzes the input text and returns the named entities. The pre-trained model's confidence score is also output for each prediction.

```
aws comprehend detect-entities \
    --language-code en \
    --text "Hello Zhang Wei, I am John. Your AnyCompany Financial Services, LLC
 credit card \
    account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by July
 31st. Based on your autopay settings, \
    we will withdraw your payment on the due date from your bank account number
 XXXXXX1111 with the routing number XXXXX0000. \
    Customer feedback for Sunshine Spa, 123 Main St, Anywhere. Send comments to
 Alice at AnySpa@example.com."
```

Output:

`detect-key-phrases`

The following code example shows how to use `detect-key-phrases`.

AWS CLI

To detect key phrases in input text

The following `detect-key-phrases` example analyzes the input text and identifies the key noun phrases. The pre-trained model's confidence score is also output for each prediction.

```
aws comprehend detect-key-phrases \
    --language-code en \
```

```
    --text "Hello Zhang Wei, I am John. Your AnyCompany Financial Services, LLC
credit card \
        account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by
July 31st. Based on your autopay settings, \
        we will withdraw your payment on the due date from your bank account number
XXXXXX1111 with the routing number XXXXX0000. \
        Customer feedback for Sunshine Spa, 123 Main St, Anywhere. Send comments to
Alice at AnySpa@example.com."
```

Output:

`import-model`

The following code example shows how to use `import-model`.

AWS CLI

To import a model

The following `import-model` example imports a model from a different AWS account. The document classifier model in account 123456789222 has a resource-based policy allowing account 123456789111 to import the model.

```
aws comprehend import-model \
```

```
    --source-model-arn arn:aws:comprehend:us-west-2:123456789222:document-
classifier/example-classifier
```

Output:

```
{
    "ModelArn": "arn:aws:comprehend:us-west-2:123456789111:document-classifier/
example-classifier"
}
```

For more information, see Copying custom models between AWS accounts in the *Amazon Comprehend Developer Guide*.

- For API details, see ImportModel in *AWS CLI Command Reference*.

`list-datasets`

The following code example shows how to use `list-datasets`.

AWS CLI

To list all flywheel datasets

The following `list-datasets` example lists all datasets associated with a flywheel.

```
aws comprehend list-datasets \
    --flywheel-arn arn:aws:comprehend:us-west-2:123456789012:flywheel/flywheel-
entity
```

Output:

```
{
    "DatasetPropertiesList": [
        {
            "DatasetArn": "arn:aws:comprehend:us-west-2:123456789012:flywheel/
flywheel-entity/dataset/example-dataset-1",
            "DatasetName": "example-dataset-1",
            "DatasetType": "TRAIN",
            "DatasetS3Uri": "s3://amzn-s3-demo-bucket/flywheel-entity/
schemaVersion=1/20230616T200543Z/datasets/example-dataset-1/20230616T203710Z/",
            "Status": "CREATING",
```

```
            "CreationTime": "2023-06-16T20:37:10.400000+00:00"
        },
        {
            "DatasetArn": "arn:aws:comprehend:us-west-2:123456789012:flywheel/
flywheel-entity/dataset/example-dataset-2",
            "DatasetName": "example-dataset-2",
            "DatasetType": "TRAIN",
            "DatasetS3Uri": "s3://amzn-s3-demo-bucket/flywheel-entity/

            "Description": "TRAIN Dataset created by Flywheel creation.",
            "Status": "COMPLETED",
            "NumberOfDocuments": 5572,
            "CreationTime": "2023-06-16T20:06:07.722000+00:00"
        }
    ]
}
```

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see ListDatasets in *AWS CLI Command Reference*.

`list-document-classification-jobs`

The following code example shows how to use `list-document-classification-jobs`.

AWS CLI

To list of all document classification jobs

The following `list-document-classification-jobs` example lists all document classification jobs.

```
aws comprehend list-document-classification-jobs
```

Output:

```
{
    "DocumentClassificationJobPropertiesList": [
        {
            "JobId": "123456abcdeb0e11022f22a11EXAMPLE",

        }
    ]
}
```

For more information, see Custom Classification in the *Amazon Comprehend Developer Guide*.

- For API details, see ListDocumentClassificationJobs in *AWS CLI Command Reference*.

`list-document-classifier-summaries`

The following code example shows how to use `list-document-classifier-summaries`.

AWS CLI

To list the summaries of all created document classifiers

The following `list-document-classifier-summaries` example lists all created document classifier summaries.

```
aws comprehend list-document-classifier-summaries
```

Output:

```
{
    "DocumentClassifierSummariesList": [
        {
            "DocumentClassifierName": "example-classifier-1",
            "NumberOfVersions": 1,
            "LatestVersionCreatedAt": "2023-06-13T22:07:59.825000+00:00",
            "LatestVersionName": "1",
            "LatestVersionStatus": "TRAINED"
        },
        {
            "DocumentClassifierName": "example-classifier-2",
            "NumberOfVersions": 2,
            "LatestVersionCreatedAt": "2023-06-13T21:54:59.589000+00:00",
            "LatestVersionName": "2",
            "LatestVersionStatus": "TRAINED"
        }
    ]
}
```

For more information, see Creating and managing custom models in the *Amazon Comprehend Developer Guide*.

- For API details, see ListDocumentClassifierSummaries in *AWS CLI Command Reference*.

`list-document-classifiers`

The following code example shows how to use `list-document-classifiers`.

AWS CLI

To list of all document classifiers

The following `list-document-classifiers` example lists all trained and in-training document classifier models.

```
aws comprehend list-document-classifiers
```

Output:

```
{
    "DocumentClassifierPropertiesList": [
        {
            "DocumentClassifierArn": "arn:aws:comprehend:us-

`list-entity-recognizer-summaries`

The following code example shows how to use `list-entity-recognizer-summaries`.

AWS CLI

To list of summaries for all created entity recognizers

The following `list-entity-recognizer-summaries` example lists all entity recognizer summaries.

```
aws comprehend list-entity-recognizer-summaries
```

Output:

```
{
    "EntityRecognizerSummariesList": [
        {
            "RecognizerName": "entity-recognizer-3",
            "NumberOfVersions": 2,
            "LatestVersionCreatedAt": "2023-06-15T23:15:07.621000+00:00",
            "LatestVersionName": "2",
            "LatestVersionStatus": "STOP_REQUESTED"
        },
        {
            "RecognizerName": "entity-recognizer-2",
            "NumberOfVersions": 1,
            "LatestVersionCreatedAt": "2023-06-14T22:55:27.805000+00:00",
            "LatestVersionName": "2",
            "LatestVersionStatus": "TRAINED"
        },
        {
            "RecognizerName": "entity-recognizer-1",
```

```
            "NumberOfVersions": 1,
            "LatestVersionCreatedAt": "2023-06-14T20:44:59.631000+00:00",

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for resource

The following `list-tags-for-resource` example lists the tags for an Amazon Comprehend resource.

```
aws comprehend list-tags-for-resource \
    --resource-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/
example-classifier/version/1
```

Output:

```
{
    "ResourceArn": "arn:aws:comprehend:us-west-2:123456789012:document-classifier/
example-classifier/version/1",
    "Tags": [
        {
            "Key": "Department",
            "Value": "Finance"
        },
        {
            "Key": "location",
            "Value": "Seattle"
        }
    ]
}
```

For more information, see Tagging your resources in the *Amazon Comprehend Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-targeted-sentiment-detection-jobs`

The following code example shows how to use `list-targeted-sentiment-detection-jobs`.

AWS CLI

To list all targeted sentiment detection jobs

The following `list-targeted-sentiment-detection-jobs` example lists all in-progress and completed asynchronous targeted sentiment detection jobs.

```
aws comprehend list-targeted-sentiment-detection-jobs
```

Output:

```
{
    "TargetedSentimentDetectionJobPropertiesList": [
        {
            "JobId": "123456abcdeb0e11022f22a11EXAMPLE",

- For API details, see ListTopicsDetectionJobs in *AWS CLI Command Reference*.

`put-resource-policy`

The following code example shows how to use `put-resource-policy`.

AWS CLI

To attach a resource-based policy

The following `put-resource-policy` example attaches a resource-based policy to a model so that can be imported by another AWS account. The policy is attached to the model in account 123456789111 and allows account 123456789222 import the model.

```
aws comprehend put-resource-policy \
    --resource-arn arn:aws:comprehend:us-west-2:123456789111:document-classifier/example-classifier/version/1 \
    --resource-policy '{"Version":"2012-10-17",       "Statement": [{"Effect":"Allow","Action":"comprehend:ImportModel","Resource":"*","Principal": {"AWS":["arn:aws:iam::123456789222:root"]}}]}'
```

Output:

```
{
    "PolicyRevisionId": "aaa111d069d07afaa2aa3106aEXAMPLE"
}
```

For more information, see Copying custom models between AWS accounts in the *Amazon Comprehend Developer Guide*.

- For API details, see PutResourcePolicy in *AWS CLI Command Reference*.

`start-document-classification-job`

The following code example shows how to use `start-document-classification-job`.

AWS CLI

To start document classification job

The following `start-document-classification-job` example starts a document classification job with a custom model on all of the files at the address specified by the `--input-data-config` tag. In this example, the input S3 bucket contains `SampleSMStext1.txt`, `SampleSMStext2.txt`, and `SampleSMStext3.txt`. The model

was previously trained on document classifications of spam and non-spam, or, "ham", SMS messages. When the job is complete, `output.tar.gz` is put at the location specified by the `--output-data-config` tag. `output.tar.gz` contains `predictions.jsonl` which lists the classification of each document. The Json output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-document-classification-job \
    --job-name exampleclassificationjob \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket1INPUT/jobdata/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-bucket2/testfolder/" \
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role \
    --document-classifier-arn arn:aws:comprehend:us-west-2:123456789012:document-
classifier/mymodel/version/12
```

Contents of `SampleSMStext1.txt`:

```
"CONGRATULATIONS! TXT 2155550100 to win $5000"
```

Contents of `SampleSMStext2.txt`:

```
"Hi, when do you want me to pick you up from practice?"
```

Contents of `SampleSMStext3.txt`:

```
"Plz send bank account # to 2155550100 to claim prize!!"
```

Output:

```
{
    "JobId": "e758dd56b824aa717ceab551fEXAMPLE",
    "JobArn": "arn:aws:comprehend:us-west-2:123456789012:document-classification-
job/e758dd56b824aa717ceab551fEXAMPLE",
    "JobStatus": "SUBMITTED"
}
```

Contents of `predictions.jsonl`:

```
{"File": "SampleSMSText1.txt", "Line": "0", "Classes": [{"Name": "spam", "Score":
 0.9999}, {"Name": "ham", "Score": 0.0001}]}
```

```
{"File": "SampleSMStext2.txt", "Line": "0", "Classes": [{"Name": "ham", "Score":
 0.9994}, {"Name": "spam", "Score": 0.0006}]}
{"File": "SampleSMSText3.txt", "Line": "0", "Classes": [{"Name": "spam", "Score":
 0.9999}, {"Name": "ham", "Score": 0.0001}]}
```

For more information, see Custom Classification in the *Amazon Comprehend Developer Guide*.

- For API details, see StartDocumentClassificationJob in *AWS CLI Command Reference*.

`start-dominant-language-detection-job`

The following code example shows how to use `start-dominant-language-detection-job`.

AWS CLI

To start an asynchronous language detection job

The following `start-dominant-language-detection-job` example starts an asynchronous language detection job for all of the files located at the address specified by the `--input-data-config` tag. The S3 bucket in this example contains `Sampletext1.txt`. When the job is complete, the folder, `output`, is placed in the location specified by the `--output-data-config` tag. The folder contains `output.txt` which contains the dominant language of each of the text files as well as the pre-trained model's confidence score for each prediction.

```
aws comprehend start-dominant-language-detection-job \
    --job-name example_language_analysis_job \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket1/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-bucket2/testfolder/" \
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role
```

Contents of `Sampletext1.txt`:

```
"Physics is the natural science that involves the study of matter and its motion and
 behavior through space and time, along with related concepts such as energy and
 force."
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
```

```
    "JobArn": "arn:aws:comprehend:us-west-2:123456789012:dominant-language-
detection-job/123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "SUBMITTED"
}
```

Contents of `output.txt`:

```
{"File": "Sampletext1.txt", "Languages": [{"LanguageCode": "en", "Score":
 0.9913753867149353}], "Line": 0}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StartDominantLanguageDetectionJob in *AWS CLI Command Reference*.

`start-entities-detection-job`

The following code example shows how to use `start-entities-detection-job`.

AWS CLI

Example 1: To start a standard entity detection job using the pre-trained model

The following `start-entities-detection-job` example starts an asynchronous entities detection job for all files located at the address specified by the `--input-data-config` tag. The S3 bucket in this example contains `Sampletext1.txt`, `Sampletext2.txt`, and `Sampletext3.txt`. When the job is complete, the folder, `output`, is placed in the location specified by the `--output-data-config` tag. The folder contains `output.txt` which lists all of the named entities detected within each text file as well as the pre-trained model's confidence score for each prediction. The Json output is printed on one line per input file, but is formatted here for readability.

```
aws comprehend start-entities-detection-job \
    --job-name entitiestest \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket1/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-bucket2/testfolder/" \
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role \
    --language-code en
```

Contents of `Sampletext1.txt`:

```
"Hello Zhang Wei, I am John. Your AnyCompany Financial Services, LLC credit card
 account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by July
 31st."
```

Contents of `Sampletext2.txt`:

```
"Dear Max, based on your autopay settings for your account example1.org account, we
 will withdraw your payment on the due date from your bank account number XXXXXX1111
 with the routing number XXXXX0000. "
```

Contents of `Sampletext3.txt`:

```
"Jane, please submit any customer feedback from this weekend to AnySpa, 123 Main St,
 Anywhere and send comments to Alice at AnySpa@example.com."
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobArn": "arn:aws:comprehend:us-west-2:123456789012:entities-detection-

Example 2: To start a custom entity detection job

The following `start-entities-detection-job` example starts an asynchronous custom entities detection job for all files located at the address specified by the `--input-data-config` tag. In this example, the S3 bucket in this example contains `SampleFeedback1.txt`, `SampleFeedback2.txt`, and `SampleFeedback3.txt`. The entity recognizer model was trained on customer support Feedbacks to recognize device names. When the job is complete, an the folder, `output`, is put at the location specified by the `--output-data-config` tag. The folder contains `output.txt`, which lists all of the named entities detected within each text file as well as the pre-trained model's confidence score for each prediction. The Json output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-entities-detection-job \
    --job-name customentitiestest \
    --entity-recognizer-arn "arn:aws:comprehend:us-west-2:123456789012:entity-
recognizer/entityrecognizer" \
    --language-code en \
```

```
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket1/jobdata/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-bucket2/testfolder/" \
    --data-access-role-arn "arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-IOrole"
```

Contents of `SampleFeedback1.txt`:

```
"I've been on the AnyPhone app have had issues for 24 hours when trying to pay bill.
 Cannot make payment. Sigh. | Oh man! Lets get that app up and running. DM me, and
 we can get to work!"
```

Contents of `SampleFeedback2.txt`:

```
"Hi, I have a discrepancy with my new bill. Could we get it sorted out? A rep added
 stuff I didn't sign up for when I did my AnyPhone 10 upgrade. | We can absolutely
 get this sorted!"
```

Contents of `SampleFeedback3.txt`:

```
"Is the by 1 get 1 free AnySmartPhone promo still going on? | Hi Christian! It ended
 yesterday, send us a DM if you have any questions and we can take a look at your
 options!"
```

Output:

```

- For API details, see StartEntitiesDetectionJob in *AWS CLI Command Reference*.

`start-events-detection-job`

The following code example shows how to use `start-events-detection-job`.

AWS CLI

To start an asynchronous events detection job

The following `start-events-detection-job` example starts an asynchronous events detection job for all files located at the address specified by the `--input-data-config` tag. Possible target event types include `BANKRUPCTY`, `EMPLOYMENT`, `CORPORATE_ACQUISITION`, `INVESTMENT_GENERAL`, `CORPORATE_MERGER`, `IPO`, `RIGHTS_ISSUE`, `SECONDARY_OFFERING`, `SHELF_OFFERING`, `TENDER_OFFERING`, and `STOCK_SPLIT`. The S3 bucket in this example contains `SampleText1.txt`, `SampleText2.txt`, and `SampleText3.txt`. When the job is complete, the folder, `output`, is placed in the location specified by the `--output-data-config` tag. The folder contains `SampleText1.txt.out`, `SampleText2.txt.out`, and `SampleText3.txt.out`. The JSON output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-events-detection-job \
    --job-name events-detection-1 \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket1/EventsData" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-bucket2/testfolder/" \
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-servicerole \
    --language-code en \
    --target-event-
types "BANKRUPTCY" "EMPLOYMENT" "CORPORATE_ACQUISITION" "CORPORATE_MERGER" "INVESTMENT_GENER
```

Contents of `SampleText1.txt`:

```
"Company AnyCompany grew by increasing sales and through acquisitions. After
 purchasing competing firms in 2020, AnyBusiness, a part of the AnyBusinessGroup,
 gave Jane Does firm a going rate of one cent a gallon or forty-two cents a barrel."
```

Contents of `SampleText2.txt`:

```
"In 2021, AnyCompany officially purchased AnyBusiness for 100 billion dollars,
 surprising and exciting the shareholders."
```

Contents of `SampleText3.txt`:

```
"In 2022, AnyCompany stock crashed 50. Eventually later that year they filed for
 bankruptcy."
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobArn": "arn:aws:comprehend:us-west-2:123456789012:events-detection-

`start-flywheel-iteration`

The following code example shows how to use `start-flywheel-iteration`.

AWS CLI

To start a flywheel iteration

The following `start-flywheel-iteration` example starts a flywheel iteration. This operation uses any new datasets in the flywheel to train a new model version.

```
aws comprehend start-flywheel-iteration \
    --flywheel-arn arn:aws:comprehend:us-west-2:123456789012:flywheel/example-flywheel
```

Output:

```
{
    "FlywheelArn": "arn:aws:comprehend:us-west-2:123456789012:flywheel/example-flywheel",
    "FlywheelIterationId": "12345123TEXAMPLE"
}
```

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see StartFlywheelIteration in *AWS CLI Command Reference*.

`start-key-phrases-detection-job`

The following code example shows how to use `start-key-phrases-detection-job`.

AWS CLI

To start a key phrases detection job

The following `start-key-phrases-detection-job` example starts an asynchronous key phrases detection job for all files located at the address specified by the `--input-data-config` tag. The S3 bucket in this example contains `Sampletext1.txt`, `Sampletext2.txt`, and `Sampletext3.txt`. When the job is completed, the folder, `output`, is placed in the location specified by the `--output-data-config` tag. The folder contains the file `output.txt` which contains all the key phrases detected within each text file and the pre-trained model's confidence score for each prediction. The Json output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-key-phrases-detection-job \
```

```
    --job-name keyphrasesanalysistest1 \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket1/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-bucket2/testfolder/" \
    --data-access-role-arn "arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role" \
    --language-code en
```

`start-pii-entities-detection-job`

The following code example shows how to use `start-pii-entities-detection-job`.

AWS CLI

To start an asynchronous PII detection job

The following `start-pii-entities-detection-job` example starts an asynchronous personal identifiable information (PII) entities detection job for all files located at the address specified by the `--input-data-config` tag. The S3 bucket in this example contains `Sampletext1.txt`, `Sampletext2.txt`, and `Sampletext3.txt`. When the job is complete, the folder, `output`, is placed in the location specified by the `--output-data-config` tag. The folder contains `SampleText1.txt.out`, `SampleText2.txt.out`, and `SampleText3.txt.out` which list the named entities within each text file. The Json output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-pii-entities-detection-job \
    --job-name entities_test \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket1/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-bucket2/testfolder/" \
```

```
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role \
    --language-code en \
    --mode ONLY_OFFSETS
```

Contents of Sampletext1.txt:

`start-sentiment-detection-job`

The following code example shows how to use `start-sentiment-detection-job`.

AWS CLI

To start an asynchronous sentiment analysis job

The following `start-sentiment-detection-job` example starts an asynchronous sentiment analysis detection job for all files located at the address specified by the `--input-data-config` tag. The S3 bucket folder in this example contains `SampleMovieReview1.txt`, `SampleMovieReview2.txt`, and `SampleMovieReview3.txt`. When the job is complete, the folder, `output`, is placed at the location specified by the `--output-data-config` tag. The folder contains the file, `output.txt`, which contains the prevailing sentiments for each text file and the pre-trained model's confidence score for each prediction. The Json output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-sentiment-detection-job \
    --job-name example-sentiment-detection-job \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket1/MovieData" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-bucket2/testfolder/" \
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role
```

Contents of `SampleMovieReview1.txt`:

```
"The film, AnyMovie2, is fairly predictable and just okay."
```

Contents of `SampleMovieReview2.txt`:

```
"AnyMovie2 is the essential sci-fi film that I grew up watching when I was a kid. I
 highly recommend this movie."
```

Contents of `SampleMovieReview3.txt`:

```
"Don't get fooled by the 'awards' for AnyMovie2. All parts of the film were poorly
 stolen from other modern directors."
```

Output:

```
{
    "JobId": "0b5001e25f62ebb40631a9a1a7fde7b3",
    "JobArn": "arn:aws:comprehend:us-west-2:123456789012:sentiment-detection-

`start-targeted-sentiment-detection-job`

The following code example shows how to use `start-targeted-sentiment-detection-job`.

AWS CLI

To start an asynchronous targeted sentiment analysis job

The following `start-targeted-sentiment-detection-job` example starts an asynchronous targeted sentiment analysis detection job for all files located at the address specified by the `--input-data-config` tag. The S3 bucket folder in this example contains `SampleMovieReview1.txt`, `SampleMovieReview2.txt`, and `SampleMovieReview3.txt`. When the job is complete, `output.tar.gz` is placed at the location specified by the `--output-data-config` tag. `output.tar.gz` contains the files `SampleMovieReview1.txt.out`, `SampleMovieReview2.txt.out`, and `SampleMovieReview3.txt.out`, which each contain all of the named entities and associated sentiments for a single input text file.

```
aws comprehend start-targeted-sentiment-detection-job \
    --job-name targeted_movie_review_analysis1 \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket1/MovieData" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-bucket2/testfolder/" \
```

```
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role
```

Contents of SampleMovieReview1.txt:

`start-topics-detection-job`

The following code example shows how to use `start-topics-detection-job`.

AWS CLI

To start a topics detection analysis job

The following `start-topics-detection-job` example starts an asynchronous topics detection job for all files located at the address specified by the `--input-data-config` tag. When the job is complete, the folder, `output`, is placed at the location specified by the `--ouput-data-config` tag. `output` contains topic-terms.csv and doc-topics.csv. The first output file, topic-terms.csv, is a list of topics in the collection. For each topic, the list includes, by default, the top terms by topic according to their weight. The second file, `doc-topics.csv`, lists the documents associated with a topic and the proportion of the document that is concerned with the topic.

```
aws comprehend start-topics-detection-job \
    --job-name example_topics_detection_job \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket1/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-bucket2/testfolder/" \
    --data-access-role-arn arn:aws:iam::123456789012:role/service-role/
AmazonComprehendServiceRole-example-role
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobArn": "arn:aws:comprehend:us-west-2:123456789012:key-phrases-detection-
job/123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "SUBMITTED"
}
```

For more information, see Topic Modeling in the *Amazon Comprehend Developer Guide*.

- For API details, see StartTopicsDetectionJob in *AWS CLI Command Reference*.

`stop-dominant-language-detection-job`

The following code example shows how to use `stop-dominant-language-detection-job`.

AWS CLI

To stop an asynchronous dominant language detection job

The following `stop-dominant-language-detection-job` example stops an in-progress, asynchronous dominant language detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-dominant-language-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopDominantLanguageDetectionJob in *AWS CLI Command Reference*.

`stop-entities-detection-job`

The following code example shows how to use `stop-entities-detection-job`.

AWS CLI

To stop an asynchronous entities detection job

The following `stop-entities-detection-job` example stops an in-progress, asynchronous entities detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-entities-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopEntitiesDetectionJob in *AWS CLI Command Reference*.

`stop-events-detection-job`

The following code example shows how to use `stop-events-detection-job`.

AWS CLI

To stop an asynchronous events detection job

The following `stop-events-detection-job` example stops an in-progress, asynchronous events detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-events-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopEventsDetectionJob in *AWS CLI Command Reference*.

`stop-key-phrases-detection-job`

The following code example shows how to use `stop-key-phrases-detection-job`.

AWS CLI

To stop an asynchronous key phrases detection job

The following `stop-key-phrases-detection-job` example stops an in-progress, asynchronous key phrases detection job. If the current job state is `IN_PROGRESS` the job is

marked for termination and put into the STOP_REQUESTED state. If the job completes before it can be stopped, it is put into the COMPLETED state.

```
aws comprehend stop-key-phrases-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopKeyPhrasesDetectionJob in *AWS CLI Command Reference*.

`stop-pii-entities-detection-job`

The following code example shows how to use `stop-pii-entities-detection-job`.

AWS CLI

To stop an asynchronous pii entities detection job

The following `stop-pii-entities-detection-job` example stops an in-progress, asynchronous pii entities detection job. If the current job state is IN_PROGRESS the job is marked for termination and put into the STOP_REQUESTED state. If the job completes before it can be stopped, it is put into the COMPLETED state.

```
aws comprehend stop-pii-entities-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopPiiEntitiesDetectionJob in *AWS CLI Command Reference*.

`stop-sentiment-detection-job`

The following code example shows how to use `stop-sentiment-detection-job`.

AWS CLI

To stop an asynchronous sentiment detection job

The following `stop-sentiment-detection-job` example stops an in-progress, asynchronous sentiment detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-sentiment-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopSentimentDetectionJob in *AWS CLI Command Reference*.

`stop-targeted-sentiment-detection-job`

The following code example shows how to use `stop-targeted-sentiment-detection-job`.

AWS CLI

To stop an asynchronous targeted sentiment detection job

The following `stop-targeted-sentiment-detection-job` example stops an in-progress, asynchronous targeted sentiment detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-targeted-sentiment-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopTargetedSentimentDetectionJob in *AWS CLI Command Reference*.

`stop-training-document-classifier`

The following code example shows how to use `stop-training-document-classifier`.

AWS CLI

To stop the training of a document classifier model

The following `stop-training-document-classifier` example stops the training of a document classifier model while in-progress.

```
aws comprehend stop-training-document-classifier \
    --document-classifier-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/example-classifier
```

This command produces no output.

For more information, see Creating and managing custom models in the *Amazon Comprehend Developer Guide*.

- For API details, see StopTrainingDocumentClassifier in *AWS CLI Command Reference*.

`stop-training-entity-recognizer`

The following code example shows how to use `stop-training-entity-recognizer`.

AWS CLI

To stop the training of an entity recognizer model

The following `stop-training-entity-recognizer` example stops the training of an entity recognizer model while in-progress.

```
aws comprehend stop-training-entity-recognizer \
    --entity-recognizer-arn "arn:aws:comprehend:us-west-2:123456789012:entity-recognizer/examplerecognizer1"
```

This command produces no output.

For more information, see Creating and managing custom models in the *Amazon Comprehend Developer Guide*.

- For API details, see StopTrainingEntityRecognizer in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To tag a resource

The following `tag-resource` example adds a single tag to an Amazon Comprehend resource.

```
aws comprehend tag-resource \
    --resource-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/example-classifier/version/1 \
    --tags Key=Location,Value=Seattle
```

This command produces no output.

For more information, see Tagging your resources in the *Amazon Comprehend Developer Guide*.

Example 2: To add multiple tags to a resource

The following `tag-resource` example adds multiple tags to an Amazon Comprehend resource.

```
aws comprehend tag-resource \
    --resource-arn "arn:aws:comprehend:us-west-2:123456789012:document-classifier/
example-classifier/version/1" \
    --tags Key=location,Value=Seattle Key=Department,Value=Finance
```

This command produces no output.

For more information, see Tagging your resources in the *Amazon Comprehend Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To remove a single tag from a resource

The following `untag-resource` example removes a single tag from an Amazon Comprehend resource.

```
aws comprehend untag-resource \
    --resource-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/
example-classifier/version/1 \
    --tag-keys Location
```

This command produces no output.

For more information, see Tagging your resources in the *Amazon Comprehend Developer Guide*.

Example 2: To remove multiple tags from a resource

The following `untag-resource` example removes multiple tags from an Amazon Comprehend resource.

```
aws comprehend untag-resource \
    --resource-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/
example-classifier/version/1 \
    --tag-keys Location Department
```

This command produces no output.

For more information, see Tagging your resources in the *Amazon Comprehend Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-endpoint`

The following code example shows how to use `update-endpoint`.

AWS CLI

Example 1: To update an endpoint's inference units

The following `update-endpoint` example updates information about an endpoint. In this example, the number of inference units is increased.

```
aws comprehend update-endpoint \
    --endpoint-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier-endpoint/example-classifier-endpoint \
    --desired-inference-units 2
```

This command produces no output.

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

Example 2: To update an endpoint's actie model

The following `update-endpoint` example updates information about an endpoint. In this example, the active model is changed.

```
aws comprehend update-endpoint \
    --endpoint-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier-endpoint/example-classifier-endpoint \
    --desired-model-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/example-classifier-new
```

This command produces no output.

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see UpdateEndpoint in *AWS CLI Command Reference*.

update-flywheel

The following code example shows how to use update-flywheel.

AWS CLI

To update a flywheel configuration

The following update-flywheel example updates a flywheel configuration. In this example, the active model for the flywheel is updated.

```
aws comprehend update-flywheel \
    --flywheel-arn arn:aws:comprehend:us-west-2:123456789012:flywheel/example-flywheel-1 \
    --active-model-arn arn:aws:comprehend:us-west-2:123456789012:document-classifier/example-classifier/version/new-example-classifier-model
```

Output:

```
{
    "FlywheelProperties": {
        "FlywheelArn": "arn:aws:comprehend:us-west-2:123456789012:flywheel/flywheel-entity",
        "ActiveModelArn": "arn:aws:comprehend:us-west-2:123456789012:document-classifier/example-classifier/version/new-example-classifier-model",
        "DataAccessRoleArn": "arn:aws:iam::123456789012:role/service-role/AmazonComprehendServiceRole-example-role",
        "TaskConfig": {
            "LanguageCode": "en",
            "DocumentClassificationConfig": {
                "Mode": "MULTI_CLASS"
            }
        },
        "DataLakeS3Uri": "s3://amzn-s3-demo-bucket/flywheel-entity/schemaVersion=1/20230616T200543Z/",
        "DataSecurityConfig": {},
        "Status": "ACTIVE",
        "ModelType": "DOCUMENT_CLASSIFIER",
        "CreationTime": "2023-06-16T20:05:43.242000+00:00",
        "LastModifiedTime": "2023-06-19T04:00:43.027000+00:00",
        "LatestFlywheelIteration": "20230619T040032Z"
    }
}
```

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see UpdateFlywheel in *AWS CLI Command Reference*.

Amazon Comprehend Medical examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Comprehend Medical.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`describe-entities-detection-v2-job`

The following code example shows how to use `describe-entities-detection-v2-job`.

AWS CLI

To describe an entities detection job

The following `describe-entities-detection-v2-job` example displays the properties associated with an asynchronous entity detection job.

```
aws comprehendmedical describe-entities-detection-v2-job \
    --job-id "ab9887877365fe70299089371c043b96"
```

Output:

```
{
    "ComprehendMedicalAsyncJobProperties": {
        "JobId": "ab9887877365fe70299089371c043b96",
        "JobStatus": "COMPLETED",
        "SubmitTime": "2020-03-18T21:20:15.614000+00:00",
```

```
        "EndTime": "2020-03-18T21:27:07.350000+00:00",
        "ExpirationTime": "2020-07-16T21:20:15+00:00",
        "InputDataConfig": {
            "S3Bucket": "comp-med-input",
            "S3Key": ""
        },
        "OutputDataConfig": {
            "S3Bucket": "comp-med-output",
            "S3Key": "123456789012-EntitiesDetection-
ab9887877365fe70299089371c043b96/"
        },
        "LanguageCode": "en",
        "DataAccessRoleArn": "arn:aws:iam::123456789012:role/
ComprehendMedicalBatchProcessingRole",
        "ModelVersion": "DetectEntitiesModelV20190930"
    }
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DescribeEntitiesDetectionV2Job in *AWS CLI Command Reference*.

`describe-icd10-cm-inference-job`

The following code example shows how to use `describe-icd10-cm-inference-job`.

AWS CLI

To describe an ICD-10-CM inference job

The following `describe-icd10-cm-inference-job` example describes the properties of the requested inference job with the specified job-id.

```
aws comprehendmedical describe-icd10-cm-inference-job \
    --job-id "5780034166536cdb52ffa3295a1b00a7"
```

Output:

```
{
    "ComprehendMedicalAsyncJobProperties": {
        "JobId": "5780034166536cdb52ffa3295a1b00a7",
        "JobStatus": "COMPLETED",
        "SubmitTime": "2020-05-18T21:20:15.614000+00:00",
```

```
        "EndTime": "2020-05-18T21:27:07.350000+00:00",
        "ExpirationTime": "2020-09-16T21:20:15+00:00",
        "InputDataConfig": {
            "S3Bucket": "comp-med-input",
            "S3Key": "AKIAIOSFODNN7EXAMPLE"
        },
        "OutputDataConfig": {
            "S3Bucket": "comp-med-output",
            "S3Key": "AKIAIOSFODNN7EXAMPLE"
        },
        "LanguageCode": "en",
        "DataAccessRoleArn": "arn:aws:iam::123456789012:role/
ComprehendMedicalBatchProcessingRole",
        "ModelVersion":  "0.1.0"
    }
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DescribeIcd10CmInferenceJob in *AWS CLI Command Reference*.

`describe-phi-detection-job`

The following code example shows how to use `describe-phi-detection-job`.

AWS CLI

To describe a PHI detection job

The following `describe-phi-detection-job` example displays the properties associated with an asynchronous protected health information (PHI) detection job.

```
aws comprehendmedical describe-phi-detection-job \
    --job-id "4750034166536cdb52ffa3295a1b00a3"
```

Output:

```
{
    "ComprehendMedicalAsyncJobProperties": {
        "JobId": "4750034166536cdb52ffa3295a1b00a3",
        "JobStatus": "COMPLETED",
        "SubmitTime": "2020-03-19T20:38:37.594000+00:00",
```

```
        "EndTime": "2020-03-19T20:45:07.894000+00:00",
        "ExpirationTime": "2020-07-17T20:38:37+00:00",
        "InputDataConfig": {
            "S3Bucket": "comp-med-input",
            "S3Key": ""
        },
        "OutputDataConfig": {
            "S3Bucket": "comp-med-output",
            "S3Key": "123456789012-PHIDetection-4750034166536cdb52ffa3295a1b00a3/"
        },
        "LanguageCode": "en",
        "DataAccessRoleArn": "arn:aws:iam::123456789012:role/
ComprehendMedicalBatchProcessingRole",
        "ModelVersion": "PHIModelV20190903"
    }
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DescribePhiDetectionJob in *AWS CLI Command Reference*.

`describe-rx-norm-inference-job`

The following code example shows how to use `describe-rx-norm-inference-job`.

AWS CLI

To describe an RxNorm inference job

The following `describe-rx-norm-inference-job` example describes the properties of the requested inference job with the specified job-id.

```
aws comprehendmedical describe-rx-norm-inference-job \
    --job-id "eg8199877365fc70299089371c043b96"
```

Output:

```
{
    "ComprehendMedicalAsyncJobProperties": {
        "JobId": "g8199877365fc70299089371c043b96",
        "JobStatus": "COMPLETED",
        "SubmitTime": "2020-05-18T21:20:15.614000+00:00",
        "EndTime": "2020-05-18T21:27:07.350000+00:00",
```

```
        "ExpirationTime": "2020-09-16T21:20:15+00:00",
        "InputDataConfig": {

`describe-snomedct-inference-job`

The following code example shows how to use `describe-snomedct-inference-job`.

AWS CLI

To describe an SNOMED CT inference job

The following `describe-snomedct-inference-job` example describes the properties of the requested inference job with the specified job-id.

```
aws comprehendmedical describe-snomedct-inference-job \
    --job-id "2630034166536cdb52ffa3295a1b00a7"
```

Output:

```
{
    "ComprehendMedicalAsyncJobProperties": {
        "JobId": "2630034166536cdb52ffa3295a1b00a7",

    }
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DescribeSnomedctInferenceJob in *AWS CLI Command Reference*.

`detect-entities-v2`

The following code example shows how to use `detect-entities-v2`.

AWS CLI

Example 1: To detect entities directly from text

The following `detect-entities-v2` example shows the detected entities and labels them according to type, directly from input text.

```
aws comprehendmedical detect-entities-v2 \
    --text "Sleeping trouble on present dosage of Clonidine. Severe rash on face and
 leg, slightly itchy."
```

Output:

```
{
    "Entities": [
        {
            "Id": 0,
            "BeginOffset": 38,
```

```
            "EndOffset": 47,
            "Score": 0.9942955374717712,
            "Text": "Clonidine",
            "Category": "MEDICATION",
            "Type": "GENERIC_NAME",
            "Traits": []
        }
    ]
}
```

For more information, see Detect Entities Version 2 in the *Amazon Comprehend Medical Developer Guide*.

Example 2: To detect entities from a file path

The following `detect-entities-v2` example shows the detected entities and labels them according to type from a file path.

```
aws comprehendmedical detect-entities-v2 \
    --text file://medical_entities.txt
```

Contents of `medical_entities.txt`:

```
{
    "Sleeping trouble on present dosage of Clonidine. Severe rash on face and leg,
 slightly itchy."
}
```

Output:

```
{
    "Entities": [
        {
            "Id": 0,
            "BeginOffset": 38,
            "EndOffset": 47,
            "Score": 0.9942955374717712,
            "Text": "Clonidine",

            "Traits": []
        }
```

```
    ]
}
```

For more information, see Detect Entities Version 2 in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DetectEntitiesV2 in *AWS CLI Command Reference*.

`detect-phi`

The following code example shows how to use `detect-phi`.

AWS CLI

Example 1: To detect protected health information (PHI) directly from text

The following `detect-phi` example displays the detected protected health information (PHI) entities directly from input text.

```
aws comprehendmedical detect-phi \
    --text "Patient Carlos Salazar presented with rash on his upper extremities and dry cough. He lives at 100 Main Street, Anytown, USA where he works from his home as a carpenter."
```

Output:

```
{
    "Entities": [
        {
            "Id": 0,

`infer-rx-norm`

The following code example shows how to use `infer-rx-norm`.

AWS CLI

Example 1: To detect medication entities and link to RxNorm directly from text

The following `infer-rx-norm` example shows and labels the detected medication entities and links those entities to concept identifiers (RxCUI) from the National Library of Medicine RxNorm database.

```
aws comprehendmedical infer-rx-norm \
    --text "Patient reports taking Levothyroxine 125 micrograms p.o. once daily, but denies taking Synthroid."
```

Output:

```

`list-icd10-cm-inference-jobs`

The following code example shows how to use `list-icd10-cm-inference-jobs`.

AWS CLI

To list all current ICD-10-CM inference jobs

The following `list-icd10-cm-inference-jobs` example returns a list of current asynchronous ICD-10-CM batch inference jobs.

```
aws comprehendmedical list-icd10-cm-inference-jobs
```

Output:

```
{
    "ComprehendMedicalAsyncJobPropertiesList": [
        {
            "JobId": "5780034166536cdb52ffa3295a1b00a7",
            "JobStatus": "COMPLETED",
            "SubmitTime": "2020-05-19T20:38:37.594000+00:00",
            "EndTime": "2020-05-19T20:45:07.894000+00:00",
            "ExpirationTime": "2020-09-17T20:38:37+00:00",
            "InputDataConfig": {

`list-phi-detection-jobs`

The following code example shows how to use `list-phi-detection-jobs`.

AWS CLI

To list protected health information (PHI) detection jobs

The following `list-phi-detection-jobs` example lists current protected health information (PHI) detection jobs.

```
aws comprehendmedical list-phi-detection-jobs
```

Output:

```
{
    "ComprehendMedicalAsyncJobPropertiesList": [
        {
            "JobId": "4750034166536cdb52ffa3295a1b00a3",
            "JobStatus": "COMPLETED",
            "SubmitTime": "2020-03-19T20:38:37.594000+00:00",

        }
    ]
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see ListPhiDetectionJobs in *AWS CLI Command Reference*.

`list-rx-norm-inference-jobs`

The following code example shows how to use `list-rx-norm-inference-jobs`.

AWS CLI

To list all current Rx-Norm inference jobs

The following `list-rx-norm-inference-jobs` example returns a list of current asynchronous Rx-Norm batch inference jobs.

```
aws comprehendmedical list-rx-norm-inference-jobs
```

Output:

```
{
    "ComprehendMedicalAsyncJobPropertiesList": [
        {
            "JobId": "4980034166536cfb52gga3295a1b00a3",
            "JobStatus": "COMPLETED",
            "SubmitTime": "2020-05-19T20:38:37.594000+00:00",
            "EndTime": "2020-05-19T20:45:07.894000+00:00",
            "ExpirationTime": "2020-09-17T20:38:37+00:00",
            "InputDataConfig": {
                "S3Bucket": "comp-med-input",
                "S3Key": "AKIAIOSFODNN7EXAMPLE"
            },
            "OutputDataConfig": {
                "S3Bucket": "comp-med-output",
                "S3Key": "AKIAIOSFODNN7EXAMPLE"
            },
            "LanguageCode": "en",
            "DataAccessRoleArn": "arn:aws:iam::123456789012:role/
ComprehendMedicalBatchProcessingRole",
            "ModelVersion": "0.0.0"
        }
    ]
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see ListRxNormInferenceJobs in *AWS CLI Command Reference*.

`list-snomedct-inference-jobs`

The following code example shows how to use `list-snomedct-inference-jobs`.

AWS CLI

To list all SNOMED CT inference jobs

The following `list-snomedct-inference-jobs` example returns a list of current asynchronous SNOMED CT batch inference jobs.

```
aws comprehendmedical list-snomedct-inference-jobs
```

Output:

```
{
    "ComprehendMedicalAsyncJobPropertiesList": [
        {
            "JobId": "5780034166536cdb52ffa3295a1b00a7",
            "JobStatus": "COMPLETED",
            "SubmitTime": "2020-05-19T20:38:37.594000+00:00",
            "EndTime": "2020-05-19T20:45:07.894000+00:00",
            "ExpirationTime": "2020-09-17T20:38:37+00:00",
            "InputDataConfig": {
                "S3Bucket": "comp-med-input",
                "S3Key": "AKIAIOSFODNN7EXAMPLE"
            },
            "OutputDataConfig": {
                "S3Bucket": "comp-med-output",
                "S3Key": "AKIAIOSFODNN7EXAMPLE"
            },
            "LanguageCode": "en",
            "DataAccessRoleArn": "arn:aws:iam::123456789012:role/
ComprehendMedicalBatchProcessingRole",
            "ModelVersion":  "0.1.0"
        }
    ]
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see ListSnomedctInferenceJobs in *AWS CLI Command Reference*.

`start-entities-detection-v2-job`

The following code example shows how to use `start-entities-detection-v2-job`.

AWS CLI

To start an entities detection job

The following `start-entities-detection-v2-job` example starts an asynchronous entity detection job.

```
aws comprehendmedical start-entities-detection-v2-job \
    --input-data-config "S3Bucket=comp-med-input" \
    --output-data-config "S3Bucket=comp-med-output" \
    --data-access-role-arn arn:aws:iam::123456789012:role/
ComprehendMedicalBatchProcessingRole \
    --language-code en
```

Output:

```
{
    "JobId": "ab9887877365fe70299089371c043b96"
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StartEntitiesDetectionV2Job in *AWS CLI Command Reference*.

`start-icd10-cm-inference-job`

The following code example shows how to use `start-icd10-cm-inference-job`.

AWS CLI

To start an ICD-10-CM inference job

The following `start-icd10-cm-inference-job` example starts an ICD-10-CM inference batch analysis job.

```
aws comprehendmedical start-icd10-cm-inference-job \
    --input-data-config "S3Bucket=comp-med-input" \
    --output-data-config "S3Bucket=comp-med-output" \
    --data-access-role-arn arn:aws:iam::123456789012:role/
ComprehendMedicalBatchProcessingRole \
    --language-code en
```

Output:

```
{
    "JobId": "ef7289877365fc70299089371c043b96"
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StartIcd10CmInferenceJob in *AWS CLI Command Reference*.

`start-phi-detection-job`

The following code example shows how to use `start-phi-detection-job`.

AWS CLI

To start a PHI detection job

The following `start-phi-detection-job` example starts an asynchronous PHI entity detection job.

```
aws comprehendmedical start-phi-detection-job \
    --input-data-config "S3Bucket=comp-med-input" \
    --output-data-config "S3Bucket=comp-med-output" \
    --data-access-role-arn arn:aws:iam::123456789012:role/
ComprehendMedicalBatchProcessingRole \
    --language-code en
```

Output:

```
{
    "JobId": "ab9887877365fe70299089371c043b96"
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StartPhiDetectionJob in *AWS CLI Command Reference*.

`start-rx-norm-inference-job`

The following code example shows how to use `start-rx-norm-inference-job`.

AWS CLI

To start an RxNorm inference job

The following `start-rx-norm-inference-job` example starts an RxNorm inference batch analysis job.

```
aws comprehendmedical start-rx-norm-inference-job \
    --input-data-config "S3Bucket=comp-med-input" \
    --output-data-config "S3Bucket=comp-med-output" \
    --data-access-role-arn arn:aws:iam::123456789012:role/
ComprehendMedicalBatchProcessingRole \
    --language-code en
```

Output:

```
{
    "JobId": "eg8199877365fc70299089371c043b96"
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StartRxNormInferenceJob in *AWS CLI Command Reference*.

`start-snomedct-inference-job`

The following code example shows how to use `start-snomedct-inference-job`.

AWS CLI

To start an SNOMED CT inference job

The following `start-snomedct-inference-job` example starts a SNOMED CT inference batch analysis job.

```
aws comprehendmedical start-snomedct-inference-job \
    --input-data-config "S3Bucket=comp-med-input" \
    --output-data-config "S3Bucket=comp-med-output" \
    --data-access-role-arn arn:aws:iam::123456789012:role/
ComprehendMedicalBatchProcessingRole \
```

```
    --language-code en
```

Output:

```
{
    "JobId": "dg7289877365fc70299089371c043b96"
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StartSnomedctInferenceJob in *AWS CLI Command Reference*.

`stop-entities-detection-v2-job`

The following code example shows how to use `stop-entities-detection-v2-job`.

AWS CLI

To stop an entity detection job

The following `stop-entities-detection-v2-job` example stops an asynchronous entity detection job.

```
aws comprehendmedical stop-entities-detection-v2-job \
    --job-id "ab9887877365fe70299089371c043b96"
```

Output:

```
{
    "JobId": "ab9887877365fe70299089371c043b96"
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StopEntitiesDetectionV2Job in *AWS CLI Command Reference*.

`stop-icd10-cm-inference-job`

The following code example shows how to use `stop-icd10-cm-inference-job`.

AWS CLI

To stop an ICD-10-CM inference job

The following `stop-icd10-cm-inference-job` example stops an ICD-10-CM inference batch analysis job.

```
aws comprehendmedical stop-icd10-cm-inference-job \
    --job-id "4750034166536cdb52ffa3295a1b00a3"
```

Output:

```
{
    "JobId": "4750034166536cdb52ffa3295a1b00a3"
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StopIcd10CmInferenceJob in *AWS CLI Command Reference*.

`stop-phi-detection-job`

The following code example shows how to use `stop-phi-detection-job`.

AWS CLI

To stop a protected health information (PHI) detection job

The following `stop-phi-detection-job` example stops an asynchronous protected health information (PHI) detection job.

```
aws comprehendmedical stop-phi-detection-job \
    --job-id "4750034166536cdb52ffa3295a1b00a3"
```

Output:

```
{
    "JobId": "ab9887877365fe70299089371c043b96"
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StopPhiDetectionJob in *AWS CLI Command Reference*.

`stop-rx-norm-inference-job`

The following code example shows how to use `stop-rx-norm-inference-job`.

AWS CLI

To stop an RxNorm inference job

The following `stop-rx-norm-inference-job` example stops an ICD-10-CM inference batch analysis job.

```
aws comprehendmedical stop-rx-norm-inference-job \
    --job-id "eg8199877365fc70299089371c043b96"
```

Output:

```
{
    "JobId": "eg8199877365fc70299089371c043b96"
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StopRxNormInferenceJob in *AWS CLI Command Reference*.

`stop-snomedct-inference-job`

The following code example shows how to use `stop-snomedct-inference-job`.

AWS CLI

To stop a SNOMED CT inference job

The following `stop-snomedct-inference-job` example stops a SNOMED CT inference batch analysis job.

```
aws comprehendmedical stop-snomedct-inference-job \
```

```
    --job-id "8750034166436cdb52ffa3295a1b00a1"
```

Output:

```
{
    "JobId": "8750034166436cdb52ffa3295a1b00a1"
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StopSnomedctInferenceJob in *AWS CLI Command Reference*.

AWS Config examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Config.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-config-rule`

The following code example shows how to use `delete-config-rule`.

AWS CLI

To delete an AWS Config rule

The following `delete-config-rule` example deletes an AWS Config rule named `MyConfigRule`.

```
aws configservice delete-config-rule \
    --config-rule-name MyConfigRule
```

This command produces no output.

For more information, see Deleting AWS Config Rules in the *AWS Config Developer Guide*.

- For API details, see DeleteConfigRule in *AWS CLI Command Reference*.

`delete-delivery-channel`

The following code example shows how to use `delete-delivery-channel`.

AWS CLI

To delete a delivery channel

The following `delete-delivery-channel` example deletes the default delivery channel.

```
aws configservice delete-delivery-channel \
    --delivery-channel-name default
```

This command produces no output.

For more information, see Working with the Delivery Channel in the *AWS Config Developer Guide*.

- For API details, see DeleteDeliveryChannel in *AWS CLI Command Reference*.

`delete-evaluation-results`

The following code example shows how to use `delete-evaluation-results`.

AWS CLI

To manually delete evaluation results

The following `delete-evaluation-results` example deletes the current evaluation results for the AWS managed rule s3-bucket-versioning-enabled.

```
aws configservice delete-evaluation-results \
    --config-rule-name s3-bucket-versioning-enabled
```

This command produces no output.

For more information, see Evaluating Your Resources with AWS Config Rules in the *AWS Config Developer Guide*.

- For API details, see DeleteEvaluationResults in *AWS CLI Command Reference*.

`deliver-config-snapshot`

The following code example shows how to use `deliver-config-snapshot`.

AWS CLI

To deliver a configuration snapshot

The following `deliver-config-snapshot` example delivers a configuration snapshot to the Amazon S3 bucket that belongs to the default delivery channel.

```
aws configservice deliver-config-snapshot \
    --delivery-channel-name default
```

Output:

```
{
    "configSnapshotId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Delivering Configuration Snapshots to an Amazon S3 Bucket in the *AWS Config Developer Guide*.

- For API details, see DeliverConfigSnapshot in *AWS CLI Command Reference*.

`describe-compliance-by-config-rule`

The following code example shows how to use `describe-compliance-by-config-rule`.

AWS CLI

To get compliance information for your AWS Config rules

The following `describe-compliance-by-config-rule` example returns compliance information for each AWS Config rule that is violated by one or more AWS resources.

```
aws configservice describe-compliance-by-config-rule \
    --compliance-types NON_COMPLIANT
```

In the output, the value for each `CappedCount` attribute indicates how many resources do not comply with the related rule. For example, the following output indicates that 3 resources do not comply with the rule named `InstanceTypesAreT2micro`.

Output:

```
{
    "ComplianceByConfigRules": [
        {
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            },
            "ConfigRuleName": "InstanceTypesAreT2micro"
        },
        {
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 10,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            },
            "ConfigRuleName": "RequiredTagsForVolumes"
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see DescribeComplianceByConfigRule in *AWS CLI Command Reference*.

`describe-compliance-by-resource`

The following code example shows how to use `describe-compliance-by-resource`.

AWS CLI

To get compliance information for your AWS resources

The following `describe-compliance-by-resource` example returns compliance information for each EC2 instance that is recorded by AWS Config and that violates one or more rules.

```
aws configservice describe-compliance-by-resource \
    --resource-type AWS::EC2::Instance \
    --compliance-types NON_COMPLIANT
```

In the output, the value for each `CappedCount` attribute indicates how many rules the resource violates. For example, the following output indicates that instance `i-1a2b3c4d` violates 2 rules.

Output:

```
{
    "ComplianceByResources": [
        {
            "ResourceType": "AWS::EC2::Instance",
            "ResourceId": "i-1a2b3c4d",
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 2,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            }
        },
        {
            "ResourceType": "AWS::EC2::Instance",
            "ResourceId": "i-2a2b3c4d ",
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            }
        }
    ]
```

```
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see DescribeComplianceByResource in *AWS CLI Command Reference*.

`describe-config-rule-evaluation-status`

The following code example shows how to use `describe-config-rule-evaluation-status`.

AWS CLI

To get status information for an AWS Config rule

The following `describe-config-rule-evaluation-status` example returns the status information for an AWS Config rule named `MyConfigRule`.

```
aws configservice describe-config-rule-evaluation-status \
    --config-rule-names MyConfigRule
```

Output:

```
{
    "ConfigRulesEvaluationStatus": [
        {
            "ConfigRuleArn": "arn:aws:config:us-west-2:123456789012:config-rule/
config-rule-abcdef",
            "FirstActivatedTime": 1450311703.844,
            "ConfigRuleId": "config-rule-abcdef",
            "LastSuccessfulInvocationTime": 1450314643.156,
            "ConfigRuleName": "MyConfigRule"
        }
    ]
}
```

For more information, see Evaluating Your Resources with AWS Config Rules in the *AWS Config Developer Guide*.

- For API details, see DescribeConfigRuleEvaluationStatus in *AWS CLI Command Reference*.

describe-config-rules

The following code example shows how to use `describe-config-rules`.

AWS CLI

To get details for an AWS Config rule

The following `describe-config-rules` example returns details for an AWS Config rule named `InstanceTypesAreT2micro`.

```
aws configservice describe-config-rules \
    --config-rule-names InstanceTypesAreT2micro
```

Output:

```
{
    "ConfigRules": [
        {
            "ConfigRuleState": "ACTIVE",
            "Description": "Evaluates whether EC2 instances are the t2.micro type.",
            "ConfigRuleName": "InstanceTypesAreT2micro",
            "ConfigRuleArn": "arn:aws:config:us-west-2:123456789012:config-rule/
config-rule-abcdef",
            "Source": {
                "Owner": "CUSTOM_LAMBDA",
                "SourceIdentifier": "arn:aws:lambda:us-
west-2:123456789012:function:InstanceTypeCheck",
                "SourceDetails": [
                    {
                        "EventSource": "aws.config",
                        "MessageType": "ConfigurationItemChangeNotification"
                    }
                ]
            },
            "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}",
            "Scope": {
                "ComplianceResourceTypes": [
                    "AWS::EC2::Instance"
                ]
            },
            "ConfigRuleId": "config-rule-abcdef"
        }
```

```
    ]
}
```

For more information, see Components of an AWS Config Rule in the *AWS Config Developer Guide*.

- For API details, see DescribeConfigRules in *AWS CLI Command Reference*.

`describe-configuration-recorder-status`

The following code example shows how to use `describe-configuration-recorder-status`.

AWS CLI

To get status information for the configuration recorder

The following `describe-configuration-recorder-status` example returns the status of the default configuration recorder.

```
aws configservice describe-configuration-recorder-status
```

Output:

```
{
    "ConfigurationRecordersStatus": [
        {
            "name": "default",
            "lastStatus": "SUCCESS",
            "recording": true,
            "lastStatusChangeTime": 1452193834.344,
            "lastStartTime": 1441039997.819,
            "lastStopTime": 1441039992.835
        }
    ]
}
```

For more information, see Working with the configuration recorder in the *AWS Config Developer Guide*.

- For API details, see DescribeConfigurationRecorderStatus in *AWS CLI Command Reference*.

`describe-configuration-recorders`

The following code example shows how to use `describe-configuration-recorders`.

AWS CLI

To get details about the configuration recorder

The following `describe-configuration-recorders` example returns details about the default configuration recorder.

```
aws configservice describe-configuration-recorders
```

Output:

```
{
    "ConfigurationRecorders": [
        {
            "recordingGroup": {
                "allSupported": true,
                "resourceTypes": [],
                "includeGlobalResourceTypes": true
            },
            "roleARN": "arn:aws:iam::123456789012:role/config-ConfigRole-
A1B2C3D4E5F6",
            "name": "default"
        }
    ]
}
```

For more information, see Working with the configuration recorder in the *AWS Config Developer Guide*.

- For API details, see DescribeConfigurationRecorders in *AWS CLI Command Reference*.

`describe-delivery-channel-status`

The following code example shows how to use `describe-delivery-channel-status`.

AWS CLI

To get status information for the delivery channel

The following `describe-delivery-channel-status` example returns the status of the delivery channel.

```
aws configservice describe-delivery-channel-status
```

Output:

```
{
    "DeliveryChannelsStatus": [
        {
            "configStreamDeliveryInfo": {
                "lastStatusChangeTime": 1452193834.381,
                "lastStatus": "SUCCESS"
            },
            "configHistoryDeliveryInfo": {
                "lastSuccessfulTime": 1450317838.412,
                "lastStatus": "SUCCESS",
                "lastAttemptTime": 1450317838.412
            },
            "configSnapshotDeliveryInfo": {
                "lastSuccessfulTime": 1452185597.094,
                "lastStatus": "SUCCESS",
                "lastAttemptTime": 1452185597.094
            },
            "name": "default"
        }
    ]
}
```

For more information, see Working with the Delivery Channel in the *AWS Config Developer Guide*.

- For API details, see DescribeDeliveryChannelStatus in *AWS CLI Command Reference*.

`describe-delivery-channels`

The following code example shows how to use `describe-delivery-channels`.

AWS CLI

To get details about the delivery channel

The following `describe-delivery-channels` example returns details about the delivery channel.

```
aws configservice describe-delivery-channels
```

Output:

```
{
    "DeliveryChannels": [
        {
            "snsTopicARN": "arn:aws:sns:us-west-2:123456789012:config-topic",
            "name": "default",
            "s3BucketName": "amzn-s3-demo-bucket"
        }
    ]
}
```

For more information, see Working with the Delivery Channel in the *AWS Config Developer Guide*.

- For API details, see DescribeDeliveryChannels in *AWS CLI Command Reference*.

`get-compliance-details-by-config-rule`

The following code example shows how to use `get-compliance-details-by-config-rule`.

AWS CLI

To get the evaluation results for an AWS Config rule

The following `get-compliance-details-by-config-rule` example returns the evaluation results for all of the resources that don't comply with an AWS Config rule named `InstanceTypesAreT2micro`.

```
aws configservice get-compliance-details-by-config-rule \
    --config-rule-name InstanceTypesAreT2micro \
    --compliance-types NON_COMPLIANT
```

Output:

```
{
    "EvaluationResults": [
```

```
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314645.261,
            "ConfigRuleInvokedTime": 1450314642.948,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-2a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314645.18,
            "ConfigRuleInvokedTime": 1450314642.902,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-3a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314643.346,
            "ConfigRuleInvokedTime": 1450314643.124,
            "ComplianceType": "NON_COMPLIANT"
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see GetComplianceDetailsByConfigRule in *AWS CLI Command Reference*.

`get-compliance-details-by-resource`

The following code example shows how to use `get-compliance-details-by-resource`.

AWS CLI

To get the evaluation results for an AWS resource

The following `get-compliance-details-by-resource` example returns the evaluation results for each rule with which the EC2 instance `i-1a2b3c4d` does not comply.

```
aws configservice get-compliance-details-by-resource \
    --resource-type AWS::EC2::Instance \
    --resource-id i-1a2b3c4d \
    --compliance-types NON_COMPLIANT
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314643.288,
            "ConfigRuleInvokedTime": 1450314643.034,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
```

```
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "RequiredTagForEC2Instances"
                }
            },
            "ResultRecordedTime": 1450314645.261,
            "ConfigRuleInvokedTime": 1450314642.948,
            "ComplianceType": "NON_COMPLIANT"
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see GetComplianceDetailsByResource in *AWS CLI Command Reference*.

`get-compliance-summary-by-config-rule`

The following code example shows how to use `get-compliance-summary-by-config-rule`.

AWS CLI

To get the compliance summary for your AWS Config rules

The following `get-compliance-summary-by-config-rule` example returns the number of rules that are compliant and the number that are noncompliant.

```
aws configservice get-compliance-summary-by-config-rule
```

In the output, the value for each `CappedCount` attribute indicates how many rules are compliant or noncompliant.

Output:

```
{
    "ComplianceSummary": {
        "NonCompliantResourceCount": {
            "CappedCount": 3,
            "CapExceeded": false
        },
```

```
        "ComplianceSummaryTimestamp": 1452204131.493,
        "CompliantResourceCount": {
            "CappedCount": 2,
            "CapExceeded": false
        }
    }
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see GetComplianceSummaryByConfigRule in *AWS CLI Command Reference*.

`get-compliance-summary-by-resource-type`

The following code example shows how to use `get-compliance-summary-by-resource-type`.

AWS CLI

Example 1: To get the compliance summary for all resource types

The following `get-compliance-summary-by-resource-type` example returns the number of AWS resources that are noncompliant and the number that are compliant.

```
aws configservice get-compliance-summary-by-resource-type
```

In the output, the value for each `CappedCount` attribute indicates how many resources are compliant or noncompliant.

Output:

```
{
    "ComplianceSummariesByResourceType": [
        {
            "ComplianceSummary": {
                "NonCompliantResourceCount": {
                    "CappedCount": 16,
                    "CapExceeded": false
                },
                "ComplianceSummaryTimestamp": 1453237464.543,
                "CompliantResourceCount": {
                    "CappedCount": 10,
```

```
                    "CapExceeded": false
                }
            }
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

Example 2: To get the compliance summary for a specific resource type

The following `get-compliance-summary-by-resource-type` example returns the number of EC2 instances that are noncompliant and the number that are compliant.

```
aws configservice get-compliance-summary-by-resource-type \
    --resource-types AWS::EC2::Instance
```

In the output, the value for each `CappedCount` attribute indicates how many resources are compliant or noncompliant.

Output:

```
{
    "ComplianceSummariesByResourceType": [
        {
            "ResourceType": "AWS::EC2::Instance",
            "ComplianceSummary": {
                "NonCompliantResourceCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceSummaryTimestamp": 1452204923.518,
                "CompliantResourceCount": {
                    "CappedCount": 7,
                    "CapExceeded": false
                }
            }
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see GetComplianceSummaryByResourceType in *AWS CLI Command Reference*.

`get-resource-config-history`

The following code example shows how to use `get-resource-config-history`.

AWS CLI

To get the configuration history of an AWS resource

The following `get-resource-config-history` example returns a list of configuration items for an EC2 instance with an ID of `i-1a2b3c4d`.

```
aws configservice get-resource-config-history \
    --resource-type AWS::EC2::Instance \
    --resource-id i-1a2b3c4d
```

Output:

```
{
    "configurationItems": [
        {
            "version": "1.3",
            "accountId": "123456789012",
            "configurationItemCaptureTime": "2024-01-15T10:30:00.123000-08:00",
            "configurationItemStatus": "OK",
            "configurationStateId": "1705343400123",
            "configurationItemMD5Hash": "",
            "arn": "arn:aws:ec2:us-west-2:123456789012:instance/i-1a2b3c4d",
            "resourceType": "AWS::EC2::Instance",
            "resourceId": "i-1a2b3c4d",
            "awsRegion": "us-west-2",
            "availabilityZone": "us-west-2a",
            "resourceCreationTime": "2024-01-10T08:00:00.000000-08:00",
            "tags": {
                "Name": "MyInstance"
            },
            "relatedEvents": [],
            "relationships": [
```

```
                {
                    "resourceType": "AWS::EC2::SecurityGroup",
                    "resourceId": "sg-1a2b3c4d",
                    "relationshipName": "Is associated with SecurityGroup"
                }
            ],
            "configuration": "{\"instanceId\":\"i-1a2b3c4d\",\"instanceType\":
\"t2.micro\",\"state\":{\"code\":16,\"name\":\"running\"}}",
            "supplementaryConfiguration": {},
            "recordingFrequency": "CONTINUOUS"
        }
    ]
}
```

For more information, see Components of a Configuration Item in the *AWS Config Developer Guide*.

- For API details, see GetResourceConfigHistory in *AWS CLI Command Reference*.

`get-status`

The following code example shows how to use `get-status`.

AWS CLI

To get the status for AWS Config

The following `get-status` example returns the status of the delivery channel and configuration recorder.

```
aws configservice get-status
```

Output:

```
Configuration Recorders:

name: default
recorder: ON
last status: SUCCESS

Delivery Channels:
```

```
name: default
last stream delivery status: SUCCESS
last history delivery status: SUCCESS
last snapshot delivery status: SUCCESS
```

For more information, see Setting Up AWS Config with the AWS CLI in the *AWS Config Developer Guide*.

- For API details, see GetStatus in *AWS CLI Command Reference*.

`list-discovered-resources`

The following code example shows how to use `list-discovered-resources`.

AWS CLI

To list resources that AWS Config has discovered

The following `list-discovered-resources` example lists the EC2 instances that AWS Config has discovered.

```
aws configservice list-discovered-resources \
    --resource-type AWS::EC2::Instance
```

Output:

```
{
    "resourceIdentifiers": [
        {
            "resourceType": "AWS::EC2::Instance",
            "resourceId": "i-1a2b3c4d"
        },
        {
            "resourceType": "AWS::EC2::Instance",
            "resourceId": "i-2a2b3c4d"
        },
        {
            "resourceType": "AWS::EC2::Instance",
            "resourceId": "i-3a2b3c4d"
        }
    ]
}
```

For more information, see Looking Up Resources That Are Discovered by AWS Config in the *AWS Config Developer Guide*.

- For API details, see ListDiscoveredResources in *AWS CLI Command Reference*.

`put-config-rule`

The following code example shows how to use `put-config-rule`.

AWS CLI

Example 1: To add an AWS managed Config rule

The following `put-config-rule` example provides JSON code to add an AWS managed Config rule.

```
aws configservice put-config-rule \
    --config-rule file://RequiredTagsForEC2Instances.json
```

`RequiredTagsForEC2Instances.json` is a JSON file that contains the rule configuration.

Contents of `RequiredTagsForEC2Instances.json`:

```
{
    "ConfigRuleName": "RequiredTagsForEC2Instances",
    "Description": "Checks whether the CostCenter and Owner tags are applied to EC2
 instances.",
    "Scope": {
        "ComplianceResourceTypes": [
            "AWS::EC2::Instance"
        ]
    },
    "Source": {
        "Owner": "AWS",
        "SourceIdentifier": "REQUIRED_TAGS"
    },
    "InputParameters": "{\"tag1Key\":\"CostCenter\",\"tag2Key\":\"Owner\"}"
}
```

For the `ComplianceResourceTypes` attribute, this JSON code limits the scope to resources of the `AWS::EC2::Instance` type, so AWS Config will evaluate only EC2 instances against the rule. Because the rule is a managed rule, the `Owner` attribute is set to `AWS`, and

the `SourceIdentifier` attribute is set to the rule identifier, `REQUIRED_TAGS`. For the `InputParameters` attribute, the tag keys that the rule requires, `CostCenter` and `Owner`, are specified.

This command produces no output. To verify the rule configuration, run the [describe-config-rules] command, and specify the rule name.

For more information, see [AWS Config Managed Rules] in the *AWS Config Developer Guide*.

Example 2: To add a customer managed Config rule

The following `put-config-rule` example provides JSON code to add a customer managed Config rule.

```
aws configservice put-config-rule \
    --config-rule file://InstanceTypesAreT2micro.json
```

`InstanceTypesAreT2micro.json` is a JSON file that contains the rule configuration.

Contents of `InstanceTypesAreT2micro.json`:

```
{
    "ConfigRuleName": "InstanceTypesAreT2micro",
    "Description": "Evaluates whether EC2 instances are the t2.micro type.",
    "Scope": {
        "ComplianceResourceTypes": [
            "AWS::EC2::Instance"
        ]
    },
    "Source": {
        "Owner": "CUSTOM_LAMBDA",
        "SourceIdentifier": "arn:aws:lambda:us-
west-2:123456789012:function:InstanceTypeCheck",
        "SourceDetails": [
            {
                "EventSource": "aws.config",
                "MessageType": "ConfigurationItemChangeNotification"
            }
        ]
    },
    "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}"
}
```

For the `ComplianceResourceTypes` attribute, this JSON code limits the scope to resources of the `AWS::EC2::Instance` type, so AWS Config will evaluate only EC2 instances against the rule. Because this rule is a customer managed rule, the `Owner` attribute is set to `CUSTOM_LAMBDA`, and the `SourceIdentifier` attribute is set to the ARN of the AWS Lambda function. The `SourceDetails` object is required. The parameters that are specified for the `InputParameters` attribute are passed to the AWS Lambda function when AWS Config invokes it to evaluate resources against the rule.

This command produces no output. To verify the rule configuration, run the describe-config-rules command, and specify the rule name.

For more information, see AWS Config Custom Rules in the *AWS Config Developer Guide*.

- For API details, see PutConfigRule in *AWS CLI Command Reference*.

`put-configuration-recorder`

The following code example shows how to use `put-configuration-recorder`.

AWS CLI

Example 1: To record all supported resources

The following `put-configuration-recorder` example creates a configuration recorder that tracks changes to all supported resource types, including global resource types.

```
aws configservice put-configuration-recorder \
    --configuration-recorder name=default,roleARN=arn:aws:iam::123456789012:role/config-role \
    --recording-group allSupported=true,includeGlobalResourceTypes=true
```

This command produces no output. To verify the settings of your configuration recorder, run the describe-configuration-recorders command.

For more information, see Recording AWS Resources with AWS Config in the *AWS Config Developer Guide*.

Example 2: To record specific types of resources

The following `put-configuration-recorder` example creates a configuration recorder that tracks changes to only those types of resources that are specified in the JSON file for the --recording-group option.

```
aws configservice put-configuration-recorder \
    --configuration-recorder name=default,roleARN=arn:aws:iam::123456789012:role/config-role \
    --recording-group file://recordingGroup.json
```

`recordingGroup.json` is a JSON file that specifies the types of resources that AWS Config will record.

Contents of `recordingGroup.json`:

```
{
    "allSupported": false,
    "includeGlobalResourceTypes": false,
    "resourceTypes": [
        "AWS::EC2::EIP",
        "AWS::EC2::Instance",
        "AWS::EC2::NetworkAcl",
        "AWS::EC2::SecurityGroup",
        "AWS::CloudTrail::Trail",
        "AWS::EC2::Volume",
        "AWS::EC2::VPC",
        "AWS::IAM::User",
        "AWS::IAM::Policy"
    ]
}
```

Before you can specify resource types for the resourceTypes key, you must set the allSupported and includeGlobalResourceTypes options to false or omit them.

This command produces no output. To verify the settings of your configuration recorder, run the describe-configuration-recorders command.

For more information, see Recording AWS Resources with AWS Config in the *AWS Config Developer Guide*.

Example 3: To select all supported resources excluding specific types of resources

The following `put-configuration-recorder` example creates a configuration recorder that tracks changes to all current and future supported resource types excluding those types of resources that are specified in the JSON file for the --recording-group option.

```
aws configservice put-configuration-recorder \
    --configuration-recorder name=default,roleARN=arn:aws:iam::123456789012:role/config-role \
    --recording-group file://recordingGroup.json
```

`recordingGroup.json` is a JSON file that specifies the types of resources that AWS Config will record.

Contents of `recordingGroup.json`:

```
{
    "allSupported": false,
    "exclusionByResourceTypes": {
        "resourceTypes": [
            "AWS::Redshift::ClusterSnapshot",
            "AWS::RDS::DBClusterSnapshot",
            "AWS::CloudFront::StreamingDistribution"
        ]
    },
    "includeGlobalResourceTypes": false,
    "recordingStrategy": {
        "useOnly": "EXCLUSION_BY_RESOURCE_TYPES"
    }
}
```

Before you can specify resource types to excluding from recording: 1) You must set the allSupported and includeGlobalResourceTypes options to false or omit them, and 2) You must set the useOnly field of RecordingStrategy to EXCLUSION_BY_RESOURCE_TYPES.

This command produces no output. To verify the settings of your configuration recorder, run the describe-configuration-recorders command.

For more information, see Recording AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see PutConfigurationRecorder in *AWS CLI Command Reference*.

`put-delivery-channel`

The following code example shows how to use `put-delivery-channel`.

AWS CLI

To create a delivery channel

The following `put-delivery-channel` example provides the settings for the delivery channel as JSON code.

```
aws configservice put-delivery-channel \
    --delivery-channel file://deliveryChannel.json
```

The `deliveryChannel.json` file specifies the delivery channel attributes.

Contents of `deliveryChannel.json`:

```
{
    "name": "default",
    "s3BucketName": "amzn-s3-demo-bucket",
    "snsTopicARN": "arn:aws:sns:us-west-2:123456789012:config-topic",
    "configSnapshotDeliveryProperties": {
        "deliveryFrequency": "Twelve_Hours"
    }
}
```

This example sets the following attributes:

`name` - The name of the delivery channel. By default, AWS Config assigns the name `default` to a new delivery channel.You cannot update the delivery channel name with the `put-delivery-channel` command. For the steps to change the name, see Renaming the Delivery Channel.`s3BucketName` - The name of the Amazon S3 bucket to which AWS Config delivers configuration snapshots and configuration history files.If you specify a bucket that belongs to another AWS account, that bucket must have policies that grant access permissions to AWS Config. For more information, see Permissions for the Amazon S3 Bucket.

`snsTopicARN` - The Amazon Resource Name (ARN) of the Amazon SNS topic to which AWS Config sends notifications about configuration changes.If you choose a topic from another account, the topic must have policies that grant access permissions to AWS Config. For more information, see Permissions for the Amazon SNS Topic.

`configSnapshotDeliveryProperties` - Contains the `deliveryFrequency` attribute, which sets how often AWS Config delivers configuration snapshots and how often it invokes evaluations for periodic Config rules.

This command produces no output. To verify the settings of your delivery channel, run the describe-delivery-channels command.

For more information, see Working with the Delivery Channel in the *AWS Config Developer Guide*.

- For API details, see PutDeliveryChannel in *AWS CLI Command Reference*.

`start-config-rules-evaluation`

The following code example shows how to use `start-config-rules-evaluation`.

AWS CLI

To run an on-demand evaluation for AWS Config rules

The following `start-config-rules-evaluation` example starts an evaluation for two AWS managed rules.

```
aws configservice start-config-rules-evaluation \
    --config-rule-names s3-bucket-versioning-enabled cloudtrail-enabled
```

This command produces no output.

For more information, see Evaluating Your Resources with AWS Config Rules in the *AWS Config Developer Guide*.

- For API details, see StartConfigRulesEvaluation in *AWS CLI Command Reference*.

`start-configuration-recorder`

The following code example shows how to use `start-configuration-recorder`.

AWS CLI

To start the configuration recorder

The following `start-configuration-recorder` example starts the default configuration recorder.

```
aws configservice start-configuration-recorder \
    --configuration-recorder-name default
```

This command produces no output. To verify that AWS Config is recording your resources, run the get-status command.

For more information, see Working with the configuration recorder in the *AWS Config Developer Guide*.

- For API details, see StartConfigurationRecorder in *AWS CLI Command Reference*.

`stop-configuration-recorder`

The following code example shows how to use `stop-configuration-recorder`.

AWS CLI

To stop the configuration recorder

The following `stop-configuration-recorder` example stops the default configuration recorder.

```
aws configservice stop-configuration-recorder \
    --configuration-recorder-name default
```

This command produces no output. To verify that AWS Config is not recording your resources, run the get-status command.

For more information, see Working with the configuration recorder in the *AWS Config Developer Guide*.

- For API details, see StopConfigurationRecorder in *AWS CLI Command Reference*.

`subscribe`

The following code example shows how to use `subscribe`.

AWS CLI

To subscribe to AWS Config

The following `subscribe` example creates the default delivery channel and configuration recorder. The command also specifies the Amazon S3 bucket and Amazon SNS topic to which AWS Config will deliver configuration information.

```
aws configservice subscribe \
    --s3-bucket amzn-s3-demo-bucket \
    --sns-topic arn:aws:sns:us-west-2:123456789012:config-topic \
    --iam-role arn:aws:iam::123456789012:role/ConfigRole-A1B2C3D4E5F6
```

Output:

```
Using existing S3 bucket: amzn-s3-demo-bucket
Using existing SNS topic: arn:aws:sns:us-west-2:123456789012:config-topic
Subscribe succeeded:

Configuration Recorders: [
    {
        "recordingGroup": {
            "allSupported": true,
            "resourceTypes": [],
            "includeGlobalResourceTypes": false
        },
        "roleARN": "arn:aws:iam::123456789012:role/ConfigRole-A1B2C3D4E5F6",
        "name": "default"
    }
]

Delivery Channels: [
    {
        "snsTopicARN": "arn:aws:sns:us-west-2:123456789012:config-topic",
        "name": "default",
        "s3BucketName": "amzn-s3-demo-bucket"
    }
]
```

For more information, see Setting Up AWS Config with the AWS CLI in the *AWS Config Developer Guide*.

- For API details, see Subscribe in *AWS CLI Command Reference*.

Connect Customer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Connect Customer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

To create a user

The following `create-user` example adds a user with the specified attributes to the specified Amazon Connect instance.

```
aws connect create-user \
    --username Mary \
    --password Pass@Word1 \
    --identity-info FirstName=Mary,LastName=Major \
    --phone-
config PhoneType=DESK_PHONE,AutoAccept=true,AfterContactWorkTimeLimit=60,DeskPhoneNumber=
+15555551212 \
    --security-profile-ids a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --routing-profile-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "UserId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
    "UserArn": "arn:aws:connect:us-west-2:123456789012:instance/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111/agent/a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
}
```

For more information, see Add Users in the *Amazon Connect Administrator Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes the specified user from the specified Amazon Connect instance.

```
aws connect delete-user \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --user-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see Manage Users in the *Amazon Connect Administrator Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`describe-user-hierarchy-group`

The following code example shows how to use `describe-user-hierarchy-group`.

AWS CLI

To display the details for a hierarchy group

The following `describe-user-hierarchy-group` example displays the details for the specified Amazon Connect hierarchy group.

```
aws connect describe-user-hierarchy-group \
    --hierarchy-group-id 12345678-1111-2222-800e-aaabbb555gg \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
```

```
    "HierarchyGroup": {
        "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Arn": "arn:aws:connect:us-west-2:123456789012:instance/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111/agent-group/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Name": "Example Corporation",
        "LevelId": "1",
        "HierarchyPath": {
            "LevelOne": {
                "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
                "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent-group/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333",
                "Name": "Example Corporation"
            }
        }
    }
}
```

For more information, see Set Up Agent Hierarchies in the *Amazon Connect Administrator Guide*.

- For API details, see DescribeUserHierarchyGroup in *AWS CLI Command Reference*.

`describe-user-hierarchy-structure`

The following code example shows how to use `describe-user-hierarchy-structure`.

AWS CLI

To display the details for a hierarchy structure

The following `describe-user-hierarchy-structure` example displays the details for the hierarchy structure for the specified Amazon Connect instance.

```
aws connect describe-user-hierarchy-structure \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "HierarchyStructure": {
        "LevelOne": {
            "Id": "12345678-1111-2222-800e-aaabbb555gg",
```

```
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent-group-level/1",
            "Name": "Corporation"
        },
        "LevelTwo": {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent-group-level/2",
            "Name": "Services Division"
        },
        "LevelThree": {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent-group-level/3",
            "Name": "EU Site"
        }
    }
}
```

For more information, see Set Up Agent Hierarchies in the *Amazon Connect Administrator Guide*.

- For API details, see DescribeUserHierarchyStructure in *AWS CLI Command Reference*.

`describe-user`

The following code example shows how to use `describe-user`.

AWS CLI

To display the details for a user

The following `describe-user` example displays the details for the specified Amazon Connect user.

```
aws connect describe-user \
    --user-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "User": {
        "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
```

```
        "Arn": "arn:aws:connect:us-west-2:123456789012:instance/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111/agent/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Username": "Jane",
        "IdentityInfo": {
            "FirstName": "Jane",
            "LastName": "Doe",
            "Email": "example.com"
        },
        "PhoneConfig": {
            "PhoneType": "SOFT_PHONE",
            "AutoAccept": false,
            "AfterContactWorkTimeLimit": 0,
            "DeskPhoneNumber": ""
        },
        "DirectoryUserId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "SecurityProfileIds": [
            "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
        ],
        "RoutingProfileId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
        "Tags": {}
    }
}
```

For more information, see Manage Users in the *Amazon Connect Administrator Guide*.

- For API details, see DescribeUser in *AWS CLI Command Reference*.

`get-contact-attributes`

The following code example shows how to use `get-contact-attributes`.

AWS CLI

To retrieve the attributes for a contact

The following `get-contact-attributes` example retrieves the attributes that were set for the specified Amazon Connect contact.

```
aws connect get-contact-attributes \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --initial-contact-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "Attributes": {
        "greetingPlayed": "true"
    }
}
```

For more information, see Use Amazon Connect Contact Attributes in the *Amazon Connect Administrator Guide*.

- For API details, see GetContactAttributes in *AWS CLI Command Reference*.

`list-contact-flows`

The following code example shows how to use `list-contact-flows`.

AWS CLI

To list the contact flows in an instance

The following `list-contact-flows` example lists the contact flows in the specified Amazon Connect instance.

```
aws connect list-contact-flows \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ContactFlowSummaryList": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/contact-flow/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
            "Name": "Default queue transfer",
            "ContactFlowType": "QUEUE_TRANSFER"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/contact-flow/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333",
```

```
            "Name": "Default agent hold",
            "ContactFlowType": "AGENT_HOLD"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/contact-flow/a1b2c3d4-5678-90ab-cdef-
EXAMPLE44444",
            "Name": "Default customer hold",
            "ContactFlowType": "CUSTOMER_HOLD"
        }
    ]
}
```

For more information, see Create Amazon Connect Contact Flows in the *Amazon Connect Administrator Guide*.

- For API details, see ListContactFlows in *AWS CLI Command Reference*.

`list-hours-of-operations`

The following code example shows how to use `list-hours-of-operations`.

AWS CLI

To list the hours of operation in an instance

The following `list-hours-of-operations` example lists the hours of operations for the specified Amazon Connect instance.

```
aws connect list-hours-of-operations \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "HoursOfOperationSummaryList": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/operating-hours/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
```

```
            "Name": "Basic Hours"
        }
    ]
}
```

For more information, see Set the Hours of Operation for a Queue in the *Amazon Connect Administrator Guide*.

- For API details, see ListHoursOfOperations in *AWS CLI Command Reference*.

`list-phone-numbers`

The following code example shows how to use `list-phone-numbers`.

AWS CLI

To list the phone numbers in an instance

The following `list-phone-numbers` example lists the phone numbers in the specified Amazon Connect instance.

```
aws connect list-phone-numbers \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "PhoneNumberSummaryList": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/phone-number/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
            "PhoneNumber": "+17065551212",
            "PhoneNumberType": "DID",
            "PhoneNumberCountryCode": "US"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/phone-number/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333",
```

```
            "PhoneNumber": "+18555551212",
            "PhoneNumberType": "TOLL_FREE",
            "PhoneNumberCountryCode": "US"
        }
    ]
}
```

For more information, see Set Up Phone Numbers for Your Contact Center in the *Amazon Connect Administrator Guide*.

- For API details, see ListPhoneNumbers in *AWS CLI Command Reference*.

`list-queues`

The following code example shows how to use `list-queues`.

AWS CLI

To list the queues in an instance

The following `list-queues` example lists the queues in the specified Amazon Connect instance.

```
aws connect list-queues \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "QueueSummaryList": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/queue/agent/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
            "QueueType": "AGENT"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/queue/agent/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333",
```

```
            "QueueType": "AGENT"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/queue/agent/a1b2c3d4-5678-90ab-cdef-
EXAMPLE44444",
            "QueueType": "AGENT"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/queue/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
            "Name": "BasicQueue",
            "QueueType": "STANDARD"
        }
    ]
}
```

For more information, see Create a Queue in the *Amazon Connect Administrator Guide*.

- For API details, see ListQueues in *AWS CLI Command Reference*.

`list-routing-profiles`

The following code example shows how to use `list-routing-profiles`.

AWS CLI

To list the routing profiles in an instance

The following `list-routing-profiles` example lists the routing profiles in the specified Amazon Connect instance.

```
aws connect list-routing-profiles \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RoutingProfileSummaryList": [
        {
```

```
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/routing-profile/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
            "Name": "Basic Routing Profile"
        }
    ]
}
```

For more information, see Create a Routing Profile in the *Amazon Connect Administrator Guide*.

- For API details, see ListRoutingProfiles in *AWS CLI Command Reference*.

`list-security-profiles`

The following code example shows how to use `list-security-profiles`.

AWS CLI

To list the security profiles in an instance

The following `list-security-profiles` example lists the security profiles in the specified Amazon Connect instance.

```
aws connect list-security-profiles \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "SecurityProfileSummaryList": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/security-profile/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
            "Name": "CallCenterManager"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/security-profile/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333",
```

```
            "Name": "QualityAnalyst"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/security-profile/a1b2c3d4-5678-90ab-cdef-
EXAMPLE44444",
            "Name": "Agent"
        },
        {
            "Id": "12345678-1111-2222-800e-x2y3c4d5fzzzz",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/security-profile/12345678-1111-2222-800e-
x2y3c4d5fzzzz",
            "Name": "Admin"
        }
    ]
}
```

For more information, see Assign Permissions: Security Profiles in the *Amazon Connect Administrator Guide*.

- For API details, see ListSecurityProfiles in *AWS CLI Command Reference*.

`list-user-hierarchy-groups`

The following code example shows how to use `list-user-hierarchy-groups`.

AWS CLI

To list the user hierarchy groups in an instance

The following `list-user-hierarchy-groups` example lists the user hierarchy groups in the specified Amazon Connect instance.

```
aws connect list-user-hierarchy-groups \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "UserHierarchyGroupSummaryList": [
```

```
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent-group/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
            "Name": "Example Corporation"
        }
    ]
}
```

For more information, see Set Up Agent Hierarchies in the *Amazon Connect Administrator Guide*.

- For API details, see ListUserHierarchyGroups in *AWS CLI Command Reference*.

`list-users`

The following code example shows how to use `list-users`.

AWS CLI

To list the user hierarchy groups in an instance

The following `list-users` example lists the users in the specified Amazon Connect instance.

```
aws connect list-users \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "UserSummaryList": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Username": "Jane"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Username": "Paulo"
```

```
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent/a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "Username": "JohnD"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
            "Username": "JohnS"
        }
    ]
}
```

For more information, see Add Users in the *Amazon Connect Administrator Guide*.

- For API details, see ListUsers in *AWS CLI Command Reference*.

`update-contact-attributes`

The following code example shows how to use `update-contact-attributes`.

AWS CLI

To update a contact's attribute

The following `update-contact-attributes` example updates the `greetingPlayed` attribute for the specified Amazon Connect user.

```
aws connect update-contact-attributes \
    --initial-contact-id 11111111-2222-3333-4444-12345678910 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --attributes greetingPlayed=false
```

This command produces no output.

For more information, see Use Amazon Connect Contact Attributes in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateContactAttributes in *AWS CLI Command Reference*.

update-user-hierarchy

The following code example shows how to use update-user-hierarchy.

AWS CLI

To update a user's hierarchy

The following update-user-hierarchy example updates the agent hierarchy for the specified Amazon Connect user.

```
aws connect update-user-hierarchy \
    --hierarchy-group-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --user-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Configure Agent Settings in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateUserHierarchy in *AWS CLI Command Reference*.

update-user-identity-info

The following code example shows how to use update-user-identity-info.

AWS CLI

To update a user's identity information

The following update-user-identity-info example updates the identity information for the specified Amazon Connect user.

```
aws connect update-user-identity-info \
    --identity-info FirstName=Mary,LastName=Major,Email=marym@example.com \
    --user-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Configure Agent Settings in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateUserIdentityInfo in *AWS CLI Command Reference*.

update-user-phone-config

The following code example shows how to use update-user-phone-config.

AWS CLI

To update a user's phone configuration

The following update-user-phone-config example updates the phone configuration for the specified user.

```
aws connect update-user-phone-config \
    --phone-
config PhoneType=SOFT_PHONE,AutoAccept=false,AfterContactWorkTimeLimit=60,DeskPhoneNumber=
+18005551212 \
    --user-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Configure Agent Settings in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateUserPhoneConfig in *AWS CLI Command Reference*.

update-user-routing-profile

The following code example shows how to use update-user-routing-profile.

AWS CLI

To update a user's routing profile

The following update-user-routing-profile example updates the routing profile for the specified Amazon Connect user.

```
aws connect update-user-routing-profile \
    --routing-profile-id 12345678-1111-3333-2222-4444EXAMPLE \
    --user-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Configure Agent Settings in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateUserRoutingProfile in *AWS CLI Command Reference*.

`update-user-security-profiles`

The following code example shows how to use `update-user-security-profiles`.

AWS CLI

To update a user's security profiles

The following `update-user-security-profiles` example updates the security profile for the specified Amazon Connect user.

```
aws connect update-user-security-profiles \
    --security-profile-ids 12345678-1234-1234-1234-1234567892111 \
    --user-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Assign Permissions: Security Profiles in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateUserSecurityProfiles in *AWS CLI Command Reference*.

AWS Control Tower examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Control Tower.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-landing-zone`

The following code example shows how to use `create-landing-zone`.

AWS CLI

To create a Control Tower landing zone

The following `create-landing-zone` example creates AWS Control Tower landing zone.

```
aws controltower create-landing-zone \
    --landing-zone-version 3.3 \
    --manifest "file://LandingZoneManifest.json"
```

Contents of `LandingZoneManifest.json`:

```
{
    "governedRegions": [
        "us-west-2"
    ],
    "organizationStructure": {
        "security": {
            "name": "Security"
        },
        "sandbox": {
            "name": "Sandbox"
        }
    },
    "centralizedLogging": {
        "accountId": "123456789222",
        "configurations": {
            "loggingBucket": {
                "retentionDays": 365
            },
            "accessLoggingBucket": {
                "retentionDays": 3650
            }
        },
        "enabled": true
    },
    "securityRoles": {
```

```
        "accountId": "123456789111"
    },
    "accessManagement": {
        "enabled": true
    }
}
```

Output:

```
{
    "arn": "arn:aws:controltower:us-
west-2:123456789012:landingzone/13CJG46WZKXXX4X5",
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Getting started with AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see CreateLandingZone in *AWS CLI Command Reference*.

`delete-landing-zone`

The following code example shows how to use `delete-landing-zone`.

AWS CLI

To decommission a landing zone

The following `delete-landing-zone` example decommissions the AWS Control Tower landing zone.

```
aws controltower delete-landing-zone \
    --landing-zone-identifier arn:aws:controltower:us-
west-2:123456789012:landingzone/13CJG46WZKXXX4X5
```

Output:

```
{
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Decommission an AWS Control Tower landing zone in the *AWS Control Tower User Guide*.

- For API details, see DeleteLandingZone in *AWS CLI Command Reference*.

`disable-baseline`

The following code example shows how to use `disable-baseline`.

AWS CLI

To disable a Control Tower baseline

The following `disable-baseline` example disables an AWS Control Tower baseline.

```
aws controltower disable-baseline \
    --enabled-baseline-identifier arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XOM12BEL4YD578CQ2
```

Output:

```
{
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Types of baselines in the *AWS Control Tower User Guide*.

- For API details, see DisableBaseline in *AWS CLI Command Reference*.

`disable-control`

The following code example shows how to use `disable-control`.

AWS CLI

To disable a Control Tower control

The following `disable-control` example disables an AWS Control Tower enabled control.

```
aws controltower disable-control \
    --control-identifier arn:aws:controlcatalog:::control/497wrm2xnk1wxlf4obrxxxxxx
 \
```

```
    --target-identifier arn:aws:organizations::123456789012:ou/o-s64ryxxxxx/ou-oqxx-
i5wnxxxx
```

Output:

```
{
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see DisableControl in *AWS CLI Command Reference*.

`enable-baseline`

The following code example shows how to use `enable-baseline`.

AWS CLI

Example 1: To enable a Control Tower baseline that is disabled

The following `enable-baseline` example enables an AWS Control Tower baseline if baseline `IdentityCenterBaseline` is disabled.

```
aws controltower enable-baseline \
    --baseline-identifier arn:aws:controltower:us-west-2::baseline/17BSJV3IGJ2QSGA2
 \
    --baseline-version 4.0 \
    --target-identifier arn:aws:organizations::123456789012:ou/o-s64ryixxxx/ou-oq9f-
i5wnxxxx
```

Output:

```
{
    "arn": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XOM12BEL4YD578CQ2",
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Types of baselines in the *AWS Control Tower User Guide*.

Example 2: To enable a Control Tower baseline that is enabled

The following `enable-baseline` example enables an AWS Control Tower baseline if baseline `IdentityCenterBaseline` is enabled.

```
aws controltower enable-baseline \
    --baseline-identifier arn:aws:controltower:us-west-2::baseline/17BSJV3IGJ2QSGA2
 \
    --baseline-version 4.0 \
    --target-identifier arn:aws:organizations::123456789012:ou/o-s64ryixxxx/ou-oqxx-
i5wnxxxx \
    --parameters
 '[{"key":"IdentityCenterEnabledBaselineArn","value":"arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XAJNZNCBC1I386C7B"}]'
```

Output:

```
{
    "arn": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XOM12BEL4YD578CQ2",
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Types of baselines in the *AWS Control Tower User Guide*.

- For API details, see EnableBaseline in *AWS CLI Command Reference*.

`enable-control`

The following code example shows how to use `enable-control`.

AWS CLI

To enable a Control Tower control

The following `enable-control` example enables an AWS Control Tower control.

```
aws controltower enable-control \
    --control-identifier arn:aws:controlcatalog:::control/497wrm2xnk1wxlf4obrxxxxxx
 \
    --target-identifier arn:aws:organizations::123456789012:ou/o-s64ryxxxxx/ou-oqxx-
i5wnxxxx
```

Output:

```
{
    "arn": "arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/18J5KBJ3W3VTIRLV",
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see EnableControl in *AWS CLI Command Reference*.

`get-baseline-operation`

The following code example shows how to use `get-baseline-operation`.

AWS CLI

To get a Control Tower baseline operation

The following `get-baseline-operation` example gets details of an AWS Control Tower baseline operation.

```
aws controltower get-baseline-operation \
    --operation-identifier "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "baselineOperation": {
        "endTime": "2025-04-17T23:48:46+00:00",
        "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "operationType": "ENABLE_BASELINE",
        "startTime": "2025-04-17T23:46:37+00:00",
        "status": "SUCCEEDED",
        "statusMessage": "AWS Control Tower completed the baseline operation
 successfully."
    }
}
```

For more information, see Types of baselines in the *AWS Control Tower User Guide*.

- For API details, see GetBaselineOperation in *AWS CLI Command Reference*.

`get-baseline`

The following code example shows how to use `get-baseline`.

AWS CLI

To get a Control Tower baseline

The following `get-baseline` example gets details of an AWS Control Tower baseline.

```
aws controltower get-baseline \
    --baseline-identifier arn:aws:controltower:us-west-2::baseline/LN25R72TTG6IGPTQ
```

Output:

```
{
    "arn": "arn:aws:controltower:us-west-2::baseline/LN25R72TTG6IGPTQ",
    "description": "Sets up shared resources for AWS Identity Center, which prepares
 the AWSControlTowerBaseline to set up Identity Center access for accounts.",
    "name": "IdentityCenterBaseline"
}
```

For more information, see Types of baselines in the *AWS Control Tower User Guide*.

- For API details, see GetBaseline in *AWS CLI Command Reference*.

`get-control-operation`

The following code example shows how to use `get-control-operation`.

AWS CLI

To get Control Tower control operations

The following `get-control-operation` example gets details of an AWS Control Tower control operation.

```
aws controltower get-control-operation \
    --operation-identifier "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "controlOperation": {
        "controlIdentifier":
 "arn:aws:controlcatalog:::control/497wrm2xnk1wxlf4obrdo7mej",
        "enabledControlIdentifier": "arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/18J5KBJ3W3VTIRLV",
        "endTime": "2025-04-17T03:08:55+00:00",
        "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "operationType": "ENABLE_CONTROL",
        "startTime": "2025-04-17T03:07:52+00:00",
        "status": "SUCCEEDED",
        "statusMessage": "Operation was successful.",
        "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-s64ryixxxx/ou-
oqxx-i5wnxxxx"
    }
}
```

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see GetControlOperation in *AWS CLI Command Reference*.

`get-enabled-baseline`

The following code example shows how to use `get-enabled-baseline`.

AWS CLI

To get a Control Tower enabled baseline

The following `get-enabled-baseline` example gets details of an AWS Control Tower enabled baseline.

```
aws controltower get-enabled-baseline \
    --enabled-baseline-identifier arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XOM12BEL4YD578CQ2
```

Output:

```
{
```

```
    "enabledBaselineDetails": {
        "arn": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XOM12BEL4YD578CQ2",
        "baselineIdentifier": "arn:aws:controltower:us-
west-2::baseline/17BSJV3IGJ2QSGA2",
        "baselineVersion": "4.0",
        "parameters": [
            {
                "key": "IdentityCenterEnabledBaselineArn",
                "value": "arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XAJNZNCBC1I386C7B"
            }
        ],
        "statusSummary": {
            "lastOperationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "status": "SUCCEEDED"
        },
        "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-3onqfufxxx/ou-
g8xx-5kluxxxx"
    }
}
```

For more information, see Types of baselines in the *AWS Control Tower User Guide*.

- For API details, see GetEnabledBaseline in *AWS CLI Command Reference*.

`get-enabled-control`

The following code example shows how to use `get-enabled-control`.

AWS CLI

To get a Control Tower enabled control

The following `get-enabled-control` example gets details of an AWS Control Tower enabled control.

```
aws controltower get-enabled-control \
    --enabled-control-identifier arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/26RGJRSLXCP1KW8D
```

Output:

```
{
    "enabledControlDetails": {
        "arn": "arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/26RGJRSLXCP1KW8D",
        "controlIdentifier": "arn:aws:controltower:us-west-2::control/AWS-
GR_CLOUDTRAIL_CHANGE_PROHIBITED",
        "driftStatusSummary": {
            "driftStatus": "NOT_CHECKING"
        },
        "parameters": [],
        "statusSummary": {
            "status": "SUCCEEDED"
        },
        "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-s64ryixxxx/ou-
oqxx-i5wnxxxx",
        "targetRegions": [
            {
                "name": "us-west-2"
            }
        ]
    }
}
```

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see GetEnabledControl in *AWS CLI Command Reference*.

`get-landing-zone-operation`

The following code example shows how to use `get-landing-zone-operation`.

AWS CLI

To get a Control Tower landing zone operation

The following `get-landing-zone-operation` example gets details of an AWS Control Tower landing zone operation.

```
aws controltower get-landing-zone-operation \
    --operation-identifier a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "operationDetails": {
        "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "operationType": "RESET",
        "startTime": "2025-04-17T03:19:33+00:00",
        "status": "IN_PROGRESS"
    }
}
```

For more information, see Getting started with AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see GetLandingZoneOperation in *AWS CLI Command Reference*.

`get-landing-zone`

The following code example shows how to use `get-landing-zone`.

AWS CLI

To describe a Control Tower landing zone

The following `get-landing-zone` example gets details of an AWS Control Tower landing zone.

```
aws controltower get-landing-zone \
    --landing-zone-identifier arn:aws:controltower:us-
west-2:123456789012:landingzone/13CJG46WZKXXX4X5
```

Output:

```
{
    "landingZone": {
        "arn": "arn:aws:controltower:us-
west-2:123456789012:landingzone/13CJG46WZKXXX4X5",
        "driftStatus": {
            "status": "IN_SYNC"
        },
        "latestAvailableVersion": "3.3",
```

```
        "manifest": {
            "accessManagement": {
                "enabled": true
            },
            "securityRoles": {
                "accountId": "123456789111"
            },
            "governedRegions": [
                "us-west-2"
            ],
            "organizationStructure": {
                "security": {
                    "name": "Security"
                }
            },
            "centralizedLogging": {
                "accountId": "123456789222",
                "configurations": {
                    "loggingBucket": {
                        "retentionDays": 365
                    },
                    "kmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/example-
key-id",
                    "accessLoggingBucket": {
                        "retentionDays": 3650
                    }
                },
                "enabled": true
            }
        },
        "status": "ACTIVE",
        "version": "3.3"
    }
}
```

For more information, see Getting started with AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see GetLandingZone in *AWS CLI Command Reference*.

`list-baselines`

The following code example shows how to use `list-baselines`.

AWS CLI

To list Control Tower baselines

The following `list-baselines` example lists all available AWS Control Tower baselines.

```
aws controltower list-baselines
```

Output:

```
{
    "baselines": [
        {
            "arn": "arn:aws:controltower:us-west-2::baseline/4T4HA1KMO10S6311",
            "description": "Sets up resources to monitor security and compliance of
 accounts in your organization.",
            "name": "AuditBaseline"
        },
        {
            "arn": "arn:aws:controltower:us-west-2::baseline/J8HX46AHS5MIKQPD",
            "description": "Sets up a central repository for logs of API activities
 and resource configurations from accounts in your organization.",
            "name": "LogArchiveBaseline"
        },
        {
            "arn": "arn:aws:controltower:us-west-2::baseline/LN25R72TTG6IGPTQ",
            "description": "Sets up shared resources for AWS Identity Center,
 which prepares the AWSControlTowerBaseline to set up Identity Center access for
 accounts.",
            "name": "IdentityCenterBaseline"
        },
        {
            "arn": "arn:aws:controltower:us-west-2::baseline/17BSJV3IGJ2QSGA2",
            "description": "Sets up resources and mandatory controls for member
 accounts within the target OU, required for AWS Control Tower governance.",
            "name": "AWSControlTowerBaseline"
        },
        {
            "arn": "arn:aws:controltower:us-west-2::baseline/3WPD0NA6TJ9AOMU2",
            "description": "Sets up a central AWS Backup vault in your
 organization.",
            "name": "BackupCentralVaultBaseline"
        },
```

```
        {
            "arn": "arn:aws:controltower:us-west-2::baseline/H6C5JFCJJ3CPU3J5",
            "description": "Sets up AWS Backup Audit Manager.",
            "name": "BackupAdminBaseline"
        },
        {
            "arn": "arn:aws:controltower:us-west-2::baseline/APO9ATVPBKFRRGLK",
            "description": "Sets up a local AWS Backup vault and attaches multiple
 AWS Backup plans.",
            "name": "BackupBaseline"
        }
    ]
}
```

For more information, see Types of baselines in the *AWS Control Tower User Guide*.

- For API details, see ListBaselines in *AWS CLI Command Reference*.

`list-control-operations`

The following code example shows how to use `list-control-operations`.

AWS CLI

To list Control Tower control operations

The following `list-control-operations` example lists details of AWS Control Tower controls in progress or queued.

```
aws controltower list-control-operations
```

Output:

```
{
    "controlOperations": [
        {
            "startTime": "2024-02-19T19:22:08+00:00",
            "operationType": "ENABLE_CONTROL",
            "status": "IN_PROGRESS",
            "statusMessage": "Operation is in progress.",
            "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "controlIdentifier": "arn:aws:controltower:us-west-2::control/
SKIBWKYUQAAC",
```

```
            "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-
yy67i3pfv2/ou-slt4-8abknXXX",
            "enabledControlIdentifier": "arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/RWZFSHV2BBRU6JSE"
        },
        {
            "startTime": "2024-02-19T19:21:09+00:00",
            "operationType": "ENABLE_CONTROL",
            "status": "IN_PROGRESS",
            "statusMessage": "Operation is in progress",
            "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "controlIdentifier": "arn:aws:controltower:us-west-2::control/
PDKYAANJEWJE",
            "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-
yy67i3pfv2/ou-slt4-fl6miXXX",
            "enabledControlIdentifier": "arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/XCNJARWZFSHV6JSE"
        }
    ]
}
```

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see ListControlOperations in *AWS CLI Command Reference*.

`list-enabled-baselines`

The following code example shows how to use `list-enabled-baselines`.

AWS CLI

To list Control Tower enabled baselines

The following `list-enabled-baselines` example lists all enabled AWS Control Tower baselines.

```
aws controltower list-enabled-baselines
```

Output:

```
{
    "enabledBaselines": [
```

```
        {
            "arn": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XAJNZNCBC1I386C7B",
            "baselineIdentifier": "arn:aws:controltower:us-west-2::baseline/
LN25R72TTG6IGPTQ",
            "statusSummary": {
                "status": "SUCCEEDED"
            },
            "targetIdentifier": "arn:aws:organizations::123456789012:account/
o-3onqfuxxxx/123456789012"
        },
        {
            "arn": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XAH3ZJL9DWA386CA5",
            "baselineIdentifier": "arn:aws:controltower:us-
west-2::baseline/4T4HA1KMO10S6311",
            "statusSummary": {
                "status": "SUCCEEDED"
            },
            "targetIdentifier": "arn:aws:organizations::123456789012:account/
o-3onqfuxxxx/123456789111"
        },
        {
            "arn": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XALFJ9548TL386CBT",
            "baselineIdentifier": "arn:aws:controltower:us-west-2::baseline/
J8HX46AHS5MIKQPD",
            "statusSummary": {

o-3onqfuxxxx/123456789222"
        }
    ]
}
```

For more information, see Types of baselines in the *AWS Control Tower User Guide*.

- For API details, see ListEnabledBaselines in *AWS CLI Command Reference*.

`list-enabled-controls`

The following code example shows how to use `list-enabled-controls`.

AWS CLI

To list Control Tower enabled controls

The following `list-enabled-controls` example gets details of AWS Control Tower enabled controls.

```
aws controltower list-enabled-controls \
    --target-identifier arn:aws:organizations::123456789012:ou/o-s64ryxxxxx/ou-oqxx-i5wnxxxx
```

Output:

```
{
    "enabledControls": [
        {
            "arn": "arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/26RGJRSLXCP1KW8D",
            "controlIdentifier": "arn:aws:controltower:us-west-2::control/AWS-
GR_CLOUDTRAIL_CHANGE_PROHIBITED",
            "driftStatusSummary": {
                "driftStatus": "NOT_CHECKING"
            },
            "statusSummary": {
                "status": "SUCCEEDED"
            },
            "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-
s64ryxxxxx/ou-oqxx-i5wnxxxx"
        },
        {
            "arn": "arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/18AY24CWKM6IVSLU",

            },
            "statusSummary": {
                "status": "SUCCEEDED"
            },
            "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-
s64ryxxxxx/ou-oqxx-i5wnxxxx"
        }
```

```
    ]
}
```

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see ListEnabledControls in *AWS CLI Command Reference*.

`list-landing-zone-operations`

The following code example shows how to use `list-landing-zone-operations`.

AWS CLI

To list Control Tower landing zone operations

The following `list-landing-zone-operations` example lists AWS Control Tower landing zone operations.

```
aws controltower list-landing-zone-operations
```

Output:

```
{
    "landingZoneOperations": [
        {
            "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "operationType": "RESET",
            "status": "SUCCEEDED"
        },
        {
            "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "operationType": "RESET",
            "status": "SUCCEEDED"
        },
        {
            "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "operationType": "UPDATE",
            "status": "SUCCEEDED"
        },
        {
            "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "operationType": "UPDATE",
```

```
            "status": "SUCCEEDED"
        }
    ]
}
```

For more information, see Getting started with AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see ListLandingZoneOperations in *AWS CLI Command Reference*.

`list-landing-zones`

The following code example shows how to use `list-landing-zones`.

AWS CLI

To list a Control Tower landing zone identifier

The following `list-landing-zones` example lists a Control Tower landing zone `identifier`.

```
aws controltower list-landing-zones
```

Output:

```
{
    "landingZones": [
        {
            "arn": "arn:aws:controltower:us-
west-2:123456789012:landingzone/13CJG46WZKXXX4X5"
        }
    ]
}
```

For more information, see Getting started with AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see ListLandingZones in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for Control Tower enabled controls

The following `list-tags-for-resource` example lists the tags for AWS Control Tower Enabled Controls.

```
aws controltower list-tags-for-resource \
    --resource-arn "arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/2H2AWUG4SKG81855"
```

Output:

```
{
    "tags": {
        "TestTagKey": "TestTagValue"
    }
}
```

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`reset-enabled-baseline`

The following code example shows how to use `reset-enabled-baseline`.

AWS CLI

To reset a Control Tower enabled baseline

The following `reset-enabled-baseline` example resets an AWS Control Tower enabled baseline.

```
aws controltower reset-enabled-baseline \
    --enabled-baseline-identifier arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XOM12BEL4YD578CQ2
```

Output:

```
{
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Types of baselines in the *AWS Control Tower User Guide*.

- For API details, see ResetEnabledBaseline in *AWS CLI Command Reference*.

`reset-enabled-control`

The following code example shows how to use `reset-enabled-control`.

AWS CLI

To reset a Control Tower enabled control

The following `reset-enabled-control` example resets an AWS Control Tower enabled control.

```
aws controltower reset-enabled-control \
    --enabled-control-identifier arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/2H2AWUG4SKG81855
```

Output:

```
{
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see ResetEnabledControl in *AWS CLI Command Reference*.

`reset-landing-zone`

The following code example shows how to use `reset-landing-zone`.

AWS CLI

To reset a Control Tower landing zone

The following `reset-landing-zone` example resets a AWS Control Tower landing zone.

```
aws controltower reset-landing-zone \
    --landing-zone-identifier arn:aws:controltower:us-
west-2:123456789012:landingzone/13CJG46WZKXXX4X5
```

Output:

```
{
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Getting started with AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see ResetLandingZone in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a Control Tower enabled control

The following `tag-resource` example tags an AWS Control Tower enabled control.

```
aws controltower tag-resource \
    --resource-arn "arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/2H2AWUG4SKG81855" \
    --tags "TestTagKey=TestTagValue"
```

This command produces no output.

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a Control Tower enabled control

The following `untag-resource` example untags an AWS Control Tower enabled control.

```
aws controltower untag-resource \
    --resource-arn "arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/2H2AWUG4SKG81855" \
    --tag-keys "TestTagKey"
```

This command produces no output.

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-enabled-baseline`

The following code example shows how to use `update-enabled-baseline`.

AWS CLI

Example 1: To update a disabled Control Tower baseline

The following `update-enabled-baseline` example updates an AWS Control Tower enabled baseline if baseline 'IdentityCenterBaseline' is disabled.

```
aws controltower update-enabled-baseline \
    --baseline-version 4.0 \
    --enabled-baseline-identifier arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XOM12BEL4YD578CQ2
```

Output:

```
{
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Example 2: To update an enabled Control Tower baseline

The following `update-enabled-baseline` example updates an AWS Control Tower enabled baseline if baseline 'IdentityCenterBaseline' is enabled.

```
aws controltower update-enabled-baseline \
    --baseline-version 4.0 \
    --enabled-baseline-identifier arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XOM12BEL4YD578CQ2 \
    --parameters
 '[{"key":"IdentityCenterEnabledBaselineArn","value":"arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XAJNZNCBC1I386C7B"}]'
```

Output:

```
{
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Types of baselines in the *AWS Control Tower User Guide*.

- For API details, see UpdateEnabledBaseline in *AWS CLI Command Reference*.

`update-enabled-control`

The following code example shows how to use `update-enabled-control`.

AWS CLI

To update a Control Tower enabled control

The following `update-enabled-control` example updates an AWS Control Tower enabled control.

```
aws controltower update-enabled-control \
    --enabled-control-identifier arn:aws:controltower:us-
west-2:123456789012:enabledcontrol/JSJN8UL0G2MWGRTZ \
    --parameters '[{"key":"AllowedRegions","value":["us-east-1","us-west-1","us-
west-2","us-east-2"]}]'
```

Output:

```
{
```

```
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see About controls in AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see UpdateEnabledControl in *AWS CLI Command Reference*.

`update-landing-zone`

The following code example shows how to use `update-landing-zone`.

AWS CLI

To update a Control Tower landing zone

The following `update-landing-zone` example updates AWS Control Tower landing zone.

```
aws controltower update-landing-zone \
    --landing-zone-identifier arn:aws:controltower:us-
west-2:123456789012:landingzone/13CJG46WZKXXX4X5 \
    --landing-zone-version 3.3 \
    --manifest "file://UpdateLandingZoneManifest.json"
```

Contents of `UpdateLandingZoneManifest.json`:

```
{
    "governedRegions": [
        "us-west-2"
    ],
    "organizationStructure": {
        "security": {
            "name": "Security"
        },
        "sandbox": {
            "name": "Sandbox"
        }
    },
    "centralizedLogging": {
        "accountId": "123456789222",
        "configurations": {
            "loggingBucket": {
```

```
                "retentionDays": 365
            },
            "accessLoggingBucket": {
                "retentionDays": 3650
            }
        },
        "enabled": true
    },
    "securityRoles": {
        "accountId": "123456789111"
    },
    "accessManagement": {
        "enabled": true
    }
}
```

Output:

```
{
    "operationIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Getting started with AWS Control Tower in the *AWS Control Tower User Guide*.

- For API details, see UpdateLandingZone in *AWS CLI Command Reference*.

AWS Cost and Usage Report examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Cost and Usage Report.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-report-definition`

The following code example shows how to use `delete-report-definition`.

AWS CLI

To delete an AWS Cost and Usage Report

The following `delete-report-definition` example deletes an AWS Cost and Usage Report.

```
aws cur delete-report-definition \
    --region us-east-1 \
    --report-name "ExampleReport"
```

Output:

```
{
    "ResponseMessage": "Report ExampleReport deleted successfully."
}
```

For more information, see What are AWS Cost and Usage Reports? in the *AWS Data Exports User Guide*.

- For API details, see DeleteReportDefinition in *AWS CLI Command Reference*.

`describe-report-definitions`

The following code example shows how to use `describe-report-definitions`.

AWS CLI

To retrieve a list of AWS Cost and Usage Reports

The following `describe-report-definitions` example describes a list of AWS Cost and Usage Reports owned by an account.

```
aws cur describe-report-definitions \
    --region us-east-1 \
```

```
    --max-items 5
```

Output:

```
{
    "ReportDefinitions": [
        {
            "ReportName": "ExampleReport",
            "Compression": "ZIP",
            "S3Region": "us-east-1",
            "Format": "textORcsv",
            "S3Prefix": "exampleprefix",
            "S3Bucket": "example-s3-bucket",
            "TimeUnit": "DAILY",
            "AdditionalArtifacts": [
                "REDSHIFT",
                "QUICKSIGHT"
            ],
            "AdditionalSchemaElements": [
                "RESOURCES"
            ]
        }
    ]
}
```

For more information, see What are AWS Cost and Usage Reports? in the *AWS Data Exports User Guide*.

- For API details, see DescribeReportDefinitions in *AWS CLI Command Reference*.

`put-report-definition`

The following code example shows how to use `put-report-definition`.

AWS CLI

To create an AWS Cost and Usage Reports

The following `put-report-definition` example creates a daily AWS Cost and Usage Report that you can upload into Amazon Redshift or Amazon QuickSight.

```
aws cur put-report-definition \
```

```
    --report-definition file://report-definition.json
```

Contents of `report-definition.json`:

```
{
    "ReportName": "ExampleReport",
    "TimeUnit": "DAILY",
    "Format": "textORcsv",
    "Compression": "ZIP",
    "AdditionalSchemaElements": [
        "RESOURCES"
    ],
    "S3Bucket": "example-s3-bucket",
    "S3Prefix": "exampleprefix",
    "S3Region": "us-west-2",
    "AdditionalArtifacts": [
        "REDSHIFT",
        "QUICKSIGHT"
    ]
}
```

This command produces no output.

For more information, see Creating a Legacy CUR export in the *AWS Data Exports User Guide*.

- For API details, see PutReportDefinition in *AWS CLI Command Reference*.

Cost Explorer Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Cost Explorer Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`get-cost-and-usage`

The following code example shows how to use `get-cost-and-usage`.

AWS CLI

To retrieve the S3 usage of an account for the month of September 2017

The following `get-cost-and-usage` example retrieves the S3 usage of an account for the month of September 2017.

```
aws ce get-cost-and-usage \
    --time-period Start=2017-09-01,End=2017-10-01 \
    --granularity MONTHLY \
    --metrics "BlendedCost" "UnblendedCost" "UsageQuantity" \
    --group-by Type=DIMENSION,Key=SERVICE Type=TAG,Key=Environment \
    --filter file://filters.json
```

Contents of `filters.json`:

```
{
    "Dimensions": {
        "Key": "SERVICE",
        "Values": [
            "Amazon Simple Storage Service"
        ]
    }
}
```

Output:

```
{
    "GroupDefinitions": [
        {
            "Type": "DIMENSION",
            "Key": "SERVICE"
        },
        {
            "Type": "TAG",
            "Key": "Environment"
        }
```

```
    ],
    "ResultsByTime": [
        {
            "Estimated": false,
            "TimePeriod": {
                "Start": "2017-09-01",
                "End": "2017-10-01"
            },
            "Total": {},
            "Groups": [
                {
                    "Keys": [
                        "Amazon Simple Storage Service",
                        "Environment$"
                    ],
                    "Metrics": {

                        "UsageQuantity": {
                            "Amount": "9312771.098461578",
                            "Unit": "N/A"
                        }
                    }
                },
                {
                    "Keys": [
                        "Amazon Simple Storage Service",
                        "Environment$Dev"
                    ],
                    "Metrics": {
                        "BlendedCost": {
                            "Amount": "0.2682364644",
                            "Unit": "USD"
                        },
                        "UnblendedCost": {
                            "Amount": "0.2682364644",
                            "Unit": "USD"
                        },
```

```
                        "UsageQuantity": {
                            "Amount": "22403.4395271182",
                            "Unit": "N/A"
                        }
                    }
                }
            ]
        }
    ]
}
```

For more information, see Exploring your data using Cost Explorer in the *AWS Cost Management User Guide*.

- For API details, see GetCostAndUsage in *AWS CLI Command Reference*.

`get-dimension-values`

The following code example shows how to use `get-dimension-values`.

AWS CLI

To retrieve the tags for the dimension SERVICE, with a value of "Elastic"

The following `get-dimension-values` example retrieves the tags for the dimension SERVICE, with a value of "Elastic" for January 01 2017 through May 18 2017.

```
aws ce get-dimension-values \
    --search-string Elastic \
    --time-period Start=2017-01-01,End=2017-05-18 \
    --dimension SERVICE
```

Output:

```
{
    "TotalSize": 6,
    "DimensionValues": [
        {
            "Attributes": {},
            "Value": "Amazon ElastiCache"
        },
        {
            "Attributes": {},
```

```
            "Value": "EC2 - Other"
        },
        {
            "Attributes": {},
            "Value": "Amazon Elastic Compute Cloud - Compute"
        },
        {
            "Attributes": {},
            "Value": "Amazon Elastic Load Balancing"
        },
        {
            "Attributes": {},
            "Value": "Amazon Elastic MapReduce"
        },
        {
            "Attributes": {},
            "Value": "Amazon Elasticsearch Service"
        }
    ],
    "ReturnSize": 6
}
```

For more information, see Filtering the data that you want to view in the *AWS Cost Management User Guide*.

- For API details, see GetDimensionValues in *AWS CLI Command Reference*.

`get-reservation-coverage`

The following code example shows how to use `get-reservation-coverage`.

AWS CLI

To retrieve the reservation coverage for EC2 t2.nano instances in the us-west-2 region

The following `get-reservation-coverage` example retrieves the reservation coverage for EC2 t2.nano instances in the us-west-2 region for July-September of 2017.

```
aws ce get-reservation-coverage \
    --time-period Start=2017-07-01,End=2017-10-01 \
    --group-by Type=Dimension,Key=REGION \
    --filter file://filters.json
```

Contents of `filters.json`:

```
{
    "And": [
        {
            "Dimensions": {
                "Key": "INSTANCE_TYPE",
                "Values": [
                    "t2.nano"
                ]
            }
        },
        {
            "Dimensions": {
                "Key": "REGION",
                "Values": [
                    "us-west-2"
                ]
            }
        }
    ]
}
```

Output:

```
{
    "CoveragesByTime": [
        {
            "TimePeriod": {
                "Start": "2017-07-01",
                "End": "2017-10-01"
            },
            "Groups": [
                {
                    "Attributes": {
                        "region": "us-west-2"
                    },
                    "Coverage": {
                        "CoverageHours": {
                            "OnDemandHours": "3000",
                            "ReservedHours": "1000",
                            "TotalRunningHours": "4000",
                            "CoverageHoursPercentage": "25"
```

```
                        }
                    }
                }
            ],
            "Total": {
                "CoverageHours": {
                    "OnDemandHours": "3000",
                    "ReservedHours": "1000",
                    "TotalRunningHours": "4000",
                    "CoverageHoursPercentage": "25"
                }
            }
        }
    ],
    "Total": {
        "CoverageHours": {
            "OnDemandHours": "3000",
            "ReservedHours": "1000",
            "TotalRunningHours": "4000",
            "CoverageHoursPercentage": "25"
        }
    }
}
```

For more information, see Understanding reservations in Cost Explorer in the *AWS Cost Management User Guide*.

- For API details, see GetReservationCoverage in *AWS CLI Command Reference*.

`get-reservation-purchase-recommendation`

The following code example shows how to use `get-reservation-purchase-recommendation`.

AWS CLI

To retrieve the reservation recommendations for Partial Upfront EC2 RIs with a three year term

The following `get-reservation-purchase-recommendation` example retrieves recommendations for Partial Upfront EC2 instances with a three-year term, based on the last 60 days of EC2 usage.

```
aws ce get-reservation-purchase-recommendation \
```

```
    --service "Amazon Redshift" \
    --lookback-period-in-days SIXTY_DAYS \
    --term-in-years THREE_YEARS \
    --payment-option PARTIAL_UPFRONT
```

Output:

```
{
    "Recommendations": [],
    "Metadata": {
        "GenerationTimestamp": "2018-08-08T15:20:57Z",
        "RecommendationId": "00d59dde-a1ad-473f-8ff2-iexample3330b"
    }
}
```

For more information, see Accessing reservation recommendations in the *AWS Cost Management User Guide*.

- For API details, see GetReservationPurchaseRecommendation in *AWS CLI Command Reference*.

`get-reservation-utilization`

The following code example shows how to use `get-reservation-utilization`.

AWS CLI

To retrieve the reservation utilization for your account

The following `get-reservation-utilization` example retrieves the RI utilization for all t2.nano instance types from 2018-03-01 to 2018-08-01 for the account.

```
aws ce get-reservation-utilization \
    --time-period Start=2018-03-01,End=2018-08-01 \
    --filter file://filters.json
```

Contents of `filters.json`:

```
{
    "Dimensions": {
        "Key": "INSTANCE_TYPE",
        "Values": [
```

```
            "t2.nano"
        ]
    }
}
```

Output:

```
{
    "Total": {
        "TotalAmortizedFee": "0",
        "UtilizationPercentage": "0",
        "PurchasedHours": "0",
        "NetRISavings": "0",
        "TotalActualHours": "0",
        "AmortizedRecurringFee": "0",
        "UnusedHours": "0",
        "TotalPotentialRISavings": "0",
        "OnDemandCostOfRIHoursUsed": "0",
        "AmortizedUpfrontFee": "0"
    },
    "UtilizationsByTime": []
}
```

For more information, see Understanding reservations in Cost Explorer in the *AWS Cost Management User Guide*.

- For API details, see GetReservationUtilization in *AWS CLI Command Reference*.

`get-tags`

The following code example shows how to use `get-tags`.

AWS CLI

To retrieve keys and values for a cost allocation tag

The following `get-tags` example retrieves all cost allocation tags with a key of "Project" and a value that contains "secretProject".

```
aws ce get-tags \
    --search-string secretProject \
    --time-period Start=2017-01-01,End=2017-05-18 \
```

```
    --tag-key Project
```

Output:

```
{
    "ReturnSize": 2,
    "Tags": [
        "secretProject1",
        "secretProject2"
    ],
    "TotalSize": 2
}
```

For more information, see Organizing and tracking costs using AWS cost allocation tags in the *AWS Billing User Guide*.

- For API details, see GetTags in *AWS CLI Command Reference*.

Firehose examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firehose.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`list-delivery-streams`

The following code example shows how to use `list-delivery-streams`.

AWS CLI

To list the available delivery streams

The following `list-delivery-streams` example lists the available delivery streams in your AWS account.

```
aws firehose list-delivery-streams
```

Output:

```
{
    "DeliveryStreamNames": [
        "my-stream"
    ],
    "HasMoreDeliveryStreams": false
}
```

For more information, see Creating an Amazon Kinesis Data Firehose Delivery Stream in the *Amazon Kinesis Data Firehose Developer Guide*.

- For API details, see ListDeliveryStreams in *AWS CLI Command Reference*.

`put-record-batch`

The following code example shows how to use `put-record-batch`.

AWS CLI

To write multiple records to a stream

The following `put-record-batch` example writes three records to a stream. The data is encoded in Base64 format.

```
aws firehose put-record-batch \
    --delivery-stream-name my-stream \
    --records file://records.json
```

Contents of `records.json`:

```
[
    {"Data": "Rmlyc3QgdGhpbmc="},
    {"Data": "U2Vjb25kIHRoaW5n"},
    {"Data": "VGhpcmQgdGhpbmc="}
]
```

Output:

```
{
    "FailedPutCount": 0,
    "Encrypted": false,
    "RequestResponses": [
        {
            "RecordId": "9D2OJ6t2EqCTZTXwGzeSv/EVHxRoRCw89xd+o3+sXg8DhYOaWKPSmZy/

        }
    ]
}
```

For more information, see Sending Data to an Amazon Kinesis Data Firehose Delivery Stream in the *Amazon Kinesis Data Firehose Developer Guide*.

- For API details, see PutRecordBatch in *AWS CLI Command Reference*.

`put-record`

The following code example shows how to use `put-record`.

AWS CLI

To write a record to a stream

The following `put-record` example writes data to a stream. The data is encoded in Base64 format.

```
aws firehose put-record \
```

```
    --delivery-stream-name my-stream \
    --record '{"Data":"SGVsbG8gd29ybGQ="}'
```

Output:

```
{
    "RecordId": "RjB5K/nnoGFHqwTsZlNd/
TTqvjE8V5dsyXZTQn2JXrdpMTOwssyEb6nfC8fwf1whhwnItt4mvrn+gsqeK5jB7QjuLg283+Ps4Sz/

    "Encrypted": false
}
```

For more information, see Sending Data to an Amazon Kinesis Data Firehose Delivery Stream in the *Amazon Kinesis Data Firehose Developer Guide*.

- For API details, see PutRecord in *AWS CLI Command Reference*.

Amazon Data Lifecycle Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Data Lifecycle Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-default-role`

The following code example shows how to use `create-default-role`.

AWS CLI

To create the required IAM role for Amazon DLM

The following `create-default-role` example creates the AWSDataLifecycleManagerDefaultRole default role for managing snapshots.

```
aws dlm create-default-role \
    --resource-type snapshot
```

This command produces no output.

For more information, see Default service roles for Amazon Data Lifecycle Manager in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see CreateDefaultRole in *AWS CLI Command Reference*.

`create-lifecycle-policy`

The following code example shows how to use `create-lifecycle-policy`.

AWS CLI

To create a lifecycle policy

The following `create-lifecycle-policy` example creates a lifecycle policy that creates a daily snapshot of volumes at the specified time. The specified tags are added to the snapshots, and tags are also copied from the volume and added to the snapshots. If creating a new snapshot exceeds the specified maximum count, the oldest snapshot is deleted.

```
aws dlm create-lifecycle-policy \
    --description "My first policy" \
    --state ENABLED \
    --execution-role-arn arn:aws:iam::12345678910:role/
AWSDataLifecycleManagerDefaultRole \
    --policy-details file://policyDetails.json
```

Contents of `policyDetails.json`:

```
{
    "ResourceTypes": [
        "VOLUME"
    ],
    "TargetTags": [
        {
```

```
            "Key": "costCenter",
            "Value": "115"
        }
    ],
    "Schedules":[
        {
            "Name": "DailySnapshots",
            "CopyTags": true,
            "TagsToAdd": [
                {
                    "Key": "type",
                    "Value": "myDailySnapshot"
                }
            ],
            "CreateRule": {
                "Interval": 24,
                "IntervalUnit": "HOURS",
                "Times": [
                    "03:00"
                ]
            },
            "RetainRule": {
                "Count":5
            }
        }
    ]
}
```

Output:

```
{
    "PolicyId": "policy-0123456789abcdef0"
}
```

For more information, see Create Amazon Data Lifecycle Manager custom policy for EBS snapshots in the *Amazon EBS User Guide*.

- For API details, see CreateLifecyclePolicy in *AWS CLI Command Reference*.

`delete-lifecycle-policy`

The following code example shows how to use `delete-lifecycle-policy`.

AWS CLI

To delete a lifecycle policy

The following `delete-lifecycle-policy` example deletes the specified lifecycle policy.

```
aws dlm delete-lifecycle-policy \
    --policy-id policy-0123456789abcdef0
```

This command produces no output.

For more information, see Delete Amazon Data Lifecycle Manager policies in the *Amazon EBS User Guide*.

- For API details, see DeleteLifecyclePolicy in *AWS CLI Command Reference*.

`get-lifecycle-policies`

The following code example shows how to use `get-lifecycle-policies`.

AWS CLI

To get a summary of your lifecycle policies

The following `get-lifecycle-policies` example lists all of your lifecycle policies.

```
aws dlm get-lifecycle-policies
```

Output:

```
{
    "Policies": [
        {
            "PolicyId": "policy-0123456789abcdef0",
            "Description": "My first policy",
            "State": "ENABLED"
        }
    ]
}
```

For more information, see Automate backups with Amazon Data Lifecycle Manager in the *Amazon EBS User Guide*.

- For API details, see GetLifecyclePolicies in *AWS CLI Command Reference*.

`get-lifecycle-policy`

The following code example shows how to use `get-lifecycle-policy`.

AWS CLI

To describe a lifecycle policy

The following `get-lifecycle-policy` example displays details for the specified lifecycle policy.

```
aws dlm get-lifecycle-policy \
    --policy-id policy-0123456789abcdef0
```

Output:

```
{
    "Policy": {
        "PolicyId": "policy-0123456789abcdef0",
        "Description": "My policy",
        "State": "ENABLED",
        "ExecutionRoleArn": "arn:aws:iam::123456789012:role/
AWSDataLifecycleManagerDefaultRole",
        "DateCreated": "2019-08-08T17:45:42Z",
        "DateModified": "2019-08-08T17:45:42Z",
        "PolicyDetails": {
            "PolicyType": "EBS_SNAPSHOT_MANAGEMENT",
            "ResourceTypes": [
                "VOLUME"
            ],
            "TargetTags": [
                {
                    "Key": "costCenter",
                    "Value": "115"
                }
            ],
            "Schedules": [
                {
                    "Name": "DailySnapshots",
                    "CopyTags": true,
```

```
                    "TagsToAdd": [
                        {
                            "Key": "type",
                            "Value": "myDailySnapshot"
                        }
                    ],
                    "CreateRule": {
                        "Interval": 24,
                        "IntervalUnit": "HOURS",
                        "Times": [
                            "03:00"
                        ]
                    },
                    "RetainRule": {
                        "Count": 5
                    }
                }
            ]
        }
    }
}
```

For more information, see Automate backups with Amazon Data Lifecycle Manager in the *Amazon EBS User Guide*.

- For API details, see GetLifecyclePolicy in *AWS CLI Command Reference*.

`update-lifecycle-policy`

The following code example shows how to use `update-lifecycle-policy`.

AWS CLI

Example 1: To enable a lifecycle policy

The following `update-lifecycle-policy` example enables the specified lifecycle policy.

```
aws dlm update-lifecycle-policy \
    --policy-id policy-0123456789abcdef0 \
    --state ENABLED
```

This command produces no output.

For more information, see Modify Amazon Data Lifecycle Manager policies in the *Amazon EBS User Guide*.

Example 2: To disable a lifecycle policy

The following `update-lifecycle-policy` example disables the specified lifecycle policy.

```
aws dlm update-lifecycle-policy \
    --policy-id policy-0123456789abcdef0 \
    --state DISABLED
```

This command produces no output.

For more information, see Modify Amazon Data Lifecycle Manager policies in the *Amazon EBS User Guide*.

Example 3: To update the details for lifecycle policy

The following `update-lifecycle-policy` example updates the target tags for the specified lifecycle policy.

```
aws dlm update-lifecycle-policy \
    --policy-id policy-0123456789abcdef0 \
    --policy-details file://policyDetails.json
```

This command produces no output.

Other details not referenced in the file are not changed by the command.

Contents of `policyDetails.json`:

```
{
    "TargetTags": [
        {
            "Key": "costCenter",
            "Value": "120"
        },
        {
            "Key": "project",
            "Value": "lima"
        }
```

```
    ]
}
```

For more information, see Modify Amazon Data Lifecycle Manager policies in the *Amazon EBS User Guide*.

- For API details, see UpdateLifecyclePolicy in *AWS CLI Command Reference*.

AWS Data Pipeline examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Data Pipeline.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`activate-pipeline`

The following code example shows how to use `activate-pipeline`.

AWS CLI

To activate a pipeline

The following `activate-pipeline` example activates the specified pipeline.

```
aws datapipeline activate-pipeline \
    --pipeline-id df-00627471SOVYZEXAMPLE
```

This command produces no output.

To activate the pipeline at a specific date and time, use the following command.

```
aws datapipeline activate-pipeline \
    --pipeline-id df-00627471SOVYZEXAMPLE \
    --start-timestamp 2015-04-07T00:00:00Z
```

For more information, see Working with pipelines in the *AWS Data Pipeline Developer Guide*.

- For API details, see ActivatePipeline in *AWS CLI Command Reference*.

`add-tags`

The following code example shows how to use `add-tags`.

AWS CLI

To add a tag to a pipeline

The following `add-tags` example adds the specified tag to the specified pipeline.

```
aws datapipeline add-tags \
    --pipeline-id df-00627471SOVYZEXAMPLE \
    --tags key=environment,value=production key=owner,value=sales
```

This command produces no output.

To view the tags, use the describe-pipelines command. For example, the tags added in the example command appear as follows in the output for describe-pipelines:

```
{
    ...
        "tags": [
            {
                "value": "production",
                "key": "environment"
            },
            {
                "value": "sales",
                "key": "owner"
            }
        ]
    ...
}
```

For more information, see Tagging Your Pipeline in the *AWS Data Pipeline Developer Guide*.

- For API details, see AddTags in *AWS CLI Command Reference*.

`create-pipeline`

The following code example shows how to use `create-pipeline`.

AWS CLI

To create a pipeline

The following `create-pipeline` example creates a pipeline.

```
aws datapipeline create-pipeline \
    --name my-pipeline \
    --unique-id my-pipeline-token
```

Output:

```
{
    "pipelineId": "df-00627471SOVYZEXAMPLE"
}
```

For more information, see Creating a pipeline in the *AWS Data Pipeline Developer Guide*.

- For API details, see CreatePipeline in *AWS CLI Command Reference*.

`deactivate-pipeline`

The following code example shows how to use `deactivate-pipeline`.

AWS CLI

To deactivate a pipeline

The following `deactivate-pipeline` example deactivates the specified pipeline.

```
aws datapipeline deactivate-pipeline \
    --pipeline-id df-00627471SOVYZEXAMPLE
```

This command produces no output.

To deactivate the pipeline only after all running activities finish, use the following command.

```
aws datapipeline deactivate-pipeline \
    --pipeline-id df-00627471SOVYZEXAMPLE \
    --no-cancel-active
```

For more information, see Deactivating Your Pipeline in the *AWS Data Pipeline Developer Guide*.

- For API details, see DeactivatePipeline in *AWS CLI Command Reference*.

`delete-pipeline`

The following code example shows how to use `delete-pipeline`.

AWS CLI

To delete a pipeline

The following `delete-pipeline` example deletes the specified pipeline.

```
aws datapipeline delete-pipeline \
    --pipeline-id df-00627471SOVYZEXAMPLE
```

This command produces no output.

For more information, see Deleting Your Pipeline in the *AWS Data Pipeline Developer Guide*.

- For API details, see DeletePipeline in *AWS CLI Command Reference*.

`describe-pipelines`

The following code example shows how to use `describe-pipelines`.

AWS CLI

To describe your pipelines

The following `describe-pipelines` example describes the specified pipeline.

```
aws datapipeline describe-pipelines \
    --pipeline-ids df-00627471SOVYZEXAMPLE
```

Output:

```
{
    "pipelineDescriptionList": [
        {
            "fields": [
                {
                    "stringValue": "PENDING",
                    "key": "@pipelineState"
                },
                {
                    "stringValue": "my-pipeline",
                    "key": "name"
                },
                {
                    "stringValue": "2015-04-07T16:05:58",
                    "key": "@creationTime"
                },
                {
                    "stringValue": "df-00627471SOVYZEXAMPLE",
                    "key": "@id"
                },
                {
                    "stringValue": "123456789012",
                    "key": "pipelineCreator"
                },
                {
                    "stringValue": "PIPELINE",
                    "key": "@sphere"
                },
                {
                    "stringValue": "123456789012",
                    "key": "@userId"
                },
                {
                    "stringValue": "123456789012",
                    "key": "@accountId"
                },
                {
                    "stringValue": "my-pipeline-token",
                    "key": "uniqueId"
                }
            ],
            "pipelineId": "df-00627471SOVYZEXAMPLE",
```

```
            "name": "my-pipeline",
            "tags": []
        }
    ]
}
```

For more information, see Working with pipelines in the *AWS Data Pipeline Developer Guide*.

- For API details, see DescribePipelines in *AWS CLI Command Reference*.

`get-pipeline-definition`

The following code example shows how to use `get-pipeline-definition`.

AWS CLI

To get a pipeline definition

The following `get-pipeline-definition` example gets the pipeline definition for the specified pipeline.

```
aws datapipeline get-pipeline-definition \
    --pipeline-id df-00627471SOVYZEXAMPLE
```

Output:

```
{
    "parameters": [
        {
            "type": "AWS::S3::ObjectKey",
            "id": "myS3OutputLoc",
            "description": "S3 output folder"
        },
        {
            "default": "s3://us-east-1.elasticmapreduce.samples/pig-apache-logs/
data",
            "type": "AWS::S3::ObjectKey",
            "id": "myS3InputLoc",
            "description": "S3 input folder"
        },
        {
            "default": "grep -rc \"GET\" ${INPUT1_STAGING_DIR}/* >
 ${OUTPUT1_STAGING_DIR}/output.txt",
```

```
            "type": "String",
            "id": "myShellCmd",
            "description": "Shell command to run"
        }
    ],
    "objects": [
        {
            "type": "Ec2Resource",
            "terminateAfter": "20 Minutes",
            "instanceType": "t1.micro",
            "id": "EC2ResourceObj",
            "name": "EC2ResourceObj"
        },
        {
            "name": "Default",
            "failureAndRerunMode": "CASCADE",
            "resourceRole": "DataPipelineDefaultResourceRole",
            "schedule": {
                "ref": "DefaultSchedule"
            },
            "role": "DataPipelineDefaultRole",
            "scheduleType": "cron",

    }
}
```

For more information, see Pipeline definition file syntax in the *AWS Data Pipeline Developer Guide*.

- For API details, see GetPipelineDefinition in *AWS CLI Command Reference*.

`list-pipelines`

The following code example shows how to use `list-pipelines`.

AWS CLI

To list your pipelines

The following `list-pipelines` example lists your pipelines.

```
aws datapipeline list-pipelines
```

Output:

```
{
    "pipelineIdList": [
        {
            "id": "df-00627471SOVYZEXAMPLE",
            "name": "my-pipeline"
        },
        {
            "id": "df-09028963KNVMREXAMPLE",
            "name": "ImportDDB"
        },
        {
            "id": "df-0870198233ZYVEXAMPLE",
            "name": "CrossRegionDDB"
        },
        {
            "id": "df-00189603TB4MZEXAMPLE",
            "name": "CopyRedshift"
        }
    ]
}
```

For more information, see Viewing Your Pipelines in the *AWS Data Pipeline Developer Guide*.

- For API details, see ListPipelines in *AWS CLI Command Reference*.

`list-runs`

The following code example shows how to use `list-runs`.

AWS CLI

Example 1: To list your pipeline runs

The following `list-runs` example lists the runs for the specified pipeline.

```
aws datapipeline list-runs \
    --pipeline-id df-00627471SOVYZEXAMPLE
```

Output:

```
    Name                          Scheduled Start        Status                      ID
                                                 Started                Ended

 ---------------------------------------------------------------------------------------
1.  EC2ResourceObj                2015-04-12T17:33:02    CREATING
 @EC2ResourceObj_2015-04-12T17:33:02              2015-04-12T17:33:10

 @ShellCommandActivityObj_2015-04-12T17:33:02     2015-04-12T17:33:09
```

For more information, see Interpreting Pipeline Status Details in the *AWS Data Pipeline Developer Guide*.

Example 2: To list the pipeline runs between the specified dates

The following `list-runs` example uses the `--start-interval` to specify the dates to include in the output.

```
aws datapipeline list-runs \
    --pipeline-id df-01434553B58A2SHZUKO5 \
    --start-interval 2017-10-07T00:00:00,2017-10-08T00:00:00
```

Output:

```
        Name                                                Scheduled Start
 Status
        ID                                                  Started
 Ended
-------------------------------------------------------------------------------------
    1.  EC2ResourceObj                                      2017-10-07T09:00:00

- For API details, see ListRuns in *AWS CLI Command Reference*.

`put-pipeline-definition`

The following code example shows how to use `put-pipeline-definition`.

AWS CLI

To upload a pipeline definition

The following `put-pipeline-definition` example uploads the specified pipeline definition to the specified pipeline.

```
aws datapipeline put-pipeline-definition \
    --pipeline-id df-00627471SOVYZEXAMPLE \
    --pipeline-definition file://my-pipeline-definition.json
```

Contents of `my-pipeline-definition.json`:

```
{
    "parameters": [
        {
            "type": "AWS::S3::ObjectKey",

            "id": "ShellCommandActivityObj",
            "runsOn": {
                "ref": "EC2ResourceObj"
            }
        }
    ],
    "values": {
        "myS3OutputLoc": "s3://amzn-s3-demo-bucket/",
        "myS3InputLoc": "s3://amzn-s3-demo-bucket/pig-apache-logs/data",
        "myShellCmd": "grep -rc \"GET\" ${INPUT1_STAGING_DIR}/* >
 ${OUTPUT1_STAGING_DIR}/output.txt"
    }
}
```

Output:

```
{
    "validationErrors": [],
    "errored": false,
    "validationWarnings": []
}
```

For more information, see Pipeline definition file syntax in the *AWS Data Pipeline Developer Guide*.

- For API details, see PutPipelineDefinition in *AWS CLI Command Reference*.

`remove-tags`

The following code example shows how to use `remove-tags`.

AWS CLI

To remove a tag from a pipeline

The following `remove-tags` example removes the specified tag from the specified pipeline.

```
aws datapipeline remove-tags \
    --pipeline-id df-00627471SOVYZEXAMPLE \
    --tag-keys environment
```

This command produces no output.

For more information, see Tagging Your Pipeline in the *AWS Data Pipeline Developer Guide*.

- For API details, see RemoveTags in *AWS CLI Command Reference*.

DataSync examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DataSync.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`update-location-azure-blob`

The following code example shows how to use `update-location-azure-blob`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-azure-blob` example updates your DataSync location for Microsoft Azure Blob Storage with a new agent.

```
aws datasync update-location-azure-blob \
    --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-
abcdef01234567890 \
    --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/
agent-1234567890abcdef0 \
    --sas-configuration '{
        "Token": "sas-token-for-azure-blob-storage-access"
    }'
```

This command produces no output.

For more information, see Replacing your agent in the *AWS DataSync User Guide*.

- For API details, see UpdateLocationAzureBlob in *AWS CLI Command Reference*.

`update-location-hdfs`

The following code example shows how to use `update-location-hdfs`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-hdfs` example updates your DataSync HDFS location with a new agent. You only need the `--kerberos-keytab` and `--kerberos-krb5-conf` options if your HDFS cluster uses Kerberos authentication.

```
aws datasync update-location-hdfs \
    --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-
abcdef01234567890 \
    --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/
agent-1234567890abcdef0 \
    --kerberos-keytab fileb://hdfs.keytab \
    --kerberos-krb5-conf fileb://krb5.conf
```

Contents of `hdfs.keytab`:

```
N/A. The content of this file is encrypted and not human readable.
```

Contents of `krb5.conf`:

```
[libdefaults]
    default_realm = EXAMPLE.COM
    dns_lookup_realm = false
    dns_lookup_kdc = false
    rdns = true
    ticket_lifetime = 24h
    forwardable = true
    udp_preference_limit = 1000000
    default_tkt_enctypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96 des3-cbc-
sha1
    default_tgs_enctypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96 des3-cbc-
sha1
    permitted_enctypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96 des3-cbc-
sha1

[realms]
    EXAMPLE.COM = {
      kdc = kdc1.example.com
      admin_server = krbadmin.example.com
      default_domain = example.com
    }

[domain_realm]
    .example.com = EXAMPLE.COM
    example.com = EXAMPLE.COM

[logging]
    kdc = FILE:/var/log/krb5kdc.log
    admin_server = FILE:/var/log/kerberos/kadmin.log
    default = FILE:/var/log/krb5libs.log
```

This command produces no output.

For more information, see Replacing your agent in the *AWS DataSync User Guide*.

- For API details, see UpdateLocationHdfs in *AWS CLI Command Reference*.

`update-location-nfs`

The following code example shows how to use `update-location-nfs`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-nfs` example updates your DataSync NFS location with a new agent.

```
aws datasync update-location-nfs \
    --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-abcdef01234567890 \
    --on-prem-config AgentArns=arn:aws:datasync:us-west-2:123456789012:agent/agent-1234567890abcdef0
```

This command produces no output.

For more information, see Replacing your agent in the *AWS DataSync User Guide*.

- For API details, see UpdateLocationNfs in *AWS CLI Command Reference*.

`update-location-object-storage`

The following code example shows how to use `update-location-object-storage`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-object-storage` example updates your DataSync object storage location with a new agent.

```
aws datasync update-location-object-storage \
    --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-abcdef01234567890 \
    --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/agent-1234567890abcdef0 \
    --secret-key secret-key-for-object-storage
```

This command produces no output.

For more information, see Replacing your agent in the *AWS DataSync User Guide*.

- For API details, see UpdateLocationObjectStorage in *AWS CLI Command Reference*.

`update-location-smb`

The following code example shows how to use `update-location-smb`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-smb` example updates your DataSync SMB location with a new agent.

```
aws datasync update-location-smb \
    --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-abcdef01234567890 \
    --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/agent-1234567890abcdef0 \
    --password smb-file-server-password
```

This command produces no output.

For more information, see Replacing your agent in the *AWS DataSync User Guide*.

- For API details, see UpdateLocationSmb in *AWS CLI Command Reference*.

DAX examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DAX.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

To create a DAX cluster

The following `create-cluster` example creates a DAX cluster with the specified settings.

```
aws dax create-cluster \
    --cluster-name daxcluster \
    --node-type dax.r4.large \
    --replication-factor 3 \
    --iam-role-arn roleARN  \
    --sse-specification Enabled=true
```

Output:

```
{
    "Cluster": {
        "ClusterName": "daxcluster",
        "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",
        "TotalNodes": 3,
        "ActiveNodes": 0,
        "NodeType": "dax.r4.large",
        "Status": "creating",
        "ClusterDiscoveryEndpoint": {
            "Port": 8111
        },
        "PreferredMaintenanceWindow": "thu:13:00-thu:14:00",
        "SubnetGroup": "default",
        "SecurityGroups": [
            {
                "SecurityGroupIdentifier": "sg-1af6e36e",
                "Status": "active"
            }
        ],
        "IamRoleArn": "arn:aws:iam::123456789012:role/
DAXServiceRoleForDynamoDBAccess",
        "ParameterGroup": {
```

```
            "ParameterGroupName": "default.dax1.0",
            "ParameterApplyStatus": "in-sync",
            "NodeIdsToReboot": []
        },
        "SSEDescription": {
            "Status": "ENABLED"
        }
    }
}
```

For more information, see Creating a DAX cluster using the AWS CLI in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

`create-parameter-group`

The following code example shows how to use `create-parameter-group`.

AWS CLI

To create a parameter group

The following `create-parameter-group` example creates a parameter group with the specified settings.

```
aws dax create-parameter-group \
    --parameter-group-name daxparametergroup \
    --description "A new parameter group"
```

Output:

```
{
    "ParameterGroup": {
        "ParameterGroupName": "daxparametergroup",
        "Description": "A new parameter group"
    }
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateParameterGroup in *AWS CLI Command Reference*.

`create-subnet-group`

The following code example shows how to use `create-subnet-group`.

AWS CLI

To create a DAX subnet group

The following `create-subnet-group` example creates a subnet group with the specified settings.

```
aws dax create-subnet-group \
    --subnet-group-name daxSubnetGroup \
    --subnet-ids subnet-11111111 subnet-22222222
```

Output:

```
{
    "SubnetGroup": {
        "SubnetGroupName": "daxSubnetGroup",
        "VpcId": "vpc-05a1fa8e00c325226",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-11111111",
                "SubnetAvailabilityZone": "us-west-2b"
            },
            {
                "SubnetIdentifier": "subnet-22222222",
                "SubnetAvailabilityZone": "us-west-2c"
            }
        ]
    }
}
```

For more information, see Creating a DAX cluster using the AWS CLI in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateSubnetGroup in *AWS CLI Command Reference*.

`decrease-replication-factor`

The following code example shows how to use `decrease-replication-factor`.

AWS CLI

To remove one or more nodes from the cluster

The following `decrease-replication-factor` example decreases the number of nodes in the specified DAX cluster to one.

```
aws dax decrease-replication-factor \
    --cluster-name daxcluster \
    --new-replication-factor 1
```

Output:

```
{
    "Cluster": {
        "ClusterName": "daxcluster",
        "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",

```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DecreaseReplicationFactor in *AWS CLI Command Reference*.

delete-cluster

The following code example shows how to use `delete-cluster`.

AWS CLI

To delete a DAX cluster

The following `delete-cluster` example deletes the specified DAX cluster.

```
aws dax delete-cluster \
    --cluster-name daxcluster
```

Output:

```
{
    "Cluster": {
        "ClusterName": "daxcluster",
        "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",
        "TotalNodes": 3,
        "ActiveNodes": 0,
        "NodeType": "dax.r4.large",
        "Status": "deleting",
        "ClusterDiscoveryEndpoint": {
            "Address": "dd.ey3o9d.clustercfg.dax.usw2.cache.amazonaws.com",
            "Port": 8111
        },
        "PreferredMaintenanceWindow": "fri:06:00-fri:07:00",
        "SubnetGroup": "default",
        "SecurityGroups": [
            {
                "SecurityGroupIdentifier": "sg-1af6e36e",
                "Status": "active"
            }
        ],
        "IamRoleArn": "arn:aws:iam::123456789012:role/
DAXServiceRoleForDynamoDBAccess",
        "ParameterGroup": {
            "ParameterGroupName": "default.dax1.0",
            "ParameterApplyStatus": "in-sync",
            "NodeIdsToReboot": []
        },
        "SSEDescription": {
```

```
            "Status": "ENABLED"
        }
    }
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteCluster in *AWS CLI Command Reference*.

`delete-parameter-group`

The following code example shows how to use `delete-parameter-group`.

AWS CLI

To delete a parameter group

The following `delete-parameter-group` example deletes the specified DAX parameter group.

```
aws dax  delete-parameter-group \
    --parameter-group-name daxparametergroup
```

Output:

```
{
    "DeletionMessage": "Parameter group daxparametergroup has been deleted."
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteParameterGroup in *AWS CLI Command Reference*.

`delete-subnet-group`

The following code example shows how to use `delete-subnet-group`.

AWS CLI

To delete a subnet group

The following `delete-subnet-group` example deletes the specified DAX subnet group.

```
aws dax delete-subnet-group \
    --subnet-group-name daxSubnetGroup
```

Output:

```
{
    "DeletionMessage": "Subnet group daxSubnetGroup has been deleted."
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteSubnetGroup in *AWS CLI Command Reference*.

`describe-clusters`

The following code example shows how to use `describe-clusters`.

AWS CLI

To return information about all provisioned DAX clusters

The following `describe-clusters` example displays details about all provisioned DAX clusters.

```
aws dax describe-clusters
```

Output:

```
{
    "Clusters": [
        {
            "ClusterName": "daxcluster",
            "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",
            "TotalNodes": 1,
            "ActiveNodes": 1,
            "NodeType": "dax.r4.large",
            "Status": "available",
            "ClusterDiscoveryEndpoint": {
                "Address":
 "daxcluster.ey3o9d.clustercfg.dax.usw2.cache.amazonaws.com",
                "Port": 8111
            },
```

```
            "Nodes": [
                {
                    "NodeId": "daxcluster-a",
                    "Endpoint": {
                        "Address": "daxcluster-
a.ey3o9d.0001.dax.usw2.cache.amazonaws.com",
                        "Port": 8111
                    },
                    "NodeCreateTime": 1576625059.509,
                    "AvailabilityZone": "us-west-2c",
                    "NodeStatus": "available",
                    "ParameterGroupStatus": "in-sync"
                }
            ],
            "PreferredMaintenanceWindow": "thu:13:00-thu:14:00",
            "SubnetGroup": "default",
            "SecurityGroups": [
                {
                    "SecurityGroupIdentifier": "sg-1af6e36e",
                    "Status": "active"
                }
            ],
            "IamRoleArn": "arn:aws:iam::123456789012:role/
DAXServiceRoleForDynamoDBAccess",
            "ParameterGroup": {
                "ParameterGroupName": "default.dax1.0",
                "ParameterApplyStatus": "in-sync",
                "NodeIdsToReboot": []
            },
            "SSEDescription": {
                "Status": "ENABLED"
            }
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeClusters in *AWS CLI Command Reference*.

`describe-default-parameters`

The following code example shows how to use `describe-default-parameters`.

AWS CLI

To return the default system parameter information for DAX

The following `describe-default-parameters` example displays the default system parameter information for DAX.

```
aws dax describe-default-parameters
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "query-ttl-millis",
            "ParameterType": "DEFAULT",
            "ParameterValue": "300000",
            "NodeTypeSpecificValues": [],
            "Description": "Duration in milliseconds for queries to remain cached",
            "Source": "user",
            "DataType": "integer",
            "AllowedValues": "0-",
            "IsModifiable": "TRUE",
            "ChangeType": "IMMEDIATE"
        },
        {
            "ParameterName": "record-ttl-millis",
            "ParameterType": "DEFAULT",
            "ParameterValue": "300000",
            "NodeTypeSpecificValues": [],
            "Description": "Duration in milliseconds for records to remain valid in
 cache (Default: 0 = infinite)",
            "Source": "user",
            "DataType": "integer",
            "AllowedValues": "0-",
            "IsModifiable": "TRUE",
            "ChangeType": "IMMEDIATE"
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeDefaultParameters in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To return all events related to DAX clusters and parameter groups

The following `describe-events` example displays details of events that are related to DAX clusters and parameter groups.

```
aws dax describe-events
```

Output:

```
{
    "Events": [
        {
            "SourceName": "daxcluster",
            "SourceType": "CLUSTER",
            "Message": "Cluster deleted.",
            "Date": 1576702736.706
        },
        {
            "SourceName": "daxcluster",
            "SourceType": "CLUSTER",
            "Message": "Removed node daxcluster-b.",
            "Date": 1576702691.738
        },
        {
            "SourceName": "daxcluster",
            "SourceType": "CLUSTER",
            "Message": "Removed node daxcluster-a.",
            "Date": 1576702633.498
        },
        {
            "SourceName": "daxcluster",
            "SourceType": "CLUSTER",
            "Message": "Removed node daxcluster-c.",
            "Date": 1576702631.329
```

```
        },
        {
            "SourceName": "daxcluster",
            "SourceType": "CLUSTER",
            "Message": "Cluster created.",
            "Date": 1576626560.057
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-parameter-groups`

The following code example shows how to use `describe-parameter-groups`.

AWS CLI

To describe the parameter groups defined in DAX

The following `describe-parameter-groups` example retrieves details about the parameter groups that are defined in DAX.

```
aws dax describe-parameter-groups
```

Output:

```
{
    "ParameterGroups": [
        {
            "ParameterGroupName": "default.dax1.0",
            "Description": "Default parameter group for dax1.0"
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeParameterGroups in *AWS CLI Command Reference*.

describe-parameters

The following code example shows how to use `describe-parameters`.

AWS CLI

To describe the parameters defined in a DAX parameter group

The following `describe-parameters` example retrieves details about the parameters that are defined in the specified DAX parameter group.

```
aws dax describe-parameters \
    --parameter-group-name default.dax1.0
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "query-ttl-millis",
            "ParameterType": "DEFAULT",
            "ParameterValue": "300000",
            "NodeTypeSpecificValues": [],
            "Description": "Duration in milliseconds for queries to remain cached",
            "Source": "user",
            "DataType": "integer",
            "AllowedValues": "0-",
            "IsModifiable": "TRUE",
            "ChangeType": "IMMEDIATE"
        },
        {
            "ParameterName": "record-ttl-millis",
            "ParameterType": "DEFAULT",
            "ParameterValue": "300000",
            "NodeTypeSpecificValues": [],
            "Description": "Duration in milliseconds for records to remain valid in
 cache (Default: 0 = infinite)",
            "Source": "user",
            "DataType": "integer",
            "AllowedValues": "0-",
            "IsModifiable": "TRUE",
            "ChangeType": "IMMEDIATE"
        }
```

```
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeParameters in *AWS CLI Command Reference*.

`describe-subnet-groups`

The following code example shows how to use `describe-subnet-groups`.

AWS CLI

To describe subnet groups defined in DAX

The following `describe-subnet-groups` example retrieves details for the subnet groups defined in DAX.

```
aws dax describe-subnet-groups
```

Output:

```
{
    "SubnetGroups": [
        {
            "SubnetGroupName": "default",
            "Description": "Default CacheSubnetGroup",
            "VpcId": "vpc-ee70a196",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-874953af",
                    "SubnetAvailabilityZone": "us-west-2d"
                },
                {
                    "SubnetIdentifier": "subnet-bd3d1fc4",
                    "SubnetAvailabilityZone": "us-west-2a"
                },
                {
                    "SubnetIdentifier": "subnet-72c2ff28",
                    "SubnetAvailabilityZone": "us-west-2c"
                },
                {
                    "SubnetIdentifier": "subnet-09e6aa42",
```

```
                    "SubnetAvailabilityZone": "us-west-2b"
                }
            ]
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeSubnetGroups in *AWS CLI Command Reference*.

`increase-replication-factor`

The following code example shows how to use `increase-replication-factor`.

AWS CLI

To increase the replication factor for a DAX cluster

The following `increase-replication-factor` example increases the specified DAX cluster's replication factor to 3.

```
aws dax increase-replication-factor \
    --cluster-name daxcluster \
    --new-replication-factor 3
```

Output:

```
{
    "Cluster": {
        "ClusterName": "daxcluster",
        "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",

DAXServiceRoleForDynamoDBAccess",
        "ParameterGroup": {
            "ParameterGroupName": "default.dax1.0",
            "ParameterApplyStatus": "in-sync",
            "NodeIdsToReboot": []
        },
        "SSEDescription": {
            "Status": "ENABLED"
        }
    }
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see IncreaseReplicationFactor in *AWS CLI Command Reference*.

`list-tags`

The following code example shows how to use `list-tags`.

AWS CLI

To list tags on a DAX resource

The following `list-tags` example lists the tag keys and values attached to the specified DAX cluster.

```
aws dax list-tags \
    --resource-name arn:aws:dax:us-west-2:123456789012:cache/daxcluster
```

Output:

```
{
    "Tags": [
        {
            "Key": "ClusterUsage",
            "Value": "prod"
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListTags in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a DAX resource

The following `tag-resource` example attaches the specified tag key name and associated value to the specified DAX cluster to describe the cluster usage.

```
aws dax tag-resource \
```

```
    --resource-name arn:aws:dax:us-west-2:123456789012:cache/daxcluster \
    --tags="Key=ClusterUsage,Value=prod"
```

Output:

```
{
    "Tags": [
        {
            "Key": "ClusterUsage",
            "Value": "prod"
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a DAX resource

The following `untag-resource` example removes the tag with the specified key name from a DAX cluster.

```
aws dax untag-resource  \
    --resource-name arn:aws:dax:us-west-2:123456789012:cache/daxcluster \
    --tag-keys="ClusterUsage"
```

Output:

```
{
    "Tags": []
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Detective examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Detective.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`accept-invitation`

The following code example shows how to use `accept-invitation`.

AWS CLI

To accept an invitation to become a member account in a behavior graph

The following `accept-invitation` example accepts an invitation to become a member account in behavior graph arn:aws:detective:us-west-2:123456789012:graph:123412341234.

```
aws detective accept-invitation \
    --graph-arn arn:aws:detective:us-
west-2:123456789012:graph:027c7c4610ea4aacaf0b883093cab899
```

This command produces no output.

For more information, see Responding to a behavior graph invitation in the *Amazon Detective Administration Guide*.

- For API details, see AcceptInvitation in *AWS CLI Command Reference*.

`create-graph`

The following code example shows how to use `create-graph`.

AWS CLI

To enable Amazon Detective and create a new behavior graph

The following `create-graph` example enables Detective for the AWS account that runs the command in the Region where the command is run. A new behavior graph is created that has that account as its administrator account. The command also assigns the value Finance to the Department tag.

```
aws detective create-graph \
    --tags '{"Department": "Finance"}'
```

Output:

```
{
    "GraphArn": "arn:aws:detective:us-
west-2:123456789012:graph:027c7c4610ea4aacaf0b883093cab899"
}
```

For more information, see Enabling Detective in the *Amazon Detective Administration Guide*.

- For API details, see CreateGraph in *AWS CLI Command Reference*.

`create-members`

The following code example shows how to use `create-members`.

AWS CLI

Example 1: To invite member accounts to a behavior graph

The following `create-members` example invites two AWS accounts to become member accounts in the behavior graph arn:aws:detective:us-west-2:123456789111:graph:123412341234. For each account, the request provides the AWS account ID and the account root user email address. The request includes a custom message to insert into the invitation email.

```
aws detective create-members \
```

```
    --
accounts AccountId=123456789222,EmailAddress=mmajor@example.com AccountId=123456789012,Email
 \
    --graph-arn arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899 \
    --message "This is Paul Santos. I need to add your account to the data we use
 for security investigation in Amazon Detective. If you have any questions, contact
 me at psantos@example.com."
```

Output:

```
{
    "Members": [
        {
            "AccountId": "123456789222",
            "AdministratorId": "123456789111",
            "EmailAddress": "mmajor@example.com",
            "GraphArn": "arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899",
            "InvitedTime": "2020-01-24T00:35:07+00:00",
            "MasterId": "123456789111",
            "Status": "INVITED",
            "UpdatedTime": "2020-01-24T00:35:07+00:00"
        },
        {
            "AccountId": "123456789012",
            "AdministratorId": "123456789111",
            "EmailAddress": "jstiles@example.com",
            "GraphArn": "arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899",

            "Status": "VERIFICATION_IN_PROGRESS",
            "UpdatedTime": "2020-01-24T00:35:07+00:00"
        }
    ],
    "UnprocessedAccounts": [ ]
}
```

For more information, see Inviting individual accounts to a behavior graph in the *Amazon Detective User Guide*.

Example 2: To invite member accounts without sending invitation emails

The following `create-members` example invites two AWS accounts to become member accounts in the behavior graph arn:aws:detective:us-west-2:123456789111:graph:123412341234. For each account, the request provides the AWS account ID and the account root user email address. The member accounts do not receive invitation emails.

```
aws detective create-members \
    --
accounts AccountId=123456789222,EmailAddress=mmajor@example.com AccountId=123456789012,Email
 \
    --graph-arn arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899 \
    --disable-email-notification
```

Output:

```
{
    "Members": [
        {
            "AccountId": "123456789222",
            "AdministratorId": "123456789111",
            "EmailAddress": "mmajor@example.com",
            "GraphArn": "arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899",
            "InvitedTime": "2020-01-24T00:35:07+00:00",
            "MasterId": "123456789111",
            "Status": "INVITED",
            "UpdatedTime": "2020-01-24T00:35:07+00:00"
        },
        {
            "AccountId": "123456789012",
            "AdministratorId": "123456789111",
            "EmailAddress": "jstiles@example.com",
            "GraphArn": "arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899",
            "InvitedTime": "2020-01-24T00:35:07+00:00",
            "MasterId": "123456789111",
            "Status": "VERIFICATION_IN_PROGRESS",
            "UpdatedTime": "2020-01-24T00:35:07+00:00"
        }
    ],
    "UnprocessedAccounts": [ ]
```

```
}
```

For more information, see Inviting individual accounts to a behavior graph in the *Amazon Detective User Guide*.

- For API details, see CreateMembers in *AWS CLI Command Reference*.

`delete-graph`

The following code example shows how to use `delete-graph`.

AWS CLI

To disable Detective and delete the behavior graph

The following `delete-graph` example disables Detective and deletes the specified behavior graph.

```
aws detective delete-graph \
    --graph-arn arn:aws:detective:us-
west-2:123456789012:graph:027c7c4610ea4aacaf0b883093cab899
```

This command produces no output.

For more information, see Disabling Amazon Detective in the *Amazon Detective Administration Guide*.

- For API details, see DeleteGraph in *AWS CLI Command Reference*.

`delete-members`

The following code example shows how to use `delete-members`.

AWS CLI

To remove member accounts from a behavior graph

The following `delete-members` example removes two member accounts from the behavior graph arn:aws:detective:us-west-2:123456789111:graph:123412341234. To identify the accounts, the request provides the AWS account IDs.

```
aws detective delete-members \
```

```
    --account-ids 123456789222 123456789012 \
    --graph-arn arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899
```

Output:

```
{
    "AccountIds": [ "123456789222", "123456789012" ],
    "UnprocessedAccounts": [ ]
}
```

For more information, see Removing member accounts from a behavior graph in the *Amazon Detective User Guide*.

- For API details, see DeleteMembers in *AWS CLI Command Reference*.

`disassociate-membership`

The following code example shows how to use `disassociate-membership`.

AWS CLI

To resign membership from a behavior graph

The following `disassociate-membership` example removes the AWS account that runs the command from the behavior graph arn:aws:detective:us-west-2:123456789012:graph:123412341234.

```
aws detective disassociate-membership \
    --graph-arn arn:aws:detective:us-
west-2:123456789012:graph:027c7c4610ea4aacaf0b883093cab899
```

This command produces no output.

For more information, see Removing your account from a behavior graph in the *Amazon Detective User Guide*.

- For API details, see DisassociateMembership in *AWS CLI Command Reference*.

`get-members`

The following code example shows how to use `get-members`.

AWS CLI

To retrieve information about selected behavior graph member accounts

The following `get-members` example retrieves information about two member accounts in the behavior graph arn:aws:detective:us-west-2:123456789111:graph:123412341234. For the two accounts, the request provides the AWS account IDs.

```
aws detective get-members \
    --account-ids 123456789222 123456789012 \
    --graph-arn arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899
```

Output:

```
{
    "MemberDetails": [
        {
            "AccountId": "123456789222",
            "AdministratorId": "123456789111",
            "EmailAddress": "mmajor@example.com",
            "GraphArn": "arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899",
            "InvitedTime": "2020-01-24T00:35:07+00:00",
            "MasterId": "123456789111",
            "Status": "INVITED",
            "UpdatedTime": "2020-01-24T00:35:07+00:00"
        },
        {
            "AccountId": "123456789012",
            "AdministratorId": "123456789111",
            "EmailAddress": "jstiles@example.com",
            "GraphArn": "arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899",
            "InvitedTime": "2020-01-24T00:35:07+00:00",
            "MasterId": "123456789111",
            "Status": "INVITED",
            "UpdatedTime": "2020-01-24T00:35:07+00:00"
        }
    ],
    "UnprocessedAccounts": []
}
```

For more information, see Viewing the list of accounts in the *Amazon Detective User Guide*.

- For API details, see GetMembers in *AWS CLI Command Reference*.

`list-graphs`

The following code example shows how to use `list-graphs`.

AWS CLI

To view a list of behavior graphs that your account is the administrator for

The following `list-graphs` example retrieves the behavior graphs that the calling account is the administrator for within the current Region.

```
aws detective list-graphs
```

Output:

```
{
    "GraphList": [
        {
            "Arn": "arn:aws:detective:us-
west-2:123456789012:graph:027c7c4610ea4aacaf0b883093cab899",
            "CreatedTime": "2020-01-22T23:35:11+00:00"
        }
    ]
}
```

For more information, see Viewing the list of accounts in the *Amazon Detective User Guide*.

- For API details, see ListGraphs in *AWS CLI Command Reference*.

`list-invitations`

The following code example shows how to use `list-invitations`.

AWS CLI

To view a list of behavior graphs that an account is a member of or is invited to

The following `list-invitations` example retrieves the behavior graphs that the calling account has been invited to. The results include only open and accepted invitations. They do not include rejected invitations or removed memberships.

```
aws detective list-invitations
```

Output:

```
{
    "Invitations": [
    {
        "AccountId": "123456789222",
        "AdministratorId": "123456789111",
        "EmailAddress": "mmajor@example.com",
        "GraphArn": "arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899",
        "InvitedTime": "2020-01-24T00:35:07+00:00",
        "MasterId": "123456789111",
        "Status": "INVITED",
        "UpdatedTime": "2020-01-24T00:35:07+00:00"
    }
]
}
```

For more information, see Viewing your list of behavior graph invitations in the *Amazon Detective User Guide*.

- For API details, see ListInvitations in *AWS CLI Command Reference*.

`list-members`

The following code example shows how to use `list-members`.

AWS CLI

To list the member accounts in a behavior graph

The following `list-members` example retrieves the invited and enabled member accounts for the behavior graph `arn:aws:detective:us-west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899`. The results do not include member accounts that were removed.

```
aws detective list-members \
    --graph-arn arn:aws:detective:us-
west-2:123456789111:graph:027c7c4610ea4aacaf0b883093cab899
```

Output:

```
{
    "MemberDetails": [
        {
            "AccountId": "123456789222",
            "AdministratorId": "123456789111",
            "EmailAddress": "mmajor@example.com",
            "GraphArn": "arn:aws:detective:us-

            "VolumeUsageUpdatedTime": "2020-04-07T19:30:43.000000+00:00"
        }
    ]
}
```

For more information, see Viewing the list of accounts in the *Amazon Detective Administration Guide*.

- For API details, see ListMembers in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve the tags assigned to a behavior graph

The following `list-tags-for-resource` example returns the tags assigned to the specified behavior graph.

```
aws detective list-tags-for-resource \
    --resource-arn arn:aws:detective:us-
west-2:123456789012:graph:027c7c4610ea4aacaf0b883093cab899
```

Output:

```
{
    "Tags": {
        "Department" : "Finance"
    }
}
```

For more information, see Managing tags for a behavior graph in the *Amazon Detective Administration Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`reject-invitation`

The following code example shows how to use `reject-invitation`.

AWS CLI

To reject an invitation to become a member account in a behavior graph

The following `reject-invitation` example rejects an invitation to become a member account in the behavior graph arn:aws:detective:us-west-2:123456789012:graph:123412341234.

```
aws detective reject-invitation \
```

```
    --graph-arn arn:aws:detective:us-
west-2:123456789012:graph:027c7c4610ea4aacaf0b883093cab899
```

This command produces no output.

For more information, see Responding to a behavior graph invitation in the *Amazon Detective User Guide*.

- For API details, see RejectInvitation in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To assign a tag to a resource

The following `tag-resource` example assigns a value for the Department tag to the specified behavior graph.

```
aws detective tag-resource \
    --resource-arn arn:aws:detective:us-
west-2:123456789012:graph:027c7c4610ea4aacaf0b883093cab899 \
    --tags '{"Department":"Finance"}'
```

This command produces no output.

For more information, see Managing tags for a behavior graph in the *Amazon Detective Administration Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag value from a resource

The following `untag-resource` example removes the Department tag from the specified behavior graph.

```
aws detective untag-resource \
    --resource-arn arn:aws:detective:us-
west-2:123456789012:graph:027c7c4610ea4aacaf0b883093cab899 \
    --tag-keys "Department"
```

This command produces no output.

For more information, see Managing tags for a behavior graph in the *Amazon Detective Administration Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Device Farm examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Device Farm.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-device-pool`

The following code example shows how to use `create-device-pool`.

AWS CLI

To create a device pool

The following `create-device-pool` example creates an Android device pool for a project.

```
aws devicefarm create-device-pool \
    --name pool1 \
    --rules file://device-pool-rules.json \
    --project-arn "arn:aws:devicefarm:us-
west-2:123456789012:project:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

You can get the project ARN from the output of `create-project` or `list-projects`. The file `device-pool-rules.json` is a JSON document in the current folder that specifies the device platform.

Contents of `device-pool-rules.json`:

```
[
    {
        "attribute": "PLATFORM",
        "operator": "EQUALS",
        "value": "\"ANDROID\""
    }
]
```

Output:

```
{
    "devicePool": {
        "rules": [
            {
                "operator": "EQUALS",
                "attribute": "PLATFORM",
                "value": "\"ANDROID\""
            }
        ],
        "type": "PRIVATE",
        "name": "pool1",
        "arn": "arn:aws:devicefarm:us-
west-2:123456789012:devicepool:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    }
}
```

For more information, see Creating a device pool in AWS Device Farm in the *AWS Device Farm Developer Guide*.

- For API details, see CreateDevicePool in *AWS CLI Command Reference*.

`create-project`

The following code example shows how to use `create-project`.

AWS CLI

To create a project

The following `create-project` example creates a new project named `my-project`.

```
aws devicefarm create-project \
    --name my-project
```

Output:

```
{
    "project": {
        "name": "myproject",
        "arn": "arn:aws:devicefarm:us-
west-2:123456789012:project:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "created": 1503612890.057
    }
}
```

For more information, see Creating a project in AWS Device Farm in the *AWS Device Farm Developer Guide*.

- For API details, see CreateProject in *AWS CLI Command Reference*.

`create-upload`

The following code example shows how to use `create-upload`.

AWS CLI

To create an upload

The following `create-upload` example creates an upload for an Android app.

```
aws devicefarm create-upload \
```

```
    --project-arn "arn:aws:devicefarm:us-
west-2:123456789012:project:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name app.apk \
    --type ANDROID_APP
```

You can get the project ARN from the output of create-project or list-projects.

Output:

```
{
    "upload": {
        "status": "INITIALIZED",
        "name": "app.apk",
        "created": 1503614408.769,
        "url": "https://prod-us-west-2-uploads.s3-us-west-2.amazonaws.com/
arn%3Aaws%3Adevicefarm%3Aus-west-2%3A123456789012%3Aproject%3A070fc3ca-
c7e1-4471-91cf-d3e4efc50604/uploads/arn%3Aaws%3Adevicefarm%3Aus-
west-2%3A123456789012%3Aupload%3A070fc3ca-7ec1-4741-9c1f-d3e044efc506/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222/app.apk?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-
Amz-Date=20170824T224008Z&X-Amz-SignedHeaders=host&X-Amz-Expires=86400&X-Amz-
Credential=AKIAEXAMPLEPBUMBC3GA%2F20170824%2Fus-west-2%2Fs3%2Faws4_request&X-Amz-
Signature=05050370c38894ef5bd09f5d009f36fc8f96fa4bb04e1bba9aca71b8dbe49a0f",
        "type": "ANDROID_APP",
        "arn": "arn:aws:devicefarm:us-west-2:123456789012:upload:a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    }
}
```

Use the signed URL in the output to upload a file to Device Farm:

```
curl -T app.apk "https://prod-us-west-2-uploads.s3-us-west-2.amazonaws.com/
arn%3Aaws%3Adevicefarm%3Aus-west-2%3A123456789012%3Aproject%3A070fc3ca-
c7e1-4471-91cf-d3e4efc50604/uploads/arn%3Aaws%3Adevicefarm%3Aus-
west-2%3A123456789012%3Aupload%3A070fc3ca-7ec1-4741-9c1f-d3e044efc506/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222/app.apk?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-
Amz-Date=20170824T224008Z&X-Amz-SignedHeaders=host&X-Amz-Expires=86400&X-Amz-
Credential=AKIAEXAMPLEPBUMBC3GA%2F20170824%2Fus-west-2%2Fs3%2Faws4_request&X-Amz-
Signature=05050370c38894ef5bd09f5d009f36fc8f96fa4bb04e1bba9aca71b8dbe49a0f"
```

For more information, see Creating a test run in Device Farm in the *AWS Device Farm Developer Guide*.

- For API details, see CreateUpload in *AWS CLI Command Reference*.

`get-upload`

The following code example shows how to use `get-upload`.

AWS CLI

To view an upload

The following `get-upload` example retrieves information about an upload.

```
aws devicefarm get-upload \
    --arn "arn:aws:devicefarm:us-west-2:123456789012:upload:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

You can get the upload ARN from the output of `create-upload`.

Output:

```
{
    "upload": {
        "status": "SUCCEEDED",
        "name": "app.apk",
        "created": 1505262773.186,
        "type": "ANDROID_APP",
        "arn": "arn:aws:devicefarm:us-west-2:123456789012:upload:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "metadata": "{\"device_admin\":false,\"activity_name\":\"ccom.example.client.LauncherActivity\",\"version_name\":\"1.0.2.94\",\"screens\":[\"small\",\"normal\",\"large\",\"xlarge\"],\"error_type\":null,\"sdk_version\":\"16\",\"package_name\":\"com.example.client\",\"version_code\":\"20994\",\"native_code\":[\"armeabi-v7a\"],\"target_sdk_version\":\"25\"}"
    }
}
```

For more information, see Creating a test run in Device Farm in the *AWS Device Farm Developer Guide*.

- For API details, see GetUpload in *AWS CLI Command Reference*.

`list-projects`

The following code example shows how to use `list-projects`.

AWS CLI

To list projects

The following `list-projects` example retrieves a list of projects.

```
aws devicefarm list-projects
```

Output:

```
{
    "projects": [
        {
            "name": "myproject",
            "arn": "arn:aws:devicefarm:us-
west-2:123456789012:project:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "created": 1503612890.057
        },
        {
            "name": "otherproject",
            "arn": "arn:aws:devicefarm:us-
west-2:123456789012:project:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "created": 1505257519.337
        }
    ]
}
```

For more information, see Projects in AWS Device Farm in the *AWS Device Farm Developer Guide*.

- For API details, see ListProjects in *AWS CLI Command Reference*.

Direct Connect examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Direct Connect.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-direct-connect-gateway-association-proposal`

The following code example shows how to use `accept-direct-connect-gateway-association-proposal`.

AWS CLI

To accept a gateway association proposal

The following `accept-direct-connect-gateway-association-proposal` example accepts the specified proposal.

```
aws directconnect accept-direct-connect-gateway-association-proposal \
    --direct-connect-gateway-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --proposal-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --associated-gateway-owner-account 123456789012
```

Output:

```
{
    "directConnectGatewayAssociation": {
        "directConnectGatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "directConnectGatewayOwnerAccount": "123456789012",
        "associationState": "associating",
        "associatedGateway": {
            "id": "tgw-02f776b1a7EXAMPLE",
            "type": "transitGateway",
            "ownerAccount": "123456789012",
            "region": "us-west-2"
        },
        "associationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "allowedPrefixesToDirectConnectGateway": [
            {
                "cidr": "192.168.1.0/30"
            }
        ]
    }
```

```
}
```

For more information, see Accept or reject a Transit Gateway and Direct Connect association proposal in the *AWS Direct Connect User Guide*.

- For API details, see AcceptDirectConnectGatewayAssociationProposal in *AWS CLI Command Reference*.

`allocate-connection-on-interconnect`

The following code example shows how to use `allocate-connection-on-interconnect`.

AWS CLI

To create a hosted connection on an interconnect

The following `allocate-connection-on-interconnect` example creates a hosted connection on an interconnect.

```
aws directconnect allocate-connection-on-interconnect \
    --bandwidth 500Mbps \
    --connection-name mydcinterconnect \
    --owner-account 123456789012 \
    --interconnect-id dxcon-fgktov66 \
    --vlan 101
```

Output:

```
{
    "partnerName": "TIVIT",
    "vlan": 101,
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-ffzc51m1",
    "connectionState": "ordering",
    "bandwidth": "500Mbps",
    "location": "TIVIT",
    "connectionName": "mydcinterconnect",
    "region": "us-west-2"
}
```

For more information, see Hosted Direct Connect connections in the *AWS Direct Connect User Guide*.

- For API details, see AllocateConnectionOnInterconnect in *AWS CLI Command Reference*.

`allocate-hosted-connection`

The following code example shows how to use `allocate-hosted-connection`.

AWS CLI

To create a hosted connection on an interconnect

The following `allocate-hosted-connection` example creates a hosted connection on the specified interconnect.

```
aws directconnect allocate-hosted-connection \
    --bandwidth 500Mbps \
    --connection-name mydcinterconnect \
    --owner-account 123456789012 \
    --connection-id dxcon-fgktov66 \
    --vlan 101
```

Output:

```
{
    "partnerName": "TIVIT",
    "vlan": 101,
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-ffzc51m1",
    "connectionState": "ordering",
    "bandwidth": "500Mbps",
    "location": "TIVIT",
    "connectionName": "mydcinterconnect",
    "region": "us-west-2"
}
```

For more information, see Hosted Direct Connect connections in the *AWS Direct Connect User Guide*.

- For API details, see AllocateHostedConnection in *AWS CLI Command Reference*.

`allocate-private-virtual-interface`

The following code example shows how to use `allocate-private-virtual-interface`.

AWS CLI

To provision a private virtual interface

The following `allocate-private-virtual-interface` example provisions a private virtual interface to be owned by a different customer.

```
aws directconnect allocate-private-virtual-interface \
    --connection-id dxcon-ffjrkx17 \
    --owner-account 123456789012 \
    --new-private-virtual-interface-
allocation virtualInterfaceName=PrivateVirtualInterface,vlan=1000,asn=65000,authKey=asdf34ex
```

Output:

```
{
    "virtualInterfaceState": "confirming",
    "asn": 65000,
    "vlan": 1000,
    "customerAddress": "192.168.1.2/30",
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-ffjrkx17",
    "virtualInterfaceId": "dxvif-fgy8orxu",
    "authKey": "asdf34example",
    "routeFilterPrefixes": [],
    "location": "TIVIT",
    "customerRouterConfig": "<?xml version=\"1.0\" encoding=\"UTF-8\"?
>\n  <logical_connection id=\"dxvif-fgy8orxu\">\n  <vlan>1000</
vlan>\n  <customer_address>192.168.1.2/30</customer_address>\n
 <amazon_address>192.168.1.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
 <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>private</connection_type>\n</logical_connection>\n",
    "amazonAddress": "192.168.1.1/30",
    "virtualInterfaceType": "private",
    "virtualInterfaceName": "PrivateVirtualInterface"
}
```

For more information, see Direct Connect virtual interfaces and hosted virtual interfaces in the *AWS Direct Connect User Guide*.

- For API details, see AllocatePrivateVirtualInterface in *AWS CLI Command Reference*.

allocate-public-virtual-interface

The following code example shows how to use `allocate-public-virtual-interface`.

AWS CLI

To provision a public virtual interface

The following `allocate-public-virtual-interface` example provisions a public virtual interface to be owned by a different customer.

```
aws directconnect allocate-public-virtual-interface \
    --connection-id dxcon-ffjrkx17 \
    --owner-account 123456789012 \
    --new-public-virtual-interface-
allocation virtualInterfaceName=PublicVirtualInterface,vlan=2000,asn=65000,authKey=asdf34exa
{cidr=203.0.113.4/30}]
```

Output:

```
{
    "virtualInterfaceState": "confirming",
    "asn": 65000,
    "vlan": 2000,
    "customerAddress": "203.0.113.2/30",
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-ffjrkx17",
    "virtualInterfaceId": "dxvif-fg9xo9vp",
    "authKey": "asdf34example",
    "routeFilterPrefixes": [
        {
            "cidr": "203.0.113.0/30"
        },
        {
            "cidr": "203.0.113.4/30"
        }
    ],
    "location": "TIVIT",
    "customerRouterConfig": "<?xml version=\"1.0\" encoding=\"UTF-8\"?
>\n<logical_connection id=\"dxvif-fg9xo9vp\">\n  <vlan>2000</
vlan>\n  <customer_address>203.0.113.2/30</customer_address>\n
 <amazon_address>203.0.113.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
```

```
 <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>public</connection_type>\n</logical_connection>\n",
    "amazonAddress": "203.0.113.1/30",
    "virtualInterfaceType": "public",
    "virtualInterfaceName": "PublicVirtualInterface"
}
```

For more information, see Direct Connect virtual interfaces and hosted virtual interfaces in the *AWS Direct Connect User Guide*.

- For API details, see AllocatePublicVirtualInterface in *AWS CLI Command Reference*.

`allocate-transit-virtual-interface`

The following code example shows how to use `allocate-transit-virtual-interface`.

AWS CLI

To provision a transit virtual interface to be owned by the specified AWS account

The following `allocate-transit-virtual-interface` example provisions a transit virtual interface for the specified account.

```
aws directconnect allocate-transit-virtual-interface \
    --connection-id dxlag-fEXAMPLE \
    --owner-account 123456789012 \
    --new-transit-virtual-interface-allocation "virtualInterfaceName=Example Transit
 Virtual
 Interface,vlan=126,asn=65110,mtu=1500,authKey=0xzxgA9YoW9h58u8SEXAMPLE,amazonAddress=192.16
```

Output:

```
{
    "virtualInterface": {
        "ownerAccount": "123456789012",
        "virtualInterfaceId": "dxvif-fEXAMPLE",
        "location": "loc1",
        "connectionId": "dxlag-fEXAMPLE",
        "virtualInterfaceType": "transit",
        "virtualInterfaceName": "Example Transit Virtual Interface",
        "vlan": 126,
        "asn": 65110,
        "amazonSideAsn": 7224,
```

```
        "authKey": "0xzxgA9YoW9h58u8SEXAMPLE",
        "amazonAddress": "192.168.1.1/30",
        "customerAddress": "192.168.1.2/30",
        "addressFamily": "ipv4",
        "virtualInterfaceState": "confirming",
        "customerRouterConfig": "<?xml version=\"1.0\" encoding=

                "customerAddress": "192.168.1.2/30",
                "bgpPeerState": "pending",
                "bgpStatus": "down",
                "awsDeviceV2": "loc1-26wz6vEXAMPLE"
            }
        ],
        "region": "us-west-2",
        "awsDeviceV2": "loc1-26wz6vEXAMPLE",
        "tags": [
            {
                "key": "Tag",
                "value": "Example"
            }
        ]
    }
}
```

For more information, see Create a Direct Connect hosted transit virtual interface in the *AWS Direct Connect User Guide*.

- For API details, see AllocateTransitVirtualInterface in *AWS CLI Command Reference*.

`associate-connection-with-lag`

The following code example shows how to use `associate-connection-with-lag`.

AWS CLI

To associate a connection with a LAG

The following `associate-connection-with-lag` example associates the specified connection with the specified LAG.

```
aws directconnect associate-connection-with-lag \
    --lag-id dxlag-fhccu14t \
    --connection-id dxcon-fg9607vm
```

Output:

```
{
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-fg9607vm",
    "lagId": "dxlag-fhccu14t",
    "connectionState": "requested",
    "bandwidth": "1Gbps",
    "location": "EqDC2",
    "connectionName": "Con2ForLag",
    "region": "us-west-2"
}
```

For more information, see Associate a connection with a LAG at a Direct Connect endpoint in the *AWS Direct Connect User Guide*.

- For API details, see AssociateConnectionWithLag in *AWS CLI Command Reference*.

`associate-hosted-connection`

The following code example shows how to use `associate-hosted-connection`.

AWS CLI

To associate a hosted connection with a LAG

The following `associate-hosted-connection` example associates the specified hosted connection with the specified LAG.

```
aws directconnect associate-hosted-connection \
    --parent-connection-id dxlag-fhccu14t \
    --connection-id dxcon-fg9607vm
```

Output:

```
{
    "partnerName": "TIVIT",
    "vlan": 101,
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-fg9607vm",
    "lagId": "dxlag-fhccu14t",
    "connectionState": "ordering",
    "bandwidth": "500Mbps",
    "location": "TIVIT",
    "connectionName": "mydcinterconnect",
    "region": "us-west-2"
}
```

For more information, see Direct Connect link aggregation groups (LAGs) in the *AWS Direct Connect User Guide*.

- For API details, see AssociateHostedConnection in *AWS CLI Command Reference*.

`associate-virtual-interface`

The following code example shows how to use `associate-virtual-interface`.

AWS CLI

To associate a virtual interface with a connection

The following `associate-virtual-interface` example associates the specified virtual interface with the specified LAG. Alternatively, to associate the virtual interface with a connection, specify the ID of an AWS Direct Connect connection for `--connection-id`; for example, `dxcon-ffnikghc`.

```
aws directconnect associate-virtual-interface \
```

```
    --connection-id dxlag-ffjhj9lx \
    --virtual-interface-id dxvif-fgputw0j
```

Output:

```
{
    "virtualInterfaceState": "pending",
    "asn": 65000,
    "vlan": 123,
    "customerAddress": "169.254.255.2/30",
    "ownerAccount": "123456789012",
    "connectionId": "dxlag-ffjhj9lx",
    "addressFamily": "ipv4",
    "virtualGatewayId": "vgw-38e90b51",
    "virtualInterfaceId": "dxvif-fgputw0j",

For more information, see Direct Connect virtual interfaces and hosted virtual interfaces in the *AWS Direct Connect User Guide*.

- For API details, see AssociateVirtualInterface in *AWS CLI Command Reference*.

`confirm-connection`

The following code example shows how to use `confirm-connection`.

AWS CLI

To confirm the creation of a hosted connection on an interconnect

The following `confirm-connection` example confirms the creation of a hosted connection on an interconnect.

```
aws directconnect confirm-connection \
    --connection-id dxcon-fg2wi7hy
```

Output:

```
{
    "connectionState": "pending"
}
```

For more information, see Accept a Direct Connect hosted connection in the *AWS Direct Connect User Guide*.

- For API details, see ConfirmConnection in *AWS CLI Command Reference*.

`confirm-private-virtual-interface`

The following code example shows how to use `confirm-private-virtual-interface`.

AWS CLI

To accept ownership of a private virtual interface

The following `confirm-private-virtual-interface` example accepts ownership of a private virtual interface created by another customer.

```
aws directconnect confirm-private-virtual-interface \
    --virtual-interface-id dxvif-fgy8orxu \
    --virtual-gateway-id vgw-e4a47df9
```

Output:

```
{
    "virtualInterfaceState": "pending"
}
```

For more information, see Accept a hosted Direct Connect virtual interface in the *AWS Direct Connect User Guide*.

- For API details, see ConfirmPrivateVirtualInterface in *AWS CLI Command Reference*.

`confirm-public-virtual-interface`

The following code example shows how to use `confirm-public-virtual-interface`.

AWS CLI

To accept ownership of a public virtual interface

The following `confirm-public-virtual-interface` example accepts ownership of a public virtual interface created by another customer.

```
aws directconnect confirm-public-virtual-interface \
    --virtual-interface-id dxvif-fg9xo9vp
```

Output:

```
{
    "virtualInterfaceState": "verifying"
}
```

For more information, see Accept a hosted Direct Connect virtual interface in the *AWS Direct Connect User Guide*.

- For API details, see ConfirmPublicVirtualInterface in *AWS CLI Command Reference*.

`confirm-transit-virtual-interface`

The following code example shows how to use `confirm-transit-virtual-interface`.

AWS CLI

To accept ownership of a transit virtual interface

The following `confirm-transit-virtual-interface` example accepts ownership of a transit virtual interface created by another customer.

```
aws directconnect confirm-transit-virtual-interface \
    --virtual-interface-id dxvif-fEXAMPLE \
    --direct-connect-gateway-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "virtualInterfaceState": "pending"
}
```

For more information, see Accepting a Hosted Virtual Interface in the *AWS Direct Connect User Guide*.

- For API details, see ConfirmTransitVirtualInterface in *AWS CLI Command Reference*.

`create-bgp-peer`

The following code example shows how to use `create-bgp-peer`.

AWS CLI

To create an IPv6 BGP peering session

The following `create-bgp-peer` example creates an IPv6 BGP peering session on private virtual interface `dxvif-fg1vuj3d`. The peer IPv6 addresses are automatically allocated by Amazon.

```
aws directconnect create-bgp-peer \
    --virtual-interface-id dxvif-fg1vuj3d \
    --new-bgp-peer asn=64600,addressFamily=ipv6
```

Output:

```
{
    "virtualInterface": {
        "virtualInterfaceState": "available",
        "asn": 65000,
        "vlan": 125,

\n  <ipv6_amazon_address>2001:db8:1100:2f0:0:1:9cb4:4211/125</ipv6_amazon_address>\n
  <ipv6_bgp_asn>64600</ipv6_bgp_asn>\n  <ipv6_bgp_auth_key>0xS27kAIU_VHPjjAexample</
ipv6_bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>\n
 <connection_type>private</connection_type>\n</logical_connection>\n",
        "amazonAddress": "169.254.255.1/30",
        "virtualInterfaceType": "private",
        "virtualInterfaceName": "Test"
    }
}
```

For more information, see Add a BGP peer to a Direct Connect virtual interface in the *AWS Direct Connect User Guide*.

- For API details, see CreateBgpPeer in *AWS CLI Command Reference*.

`create-connection`

The following code example shows how to use `create-connection`.

AWS CLI

To create a connection from your network to an AWS Direct Connect location

The following `create-connection` example creates a connection from your network to an AWS Direct Connect location.

```
aws directconnect create-connection \
    --location TIVIT \
    --bandwidth 1Gbps \
    --connection-name "Connection to AWS"
```

Output:

```
{
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-fg31dyv6",
    "connectionState": "requested",
    "bandwidth": "1Gbps",
    "location": "TIVIT",
```

```
    "connectionName": "Connection to AWS",
    "region": "us-west-2"
}
```

For more information, see Dedicated Direct Connect connections in the *AWS Direct Connect User Guide*.

- For API details, see CreateConnection in *AWS CLI Command Reference*.

`create-direct-connect-gateway-association-proposal`

The following code example shows how to use `create-direct-connect-gateway-association-proposal`.

AWS CLI

To create a proposal to associate the specified transit gateway with the specified Direct Connect gateway

The following `create-direct-connect-gateway-association-proposal` example creates a proposal that associates the specified transit gateway with the specified Direct Connect gateway.

```
aws directconnect create-direct-connect-gateway-association-proposal \
    --direct-connect-gateway-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --direct-connect-gateway-owner-account 123456789012 \
    --gateway-id tgw-02f776b1a7EXAMPLE \
    --add-allowed-prefixes-to-direct-connect-gateway cidr=192.168.1.0/30
```

Output:

```
{
    "directConnectGatewayAssociationProposal": {
        "proposalId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "directConnectGatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "directConnectGatewayOwnerAccount": "123456789012",
        "proposalState": "requested",
        "associatedGateway": {
            "id": "tgw-02f776b1a7EXAMPLE",
            "type": "transitGateway",
            "ownerAccount": "123456789012",
            "region": "us-west-2"
```

```
        },
        "requestedAllowedPrefixesToDirectConnectGateway": [
            {
                "cidr": "192.168.1.0/30"
            }
        ]
    }
}
```

For more information, see Create a Transit Gateway and Direct Connect association proposal in the *AWS Direct Connect User Guide*.

- For API details, see CreateDirectConnectGatewayAssociationProposal in *AWS CLI Command Reference*.

`create-direct-connect-gateway-association`

The following code example shows how to use `create-direct-connect-gateway-association`.

AWS CLI

To associate a virtual private gateway with a Direct Connect gateway

The following `create-direct-connect-gateway-association` example associates virtual private gateway `vgw-6efe725e` with Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`. You must run the command in the region in which the virtual private gateway is located.

```
aws directconnect create-direct-connect-gateway-association \
    --direct-connect-gateway-id 5f294f92-bafb-4011-916d-9b0bexample \
    --virtual-gateway-id vgw-6efe725e
```

Output:

```
{
    "directConnectGatewayAssociation": {
        "associationState": "associating",
        "virtualGatewayOwnerAccount": "123456789012",
        "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bexample",
        "virtualGatewayId": "vgw-6efe725e",
        "virtualGatewayRegion": "us-west-2"
```

```
    }
}
```

For more information, see Associate or disassociate Direct Connect virtual private gateways in the *AWS Direct Connect User Guide*.

- For API details, see CreateDirectConnectGatewayAssociation in *AWS CLI Command Reference*.

`create-direct-connect-gateway`

The following code example shows how to use `create-direct-connect-gateway`.

AWS CLI

To create a Direct Connect gateway

The following `create-direct-connect-gateway` example creates a Direct Connect gateway with the name `DxGateway1`.

```
aws directconnect create-direct-connect-gateway \
    --direct-connect-gateway-name "DxGateway1"
```

Output:

```
{
    "directConnectGateway": {
        "amazonSideAsn": 64512,
        "directConnectGatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "ownerAccount": "123456789012",
        "directConnectGatewayName": "DxGateway1",
        "directConnectGatewayState": "available"
    }
}
```

For more information, see Create a Direct Connect gateway in the *AWS Direct Connect User Guide*.

- For API details, see CreateDirectConnectGateway in *AWS CLI Command Reference*.

`create-interconnect`

The following code example shows how to use `create-interconnect`.

AWS CLI

To create an interconnect between a partner's network and AWS

The following `create-interconnect` example creates an interconnect between an AWS Direct Connect partner's network and a specific AWS Direct Connect location.

```
aws directconnect create-interconnect \
    --interconnect-name "1G Interconnect to AWS" \
    --bandwidth 1Gbps \
    --location TIVIT
```

Output:

```
{
    "region": "us-west-2",
    "bandwidth": "1Gbps",
    "location": "TIVIT",
    "interconnectName": "1G Interconnect to AWS",
    "interconnectId": "dxcon-fgktov66",
    "interconnectState": "requested"
}
```

For more information, see Hosted Direct Connect connections in the *AWS Direct Connect User Guide*.

- For API details, see CreateInterconnect in *AWS CLI Command Reference*.

`create-lag`

The following code example shows how to use `create-lag`.

AWS CLI

Example 1: To create a LAG with new connections

The following `create-lag` example creates a LAG and requests two new AWS Direct Connect connections for the LAG with a bandwidth of 1 Gbps.

```
aws directconnect create-lag \
    --location CSVA1 \
```

```
    --number-of-connections 2 \
    --connections-bandwidth 1Gbps \
    --lag-name 1GBLag
```

Output:

```
{
    "awsDevice": "CSVA1-23u8tlpaz8iks",
    "numberOfConnections": 2,
    "lagState": "pending",
    "ownerAccount": "123456789012",
    "lagName": "1GBLag",
    "connections": [
        {
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffqr6x5q",
            "lagId": "dxlag-ffjhj9lx",
            "connectionState": "requested",
            "bandwidth": "1Gbps",
            "location": "CSVA1",
            "connectionName": "Requested Connection 1 for Lag dxlag-ffjhj9lx",
            "region": "us-west-2"
        },
        {
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-fflqyj95",
            "lagId": "dxlag-ffjhj9lx",
            "connectionState": "requested",
            "bandwidth": "1Gbps",
            "location": "CSVA1",
            "connectionName": "Requested Connection 2 for Lag dxlag-ffjhj9lx",
            "region": "us-west-2"
        }
    ],
    "lagId": "dxlag-ffjhj9lx",
    "minimumLinks": 0,
    "connectionsBandwidth": "1Gbps",
    "region": "us-west-2",
    "location": "CSVA1"
}
```

For more information, see Create a LAG at a Direct Connect endpoint in the *AWS Direct Connect User Guide*.

Example 2: To create a LAG using an existing connection

The following `create-lag` example creates a LAG from an existing connection in your account, and requests a second new connection for the LAG with the same bandwidth and location as the existing connection.

```
aws directconnect create-lag \
    --location EqDC2 \
    --number-of-connections 2 \
    --connections-bandwidth 1Gbps \
    --lag-name 2ConnLAG \
    --connection-id dxcon-fgk145dr
```

Output:

```
{
    "awsDevice": "EqDC2-4h6ce2r1bes6",
    "numberOfConnections": 2,
    "lagState": "pending",
    "ownerAccount": "123456789012",
    "lagName": "2ConnLAG",
    "connections": [
        {
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-fh6ljcvo",
            "lagId": "dxlag-fhccu14t",
            "connectionState": "requested",
            "bandwidth": "1Gbps",
            "location": "EqDC2",
            "connectionName": "Requested Connection 1 for Lag dxlag-fhccu14t",
            "region": "us-west-2"
        },
        {
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-fgk145dr",
            "lagId": "dxlag-fhccu14t",
            "connectionState": "down",
            "bandwidth": "1Gbps",
            "location": "EqDC2",
            "connectionName": "VAConn1",
            "region": "us-west-2"
        }
    ],
```

```
    "lagId": "dxlag-fhccu14t",
    "minimumLinks": 0,
    "connectionsBandwidth": "1Gbps",
    "region": "us-west-2",
    "location": "EqDC2"
}
```

For more information, see Create a LAG at a Direct Connect endpoint in the *AWS Direct Connect User Guide*.

- For API details, see CreateLag in *AWS CLI Command Reference*.

`create-private-virtual-interface`

The following code example shows how to use `create-private-virtual-interface`.

AWS CLI

To create a private virtual interface

The following `create-private-virtual-interface` example creates a private virtual interface.

```
aws directconnect create-private-virtual-interface \
    --connection-id dxcon-ffjrkx17 \
    --new-private-virtual-
interface virtualInterfaceName=PrivateVirtualInterface,vlan=101,asn=65000,authKey=asdf34exam
aba37db6
```

Output:

```
{
    "virtualInterfaceState": "pending",
    "asn": 65000,
    "vlan": 101,
    "customerAddress": "192.168.1.2/30",
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-ffjrkx17",
    "virtualGatewayId": "vgw-aba37db6",
    "virtualInterfaceId": "dxvif-ffhhk74f",
    "authKey": "asdf34example",
    "routeFilterPrefixes": [],
    "location": "TIVIT",
```

```
    "customerRouterConfig": "<?xml version=\"1.0\" encoding=
\"UTF-8\"?>\n<logical_connection id=\"dxvif-ffhhk74f\">\n  <vlan>101</
vlan>\n  <customer_address>192.168.1.2/30</customer_address>\n
 <amazon_address>192.168.1.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
 <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>private</connection_type>\n</logical_connection>\n",
    "amazonAddress": "192.168.1.1/30",
    "virtualInterfaceType": "private",
    "virtualInterfaceName": "PrivateVirtualInterface"
}
```

For more information, see Create a Direct Connect private virtual interface in the *AWS Direct Connect User Guide*.

- For API details, see CreatePrivateVirtualInterface in *AWS CLI Command Reference*.

`create-public-virtual-interface`

The following code example shows how to use `create-public-virtual-interface`.

AWS CLI

To create a public virtual interface

The following `create-public-virtual-interface` example creates a public virtual interface.

```
aws directconnect create-public-virtual-interface \
    --connection-id dxcon-ffjrkx17 \
    --new-public-virtual-
interface virtualInterfaceName=PublicVirtualInterface,vlan=2000,asn=65000,authKey=asdf34exam
{cidr=203.0.113.4/30}]
```

Output:

```
{
    "virtualInterfaceState": "verifying",
    "asn": 65000,
    "vlan": 2000,
    "customerAddress": "203.0.113.2/30",
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-ffjrkx17",
    "virtualInterfaceId": "dxvif-fgh0hcrk",
```

```
    "authKey": "asdf34example",
    "routeFilterPrefixes": [
        {
            "cidr": "203.0.113.0/30"
        },
        {
            "cidr": "203.0.113.4/30"
        }
    ],
    "location": "TIVIT",
    "customerRouterConfig": "<?xml version=\"1.0\" encoding=\"UTF-8\"?
>\n<logical_connection id=\"dxvif-fgh0hcrk\">\n  <vlan>2000</
vlan>\n  <customer_address>203.0.113.2/30</customer_address>\n
 <amazon_address>203.0.113.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
 <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>public</connection_type>\n</logical_connection>\n",
    "amazonAddress": "203.0.113.1/30",
    "virtualInterfaceType": "public",
    "virtualInterfaceName": "PublicVirtualInterface"
}
```

For more information, see Create a Direct Connect public virtual interface in the *AWS Direct Connect User Guide*.

- For API details, see CreatePublicVirtualInterface in *AWS CLI Command Reference*.

`create-transit-virtual-interface`

The following code example shows how to use `create-transit-virtual-interface`.

AWS CLI

To create a transit virtual interface

The following `create-transit-virtual-interface` example creates a transit virtual interface for the specified connection.

```
aws directconnect create-transit-virtual-interface \
    --connection-id dxlag-fEXAMPLE \
    --new-transit-virtual-interface "virtualInterfaceName=Example Transit Virtual
 Interface,vlan=126,asn=65110,mtu=1500,authKey=0xzxgA9YoW9h58u8SvEXAMPLE,amazonAddress=192.1
cdef-EXAMPLE11111,tags=[{key=Tag,value=Example}]"
```

Output:

```
{
    "virtualInterface": {
        "ownerAccount": "1111222233333",
        "virtualInterfaceId": "dxvif-fEXAMPLE",

For more information, see Creating a Transit Virtual Interface to the Direct Connect Gateway in the *AWS Direct Connect User Guide*.

- For API details, see CreateTransitVirtualInterface in *AWS CLI Command Reference*.

`delete-bgp-peer`

The following code example shows how to use `delete-bgp-peer`.

AWS CLI

To delete a BGP peer from a virtual interface

The following `delete-bgp-peer` example deletes the IPv6 BGP peer from virtual interface `dxvif-fg1vuj3d`.

```
aws directconnect delete-bgp-peer \
    --virtual-interface-id dxvif-fg1vuj3d \
    --asn 64600 \
    --customer-address 2001:db8:1100:2f0:0:1:9cb4:4216/125
```

Output:

```
{
    "virtualInterface": {
        "virtualInterfaceState": "available",
        "asn": 65000,
        "vlan": 125,
        "customerAddress": "169.254.255.2/30",
        "ownerAccount": "123456789012",
        "connectionId": "dxcon-fguhmqlc",
```

```
        "addressFamily": "ipv4",
        "virtualGatewayId": "vgw-f9eb0c90",
        "virtualInterfaceId": "dxvif-fg1vuj3d",

        "virtualInterfaceName": "Test"
    }
}
```

For more information, see Delete a Direct Connect virtual interface BGP peer in the *AWS Direct Connect User Guide*.

- For API details, see DeleteBgpPeer in *AWS CLI Command Reference*.

`delete-connection`

The following code example shows how to use `delete-connection`.

AWS CLI

To delete a connection

The following `delete-connection` example deletes the specified connection.

```
aws directconnect delete-connection \
    --connection-id dxcon-fg31dyv6
```

Output:

```
{
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-fg31dyv6",
    "connectionState": "deleted",
    "bandwidth": "1Gbps",
    "location": "TIVIT",
    "connectionName": "Connection to AWS",
    "region": "us-west-2"
}
```

For more information, see Delete a Direct Connect connection in the *AWS Direct Connect User Guide*.

- For API details, see DeleteConnection in *AWS CLI Command Reference*.

`delete-direct-connect-gateway-association`

The following code example shows how to use `delete-direct-connect-gateway-association`.

AWS CLI

To delete a Direct Connect gateway association

The following `delete-direct-connect-gateway-association` example deletes the Direct Connect gateway association with a transit gateway that has the specified association ID.

```
aws directconnect delete-direct-connect-gateway-association \
    --association-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "directConnectGatewayAssociation": {
        "directConnectGatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "directConnectGatewayOwnerAccount": "123456789012",
        "associationState": "disassociating",
        "associatedGateway": {
            "id": "tgw-095b3b0b54EXAMPLE",
            "type": "transitGateway",
            "ownerAccount": "123456789012",
            "region": "us-west-2"
        },
        "associationId": " be85116d-46eb-4b43-a27a-da0c2ad648deEXAMPLE ",
        "allowedPrefixesToDirectConnectGateway": [
            {
                "cidr": "192.0.1.0/28"
            }
        ]
    }
}
```

For more information, see Associate or disassociate Direct Connect with a Transit Gateway in the *AWS Direct Connect User Guide*.

- For API details, see DeleteDirectConnectGatewayAssociation in *AWS CLI Command Reference*.

`delete-direct-connect-gateway`

The following code example shows how to use `delete-direct-connect-gateway`.

AWS CLI

To delete a Direct Connect gateway

The following `delete-direct-connect-gateway` example deletes Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`.

```
aws directconnect delete-direct-connect-gateway \
```

```
    --direct-connect-gateway-id 5f294f92-bafb-4011-916d-9b0bexample
```

Output:

```
{
    "directConnectGateway": {
        "amazonSideAsn": 64512,
        "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bexample",
        "ownerAccount": "123456789012",
        "directConnectGatewayName": "DxGateway1",
        "directConnectGatewayState": "deleting"
    }
}
```

For more information, see Delete a Direct Connect gateway in the *AWS Direct Connect User Guide*.

- For API details, see DeleteDirectConnectGateway in *AWS CLI Command Reference*.

`delete-interconnect`

The following code example shows how to use `delete-interconnect`.

AWS CLI

To delete an interconnect

The following `delete-interconnect` example deletes the specified interconnect.

```
aws directconnect delete-interconnect \
    --interconnect-id dxcon-fgktov66
```

Output:

```
{
    "interconnectState": "deleted"
}
```

For more information, see Direct Connect dedicated and hosted connections in the *AWS Direct Connect User Guide*.

- For API details, see DeleteInterconnect in *AWS CLI Command Reference*.

`delete-lag`

The following code example shows how to use `delete-lag`.

AWS CLI

To delete a LAG

The following `delete-lag` example deletes the specified LAG.

```
aws directconnect delete-lag \
    --lag-id dxlag-ffrhowd9
```

Output:

```
{
    "awsDevice": "EqDC2-4h6ce2r1bes6",
    "numberOfConnections": 0,
    "lagState": "deleted",
    "ownerAccount": "123456789012",
    "lagName": "TestLAG",
    "connections": [],
    "lagId": "dxlag-ffrhowd9",
    "minimumLinks": 0,
    "connectionsBandwidth": "1Gbps",
    "region": "us-west-2",
    "location": "EqDC2"
}
```

For more information, see Delete a Direct Connect endpoint LAG in the *AWS Direct Connect User Guide*.

- For API details, see DeleteLag in *AWS CLI Command Reference*.

`delete-virtual-interface`

The following code example shows how to use `delete-virtual-interface`.

AWS CLI

To delete a virtual interface

The following `delete-virtual-interface` example deletes the specified virtual interface.

```
aws directconnect delete-virtual-interface \
    --virtual-interface-id dxvif-ffhhk74f
```

Output:

```
{
    "virtualInterfaceState": "deleting"
}
```

For more information, see Delete a Direct Connect virtual interface in the *AWS Direct Connect User Guide*.

- For API details, see DeleteVirtualInterface in *AWS CLI Command Reference*.

`describe-connection-loa`

The following code example shows how to use `describe-connection-loa`.

AWS CLI

Example 1: To describe your LOA-CFA for a connection (Linux and macOS)

The following `describe-connection-loa` example describes your LOA-CFA for connection `dxcon-fh6ayh1d`. The contents of the LOA-CFA are base64-encoded. This command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure. The final part of the command decodes the content using the `base64` utility, and sends the output to a PDF file.

```
aws directconnect describe-connection-loa \
    --connection-id dxcon-fh6ayh1d \
    --query loa.loaContent \
    --output text | base64 --decode > myLoaCfa.pdf
```

This command produces no output. The decoded content is written to `myLoaCfa.pdf`.

For more information, see Download the Direct Connect LOA-CFA in the *AWS Direct Connect User Guide*.

Example 2: To describe your LOA-CFA for a connection (Windows)

The following `describe-connection-loa` example describes your LOA-CFA for connection `dxcon-fh6ayh1d` on a Windows computer. The previous example requires the use of the `base64` utility to decode the output, but on Windows you can use `certutil` instead. The first command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure to a file called `myLoaCfa.base64`.

```
aws directconnect describe-connection-loa ^
    --connection-id dxcon-fh6ayh1d ^
    --query loa.loaContent ^
    --output text > myLoaCfa.base64
```

This command produces no output. Its output is redirected to `myLoaCfa.base64`.

The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

For more information, see Download the Direct Connect LOA-CFA in the *AWS Direct Connect User Guide*.

For more information about controlling AWS CLI output, see Controlling command output in the AWS CLI in the *AWS Command Line Interface User Guide*.

- For API details, see DescribeConnectionLoa in *AWS CLI Command Reference*.

`describe-connections-on-interconnect`

The following code example shows how to use `describe-connections-on-interconnect`.

AWS CLI

To list connections on an interconnect

The following `describe-connections-on-interconnect` example lists connections that have been provisioned on the given interconnect.

```
aws directconnect describe-connections-on-interconnect \
    --interconnect-id dxcon-fgktov66
```

Output:

```
{
    "connections": [
        {
            "partnerName": "TIVIT",
            "vlan": 101,
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffzc51m1",
            "connectionState": "ordering",
            "bandwidth": "500Mbps",
            "location": "TIVIT",
            "connectionName": "mydcinterconnect",
            "region": "us-west-2"
        }
    ]
}
```

For more information, see Hosted Direct Connect connections in the *AWS Direct Connect User Guide*.

- For API details, see DescribeConnectionsOnInterconnect in *AWS CLI Command Reference*.

`describe-connections`

The following code example shows how to use `describe-connections`.

AWS CLI

To list all connections in the current region

The following `describe-connections` example lists all connections in the current region.

```
aws directconnect describe-connections
```

Output:

```
{
    "connections": [
        {
            "awsDevice": "EqDC2-123h49s71dabc",
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-fguhmqlc",
            "lagId": "dxlag-ffrz71kw",
```

```
            "connectionState": "down",
            "bandwidth": "1Gbps",
            "location": "EqDC2",
            "connectionName": "My_Connection",
            "loaIssueTime": 1491568964.0,
            "region": "us-west-2"
        }
    ]
}
```

For more information, see View Direct Connect connection details in the *AWS Direct Connect User Guide*.

- For API details, see DescribeConnections in *AWS CLI Command Reference*.

`describe-direct-connect-gateway-association-proposals`

The following code example shows how to use `describe-direct-connect-gateway-association-proposals`.

AWS CLI

To describe your Direct Connect gateway association proposals

The following `describe-direct-connect-gateway-association-proposals` example displays details about your Direct Connect gateway association proposals.

```
aws directconnect describe-direct-connect-gateway-association-proposals
```

Output:

```
{
    "directConnectGatewayAssociationProposals": [
        {
            "proposalId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

                }
            ]
        }
    ]
}
```

For more information, see Associating and Disassociating Transit Gateways in the *AWS Direct Connect User Guide*.

- For API details, see DescribeDirectConnectGatewayAssociationProposals in *AWS CLI Command Reference*.

`describe-direct-connect-gateway-associations`

The following code example shows how to use `describe-direct-connect-gateway-associations`.

AWS CLI

To describe Direct Connect gateway associations

The following `describe-direct-connect-gateway-associations` example describes all the associations with Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`.

```
aws directconnect describe-direct-connect-gateway-associations \
    --direct-connect-gateway-id 5f294f92-bafb-4011-916d-9b0bexample
```

Output:

```
{
    "nextToken":
 "eyJ2IjoxLCJzIjoxLCJpIjoiOU83OTFodzdycnZCbkN4MExHeHVwQT09IiwiYyI6InIxTEN0UEVHV0I1UFlkaWFnNl
    "directConnectGatewayAssociations": [
        {
            "associationState": "associating",

            "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bexample",
            "virtualGatewayId": "vgw-ebaa27db",
            "virtualGatewayRegion": "us-west-2"
        }
```

```
    ]
}
```

For more information, see Associate or disassociate Direct Connect virtual private gateways in the *AWS Direct Connect User Guide*.

- For API details, see DescribeDirectConnectGatewayAssociations in *AWS CLI Command Reference*.

`describe-direct-connect-gateway-attachments`

The following code example shows how to use `describe-direct-connect-gateway-attachments`.

AWS CLI

To describe Direct Connect gateway attachments

The following `describe-direct-connect-gateway-attachments` example describes the virtual interfaces that are attached to Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`.

```
aws directconnect describe-direct-connect-gateway-attachments \
    --direct-connect-gateway-id 5f294f92-bafb-4011-916d-9b0bexample
```

Output:

```
{
    "directConnectGatewayAttachments": [
        {
            "virtualInterfaceOwnerAccount": "123456789012",

```

For more information, see Direct Connect gateways in the *AWS Direct Connect User Guide*.

- For API details, see DescribeDirectConnectGatewayAttachments in *AWS CLI Command Reference*.

`describe-direct-connect-gateways`

The following code example shows how to use `describe-direct-connect-gateways`.

AWS CLI

To describe your Direct Connect gateways

The following `describe-direct-connect-gateways` example describes all of your Direct Connect gateways.

```
aws directconnect describe-direct-connect-gateways
```

Output:

```
{
    "directConnectGateways": [
        {
            "amazonSideAsn": 64512,
            "directConnectGatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ownerAccount": "123456789012",
            "directConnectGatewayName": "DxGateway2",
            "directConnectGatewayState": "available"
        },
        {
            "amazonSideAsn": 64512,
            "directConnectGatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ownerAccount": "123456789012",
            "directConnectGatewayName": "DxGateway1",
            "directConnectGatewayState": "available"
        }
    ]
}
```

For more information, see Direct Connect gateways in the *AWS Direct Connect User Guide*.

- For API details, see DescribeDirectConnectGateways in *AWS CLI Command Reference*.

`describe-hosted-connections`

The following code example shows how to use `describe-hosted-connections`.

AWS CLI

To list connections on an interconnect

The following `describe-hosted-connections` example lists connections that have been provisioned on the given interconnect.

```
aws directconnect describe-hosted-connections \
    --connection-id dxcon-fgktov66
```

Output:

```
{
    "connections": [
        {
            "partnerName": "TIVIT",
            "vlan": 101,
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffzc51m1",
            "connectionState": "ordering",
            "bandwidth": "500Mbps",
            "location": "TIVIT",
            "connectionName": "mydcinterconnect",
            "region": "us-west-2"
        }
    ]
}
```

For more information, see Hosted Direct Connect connections in the *AWS Direct Connect User Guide*.

- For API details, see DescribeHostedConnections in *AWS CLI Command Reference*.

`describe-interconnect-loa`

The following code example shows how to use `describe-interconnect-loa`.

AWS CLI

Example 1: To describe your LOA-CFA for an interconnect (Linux and macOS)

The following `describe-interconnect-loa` example describes your LOA-CFA for interconnect `dxcon-fh6ayh1d`. The contents of the LOA-CFA are base64-encoded. This command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure. The final part of the command decodes the content using the `base64` utility, and sends the output to a PDF file.

```
aws directconnect describe-interconnect-loa \
    --interconnect-id dxcon-fh6ayh1d \
    --query loa.loaContent \
    --output text | base64 --decode > myLoaCfa.pdf
```

This command produces no output. The decoded content is written to the file.

For more information, see Download the Direct Connect LOA-CFA in the *AWS Direct Connect User Guide*.

Example 2: To describe your LOA-CFA for an interconnect (Windows)

The following `describe-interconnect-loa` example describes your LOA-CFA for interconnect `dxcon-fh6ayh1d` on a Windows computer. The previous example requires the use of the `base64` utility to decode the output, but on Windows you can use `certutil` instead. The first command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure to a file called `myLoaCfa.base64`.

```
aws directconnect describe-interconnect-loa ^
    --interconnect-id dxcon-fh6ayh1d ^
    --query loa.loaContent ^
    --output text > myLoaCfa.base64
```

This command produces no output. Its output is redirected to `myLoaCfa.base64`.

The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

For more information, see Download the Direct Connect LOA-CFA in the *AWS Direct Connect User Guide*.

For more information about controlling AWS CLI output, see Controlling command output in the AWS CLI in the *AWS Command Line Interface User Guide*.

- For API details, see DescribeInterconnectLoa in *AWS CLI Command Reference*.

`describe-interconnects`

The following code example shows how to use `describe-interconnects`.

AWS CLI

To list interconnects

The following `describe-interconnects` example lists the interconnects owned by your AWS account.

```
aws directconnect describe-interconnects
```

Output:

```
{
    "interconnects": [
        {
            "region": "us-west-2",
            "bandwidth": "1Gbps",
            "location": "TIVIT",
            "interconnectName": "1G Interconnect to AWS",
            "interconnectId": "dxcon-fgktov66",
            "interconnectState": "down"
        }
    ]
}
```

For more information, see Direct Connect dedicated and hosted connections in the *AWS Direct Connect User Guide*.

- For API details, see DescribeInterconnects in *AWS CLI Command Reference*.

describe-lags

The following code example shows how to use `describe-lags`.

AWS CLI

To describe your LAGs

The following `describe-lags` example describes all of your LAGs for the current region.

```
aws directconnect describe-lags
```

Output:

```
{
    "lags": [
        {
            "awsDevice": "EqDC2-19y7z3m17xpuz",
            "numberOfConnections": 2,
            "lagState": "down",
            "ownerAccount": "123456789012",
            "lagName": "DA-LAG",
            "connections": [
                {
                    "ownerAccount": "123456789012",
                    "connectionId": "dxcon-ffnikghc",
                    "lagId": "dxlag-fgsu9erb",
                    "connectionState": "requested",
                    "bandwidth": "10Gbps",
                    "location": "EqDC2",
                    "connectionName": "Requested Connection 1 for Lag dxlag-
fgsu9erb",
                    "region": "us-west-2"
                },
                {
                    "ownerAccount": "123456789012",
                    "connectionId": "dxcon-fglgbdea",
                    "lagId": "dxlag-fgsu9erb",
                    "connectionState": "requested",
                    "bandwidth": "10Gbps",
                    "location": "EqDC2",
                    "connectionName": "Requested Connection 2 for Lag dxlag-
fgsu9erb",
```

```
                    "region": "us-west-2"
                }
            ],
            "lagId": "dxlag-fgsu9erb",
            "minimumLinks": 0,
            "connectionsBandwidth": "10Gbps",
            "region": "us-west-2",
            "location": "EqDC2"
        }
    ]
}
```

For more information, see View LAG details at a Direct Connect endpoint in the *AWS Direct Connect User Guide*.

- For API details, see DescribeLags in *AWS CLI Command Reference*.

`describe-loa`

The following code example shows how to use `describe-loa`.

AWS CLI

Example 1: To describe your LOA-CFA for a connection (Linux and macOS)

The following `describe-loa` example describes your LOA-CFA for connection `dxcon-fh6ayh1d`. The contents of the LOA-CFA are base64-encoded. This command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure. The final part of the command decodes the content using the `base64` utility, and sends the output to a PDF file.

```
aws directconnect describe-loa \
    --connection-id dxcon-fh6ayh1d \
    --query loa.loaContent \
    --output text | base64 --decode > myLoaCfa.pdf
```

This command produces no output. The decoded content is written to the file `myLoaCfa.pdf`.

For more information, see Download the Direct Connect LOA-CFA in the *AWS Direct Connect User Guide*.

Example 2: To describe your LOA-CFA for a connection (Windows)

The following `describe-loa` example describes your LOA-CFA for connection `dxcon-fh6ayh1d` on a Windows computer. The previous example requires the use of the `base64` utility to decode the output, but on Windows you can use `certutil` instead. The first command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure to a file called `myLoaCfa.base64`.

```
aws directconnect describe-loa ^
    --connection-id dxcon-fh6ayh1d ^
    --query loa.loaContent ^
    --output text > myLoaCfa.base64
```

This command produces no output. The output is redirected to `myLoaCfa.base64`.

The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

For more information, see Download the Direct Connect LOA-CFA in the *AWS Direct Connect User Guide*.

For more information about controlling AWS CLI output, see Controlling command output in the AWS CLI in the *AWS Command Line Interface User Guide*.

- For API details, see DescribeLoa in *AWS CLI Command Reference*.

`describe-locations`

The following code example shows how to use `describe-locations`.

AWS CLI

To list AWS Direct Connect partners and locations

The following `describe-locations` example lists AWS Direct Connect partners and locations in the current region.

```
aws directconnect describe-locations
```

Output:

```
{
    "locations": [
        {
            "locationName": "NAP do Brasil, Barueri, Sao Paulo",
            "locationCode": "TNDB"
        },
        {
            "locationName": "Tivit - Site Transamerica (Sao Paulo)",
            "locationCode": "TIVIT"
        }
    ]
}
```

For more information, see Requesting cross connects at Direct Connect locations in the *AWS Direct Connect User Guide*.

- For API details, see DescribeLocations in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe tags for your AWS Direct Connect resources

The following `describe-tags` example describes the tags for the connection `dxcon-abcabc12`.

```
aws directconnect describe-tags \
    --resource-arns arn:aws:directconnect:us-west-2:123456789012:dxcon/dxcon-abcabc12
```

Output:

```
{
    "resourceTags": [
        {
            "resourceArn": "arn:aws:directconnect:us-west-2:123456789012:dxcon/
dxcon-abcabc12",
            "tags": [
```

```
                {
                    "value": "VAConnection",
                    "key": "Name"
                }
            ]
        }
    ]
}
```

For more information, see Tag AWS Direct Connect resources in the *AWS Direct Connect User Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`describe-virtual-gateways`

The following code example shows how to use `describe-virtual-gateways`.

AWS CLI

To list virtual private gateways

The following `describe-virtual-gateways` example lists virtual private gateways owned by your AWS account.

```
aws directconnect describe-virtual-gateways
```

Output:

```
{
    "virtualGateways": [
        {
            "virtualGatewayId": "vgw-aba37db6",
            "virtualGatewayState": "available"
        }
    ]
}
```

For more information, see Direct Connect virtual private gateway associations in the *AWS Direct Connect User Guide*.

- For API details, see DescribeVirtualGateways in *AWS CLI Command Reference*.

describe-virtual-interfaces

The following code example shows how to use `describe-virtual-interfaces`.

AWS CLI

To list all virtual interfaces

The following `describe-virtual-interfaces` example lists the information about all virtual interfaces associated with your AWS account.

```
aws directconnect describe-virtual-interfaces \
    --connection-id dxcon-ffjrkx17
```

Output:

```
{
    "virtualInterfaces": [
        {
            "virtualInterfaceState": "down",
            "asn": 65000,
            "vlan": 101,
            "customerAddress": "192.168.1.2/30",
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffjrkx17",
            "virtualGatewayId": "vgw-aba37db6",
            "virtualInterfaceId": "dxvif-ffhhk74f",
            "authKey": "asdf34example",
            "routeFilterPrefixes": [],
            "location": "TIVIT",
            "customerRouterConfig": "<?xml version=\"1.0\" encoding=
\"UTF-8\"?>\n<logical_connection id=\"dxvif-ffhhk74f\">\n  <vlan>101</
vlan>\n  <customer_address>192.168.1.2/30</customer_address>\n
 <amazon_address>192.168.1.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n

\n  <connection_type>public</connection_type>\n</logical_connection>\n",
            "amazonAddress": "203.0.113.1/30",
            "virtualInterfaceType": "public",
            "virtualInterfaceName": "PublicVirtualInterface"
        }
    ]
}
```

For more information, see View Direct Connect virtual interface details in the *AWS Direct Connect User Guide*.

- For API details, see DescribeVirtualInterfaces in *AWS CLI Command Reference*.

`disassociate-connection-from-lag`

The following code example shows how to use `disassociate-connection-from-lag`.

AWS CLI

To disassociate a connection from a LAG

The following `disassociate-connection-from-lag` example disassociates the specified connection from the specified LAG.

```
aws directconnect disassociate-connection-from-lag \
    --lag-id dxlag-fhccu14t \
    --connection-id dxcon-fg9607vm
```

Output:

```
{
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-fg9607vm",
    "connectionState": "requested",
    "bandwidth": "1Gbps",
    "location": "EqDC2",
    "connectionName": "Con2ForLag",
    "region": "us-west-2"
}
```

For more information, see Disassociate a connection from a LAG at a Direct Connect endpoint in the *AWS Direct Connect User Guide*.

- For API details, see DisassociateConnectionFromLag in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to an AWS Direct Connect resource

The following `tag-resource` example adds a tag with a key of `Name` and a value of `VAConnection` to the connection `dxcon-abcabc12`.

```
aws directconnect tag-resource \
    --resource-arn arn:aws:directconnect:us-west-2:123456789012:dxcon/dxcon-abcabc12
 \
    --tags "key=Name,value=VAConnection"
```

This command produces no output.

For more information, see Tag AWS Direct Connect resources in the *AWS Direct Connect User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from an AWS Direct Connect resource

The following `untag-resource` example removes the tag with the key `Name` from connection `dxcon-abcabc12`.

```
aws directconnect untag-resource \
    --resource-arn arn:aws:directconnect:us-west-2:123456789012:dxcon/dxcon-abcabc12
 \
    --tag-keys Name
```

This command produces no output.

For more information, see Tag AWS Direct Connect resources in the *AWS Direct Connect User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-direct-connect-gateway-association`

The following code example shows how to use `update-direct-connect-gateway-association`.

AWS CLI

To update the specified attributes of the Direct Connect gateway association

The following `update-direct-connect-gateway-association` example adds the specified CIDR block to a Direct Connect gateway association.

```
aws directconnect update-direct-connect-gateway-association \
    --association-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
```

```
    --add-allowed-prefixes-to-direct-connect-gateway cidr=192.168.2.0/30
```

Output:

```
{
    "directConnectGatewayAssociation": {
        "directConnectGatewayId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "directConnectGatewayOwnerAccount": "123456789012",
        "associationState": "updating",
        "associatedGateway": {
            "id": "tgw-02f776b1a7EXAMPLE",
            "type": "transitGateway",
            "ownerAccount": "123456789012",
            "region": "us-west-2"
        },
        "associationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "allowedPrefixesToDirectConnectGateway": [
            {
                "cidr": "192.168.2.0/30"
            },
            {
                "cidr": "192.168.1.0/30"
            }
        ]
    }
}
```

For more information, see Working with Direct Connect Gateways in the *AWS Direct Connect User Guide*.

- For API details, see UpdateDirectConnectGatewayAssociation in *AWS CLI Command Reference*.

`update-lag`

The following code example shows how to use `update-lag`.

AWS CLI

To update a LAG

The following `update-lag` example changes the name of the specified LAG.

```
aws directconnect update-lag \
```

```
    --lag-id dxlag-ffjhj9lx \
    --lag-name 2ConnLag
```

Output:

```
{
    "awsDevice": "CSVA1-23u8tlpaz8iks",
    "numberOfConnections": 2,
    "lagState": "down",
    "ownerAccount": "123456789012",
    "lagName": "2ConnLag",
    "connections": [
        {
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-fflqyj95",
            "lagId": "dxlag-ffjhj9lx",
            "connectionState": "requested",
            "bandwidth": "1Gbps",
            "location": "CSVA1",
            "connectionName": "Requested Connection 2 for Lag dxlag-ffjhj9lx",
            "region": "us-west-2"
        },
        {
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffqr6x5q",
            "lagId": "dxlag-ffjhj9lx",
            "connectionState": "requested",

```

For more information, see Update a LAG at a Direct Connect endpoint in the *AWS Direct Connect User Guide*.

- For API details, see UpdateLag in *AWS CLI Command Reference*.

`update-virtual-interface-attributes`

The following code example shows how to use `update-virtual-interface-attributes`.

AWS CLI

To update the MTU of a virtual interface

The following `update-virtual-interface-attributes` example updates the MTU of the specified virtual interface.

```
aws directconnect update-virtual-interface-attributes \
    --virtual-interface-id dxvif-fEXAMPLE \
    --mtu 1500
```

Output:

```
{
    "ownerAccount": "1111222233333",

- For API details, see UpdateVirtualInterfaceAttributes in *AWS CLI Command Reference*.

Directory Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Directory Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`describe-directories`

The following code example shows how to use `describe-directories`.

AWS CLI

To get details about your directories

The following `describe-directories` example displays details about the specified directory.

```
aws ds describe-directories \
    --directory-ids d-a1b2c3d4e5
```

Output:

```
{
    "DirectoryDescriptions": [
        {
            "DirectoryId": "d-a1b2c3d4e5",
            "Name": "mydirectory.example.com",
            "ShortName": "mydirectory",
            "Size": "Small",
            "Edition": "Standard",

                    ]
                }
            }
        }
    ]
}
```

For more information, see Viewing AWS Managed Microsoft AD directory information in the *AWS Directory Service Administration Guide*.

- For API details, see DescribeDirectories in *AWS CLI Command Reference*.

`describe-trusts`

The following code example shows how to use `describe-trusts`.

AWS CLI

To get details about your trust relationships

The following `describe-trusts` example displays details about the trust relationships for the specified directory.

```
aws ds describe-trusts \
    --directory-id d-a1b2c3d4e5
```

Output:

```
{
    "Trusts": [
        {
            "DirectoryId": "d-a1b2c3d4e5",
            "TrustId": "t-9a8b7c6d5e",
            "RemoteDomainName": "other.example.com",
            "TrustType": "Forest",
```

```
            "TrustDirection": "Two-Way",
            "TrustState": "Verified",
            "CreatedDateTime": "2017-06-20T18:08:45.614000-07:00",
            "LastUpdatedDateTime": "2019-06-04T10:52:12.410000-07:00",
            "StateLastUpdatedDateTime": "2019-06-04T10:52:12.410000-07:00",
            "SelectiveAuth": "Disabled"
        }
    ]
}
```

For more information, see Creating a trust relationship between your AWS Managed Microsoft AD and self-managed AD in the *AWS Directory Service Administration Guide*.

- For API details, see DescribeTrusts in *AWS CLI Command Reference*.

`disable-directory-data-access`

The following code example shows how to use `disable-directory-data-access`.

AWS CLI

To disable Directory Service Data API for a directory

The following `disable-directory-data-access` example disables the Directory Service Data API for the specified directory.

```
aws ds disable-directory-data-access \
    --directory-id d-1234567890
```

This command produces no output.

For more information, see Enabling or disabling user and group management or AWS Directory Service Data in the *AWS Directory Service Administration Guide*.

- For API details, see DisableDirectoryDataAccess in *AWS CLI Command Reference*.

`enable-directory-data-access`

The following code example shows how to use `enable-directory-data-access`.

AWS CLI

To enable Directory Service Data API for a directory

The following `enable-directory-data-access` example enables the Directory Service Data API for the specified directory.

```
aws ds enable-directory-data-access \
    --directory-id d-1234567890
```

This command produces no output.

For more information, see Enabling or disabling user and group management or AWS Directory Service Data in the *AWS Directory Service Administration Guide*.

- For API details, see EnableDirectoryDataAccess in *AWS CLI Command Reference*.

`reset-user-password`

The following code example shows how to use `reset-user-password`.

AWS CLI

To reset a user password in a directory

The following `reset-user-password` example resets and enables the specified user in the specified directory.

```
aws ds reset-user-password \
    --directory-id d-1234567890 \
    --user-name 'john.doe' \
    --new-password 'password'
```

This command produces no output.

For more information, see Resetting and enabling an AWS Managed Microsoft AD user's password in the *AWS Directory Service Administration Guide*.

- For API details, see ResetUserPassword in *AWS CLI Command Reference*.

Directory Service Data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Directory Service Data.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`add-group-member`

The following code example shows how to use `add-group-member`.

AWS CLI

To add a group member to a directory

The following `add-group-member` example adds the specified user to the specified group in the specified directory.

```
aws ds-data add-group-member \
    --directory-id d-1234567890 \
    --group-name 'sales' \
    --member-name 'john.doe'
```

This command produces no output.

For more information, see Adding or removing AWS Managed Microsoft AD members to groups and groups to groups in the *AWS Directory Service Administration Guide*.

- For API details, see AddGroupMember in *AWS CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

To list the available widgets

The following `create-group` example creates a group in a specified directory.

```
aws ds-data create-group \
    --directory-id d-1234567890 \
    --sam-account-name "sales"
```

Output:

```
{
    "DirectoryId": "d-1234567890",
    "SAMAccountName": "sales",
    "SID": "S-1-2-34-5567891234-5678912345-67891234567-8912"
}
```

For more information, see Creating an AWS Managed Microsoft AD group in the *AWS Directory Service Administration Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

To create a user

The following `create-user` example creates a user in the specified directory.

```
aws ds-data create-user \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe'
```

Output:

```
{
    "DirectoryId": "d-1234567890",
    "SAMAccountName": "john.doe",
    "SID": "S-1-2-34-5567891234-5678912345-67891234567-8912"
}
```

For more information, see Creating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To delete a group

The following `delete-group` example deletes the specified group from the specified directory.

```
aws ds-data delete-group \
    --directory-id d-1234567890 \
    --sam-account-name 'sales'
```

This command produces no output.

For more information, see Deleting an AWS Managed Microsoft AD group in the *AWS Directory Service Administration Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes the specified user from the specified directory.

```
aws ds-data delete-user \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe'
```

This command produces no output.

For more information, see Deleting an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`describe-group`

The following code example shows how to use `describe-group`.

AWS CLI

To list details of a group

The following `describe-group` example gets information for the specified group in the specified directory.

```
aws ds-data describe-group \
    --directory-id d-1234567890 \
    --sam-account-name 'sales'
```

Output:

```
{
    "DirectoryId": "d-1234567890",
    "DistinguishedName": "CN=sales,OU=Users,OU=CORP,DC=corp,DC=example,DC=com",
    "GroupScope": "Global",
    "GroupType": "Security",
    "Realm": "corp.example.com",
    "SAMAccountName": "sales",
    "SID": "S-1-2-34-5567891234-5678912345-67891234567-8912"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD group's details in the *AWS Directory Service Administration Guide*.

- For API details, see DescribeGroup in *AWS CLI Command Reference*.

`describe-user`

The following code example shows how to use `describe-user`.

AWS CLI

To list information for a user

The following `describe-user` example gets information for the specified user in the specified directory.

```
aws ds-data describe-user \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe'
```

Output:

```
{
    "DirectoryId": "d-1234567890",
    "DistinguishedName": "CN=john.doe,OU=Users,OU=CORP,DC=corp,DC=example,DC=com",
    "Enabled": false,
    "Realm": "corp.example.com",
    "SAMAccountName": "john.doe",
    "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567",
    "UserPrincipalName": "john.doe@CORP.EXAMPLE.COM"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see DescribeUser in *AWS CLI Command Reference*.

`disable-user`

The following code example shows how to use `disable-user`.

AWS CLI

To disable a user

The following `disable-user` example disables the specified user in the specified directory.

```
aws ds-data disable-user \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe'
```

This command produces no output.

For more information, see Disabling an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see DisableUser in *AWS CLI Command Reference*.

`list-group-members`

The following code example shows how to use `list-group-members`.

AWS CLI

To list a directory's group members

The following `list-group-members` example lists the group members for the specified group in the specified directory.

```
aws ds-data list-group-members \
    --directory-id d-1234567890 \
    --sam-account-name 'sales'
```

Output:

```
{
    "Members": [
        {
            "MemberType": "USER",
            "SAMAccountName": "Jane Doe",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4568"
        },
        {
            "MemberType": "USER",
            "SAMAccountName": "John Doe",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4569"
        }
    ],
    "DirectoryId": "d-1234567890",
    "MemberRealm": "corp.example.com",
    "Realm": "corp.example.com"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD group's details in the *AWS Directory Service Administration Guide*.

- For API details, see ListGroupMembers in *AWS CLI Command Reference*.

`list-groups-for-member`

The following code example shows how to use `list-groups-for-member`.

AWS CLI

To list a directory's group membership

The following `list-groups-for-member` example lists group membership for the specified user in the specified directory.

```
aws ds-data list-groups-for-member \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe'
```

Output:

```
{
    "Groups": [
        {
            "GroupScope": "Global",
            "GroupType": "Security",
            "SAMAccountName": "Domain Users",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567"
        }
    ],
    "DirectoryId": "d-1234567890",
    "MemberRealm": "corp.example.com",
    "Realm": "corp.example.com"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see ListGroupsForMember in *AWS CLI Command Reference*.

`list-groups`

The following code example shows how to use `list-groups`.

AWS CLI

To list a directory's groups

The following `list-groups` example lists groups in the specified directory.

```
aws ds-data list-groups \
    --directory-id d-1234567890
```

Output:

```
{
    "Groups": [
        {
            "GroupScope": "BuiltinLocal",
            "GroupType": "Security",
            "SAMAccountName": "Administrators",
            "SID": "S-1-2-33-441"
        },
        {
            "GroupScope": "BuiltinLocal",
            "GroupType": "Security",
            "SAMAccountName": "Users",
            "SID": "S-1-2-33-442"
        },
        {
            "GroupScope": "BuiltinLocal",
            "GroupType": "Security",
            "SAMAccountName": "Guests",

```

For more information, see Viewing and updating an AWS Managed Microsoft AD group's details in the *AWS Directory Service Administration Guide*.

- For API details, see ListGroups in *AWS CLI Command Reference*.

`list-users`

The following code example shows how to use `list-users`.

AWS CLI

To list a directory's users

The following `list-users` example lists users in the specified directory.

```
aws ds-data list-users \
    --directory-id d-1234567890
```

Output:

```
{
    "Users": [
        {
            "Enabled": true,
            "SAMAccountName": "Administrator",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-345"
        },
        {
            "Enabled": false,
            "SAMAccountName": "Guest",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-345"
        },
        {
            "Enabled": false,
            "SAMAccountName": "krbtgt",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-346"
        },
        {
            "Enabled": true,
            "SAMAccountName": "Admin",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-347"
        },
        {
            "Enabled": true,
            "SAMAccountName": "Richard Roe",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-348"
        },
        {
            "Enabled": true,
            "SAMAccountName": "Jane Doe",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-349"
        },
```

```
        {
            "Enabled": true,
            "SAMAccountName": "AWS_WGnzYlN6YyY",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567"
        },
        {
            "Enabled": true,
            "SAMAccountName": "john.doe",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4568"
        }
    ],
    "DirectoryId": "d-1234567890",
    "Realm": "corp.example.com"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see ListUsers in *AWS CLI Command Reference*.

`remove-group-member`

The following code example shows how to use `remove-group-member`.

AWS CLI

To remove a group member from a directory

The following `remove-group-member` example removes the specified group member from the specified group in the specified directory.

```
aws ds-data remove-group-member \
    --directory-id d-1234567890 \
    --group-name 'sales' \
    --member-name 'john.doe'
```

This command produces no output.

For more information, see Adding and removing AWS Managed Microsoft AD members to groups and groups to groups in the *AWS Directory Service Administration Guide*.

- For API details, see RemoveGroupMember in *AWS CLI Command Reference*.

`search-groups`

The following code example shows how to use `search-groups`.

AWS CLI

To search for a group in a directory

The following `search-groups` example searches for the specified group in the specified directory.

```
aws ds-data search-groups \
    --directory-id d-1234567890 \
    --search-attributes 'SamAccountName' \
    --search-string 'sales'
```

Output:

```
{
    "Groups": [
        {
            "GroupScope": "Global",
            "GroupType": "Distribution",
            "SAMAccountName": "sales",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567"
        }
    ],
    "DirectoryId": "d-1234567890",
    "Realm": "corp.example.com"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD group's details in the *AWS Directory Service Administration Guide*.

- For API details, see SearchGroups in *AWS CLI Command Reference*.

`search-users`

The following code example shows how to use `search-users`.

AWS CLI

To search for a user in a directory

The following `search-users` example searches for the specified user in the specified directory.

```
aws ds-data search-users \
    --directory-id d-1234567890 \
    --search-attributes 'SamAccountName' \
    --search-string 'john.doe'
```

Output:

```
{
    "Users": [
        {
            "Enabled": true,
            "SAMAccountName": "john.doe",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567"
        }
    ],
    "DirectoryId": "d-1234567890",
    "Realm": "corp.example.com"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see SearchUsers in *AWS CLI Command Reference*.

`update-group`

The following code example shows how to use `update-group`.

AWS CLI

To update a group's attribute in a directory

The following `update-group` example updates the specified attribute for the specified group in the specified directory.

```
aws ds-data update-group \
    --directory-id d-1234567890 \
    --sam-account-name 'sales' \
    --update-type 'REPLACE' \
    --group-type 'Distribution'
```

This command produces no output.

For more information, see Viewing and updating an AWS Managed Microsoft AD group's details in the *AWS Directory Service Administration Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

`update-user`

The following code example shows how to use `update-user`.

AWS CLI

To update a user's attribute in a directory

The following `update-user` example updates the specified attribute for the specified user in the specified directory.

```
aws ds-data update-user \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe' \
    --update-type 'ADD' \
    --email-address 'example.corp.com'
```

This command produces no output.

For more information, see Viewing and updating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see UpdateUser in *AWS CLI Command Reference*.

AWS DMS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS DMS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add tags to a resource

The following `add-tags-to-resource` example adds tags to a replication instance.

```
aws dms add-tags-to-resource \
    --resource-arn arn:aws:dms:us-west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
 \
    --tags Key=Environment,Value=PROD Key=Project,Value=dbMigration
```

This command produces no output.

For more information, see Tagging Resources in the *AWS Database Migration Service User Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

`cancel-metadata-model-conversion`

The following code example shows how to use `cancel-metadata-model-conversion`.

AWS CLI

To cancel a metadata model conversion

The following `cancel-metadata-model-conversion` example cancels a metadata model conversion operation.

```
aws dms cancel-metadata-model-conversion \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --request-identifier a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Request": {
        "Status": "CANCELING",
        "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS"
    }
}
```

For more information, see Converting database schemas in the *AWS Database Migration Service User Guide*.

- For API details, see CancelMetadataModelConversion in *AWS CLI Command Reference*.

`cancel-metadata-model-creation`

The following code example shows how to use `cancel-metadata-model-creation`.

AWS CLI

To cancel a metadata model creation

The following `cancel-metadata-model-creation` example cancels a metadata model creation operation.

```
aws dms cancel-metadata-model-creation \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --request-identifier a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Request": {
        "Status": "CANCELING",
        "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS"
    }
}
```

For more information, see Creating statement metadata models in the *AWS Database Migration Service User Guide*.

- For API details, see CancelMetadataModelCreation in *AWS CLI Command Reference*.

`create-data-provider`

The following code example shows how to use `create-data-provider`.

AWS CLI

Example 1: To create a Microsoft SQL Server data provider

The following `create-data-provider` example creates a Microsoft SQL Server data provider.

```
aws dms create-data-provider \
    --data-provider-name example-data-provider \
    --engine sqlserver \
    --description "Example data provider for documentation" \
    --settings MicrosoftSqlServerSettings={ServerName=example-source-server.us-west-2.rds.amazonaws.com,Port=1433,DatabaseName=ExampleDatabase,SslMode=verify-full,CertificateArn=arn:aws:dms:us-west-2:123456789012:cert:EXAMPLEABCDEFGHIJKLMNOPQRS}
```

Output:

```
{
    "DataProvider": {
        "DataProviderName": "example-data-provider",
        "DataProviderArn": "arn:aws:dms:us-west-2:123456789012:data-provider:EXAMPLEABCDEFGHIJKLMNOPQRS",
        "DataProviderCreationTime": "2026-01-09T12:30:00.000000+00:00",
        "Description": "Example data provider for documentation",
        "Engine": "sqlserver",
        "Settings": {
            "MicrosoftSqlServerSettings": {
                "ServerName": "example-source-server.us-west-2.rds.amazonaws.com",
                "Port": 1433,
                "DatabaseName": "ExampleDatabase",
                "SslMode": "verify-full",
                "CertificateArn": "arn:aws:dms:us-west-2:123456789012:cert:EXAMPLEABCDEFGHIJKLMNOPQRS"
```

```
            }
        }
    }
}
```

For more information, see Working with data providers in the *AWS Database Migration Service User Guide*.

Example 2: To create a virtual data provider

The following `create-data-provider` example creates a virtual data provider, which doesn't require a connection to the database.

```
aws dms create-data-provider \
    --data-provider-name example-virtual-data-provider \
    --engine aurora-postgresql \
    --description "Example data provider for documentation" \
    --virtual \
    --
settings PostgreSqlSettings={ServerName=virtual,Port=5432,DatabaseName=virtual,SslMode=none}
```

Output:

```
{
    "DataProvider": {
        "DataProviderName": "example-virtual-data-provider",
        "DataProviderArn": "arn:aws:dms:us-west-2:123456789012:data-
provider:EXAMPLEABCDEFGHIJKLMNOPQRS",
        "DataProviderCreationTime": "2026-01-09T12:30:00.000000+00:00",
        "Description": "Example data provider for documentation",
        "Engine": "aurora-postgresql",
        "Virtual": true,
        "Settings": {
            "PostgreSqlSettings": {
                "ServerName": "virtual",
                "Port": 5432,
                "DatabaseName": "virtual",
                "SslMode": "none"
            }
        }
    }
}
```

For more information, see Working with virtual data providers in the *AWS Database Migration Service User Guide*.

- For API details, see CreateDataProvider in *AWS CLI Command Reference*.

`create-endpoint`

The following code example shows how to use `create-endpoint`.

AWS CLI

To create an endpoint

The following `create-endpoint` example creates an endpoint for an Amazon S3 source.

```
aws dms create-endpoint \
    --endpoint-type source \
    --engine-name s3 \
    --endpoint-identifier src-endpoint \
    --s3-settings file://s3-settings.json
```

Contents of `s3-settings.json`:

```
{
    "BucketName":"amzn-s3-demo-bucket",
    "BucketFolder":"sourcedata",
    "ServiceAccessRoleArn":"arn:aws:iam::123456789012:role/my-s3-access-role"
}
```

Output:

```
{
    "Endpoint": {
        "EndpointIdentifier": "src-endpoint",
        "EndpointType": "SOURCE",
        "EngineName": "s3",
        "EngineDisplayName": "Amazon S3",
        "ExtraConnectionAttributes": "bucketFolder=sourcedata;bucketName=amzn-s3-
demo-bucket;compressionType=NONE;csvDelimiter=,;csvRowDelimiter=\\n;",
        "Status": "active",
        "EndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:GUVAFG34EECUOJ6QVZ56DAHT3U",
        "SslMode": "none",
```

```
        "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
        "S3Settings": {
            "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-
role",
            "CsvRowDelimiter": "\\n",
            "CsvDelimiter": ",",
            "BucketFolder": "sourcedata",
            "BucketName": "amzn-s3-demo-bucket",
            "CompressionType": "NONE",
            "EnableStatistics": true
        }
    }
}
```

For more information, see Working with AWS DMS Endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see CreateEndpoint in *AWS CLI Command Reference*.

`create-event-subscription`

The following code example shows how to use `create-event-subscription`.

AWS CLI

To list event subscriptions

The following `create-event-subscription` example creates an event subscription to an Amazon SNS topic (my-sns-topic).

```
aws dms create-event-subscription \
    --subscription-name my-dms-events \
    --sns-topic-arn arn:aws:sns:us-west-2:123456789012:my-sns-topic
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "my-dms-events",
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:my-sns-topic",
        "Status": "creating",
        "SubscriptionCreationTime": "2020-05-21 21:58:38.598",
```

```
        "Enabled": true
    }
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see CreateEventSubscription in *AWS CLI Command Reference*.

`create-instance-profile`

The following code example shows how to use `create-instance-profile`.

AWS CLI

To create an instance profile

The following `create-instance-profile` example creates an instance profile.

```
aws dms create-instance-profile \
    --instance-profile-name example-instance-profile \
    --description "Example instance profile for documentation" \
    --subnet-group-identifier example-replication-subnet-group \
    --vpc-security-groups "sg-0123456789abcdef0" \
    --kms-key-arn arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --network-type IPV4 \
    --no-publicly-accessible
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileArn": "arn:aws:dms:us-west-2:123456789012:instance-profile:EXAMPLEABCDEFGHIJKLMNOPQRS",
        "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PubliclyAccessible": false,
        "NetworkType": "IPV4",
        "InstanceProfileName": "example-instance-profile",
        "Description": "Example instance profile for documentation",
        "InstanceProfileCreationTime": "2026-01-09T12:30:00.000000+00:00",
        "SubnetGroupIdentifier": "example-replication-subnet-group",
```

```
        "VpcSecurityGroups": [
            "sg-0123456789abcdef0"
        ]
    }
}
```

For more information, see Working with instance profiles in the *AWS Database Migration Service User Guide*.

- For API details, see CreateInstanceProfile in *AWS CLI Command Reference*.

`create-migration-project`

The following code example shows how to use `create-migration-project`.

AWS CLI

To create a migration project

The following `create-migration-project` example creates a migration project.

```
aws dms create-migration-project \
    --migration-project-name example-migration-project \
    --description "Example migration project for documentation" \
    --source-data-provider-descriptors DataProviderIdentifier=arn:aws:dms:us-
west-2:123456789012:data-

`create-replication-instance`

The following code example shows how to use `create-replication-instance`.

AWS CLI

To create a replication instance

The following `create-replication-instance` example creates a replication instance.

```
aws dms create-replication-instance \
    --replication-instance-identifier my-repl-instance \
    --replication-instance-class dms.t2.micro \
    --allocated-storage 5
```

Output:

```
{
    "ReplicationInstance": {
        "ReplicationInstanceIdentifier": "my-repl-instance",
        "ReplicationInstanceClass": "dms.t2.micro",
        "ReplicationInstanceStatus": "creating",
        "AllocatedStorage": 5,
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-f839b688",
                "Status": "active"
            }
        ],
        "ReplicationSubnetGroup": {

        "PubliclyAccessible": true
    }
}
```

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see CreateReplicationInstance in *AWS CLI Command Reference*.

`create-replication-subnet-group`

The following code example shows how to use `create-replication-subnet-group`.

AWS CLI

To create a subnet group

The following `create-replication-subnet-group` example creates a group consisting of 3 subnets.

```
aws dms create-replication-subnet-group \
    --replication-subnet-group-identifier my-subnet-group \
    --replication-subnet-group-description "my subnet group" \
    --subnet-ids subnet-da327bf6 subnet-bac383e0 subnet-d7c825e8
```

Output:

```
{
    "ReplicationSubnetGroup": {
        "ReplicationSubnetGroupIdentifier": "my-subnet-group",
        "ReplicationSubnetGroupDescription": "my subnet group",
        "VpcId": "vpc-136a4c6a",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-da327bf6",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-bac383e0",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2c"
                },
                "SubnetStatus": "Active"
```

```
            },
            {
                "SubnetIdentifier": "subnet-d7c825e8",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                },
                "SubnetStatus": "Active"
            }
        ]
    }
}
```

For more information, see Setting Up a Network for a Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see CreateReplicationSubnetGroup in *AWS CLI Command Reference*.

`create-replication-task`

The following code example shows how to use `create-replication-task`.

AWS CLI

To create a replication task

The following `create-replication-task` example creates a replication task.

```
aws dms create-replication-task \
    --replication-task-identifier movedata \
    --source-endpoint-arn arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA \
    --target-endpoint-arn arn:aws:dms:us-
west-2:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U \
    --replication-instance-arn $RI_ARN \
    --migration-type full-load \
    --table-mappings file://table-mappings.json
```

Contents of `table-mappings.json`:

```
{
    "rules": [
        {
            "rule-type": "selection",
```

```
            "rule-id": "1",
            "rule-name": "1",
            "object-locator": {
                "schema-name": "prodrep",
                "table-name": "%"
            },
            "rule-action": "include",
            "filters": []
        }
    ]
}
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "movedata",
        "SourceEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "Status": "creating",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskArn": "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see CreateReplicationTask in *AWS CLI Command Reference*.

`delete-connection`

The following code example shows how to use `delete-connection`.

AWS CLI

To delete a connection

The following `delete-connection` example disassociates an endpoint from a replication instance.

```
aws dms delete-connection \
    --endpoint-arn arn:aws:dms:us-west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA \
    --replication-instance-arn arn:aws:dms:us-west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
    "Connection": {
        "ReplicationInstanceArn": "arn:aws:dms:us-west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "EndpointArn": "arn:aws:dms:us-west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "Status": "deleting",
        "EndpointIdentifier": "src-database-1",
        "ReplicationInstanceIdentifier": "my-repl-instance"
    }
}
```

For more information, see https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.Creating.html in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteConnection in *AWS CLI Command Reference*.

`delete-data-provider`

The following code example shows how to use `delete-data-provider`.

AWS CLI

To delete a data provider

The following `delete-data-provider` example deletes a data provider identified by its ARN.

```
aws dms delete-data-provider \
    --data-provider-identifier arn:aws:dms:us-west-2:123456789012:data-provider:EXAMPLEABCDEFGHIJKLMNOPQRS
```

Output:

```
{
    "DataProvider": {
        "DataProviderName": "example-data-provider",
        "DataProviderArn": "arn:aws:dms:us-west-2:123456789012:data-
provider:EXAMPLEABCDEFGHIJKLMNOPQRS",
        "DataProviderCreationTime": "2026-01-09T12:30:00.000000+00:00",
        "Description": "Example data provider for documentation",
        "Engine": "sqlserver",
        "Settings": {
            "MicrosoftSqlServerSettings": {
                "ServerName": "example-source-server.us-west-2.rds.amazonaws.com",
                "Port": 1433,
                "DatabaseName": "ExampleDatabase",
                "SslMode": "verify-full",
                "CertificateArn": "arn:aws:dms:us-
west-2:123456789012:cert:EXAMPLEABCDEFGHIJKLMNOPQRS"
            }
        }
    }
}
```

For more information, see Working with data providers in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteDataProvider in *AWS CLI Command Reference*.

`delete-endpoint`

The following code example shows how to use `delete-endpoint`.

AWS CLI

To delete an endpoint

The following `delete-endpoint` example deletes an endpoint.

```
aws dms delete-endpoint \
    --endpoint-arn arn:aws:dms:us-
west-2:123456789012:endpoint:OUJJVXO4XZ4CYTSEG5XGMN2R3Y
```

Output:

```
{
    "Endpoint": {
        "EndpointIdentifier": "src-endpoint",
        "EndpointType": "SOURCE",
        "EngineName": "s3",
        "EngineDisplayName": "Amazon S3",
        "ExtraConnectionAttributes": "bucketFolder=sourcedata;bucketName=amzn-s3-
demo-bucket;compressionType=NONE;csvDelimiter=,;csvRowDelimiter=\\n;",
        "Status": "deleting",
        "EndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:OUJJVXO4XZ4CYTSEG5XGMN2R3Y",
        "SslMode": "none",
        "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
        "S3Settings": {
            "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-
role",
            "CsvRowDelimiter": "\\n",
            "CsvDelimiter": ",",
            "BucketFolder": "sourcedata",
            "BucketName": "amzn-s3-demo-bucket",
            "CompressionType": "NONE",
            "EnableStatistics": true
        }
    }
}
```

For more information, see Working with AWS DMS Endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteEndpoint in *AWS CLI Command Reference*.

`delete-event-subscription`

The following code example shows how to use `delete-event-subscription`.

AWS CLI

To delete an event subscription

The following `delete-event-subscription` example deletes a subscription to an Amazon SNS topic.

```
aws dms delete-event-subscription \
```

```
    --subscription-name "my-dms-events"
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "my-dms-events",
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:my-sns-topic",
        "Status": "deleting",
        "SubscriptionCreationTime": "2020-05-21 21:58:38.598",
        "Enabled": true
    }
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteEventSubscription in *AWS CLI Command Reference*.

`delete-instance-profile`

The following code example shows how to use `delete-instance-profile`.

AWS CLI

To delete an instance profile

The following `delete-instance-profile` example deletes an instance profile identified by its ARN.

```
aws dms delete-instance-profile \
    --instance-profile-identifier arn:aws:dms:us-west-2:123456789012:instance-profile:EXAMPLEABCDEFGHIJKLMNOPQRS
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileArn": "arn:aws:dms:us-west-2:123456789012:instance-profile:EXAMPLEABCDEFGHIJKLMNOPQRS",
```

```
        "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "PubliclyAccessible": false,
        "NetworkType": "IPV4",
        "InstanceProfileName": "example-instance-profile",
        "Description": "Example instance profile for documentation",
        "InstanceProfileCreationTime": "2026-01-09T12:30:00.000000+00:00",
        "SubnetGroupIdentifier": "example-replication-subnet-group",
        "VpcSecurityGroups": [
            "sg-0123456789abcdef0"
        ]
    }
}
```

For more information, see Working with instance profiles in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteInstanceProfile in *AWS CLI Command Reference*.

`delete-migration-project`

The following code example shows how to use `delete-migration-project`.

AWS CLI

To delete a migration project

The following `delete-migration-project` example deletes a migration project identified by its ARN.

```
aws dms delete-migration-project \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS
```

Output:

```
{
    "MigrationProject": {
        "MigrationProjectName": "example-migration-project",
        "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS",
```

```

For more information, see Working with migration projects in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteMigrationProject in *AWS CLI Command Reference*.

delete-replication-instance

The following code example shows how to use `delete-replication-instance`.

AWS CLI

To delete a replication instance

The following `delete-replication-instance` example deletes a replication instance.

```
aws dms delete-replication-instance \
    --replication-instance-arn arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
    "ReplicationInstance": {
        "ReplicationInstanceIdentifier": "my-repl-instance",
        "ReplicationInstanceClass": "dms.t2.micro",
        "ReplicationInstanceStatus": "deleting",
        "AllocatedStorage": 5,
        "InstanceCreateTime": 1590011235.952,
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-f839b688",
                "Status": "active"
            }
        ],
        "AvailabilityZone": "us-west-2d",
        "ReplicationSubnetGroup": {
            "ReplicationSubnetGroupIdentifier": "default",
            "ReplicationSubnetGroupDescription": "default",
            "VpcId": "vpc-136a4c6a",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {

        "ReplicationInstancePublicIpAddresses": [
            "54.225.120.92",
            "3.230.18.248"
        ],
        "ReplicationInstancePrivateIpAddresses": [
            "172.31.30.121",
            "172.31.75.90"
        ],
        "PubliclyAccessible": true,
        "SecondaryAvailabilityZone": "us-west-2b"
    }
```

```
}
```

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteReplicationInstance in *AWS CLI Command Reference*.

`delete-replication-subnet-group`

The following code example shows how to use `delete-replication-subnet-group`.

AWS CLI

To delete a subnet group

The following `delete-replication-subnet-group` example deletes a subnet group.

```
aws dms delete-replication-subnet-group \
    --replication-subnet-group-identifier my-subnet-group
```

This command produces no output.

For more information, see Setting Up a Network for a Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteReplicationSubnetGroup in *AWS CLI Command Reference*.

`delete-replication-task`

The following code example shows how to use `delete-replication-task`.

AWS CLI

To delete a replication task

The following `delete-replication-task` example deletes a replication task.

```
aws dms delete-replication-task \
    --replication-task-arn arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "Status": "deleting",
        "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590789988.677,
        "ReplicationTaskArn": "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteReplicationTask in *AWS CLI Command Reference*.

`describe-account-attributes`

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe account attributes

The following `describe-account-attributes` example lists the attributes for your AWS account.

```
aws dms describe-account-attributes
```

Output:

```
{
```

```
    "AccountQuotas": [
        {
            "AccountQuotaName": "ReplicationInstances",
            "Used": 1,
            "Max": 20
        },
        {
            "AccountQuotaName": "AllocatedStorage",
            "Used": 5,
            "Max": 10000
        }
    ],
    "UniqueAccountIdentifier": "cqahfbfy5xee"
}
```

For more information, see Quotas for AWS Database Migration Service in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeAccountAttributes in *AWS CLI Command Reference*.

`describe-certificates`

The following code example shows how to use `describe-certificates`.

AWS CLI

To list the available certificates

The following `describe-certificates` example lists the available certificates in your AWS account.

```
aws dms describe-certificates
```

Output:

```
{
    "Certificates": [
        {
            "CertificateIdentifier": "my-cert",
            "CertificateCreationDate": 1543259542.506,
            "CertificatePem": "-----BEGIN CERTIFICATE-----
\nMIID9DCCAtygAwIBAgIBQjANBgkqhkiG9w0BAQ ...U"
```

```
        }
    ]
}
```

For more information, see Using SSL in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeCertificates in *AWS CLI Command Reference*.

`describe-connections`

The following code example shows how to use `describe-connections`.

AWS CLI

To describe connections

The following `describe-connections` example lists the connections that you have tested between a replication instance and an endpoint.

```
aws dms describe-connections
```

Output:

```
{
    "Connections": [
        {
            "Status": "successful",
            "ReplicationInstanceIdentifier": "test",
            "EndpointArn": "arn:aws:dms:us-east-arn:aws:dms:us-
west-2:123456789012:endpoint:ZW5UAN6P4E77EC7YWHK4RZZ3BE",
            "EndpointIdentifier": "testsrc1",
            "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:6UTDJGBOUS3VI3SUWA66XFJCJQ"
        }
    ]
}
```

For more information, see Creating Source and Target Endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeConnections in *AWS CLI Command Reference*.

`describe-conversion-configuration`

The following code example shows how to use `describe-conversion-configuration`.

AWS CLI

To describe a conversion configuration

The following `describe-conversion-configuration` example retrieves the conversion configuration for a migration project.

```
aws dms describe-conversion-configuration \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS
```

Output:

```
{
    "MigrationProjectIdentifier": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS",
    "ConversionConfiguration": "{\"Common project settings\": {\"ShowSeverityLevelInSql\":\"CRITICAL\",\"EnableGenAiConversion\":false}, \"MSSQL_TO_AURORA_POSTGRESQL\":{\"ConvertProceduresToFunction\":true, \"UniqueIndexGeneration\":true,\"CaseSensitivityNames\":false},\"Conversion version \":{\"MSSQL_TO_AURORA_POSTGRESQL_target_engine_version\":\"15\"}}"
}
```

For more information, see Specifying schema conversion settings in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeConversionConfiguration in *AWS CLI Command Reference*.

`describe-data-providers`

The following code example shows how to use `describe-data-providers`.

AWS CLI

To describe data providers

The following `describe-data-providers` example retrieves the details of a data provider identified by its ARN.

```
aws dms describe-data-providers \
    --filters Name=data-provider-identifier,Values=arn:aws:dms:us-
west-2:123456789012:data-provider:EXAMPLEABCDEFGHIJKLMNOPQRS
```

Output:

```
{
    "DataProviders": [
        {
            "DataProviderName": "example-data-provider",
            "DataProviderArn": "arn:aws:dms:us-west-2:123456789012:data-
provider:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "DataProviderCreationTime": "2026-01-09T12:30:00.000000+00:00",
            "Description": "Example data provider for documentation",
            "Engine": "sqlserver",
            "Settings": {
                "MicrosoftSqlServerSettings": {
                    "ServerName": "example-source-server.us-
west-2.rds.amazonaws.com",
                    "Port": 1433,
                    "DatabaseName": "ExampleDatabase",
                    "SslMode": "verify-full",
                    "CertificateArn": "arn:aws:dms:us-
west-2:123456789012:cert:EXAMPLEABCDEFGHIJKLMNOPQRS"
                }
            }
        }
    ]
}
```

For more information, see Working with data providers in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeDataProviders in *AWS CLI Command Reference*.

`describe-endpoint-types`

The following code example shows how to use `describe-endpoint-types`.

AWS CLI

To list the available endpoint types

The following `describe-endpoint-types` example lists the MySQL endpoint types that are available.

```
aws dms describe-endpoint-types \
    --filters "Name=engine-name,Values=mysql"
```

Output:

```
{
    "SupportedEndpointTypes": [
        {
            "EngineName": "mysql",
            "SupportsCDC": true,
            "EndpointType": "source",
            "EngineDisplayName": "MySQL"
        },
        {
            "EngineName": "mysql",
            "SupportsCDC": true,
            "EndpointType": "target",
            "EngineDisplayName": "MySQL"
        }
    ]
}
```

For more information, see Working with AWS DMS endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeEndpointTypes in *AWS CLI Command Reference*.

`describe-endpoints`

The following code example shows how to use `describe-endpoints`.

AWS CLI

To describe endpoints

The following `describe-endpoints` example lists the endpoints in your AWS account.

```
aws dms describe-endpoints
```

Output:

```
{
    "Endpoints": [
        {
            "Username": "dms",
            "Status": "active",
            "EndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:SF2WOFLWYWKVEOHID2EKLP3SJI",
            "ServerName": "ec2-52-32-48-61.us-west-2.compute.amazonaws.com",
            "EndpointType": "SOURCE",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "DatabaseName": "test",
            "EngineName": "mysql",
            "EndpointIdentifier": "pri100",
            "Port": 8193
        },
        {
            "Username": "admin",
            "Status": "active",
            "EndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:TJJZCIH3CJ24TJRU4VC32WEWFR",
            "ServerName": "test.example.com",
            "EndpointType": "SOURCE",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "DatabaseName": "EMPL",
            "EngineName": "oracle",
            "EndpointIdentifier": "test",
            "Port": 1521
        }
    ]
}
```

For more information, see Working with AWS DMS Endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeEndpoints in *AWS CLI Command Reference*.

`describe-event-categories`

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe event categories

The following `describe-event-categories` example lists the available event categories.

```
aws dms describe-event-categories
```

Output:

```
{
    "EventCategoryGroupList": [
        {
            "SourceType": "replication-instance",
            "EventCategories": [
                "low storage",
                "configuration change",
                "maintenance",
                "deletion",
                "creation",
                "failover",
                "failure"
            ]
        },
        {
            "SourceType": "replication-task",
            "EventCategories": [
                "configuration change",
                "state change",
                "deletion",
                "creation",
                "failure"
            ]
        }
    ]
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeEventCategories in *AWS CLI Command Reference*.

`describe-event-subscriptions`

The following code example shows how to use `describe-event-subscriptions`.

AWS CLI

To describe event subscriptions

The following `describe-event-subscriptions` example lists the event subscriptions to an Amazon SNS topic.

```
aws dms describe-event-subscriptions
```

Output:

```
{
    "EventSubscriptionsList": [
        {
            "CustomerAwsId": "123456789012",
            "CustSubscriptionId": "my-dms-events",
            "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:my-sns-topic",
            "Status": "deleting",
            "SubscriptionCreationTime": "2020-05-21 22:28:51.924",
            "Enabled": true
        }
    ]
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeEventSubscriptions in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To list DMS events

The following `describe-events` example lists the events that originated from a replication instance.

```
aws dms describe-events \
    --source-type "replication-instance"
```

Output:

```
{
    "Events": [
        {
            "SourceIdentifier": "my-repl-instance",
            "SourceType": "replication-instance",
            "Message": "Replication application shutdown",
            "EventCategories": [],
            "Date": 1590771645.776
        }
    ]
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-extension-pack-associations`

The following code example shows how to use `describe-extension-pack-associations`.

AWS CLI

To describe extension pack associations

The following `describe-extension-pack-associations` example retrieves the status of operations that apply an extension pack to the target database, identified by their request IDs.

```
aws dms describe-extension-pack-associations \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --filters Name=request-id,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE11111,a1b2c3d4-5678-90ab-cdef-EXAMPLE22222,a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

Output:

```
{
    "Requests": [
        {
            "Status": "SUCCESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS"
        },
        {
            "Status": "IN_PROGRESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Progress": {
                "ProgressPercent": 50.0,
                "ProgressStep": "IN_PROGRESS"
            }
        },
        {
            "Status": "FAILED",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Error": {
                "defaultErrorDetails": {
                    "Message": "The database user in your target secret does not
 have sufficient privileges. Grant the required privileges and try again."
                }
            }
        }
    ]
}
```

For more information, see Using extension packs in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeExtensionPackAssociations in *AWS CLI Command Reference*.

`describe-instance-profiles`

The following code example shows how to use `describe-instance-profiles`.

AWS CLI

To describe instance profiles

The following `describe-instance-profiles` example retrieves the details of an instance profile identified by its ARN.

```
aws dms describe-instance-profiles \
    --filters Name=instance-profile-identifier,Values=arn:aws:dms:us-
west-2:123456789012:instance-profile:EXAMPLEABCDEFGHIJKLMNOPQRS
```

Output:

```
{
    "InstanceProfiles": [
        {

}
```

For more information, see Working with instance profiles in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeInstanceProfiles in *AWS CLI Command Reference*.

`describe-metadata-model-assessments`

The following code example shows how to use `describe-metadata-model-assessments`.

AWS CLI

To describe metadata model assessments

The following `describe-metadata-model-assessments` example retrieves the status of metadata model assessment operations identified by their request IDs.

```
aws dms describe-metadata-model-assessments \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --filters Name=request-id,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE11111,a1b2c3d4-5678-90ab-cdef-EXAMPLE22222,a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

Output:

```
{
    "Requests": [
        {
            "Status": "SUCCESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS"
        },
        {
            "Status": "IN_PROGRESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Progress": {
                "ProgressPercent": 50.0,
                "TotalObjects": 100,
                "ProgressStep": "ANALYZING",
                "ProcessedObject": {
                    "Name": "ExampleTable",
                    "Type": "table",
                    "EndpointType": "SOURCE"
                }
            }
        },
        {
            "Status": "FAILED",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
```

```
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Error": {
                "defaultErrorDetails": {
                    "Message": "No objects were found according to the specified
 selection rules. Please review your selection rules and try again."
                }
            }
        }
    ]
}
```

For more information, see Creating database migration assessment reports in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeMetadataModelAssessments in *AWS CLI Command Reference*.

`describe-metadata-model-children`

The following code example shows how to use `describe-metadata-model-children`.

AWS CLI

To describe metadata model children

The following `describe-metadata-model-children` example retrieves the child metadata models of the `ExampleSchema` schema from the source metadata tree.

```
aws dms describe-metadata-model-children \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --selection-rules '{"rules": [{"rule-type": "selection", "rule-id": "1",
 "rule-name": "1", "object-locator": {"server-name": "example-source-server.us-
west-2.rds.amazonaws.com", "schema-name": "ExampleSchema"}, "rule-action":
 "explicit"}]}' \
    --origin SOURCE
```

Output:

```
{
    "MetadataModelChildren": [
```

```
        {
            "MetadataModelName": "Tables",
            "SelectionRules": "{\"rules\": [{\"rule-type\": \"selection\", \"rule-
id\": \"1\", \"rule-name\": \"1\", \"object-locator\": {\"server-name\": \"example-
source-server.us-west-2.rds.amazonaws.com\", \"schema-name\": \"ExampleSchema\",
 \"category-name\": \"Tables\"}, \"rule-action\": \"explicit\"}]}"
        },
        {
            "MetadataModelName": "Views",
            "SelectionRules": "{\"rules\": [{\"rule-type\": \"selection\", \"rule-
id\": \"2\", \"rule-name\": \"2\", \"object-locator\": {\"server-name\": \"example-
source-server.us-west-2.rds.amazonaws.com\", \"schema-name\": \"ExampleSchema\",
 \"category-name\": \"Views\"}, \"rule-action\": \"explicit\"}]}"
        },
        {
            "MetadataModelName": "Functions",
            "SelectionRules": "{\"rules\": [{\"rule-type\": \"selection\", \"rule-
id\": \"3\", \"rule-name\": \"3\", \"object-locator\": {\"server-name\": \"example-
source-server.us-west-2.rds.amazonaws.com\", \"schema-name\": \"ExampleSchema\",
 \"category-name\": \"Functions\"}, \"rule-action\": \"explicit\"}]}"
        },
        {
            "MetadataModelName": "Sequences",
            "SelectionRules": "{\"rules\": [{\"rule-type\": \"selection\", \"rule-
id\": \"4\", \"rule-name\": \"4\", \"object-locator\": {\"server-name\": \"example-
source-server.us-west-2.rds.amazonaws.com\", \"schema-name\": \"ExampleSchema\",
 \"category-name\": \"Sequences\"}, \"rule-action\": \"explicit\"}]}"
        }
    ]
}
```

For more information, see Navigating the metadata model tree in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeMetadataModelChildren in *AWS CLI Command Reference*.

`describe-metadata-model-conversions`

The following code example shows how to use `describe-metadata-model-conversions`.

AWS CLI

To describe metadata model conversions

The following `describe-metadata-model-conversions` example retrieves the status of metadata model conversion operations identified by their request IDs.

```
aws dms describe-metadata-model-conversions \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --filters Name=request-id,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE11111,a1b2c3d4-5678-90ab-cdef-EXAMPLE22222,a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

Output:

```
{
    "Requests": [
        {
            "Status": "SUCCESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS"
        },
        {
            "Status": "IN_PROGRESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Progress": {
                "ProgressPercent": 50.0,
                "TotalObjects": 100,
                "ProgressStep": "CONVERTING",
                "ProcessedObject": {
                    "Name": "ExampleTable",
                    "Type": "table",
                    "EndpointType": "SOURCE"
                }
            }
        },
        {
            "Status": "FAILED",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Error": {
                "defaultErrorDetails": {
```

```
                    "Message": "No objects were found according to the specified
 selection rules. Please review your selection rules and try again."
                }
            }
        }
    ]
}
```

For more information, see Converting database schemas in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeMetadataModelConversions in *AWS CLI Command Reference*.

`describe-metadata-model-creations`

The following code example shows how to use `describe-metadata-model-creations`.

AWS CLI

To describe metadata model creations

The following `describe-metadata-model-creations` example retrieves the status of metadata model creation operations identified by their request IDs.

```
aws dms describe-metadata-model-creations \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --filters Name=request-id,Values=a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111,a1b2c3d4-5678-90ab-cdef-EXAMPLE22222,a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333
```

Output:

```
{
    "Requests": [
        {
            "Status": "SUCCESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS"
        },
```

```
        {
            "Status": "IN_PROGRESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS"
        },
        {
            "Status": "FAILED",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Error": {
                "defaultErrorDetails": {
                    "Message": "No objects were found according to the specified
 selection rules. Please review your selection rules and try again."
                }
            }
        }
    ]
}
```

For more information, see Creating statement metadata models in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeMetadataModelCreations in *AWS CLI Command Reference*.

`describe-metadata-model-exports-as-script`

The following code example shows how to use `describe-metadata-model-exports-as-script`.

AWS CLI

To describe metadata model exports as script

The following `describe-metadata-model-exports-as-script` example retrieves the status of operations that export metadata models as data definition language (DDL) scripts, identified by their request IDs.

```
aws dms describe-metadata-model-exports-as-script \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS \
```

```
    --filters Name=request-id,Values=a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111,a1b2c3d4-5678-90ab-cdef-EXAMPLE22222,a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333
```

Output:

```
{
    "Requests": [
        {
            "Status": "SUCCESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "ExportSqlDetails": {

```

```
                }
            }
        }
    ]
}
```

For more information, see Saving your converted code to a SQL file in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeMetadataModelExportsAsScript in *AWS CLI Command Reference*.

`describe-metadata-model-exports-to-target`

The following code example shows how to use `describe-metadata-model-exports-to-target`.

AWS CLI

To describe metadata model exports to target

The following `describe-metadata-model-exports-to-target` example retrieves the status of operations that export converted metadata models to the target database, identified by their request IDs.

```
aws dms describe-metadata-model-exports-to-target \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --filters Name=request-id,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE11111,a1b2c3d4-5678-90ab-cdef-EXAMPLE22222,a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

Output:

```
{
    "Requests": [
        {
            "Status": "SUCCESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS"
        },
        {
```

```
            "Status": "IN_PROGRESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Progress": {
                "ProgressPercent": 50.0,
                "TotalObjects": 100,
                "ProgressStep": "APPLYING",
                "ProcessedObject": {
                    "EndpointType": "TARGET"
                }
            }
        },
        {
            "Status": "FAILED",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Error": {
                "defaultErrorDetails": {
                    "Message": "No objects were found according to the specified
 selection rules. Please review your selection rules and try again."
                }
            }
        }
    ]
}
```

For more information, see Applying your converted code in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeMetadataModelExportsToTarget in *AWS CLI Command Reference*.

`describe-metadata-model-imports`

The following code example shows how to use `describe-metadata-model-imports`.

AWS CLI

To describe metadata model imports

The following `describe-metadata-model-imports` example retrieves the status of metadata import operations identified by their request IDs.

```
aws dms describe-metadata-model-imports \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --filters Name=request-id,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE11111,a1b2c3d4-5678-90ab-cdef-EXAMPLE22222,a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

Output:

```
{
    "Requests": [
        {
            "Status": "SUCCESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS"
        },
        {
            "Status": "IN_PROGRESS",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Progress": {
                "ProgressPercent": 50.0,
                "TotalObjects": 100,
                "ProgressStep": "IN_PROGRESS",
                "ProcessedObject": {
                    "EndpointType": "SOURCE"
                }
            }
        },
        {
            "Status": "FAILED",
            "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "Error": {
                "defaultErrorDetails": {
                    "Message": "No objects were found according to the specified selection rules. Please review your selection rules and try again."
                }
            }
        }
```

```
    ]
}
```

For more information, see Navigating the metadata model tree in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeMetadataModelImports in *AWS CLI Command Reference*.

`describe-metadata-model`

The following code example shows how to use `describe-metadata-model`.

AWS CLI

To describe a metadata model

The following `describe-metadata-model` example retrieves detailed information about the `ExampleTable` table in the `ExampleSchema` schema from the source metadata tree, including its SQL definition and references to the corresponding converted metadata models in the target database.

```
aws dms describe-metadata-model \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --selection-rules '{"rules": [{"rule-type": "selection", "rule-id": "1", "rule-name": "1", "object-locator": {"server-name": "example-source-server.us-west-2.rds.amazonaws.com", "schema-name": "ExampleSchema", "table-name": "ExampleTable"}, "rule-action": "explicit"}]}' \
    --origin SOURCE
```

Output:

```
{
    "MetadataModelName": "ExampleTable",
    "MetadataModelType": "table",
    "TargetMetadataModels": [
        {
            "MetadataModelName": "exampletable",
            "SelectionRules": "{\"rules\": [{\"rule-type\": \"selection\", \"rule-id\": \"1\", \"rule-name\": \"1\", \"object-locator\": {\"server-name\": \"example-target-server.us-west-2.rds.amazonaws.com\", \"schema-name\": \"exampleschema\", \"table-name\": \"exampletable\"}, \"rule-action\": \"explicit\"}]}"
```

```
        }
    ],
    "Definition": "CREATE TABLE ExampleTable (ExampleColumn INTEGER NOT NULL);"
}
```

For more information, see Navigating the metadata model tree in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeMetadataModel in *AWS CLI Command Reference*.

`describe-migration-projects`

The following code example shows how to use `describe-migration-projects`.

AWS CLI

To describe migration projects

The following `describe-migration-projects` example retrieves the details of a migration project identified by its ARN.

```
aws dms describe-migration-projects \
    --filters Name=migration-project-identifier,Values=arn:aws:dms:us-
west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS
```

Output:

```
{
    "MigrationProjects": [
        {
            "MigrationProjectName": "example-migration-project",
            "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS",
            "MigrationProjectCreationTime": "2026-01-09T12:30:00.000000+00:00",
            "SourceDataProviderDescriptors": [
                {
                    "SecretsManagerSecretId": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:example-source-secret-A1B2C3",
                    "SecretsManagerAccessRoleArn": "arn:aws:iam::123456789012:role/
example-secrets-manager-role",
                    "DataProviderName": "example-data-provider",
                    "DataProviderArn": "arn:aws:dms:us-west-2:123456789012:data-
provider:EXAMPLEABCDEFGHIJKLMNOPQRS"
```

```
                }
            ],
            "TargetDataProviderDescriptors": [
                {
                    "SecretsManagerSecretId": "arn:aws:secretsmanager:us-

access-role"
            }
        }
    ]
}
```

For more information, see Working with migration projects in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeMigrationProjects in *AWS CLI Command Reference*.

`describe-orderable-replication-instances`

The following code example shows how to use `describe-orderable-replication-instances`.

AWS CLI

To describe orderable replication instances

The following `describe-orderable-replication-instances` example lists replication instance types that you can order.

```
aws dms describe-orderable-replication-instances
```

Output:

```
{
    "OrderableReplicationInstances": [
        {
            "EngineVersion": "3.3.2",
            "ReplicationInstanceClass": "dms.c4.2xlarge",
            "StorageType": "gp2",
            "MinAllocatedStorage": 5,
            "MaxAllocatedStorage": 6144,
            "DefaultAllocatedStorage": 100,
            "IncludedAllocatedStorage": 100,
            "AvailabilityZones": [
                "us-west-2a",
                "us-west-2b",
                "us-west-2c",
                "us-west-2d"
            ]
        },
        {
            "EngineVersion": "3.3.2",
            "ReplicationInstanceClass": "dms.c4.4xlarge",
            "StorageType": "gp2",
            "MinAllocatedStorage": 5,
            "MaxAllocatedStorage": 6144,
            "DefaultAllocatedStorage": 100,
            "IncludedAllocatedStorage": 100,
            "AvailabilityZones": [
                "us-west-2a",
                "us-west-2b",
                "us-west-2c",
                "us-west-2d"
            ]
        }
    ]
}
```

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeOrderableReplicationInstances in *AWS CLI Command Reference*.

`describe-refresh-schemas-status`

The following code example shows how to use `describe-refresh-schemas-status`.

AWS CLI

To list the refresh status for an endpoint

The following `describe-refresh-schemas-status` example returns the status of a previous refresh request.

```
aws dms describe-refresh-schemas-status \
    --endpoint-arn arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA
```

Output:

```
{
    "RefreshSchemasStatus": {
        "EndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "Status": "successful",
        "LastRefreshDate": 1590786544.605
    }
}
```

For more information, see Working with AWS DMS endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeRefreshSchemasStatus in *AWS CLI Command Reference*.

`describe-replication-instances`

The following code example shows how to use `describe-replication-instances`.

AWS CLI

To describe replication instances

The following `describe-replication-instances` example lists the replication instances in your AWS account.

```
aws dms describe-replication-instances
```

Output:

```
{
    "ReplicationInstances": [
        {
            "ReplicationInstanceIdentifier": "my-repl-instance",
            "ReplicationInstanceClass": "dms.t2.micro",
            "ReplicationInstanceStatus": "available",
            "AllocatedStorage": 5,
            "InstanceCreateTime": 1590011235.952,
            "VpcSecurityGroups": [
                {
                    "VpcSecurityGroupId": "sg-f839b688",
                    "Status": "active"
                }
            ],
            "AvailabilityZone": "us-west-2d",
            "ReplicationSubnetGroup": {
                "ReplicationSubnetGroupIdentifier": "default",
                "ReplicationSubnetGroupDescription": "default",
                "VpcId": "vpc-136a4c6a",
                "SubnetGroupStatus": "Complete",
                "Subnets": [
                    {
                        "SubnetIdentifier": "subnet-da327bf6",
                        "SubnetAvailabilityZone": {
                            "Name": "us-west-2a"
                        },
                        "SubnetStatus": "Active"
                    },
                    {
                        "SubnetIdentifier": "subnet-bac383e0",
                        "SubnetAvailabilityZone": {
                            "Name": "us-west-2c"
```

```
                        },
                        "SubnetStatus": "Active"
                    },

}
```

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeReplicationInstances in *AWS CLI Command Reference*.

`describe-replication-subnet-groups`

The following code example shows how to use `describe-replication-subnet-groups`.

AWS CLI

To display the available subnet groups

The following `describe-replication-subnet-groups` example lists the available subnet groups.

```
aws dms describe-replication-subnet-groups \
    --filters "Name=replication-subnet-group-id,Values=my-subnet-group"
```

Output:

```
{
    "ReplicationSubnetGroups": [
        {
            "ReplicationSubnetGroupIdentifier": "my-subnet-group",
            "ReplicationSubnetGroupDescription": "my subnet group",
            "VpcId": "vpc-136a4c6a",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-da327bf6",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-bac383e0",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    },
                    "SubnetStatus": "Active"
                },
```

```
                {
                    "SubnetIdentifier": "subnet-d7c825e8",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2d"
                    },
                    "SubnetStatus": "Active"
                }
            ]
        }
    ]
}
```

For more information, see Setting Up a Network for a Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeReplicationSubnetGroups in *AWS CLI Command Reference*.

`describe-replication-task-assessment-results`

The following code example shows how to use `describe-replication-task-assessment-results`.

AWS CLI

To list the results of replication task assessmentss

The following `describe-replication-task-assessment-results` example lists the results of a prior task assesssment.

```
aws dms describe-replication-task-assessment-results
```

Output:

```
{
    "ReplicationTaskAssessmentResults": [
        {
            "ReplicationTaskIdentifier": "moveit2",
            "ReplicationTaskArn": "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII",
            "ReplicationTaskLastAssessmentDate": 1590790230.0,
            "AssessmentStatus": "No issues found",
            "AssessmentResultsFile": "moveit2/2020-05-29-22-10"
```

```
        }
    ]
}
```

For more information, see Creating a Task Assessment Report in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeReplicationTaskAssessmentResults in *AWS CLI Command Reference*.

`describe-replication-tasks`

The following code example shows how to use `describe-replication-tasks`.

AWS CLI

To describe a replication task

The following `describe-replication-tasks` example describes current replication tasks.

```
aws dms describe-replication-tasks
```

Output:

```
{
    "ReplicationTasks": [
        {
            "ReplicationTaskIdentifier": "moveit2",
            "SourceEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
            "TargetEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
            "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
            "MigrationType": "full-load",
            "Status": "stopped",
            "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
            "ReplicationTaskCreationDate": 1590524772.505,
            "ReplicationTaskStartDate": 1590619805.212,
            "ReplicationTaskArn": "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII",
            "ReplicationTaskStats": {
                "FullLoadProgressPercent": 100,
```

```
                "ElapsedTimeMillis": 0,
                "TablesLoaded": 0,
                "TablesLoading": 0,
                "TablesQueued": 0,
                "TablesErrored": 0,
                "FreshStartDate": 1590619811.528,
                "StartDate": 1590619811.528,
                "StopDate": 1590619842.068
            }
        }
    ]
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeReplicationTasks in *AWS CLI Command Reference*.

`describe-schemas`

The following code example shows how to use `describe-schemas`.

AWS CLI

To describe database schemas

The following `describe-schemas` example lists the available tables at an endpoint.

```
aws dms describe-schemas \
    --endpoint-arn "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA"
```

Output:

```
{
    "Schemas": [
        "prodrep"
    ]
}
```

For more information, see Working with AWS DMS endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeSchemas in *AWS CLI Command Reference*.

`export-metadata-model-assessment`

The following code example shows how to use `export-metadata-model-assessment`.

AWS CLI

To export a conversion assessment report

The following `export-metadata-model-assessment` example exports a conversion assessment report for all objects in the `ExampleSchema` schema.

```
aws dms export-metadata-model-assessment \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --selection-rules '{"rules": [{"rule-type": "selection", "rule-id": "1", "rule-name": "1", "object-locator": {"server-name": "example-source-server.us-west-2.rds.amazonaws.com", "schema-name": "ExampleSchema"}, "rule-action": "explicit"}]}' \
    --file-name example-assessment-report \
    --assessment-report-types pdf csv
```

Output:

```
{
    "PdfReport": {
        "S3ObjectKey": "example-migration-project/example-assessment-report.pdf",
        "ObjectURL": "https://amzn-s3-demo-bucket.s3.amazonaws.com/example-migration-project/example-assessment-report.pdf"
    },
    "CsvReport": {
        "S3ObjectKey": "example-migration-project/example-assessment-report.zip",
        "ObjectURL": "https://amzn-s3-demo-bucket.s3.amazonaws.com/example-migration-project/example-assessment-report.zip"
    }
}
```

For more information, see Creating database migration assessment reports in the *AWS Database Migration Service User Guide*.

- For API details, see ExportMetadataModelAssessment in *AWS CLI Command Reference*.

`get-target-selection-rules`

The following code example shows how to use `get-target-selection-rules`.

AWS CLI

To convert source selection rules to target selection rules

The following `get-target-selection-rules` example converts source selection rules that select the `ExampleTable` table in the `ExampleSchema` schema into target selection rules that reference its converted counterpart.

```
aws dms get-target-selection-rules \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --selection-rules '{"rules": [{"rule-type": "selection", "rule-id": "1", "rule-name": "1", "object-locator": {"server-name": "example-source-server.us-west-2.rds.amazonaws.com", "database-name": "ExampleDatabase", "schema-name": "ExampleSchema", "table-name": "ExampleTable"}, "rule-action": "explicit"}]}'
```

Output:

```
{
    "TargetSelectionRules": "{\"rules\": [{\"rule-type\": \"selection\", \"rule-id\": \"1\", \"rule-name\": \"1\", \"object-locator\": {\"server-name\": \"example-target-server.us-west-2.rds.amazonaws.com\", \"schema-name\": \"exampledatabase_exampleschema\", \"table-name\": \"exampletable\"}, \"rule-action\": \"explicit\"}]}"
}
```

For more information, see Using selection rules in the *AWS Database Migration Service User Guide*.

- For API details, see GetTargetSelectionRules in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for a replication instance.

```
aws dms list-tags-for-resource \
    --resource-arn arn:aws:dms:us-west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
    "TagList": [
        {
            "Key": "Project",
            "Value": "dbMigration"
        },
        {
            "Key": "Environment",
            "Value": "PROD"
        }
    ]
}
```

For more information, see Tagging Resources in the *AWS Database Migration Service User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`modify-conversion-configuration`

The following code example shows how to use `modify-conversion-configuration`.

AWS CLI

To modify a conversion configuration

The following `modify-conversion-configuration` example enables generative AI assisted conversion and updates a conversion path setting for a migration project.

```
aws dms modify-conversion-configuration \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --conversion-configuration '{"Common project settings": {"EnableGenAiConversion":true},"MSSQL_TO_AURORA_POSTGRESQL": {"ConvertProceduresToFunction":false}}'
```

Output:

```
{
    "MigrationProjectIdentifier": "arn:aws:dms:us-west-2:123456789012:migration-
project:EXAMPLEABCDEFGHIJKLMNOPQRS"
}
```

For more information, see Specifying schema conversion settings in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyConversionConfiguration in *AWS CLI Command Reference*.

`modify-data-provider`

The following code example shows how to use `modify-data-provider`.

AWS CLI

To modify a data provider

The following `modify-data-provider` example updates the description and server name of a data provider.

```
aws dms modify-data-provider \
    --data-provider-identifier arn:aws:dms:us-west-2:123456789012:data-
provider:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --description "Updated data provider description" \
    --engine sqlserver \
    --settings MicrosoftSqlServerSettings={ServerName=new-source-server.us-
west-2.rds.amazonaws.com}
```

Output:

```
{
    "DataProvider": {
        "DataProviderName": "example-data-provider",
        "DataProviderArn": "arn:aws:dms:us-west-2:123456789012:data-
provider:EXAMPLEABCDEFGHIJKLMNOPQRS",
        "DataProviderCreationTime": "2026-01-09T12:30:00.000000+00:00",
        "Description": "Updated data provider description",
        "Engine": "sqlserver",
        "Settings": {
```

```
            "MicrosoftSqlServerSettings": {
                "ServerName": "new-source-server.us-west-2.rds.amazonaws.com",
                "Port": 1433,
                "DatabaseName": "ExampleDatabase",
                "SslMode": "verify-full",
                "CertificateArn": "arn:aws:dms:us-
west-2:123456789012:cert:EXAMPLEABCDEFGHIJKLMNOPQRS"
            }
        }
    }
}
```

For more information, see Working with data providers in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyDataProvider in *AWS CLI Command Reference*.

`modify-endpoint`

The following code example shows how to use `modify-endpoint`.

AWS CLI

To modify an endpoint

The following `modify-endpoint` example adds an extra connection attribute to an endpoint.

```
aws dms modify-endpoint \
    --endpoint-arn "arn:aws:dms:us-
west-2:123456789012:endpoint:GUVAFG34EECU0J6QVZ56DAHT3U" \
    --extra-connection-attributes "compressionType=GZIP"
```

Output:

```
{
    "Endpoint": {
        "EndpointIdentifier": "src-endpoint",
        "EndpointType": "SOURCE",
        "EngineName": "s3",
        "EngineDisplayName": "Amazon S3",
        "ExtraConnectionAttributes":
 "compressionType=GZIP;csvDelimiter=,;csvRowDelimiter=\\n;",
        "Status": "active",
```

```
        "EndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:GUVAFG34EECUOJ6QVZ56DAHT3U",
        "SslMode": "none",
        "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
        "S3Settings": {
            "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-
role",
            "CsvRowDelimiter": "\\n",
            "CsvDelimiter": ",",
            "BucketFolder": "",
            "BucketName": "",
            "CompressionType": "GZIP",
            "EnableStatistics": true
        }
    }
}
```

For more information, see Working with AWS DMS endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyEndpoint in *AWS CLI Command Reference*.

`modify-event-subscription`

The following code example shows how to use `modify-event-subscription`.

AWS CLI

To modify an event subscription

The following `modify-event-subscription` example changes the source type of an event subscription.

```
aws dms modify-event-subscription \
    --subscription-name "my-dms-events" \
    --source-type replication-task
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "my-dms-events",
```

```
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:my-sns-topic",
        "Status": "modifying",
        "SubscriptionCreationTime": "2020-05-29 17:04:40.262",
        "SourceType": "replication-task",
        "Enabled": true
    }
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyEventSubscription in *AWS CLI Command Reference*.

`modify-instance-profile`

The following code example shows how to use `modify-instance-profile`.

AWS CLI

To modify an instance profile

The following `modify-instance-profile` example updates the description and network type of an instance profile.

```
aws dms modify-instance-profile \
    --instance-profile-identifier arn:aws:dms:us-west-2:123456789012:instance-profile:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --description "Updated instance profile description" \
    --network-type DUAL
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileArn": "arn:aws:dms:us-west-2:123456789012:instance-profile:EXAMPLEABCDEFGHIJKLMNOPQRS",
        "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PubliclyAccessible": false,
        "NetworkType": "DUAL",
        "InstanceProfileName": "example-instance-profile",
        "Description": "Updated instance profile description",
        "InstanceProfileCreationTime": "2026-01-09T12:30:00.000000+00:00",
```

```
        "SubnetGroupIdentifier": "example-replication-subnet-group",
        "VpcSecurityGroups": [
            "sg-0123456789abcdef0"
        ]
    }
}
```

For more information, see Working with instance profiles in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyInstanceProfile in *AWS CLI Command Reference*.

`modify-migration-project`

The following code example shows how to use `modify-migration-project`.

AWS CLI

To modify a migration project

The following `modify-migration-project` example updates the source data provider and description of a migration project.

```
aws dms modify-migration-project \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --description "Updated migration project description" \
    --source-data-provider-descriptors DataProviderIdentifier=arn:aws:dms:us-west-2:123456789012:data-provider:EXAMPLEABCDEFGHIJKLMNOPQRS
```

Output:

```
{
    "MigrationProject": {
        "MigrationProjectName": "example-migration-project",
        "MigrationProjectArn": "arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS",
        "MigrationProjectCreationTime": "2026-01-09T12:30:00.000000+00:00",
        "SourceDataProviderDescriptors": [
            {
                "SecretsManagerSecretId": "arn:aws:secretsmanager:us-west-2:123456789012:secret:example-source-secret-A1B2C3",
```

```
                "SecretsManagerAccessRoleArn": "arn:aws:iam::123456789012:role/
example-secrets-manager-role",
                "DataProviderName": "example-data-provider",
                "DataProviderArn": "arn:aws:dms:us-west-2:123456789012:data-
provider:EXAMPLEABCDEFGHIJKLMNOPQRS"
            }
        ],
        "TargetDataProviderDescriptors": [
            {
                "SecretsManagerSecretId": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:example-target-secret-A1B2C3",
                "SecretsManagerAccessRoleArn": "arn:aws:iam::123456789012:role/
example-secrets-manager-role",
                "DataProviderName": "example-data-provider",
                "DataProviderArn": "arn:aws:dms:us-west-2:123456789012:data-
provider:EXAMPLEABCDEFGHIJKLMNOPQRS"
            }
        ],
        "InstanceProfileArn": "arn:aws:dms:us-west-2:123456789012:instance-
profile:EXAMPLEABCDEFGHIJKLMNOPQRS",
        "InstanceProfileName": "example-instance-profile",
        "TransformationRules": "{\"rules\":[{\"rule-type\":\"transformation\",
\"rule-id\":\"1\",\"rule-name\":\"1\",\"rule-target\":\"schema\",\"rule-action
\":\"rename\",\"object-locator\":{\"schema-name\":\"ExampleSchema\"},\"value\":
\"TargetSchema\"}]}",
        "Description": "Updated migration project description",
        "SchemaConversionApplicationAttributes": {
            "S3BucketPath": "s3://amzn-s3-demo-bucket",
            "S3BucketRoleArn": "arn:aws:iam::123456789012:role/example-s3-access-
role"
        }
    }
}
```

For more information, see Working with migration projects in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyMigrationProject in *AWS CLI Command Reference*.

`modify-replication-instance`

The following code example shows how to use `modify-replication-instance`.

AWS CLI

To modify a replication instance

The following `modify-replication-instance` example modifies a replication instance so that it uses a Multi-AZ deployment.

```
aws dms modify-replication-instance \
    --replication-instance-arn arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE \
    --multi-az
```

Output:

```
{
    "ReplicationInstance": {
        "ReplicationInstanceIdentifier": "my-repl-instance",
        "ReplicationInstanceClass": "dms.t2.micro",
        "ReplicationInstanceStatus": "available",
        "AllocatedStorage": 5,
        "InstanceCreateTime": 1590011235.952,
        "PendingModifiedValues": {
            "MultiAZ": true
        },
        "MultiAZ": false,
        "EngineVersion": "3.3.2",
        "AutoMinorVersionUpgrade": true,
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE"
    }
}
```

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyReplicationInstance in *AWS CLI Command Reference*.

`modify-replication-subnet-group`

The following code example shows how to use `modify-replication-subnet-group`.

AWS CLI

To modify a subnet group

The following `modify-replication-subnet-group` example changes the lists of subnets associated with a subnet group.

```
aws dms modify-replication-subnet-group \
    --replication-subnet-group-identifier my-subnet-group \
    --subnet-ids subnet-da327bf6 subnet-bac383e0
```

Output:

```
{
    "ReplicationSubnetGroup": {
        "ReplicationSubnetGroupIdentifier": "my-subnet-group",
        "ReplicationSubnetGroupDescription": "my subnet group",
        "VpcId": "vpc-136a4c6a",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-da327bf6",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-bac383e0",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2c"
                },
                "SubnetStatus": "Active"
            }
        ]
    }
}
```

For more information, see Setting Up a Network for a Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyReplicationSubnetGroup in *AWS CLI Command Reference*.

`modify-replication-task`

The following code example shows how to use `modify-replication-task`.

AWS CLI

To modify a replication task

The following `modify-replication-task` example changes the table mappings for a task.

```
aws dms modify-replication-task \
    --replication-task-arn "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII" \
    --table-mappings file://table-mappings.json
```

Contents of `table-mappings.json`:

```
{
    "rules": [
        {
            "rule-type": "selection",
            "rule-id": "1",
            "rule-name": "1",
            "object-locator": {
                "schema-name": "prodrep",
                "table-name": "ACCT_%"
            },
            "rule-action": "include",
            "filters": []
        }
    ]
}
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
```

```
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "Status": "modifying",
        "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590789424.653,
        "ReplicationTaskArn": "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyReplicationTask in *AWS CLI Command Reference*.

`reboot-replication-instance`

The following code example shows how to use `reboot-replication-instance`.

AWS CLI

To reboot a replication instance

The following `reboot-replication-instance` example reboots a replication instance.

```
aws dms reboot-replication-instance \
    --replication-instance-arn arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
    "ReplicationInstance": {
        "ReplicationInstanceIdentifier": "my-repl-instance",
        "ReplicationInstanceClass": "dms.t2.micro",
        "ReplicationInstanceStatus": "rebooting",
        "AllocatedStorage": 5,
        "InstanceCreateTime": 1590011235.952,
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE"
```

```
    }
}
```

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see RebootReplicationInstance in *AWS CLI Command Reference*.

`refresh-schemas`

The following code example shows how to use `refresh-schemas`.

AWS CLI

To refresh database schemas

The following `refresh-schemas` example requests that AWS DMS refresh the list of schemas at an endpoint.

```
aws dms refresh-schemas \
    --replication-instance-arn arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE \
    --endpoint-arn "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA"
```

Output:

```
{
    "RefreshSchemasStatus": {
        "EndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "Status": "refreshing",
        "LastRefreshDate": 1590019949.103
    }
}
```

For more information, see Working with AWS DMS endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see RefreshSchemas in *AWS CLI Command Reference*.

`reload-tables`

The following code example shows how to use `reload-tables`.

AWS CLI

To refresh the list of tables available at an endpoint

The following `reload-tables` example reloads the list of available tables at an endpoint.

```
aws dms reload-tables \
    --replication-task-arn "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII" \
    --tables-to-reload "SchemaName=prodrep,TableName=ACCT_BAL"
```

Output:

```
{
    "ReplicationTaskArn": "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
}
```

For more information, see Reloading tables during a task in the *AWS Database Migration Service User Guide*.

- For API details, see ReloadTables in *AWS CLI Command Reference*.

`remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI

To remove tags from a replication instance

The following `remove-tags-from-resource` example removes tags from a replication instance.

```
aws dms remove-tags-from-resource \
    --resource-arn arn:aws:dms:us-west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
 \
```

```
    --tag-keys Environment Project
```

This command produces no output.

For more information, see Tagging Resources in the *AWS Database Migration Service User Guide*.

- For API details, see RemoveTagsFromResource in *AWS CLI Command Reference*.

`start-extension-pack-association`

The following code example shows how to use `start-extension-pack-association`.

AWS CLI

To apply an extension pack to the target database

The following `start-extension-pack-association` example queues the application of an extension pack to the target database.

```
aws dms start-extension-pack-association \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS
```

Output:

```
{
    "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Using extension packs in the *AWS Database Migration Service User Guide*.

- For API details, see StartExtensionPackAssociation in *AWS CLI Command Reference*.

`start-metadata-model-assessment`

The following code example shows how to use `start-metadata-model-assessment`.

AWS CLI

To assess all objects in a schema

The following `start-metadata-model-assessment` example queues an assessment of the conversion complexity for all objects in the `ExampleSchema` schema.

```
aws dms start-metadata-model-assessment \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --selection-rules '{"rules": [{"rule-type": "selection","rule-id": "1","rule-name": "1","object-locator": {"server-name": "example-source-server.us-west-2.rds.amazonaws.com", "schema-name": "ExampleSchema"},"rule-action": "explicit"}]}'
```

Output:

```
{
    "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Creating database migration assessment reports in the *AWS Database Migration Service User Guide*.

- For API details, see StartMetadataModelAssessment in *AWS CLI Command Reference*.

`start-metadata-model-conversion`

The following code example shows how to use `start-metadata-model-conversion`.

AWS CLI

To convert all objects in a schema

The following `start-metadata-model-conversion` example queues a conversion of all objects in the `ExampleSchema` schema to the target database format.

```
aws dms start-metadata-model-conversion \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --selection-rules '{"rules": [{"rule-type": "selection","rule-id": "1","rule-name": "1","object-locator": {"server-name": "example-source-server.us-west-2.rds.amazonaws.com", "schema-name": "ExampleSchema"},"rule-action": "explicit"}]}'
```

Output:

```
{
    "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Converting database schemas in the *AWS Database Migration Service User Guide*.

- For API details, see StartMetadataModelConversion in *AWS CLI Command Reference*.

`start-metadata-model-creation`

The following code example shows how to use `start-metadata-model-creation`.

AWS CLI

To create a metadata model for a SQL statement

The following `start-metadata-model-creation` example queues the creation of a metadata model for a SQL statement. The selection rule specifies the schema where the metadata model is placed, and `--metadata-model-name` provides a unique identifier for use in subsequent operations.

```
aws dms start-metadata-model-creation \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --selection-rules '{"rules": [{"rule-type": "selection", "rule-id": "1", "rule-name": "1", "object-locator": {"server-name": "example-source-server.us-west-2.rds.amazonaws.com", "database-name": "ExampleDatabase", "schema-name": "ExampleSchema"}, "rule-action": "explicit"}]}' \
    --metadata-model-name ExampleStatement \
    --properties StatementProperties={Definition="SELECT * FROM ExampleTable;"}
```

Output:

```
{
    "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Creating statement metadata models in the *AWS Database Migration Service User Guide*.

- For API details, see StartMetadataModelCreation in *AWS CLI Command Reference*.

`start-metadata-model-export-as-script`

The following code example shows how to use `start-metadata-model-export-as-script`.

AWS CLI

To export converted metadata models as DDL scripts

The following `start-metadata-model-export-as-script` example queues an export of converted metadata models for all objects in the `ExampleSchema` schema as data definition language (DDL) scripts to the Amazon S3 bucket associated with the migration project.

```
aws dms start-metadata-model-export-as-script \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --selection-rules '{"rules": [{"rule-type": "selection","rule-id": "1","rule-name": "1","object-locator": {"server-name": "example-target-server.us-west-2.rds.amazonaws.com", "schema-name": "ExampleSchema"},"rule-action": "explicit"}]}' \
    --origin TARGET \
    --file-name ExampleScript
```

Output:

```
{
    "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Saving your converted code to a SQL file in the *AWS Database Migration Service User Guide*.

- For API details, see StartMetadataModelExportAsScript in *AWS CLI Command Reference*.

`start-metadata-model-export-to-target`

The following code example shows how to use `start-metadata-model-export-to-target`.

AWS CLI

To export converted metadata models to the target database

The following `start-metadata-model-export-to-target` example queues an export of converted metadata models for all objects in the `ExampleSchema` schema to the target database.

```
aws dms start-metadata-model-export-to-target \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --selection-rules '{"rules": [{"rule-type": "selection","rule-id": "1","rule-name": "1","object-locator": {"server-name": "example-target-server.us-west-2.rds.amazonaws.com", "schema-name": "ExampleSchema"},"rule-action": "explicit"}]}' \
    --overwrite-extension-pack
```

Output:

```
{
    "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Applying your converted code in the *AWS Database Migration Service User Guide*.

- For API details, see StartMetadataModelExportToTarget in *AWS CLI Command Reference*.

`start-metadata-model-import`

The following code example shows how to use `start-metadata-model-import`.

AWS CLI

To import metadata from the source database

The following `start-metadata-model-import` example queues a metadata import for all objects in the `ExampleSchema` schema from the source database.

```
aws dms start-metadata-model-import \
    --migration-project-identifier arn:aws:dms:us-west-2:123456789012:migration-project:EXAMPLEABCDEFGHIJKLMNOPQRS \
    --selection-rules '{"rules": [{"rule-type": "selection","rule-id": "1","rule-name": "1","object-locator": {"server-name": "example-source-server.us-west-2.rds.amazonaws.com", "schema-name": "ExampleSchema"},"rule-action": "explicit"}]}' \
```

```
    --origin SOURCE \
    --no-refresh
```

Output:

```
{
    "RequestIdentifier": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Navigating the metadata model tree in the *AWS Database Migration Service User Guide*.

- For API details, see StartMetadataModelImport in *AWS CLI Command Reference*.

`start-replication-task-assessment`

The following code example shows how to use `start-replication-task-assessment`.

AWS CLI

To start a task assessment

The following `start-replication-task-assessment` example starts a replication task assessment.

```
aws dms start-replication-task-assessment \
    --replication-task-arn arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "Status": "testing",
```

```
        "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590789988.677,
        "ReplicationTaskArn": "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Creating a Task Assessment Report in the *AWS Database Migration Service User Guide*.

- For API details, see StartReplicationTaskAssessment in *AWS CLI Command Reference*.

`start-replication-task`

The following code example shows how to use `start-replication-task`.

AWS CLI

To start a replication task

The following `start-replication-task` example starts the specified replication task with the `reload-target` start type.

```
aws dms start-replication-task \
    --replication-task-arn arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII \
    --start-replication-task-type reload-target
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "Status": "starting",
```

```
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590619805.212,
        "ReplicationTaskArn": "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see StartReplicationTask in *AWS CLI Command Reference*.

`stop-replication-task`

The following code example shows how to use `stop-replication-task`.

AWS CLI

To stop a task

The following `stop-replication-task` example stops a task.

```
aws dms stop-replication-task \
    --replication-task-arn arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "Status": "stopping",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590789424.653,
        "ReplicationTaskArn": "arn:aws:dms:us-
west-2:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
```

```
    }
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see StopReplicationTask in *AWS CLI Command Reference*.

`test-connection`

The following code example shows how to use `test-connection`.

AWS CLI

To test a connection to an endpoint

The following `test-connection` example tests whether an endpoint can be accessed from a replication instance.

```
aws dms test-connection \
    --replication-instance-arn arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE \
    --endpoint-arn arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA
```

Output:

```
{
    "Connection": {
        "ReplicationInstanceArn": "arn:aws:dms:us-
west-2:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "EndpointArn": "arn:aws:dms:us-
west-2:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "Status": "testing",
        "EndpointIdentifier": "src-database-1",
        "ReplicationInstanceIdentifier": "my-repl-instance"
    }
}
```

For more information, see Creating source and target endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see TestConnection in *AWS CLI Command Reference*.

Amazon DocumentDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon DocumentDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add one or more tags to a specified resource

The following `add-tags-to-resource` example adds three tags to `sample-cluster`. One tag (`CropB`) has a key name but no value.

```
aws docdb add-tags-to-resource \
    --resource-name arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster \
    --tags Key="CropA",Value="Apple" Key="CropB" Key="CropC",Value="Corn"
```

This command produces no output.

For more information, see Tagging Amazon DocumentDB Resources in the *Amazon DocumentDB Developer Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

apply-pending-maintenance-action

The following code example shows how to use `apply-pending-maintenance-action`.

AWS CLI

To have pending maintenance actions take place during the next maintenance window

The following `apply-pending-maintenance-action` example causes all system-update actions to be performed during the next scheduled maintenance window.

```
aws docdb apply-pending-maintenance-action \
    --resource-identifier arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster
 \
    --apply-action system-update \
    --opt-in-type next-maintenance
```

This command produces no output.

For more information, see Applying Amazon DocumentDB Updates in the *Amazon DocumentDB Developer Guide*.

- For API details, see ApplyPendingMaintenanceAction in *AWS CLI Command Reference*.

copy-db-cluster-parameter-group

The following code example shows how to use `copy-db-cluster-parameter-group`.

AWS CLI

To duplicate an existing DB cluster parameter group

The following `copy-db-cluster-parameter-group` example makes a copy of the parameter group `custom-docdb3-6` named `custom-docdb3-6-copy`. When making the copy it adds tags to the new parameter group.

```
aws docdb copy-db-cluster-parameter-group \
    --source-db-cluster-parameter-group-identifier custom-docdb3-6 \
    --target-db-cluster-parameter-group-identifier custom-docdb3-6-copy \
    --target-db-cluster-parameter-group-description "Copy of custom-docdb3-6" \
    --tags Key="CopyNumber",Value="1" Key="Modifiable",Value="Yes"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "DBParameterGroupFamily": "docdb3.6",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-west-2:12345678901:cluster-
pg:custom-docdb3-6-copy",
        "DBClusterParameterGroupName": "custom-docdb3-6-copy",
        "Description": "Copy of custom-docdb3-6"
    }
}
```

For more information, see Copying an Amazon DocumentDB Cluster Parameter Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see CopyDbClusterParameterGroup in *AWS CLI Command Reference*.

`copy-db-cluster-snapshot`

The following code example shows how to use `copy-db-cluster-snapshot`.

AWS CLI

To create a copy of a snapshot

The following `copy-db-cluster-snapshot` example makes a copy of `sample-cluster-snapshot` named `sample-cluster-snapshot-copy`. The copy has all the tags of the original plus a new tag with the key name `CopyNumber`.

```
aws docdb copy-db-cluster-snapshot \
    --source-db-cluster-snapshot-identifier sample-cluster-snapshot \
    --target-db-cluster-snapshot-identifier sample-cluster-snapshot-copy \
    --copy-tags \
    --tags Key="CopyNumber",Value="1"
```

This command produces no output.

For more information, see Copying a Cluster Snapshot in the *Amazon DocumentDB Developer Guide*.

- For API details, see CopyDbClusterSnapshot in *AWS CLI Command Reference*.

`create-db-cluster-parameter-group`

The following code example shows how to use `create-db-cluster-parameter-group`.

AWS CLI

To create an Amazon DocumentDB cluster parameter group

The following `create-db-cluster-parameter-group` example creates the DB cluster parameter group `sample-parameter-group` using the `docdb3.6` family.

```
aws docdb create-db-cluster-parameter-group \
    --db-cluster-parameter-group-name sample-parameter-group \
    --db-parameter-group-family docdb3.6 \
    --description "Sample parameter group based on docdb3.6"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "Description": "Sample parameter group based on docdb3.6",
        "DBParameterGroupFamily": "docdb3.6",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-west-2:123456789012:cluster-
pg:sample-parameter-group",
        "DBClusterParameterGroupName": "sample-parameter-group"
    }
}
```

For more information, see Creating an Amazon DocumentDB Cluster Parameter Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see CreateDbClusterParameterGroup in *AWS CLI Command Reference*.

`create-db-cluster-snapshot`

The following code example shows how to use `create-db-cluster-snapshot`.

AWS CLI

To create a manual Amazon DocumentDB cluster snapshot

The following `create-db-cluster-snapshot` example creates an Amazon DB cluster snapshot named sample-cluster-snapshot.

```
aws docdb create-db-cluster-snapshot \
    --db-cluster-identifier sample-cluster \
    --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
    "DBClusterSnapshot": {
        "MasterUsername": "master-user",
        "SnapshotCreateTime": "2019-03-18T18:27:14.794Z",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2c",
            "us-west-2d",
            "us-west-2e",
            "us-west-2f"
        ],
        "SnapshotType": "manual",
        "DBClusterSnapshotArn": "arn:aws:rds:us-west-2:123456789012:cluster-
snapshot:sample-cluster-snapshot",
        "EngineVersion": "3.6.0",
        "PercentProgress": 0,
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
        "Engine": "docdb",
        "DBClusterIdentifier": "sample-cluster",
        "Status": "creating",
        "ClusterCreateTime": "2019-03-15T20:29:58.836Z",
        "Port": 0,
        "StorageEncrypted": false,
        "VpcId": "vpc-91280df6"
    }
}
```

For more information, see Creating a Manual Cluster Snapshot in the *Amazon DocumentDB Developer Guide*.

- For API details, see CreateDbClusterSnapshot in *AWS CLI Command Reference*.

`create-db-cluster`

The following code example shows how to use `create-db-cluster`.

AWS CLI

To create an Amazon DocumentDB cluster

The following `create-db-cluster` example creates an Amazon DocumentDB cluster named `sample-cluster` with the preferred maintenance window on Sundays between 20:30 and 11:00.

```
aws docdb create-db-cluster \
    --db-cluster-identifier sample-cluster \
    --engine docdb \
    --master-username master-user \
    --master-user-password password \
    --preferred-maintenance-window Sun:20:30-Sun:21:00
```

Output:

```
{
    "DBCluster": {
        "DBClusterParameterGroup": "default.docdb3.6",
        "AssociatedRoles": [],
        "DBSubnetGroup": "default",
        "ClusterCreateTime": "2019-03-18T18:06:34.616Z",
        "Status": "creating",
        "Port": 27017,
        "PreferredMaintenanceWindow": "sun:20:30-sun:21:00",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "DBClusterMembers": [],
        "Engine": "docdb",
        "DBClusterIdentifier": "sample-cluster",
        "PreferredBackupWindow": "10:12-10:42",
        "AvailabilityZones": [
            "us-west-2d",
            "us-west-2f",
            "us-west-2e"
        ],
        "MasterUsername": "master-user",
        "BackupRetentionPeriod": 1,
        "ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-77186e0d",
```

```
                "Status": "active"
            }
        ],
        "StorageEncrypted": false,
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster",
        "DbClusterResourceId": "cluster-L3R4YRSBUYDP4GLMTJ2WF5GH5Q",
        "MultiAZ": false,
        "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
        "EngineVersion": "3.6.0"
    }
}
```

For more information, see Creating an Amazon DocumentDB Cluster in the *Amazon DocumentDB Developer Guide*.

- For API details, see CreateDbCluster in *AWS CLI Command Reference*.

`create-db-instance`

The following code example shows how to use `create-db-instance`.

AWS CLI

To create an Amazon DocumentDB cluster instance

The following `create-db-instance` example code creates the instance `sample-cluster-instance-2` in the Amazon DocumentDB cluster `sample-cluster`.

```
aws docdb create-db-instance \
    --db-cluster-identifier sample-cluster \
    --db-instance-class db.r4.xlarge \
    --db-instance-identifier sample-cluster-instance-2 \
    --engine docdb
```

Output:

```
{
    "DBInstance": {
        "DBInstanceStatus": "creating",
        "PendingModifiedValues": {
            "PendingCloudwatchLogsExports": {
                "LogTypesToEnable": [
```

```
                "audit"
            ]
        }
    },
    "PubliclyAccessible": false,
    "PreferredBackupWindow": "00:00-00:30",
    "PromotionTier": 1,
    "EngineVersion": "3.6.0",
    "BackupRetentionPeriod": 3,
    "DBInstanceIdentifier": "sample-cluster-instance-2",
    "PreferredMaintenanceWindow": "tue:10:28-tue:10:58",
    "StorageEncrypted": false,
    "Engine": "docdb",
    "DBClusterIdentifier": "sample-cluster",
    "DBSubnetGroup": {
        "Subnets": [
            {
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                },
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-4e26d263"
            },
            {
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2c"
                },
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-afc329f4"
            },

            }
        ],
        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:sample-cluster-
instance-2",
        "DbiResourceId": "db-XEKJLEMGRV5ZKCARUVA4HO3ITE"
    }
}
```

For more information, see Adding an Amazon DocumentDB Instance to a Cluster in the *Amazon DocumentDB Developer Guide*.

- For API details, see CreateDbInstance in *AWS CLI Command Reference*.

`create-db-subnet-group`

The following code example shows how to use `create-db-subnet-group`.

AWS CLI

To create an Amazon DocumentDB subnet group

The following `create-db-subnet-group` example creates an Amazon DocumentDB subnet group named `sample-subnet-group`.

```
aws docdb create-db-subnet-group \
    --db-subnet-group-description "a sample subnet group" \
    --db-subnet-group-name sample-subnet-group \
    --subnet-ids "subnet-29ab1025" "subnet-991cb8d0" "subnet-53ab3636"
```

Output:

```
{

        ]
    }
}
```

For more information, see Creating an Amazon DocumentDB Subnet Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see CreateDbSubnetGroup in *AWS CLI Command Reference*.

`delete-db-cluster-parameter-group`

The following code example shows how to use `delete-db-cluster-parameter-group`.

AWS CLI

To delete an Amazon DocumentDB cluster parameter group

The following `delete-db-cluster-parameter-group` example deletes the Amazon DocumentDB parameter group `sample-parameter-group`.

```
aws docdb delete-db-cluster-parameter-group \
    --db-cluster-parameter-group-name sample-parameter-group
```

This command produces no output.

For more information, see Deleting an Amazon DocumentDB Cluster Parameter Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see DeleteDbClusterParameterGroup in *AWS CLI Command Reference*.

`delete-db-cluster-snapshot`

The following code example shows how to use `delete-db-cluster-snapshot`.

AWS CLI

To delete an Amazon DocumentDB cluster snapshot

The following `delete-db-cluster-snapshot` example deletes the Amazon DocumentDB cluster snapshot `sample-cluster-snapshot`.

```
aws docdb delete-db-cluster-snapshot \
    --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
    "DBClusterSnapshot": {
        "DBClusterIdentifier": "sample-cluster",
        "AvailabilityZones": [
            "us-west-2a",

- For API details, see DeleteDbClusterSnapshot in *AWS CLI Command Reference*.

`delete-db-cluster`

The following code example shows how to use `delete-db-cluster`.

AWS CLI

To delete an Amazon DocumentDB cluster

The following `delete-db-cluster` example deletes the Amazon DocumentDB cluster `sample-cluster`. No backup of the cluster is made prior to deleting it. NOTE: You must delete all instances associated with the cluster before you can delete it.

```
aws docdb delete-db-cluster \
    --db-cluster-identifier sample-cluster \
    --skip-final-snapshot
```

Output:

```
{
```

```
    "DBCluster": {

delete-db-instance

The following code example shows how to use `delete-db-instance`.

AWS CLI

To delete an Amazon DocumentDB instance

The following `delete-db-instance` example deletes the Amazon DocumentDB instance `sample-cluster-instance-2`.

```
aws docdb delete-db-instance \
    --db-instance-identifier sample-cluster-instance-2
```

Output:

```
{
    "DBInstance": {
        "DBSubnetGroup": {
            "Subnets": [
                {

    }
}
```

For more information, see Deleting an Amazon DocumentDB Instance in the *Amazon DocumentDB Developer Guide*.

- For API details, see DeleteDbInstance in *AWS CLI Command Reference*.

`delete-db-subnet-group`

The following code example shows how to use `delete-db-subnet-group`.

AWS CLI

To delete an Amazon DocumentDB subnet group

The following `delete-db-subnet-group` example deletes the Amazon DocumentDB subnet group `sample-subnet-group`.

```
aws docdb delete-db-subnet-group \
    --db-subnet-group-name sample-subnet-group
```

This command produces no output.

For more information, see Deleting an Amazon DocumentDB Subnet Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see DeleteDbSubnetGroup in *AWS CLI Command Reference*.

`describe-db-cluster-parameter-groups`

The following code example shows how to use `describe-db-cluster-parameter-groups`.

AWS CLI

To see the details of one or more Amazon DocumentDB cluster parameter groups

The following `describe-db-cluster-parameter-groups` example displays details for the Amazon DocumentDB cluster parameter group `custom3-6-param-grp`.

```
aws docdb describe-db-cluster-parameter-groups \
    --db-cluster-parameter-group-name custom3-6-param-grp
```

Output:

```
{
    "DBClusterParameterGroups": [
        {
            "DBParameterGroupFamily": "docdb3.6",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
west-2:123456789012:cluster-pg:custom3-6-param-grp",
            "Description": "Custom docdb3.6 parameter group",
            "DBClusterParameterGroupName": "custom3-6-param-grp"
        }
    ]
}
```

For more information, see Viewing Amazon DocumentDB Cluster Parameter Groups in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbClusterParameterGroups in *AWS CLI Command Reference*.

`describe-db-cluster-parameters`

The following code example shows how to use `describe-db-cluster-parameters`.

AWS CLI

To view the detailed parameter list for an Amazon DocumentDB cluster parameter group.

The following `describe-db-cluster-parameters` example lists the parameters for the Amazon DocumentDB parameter group custom3-6-param-grp.

```
aws docdb describe-db-cluster-parameters \
    --db-cluster-parameter-group-name custom3-6-param-grp
```

Output:

```
{
    "Parameters": [
        {
```

```
            "DataType": "string",
            "ParameterName": "audit_logs",
            "IsModifiable": true,
            "ApplyMethod": "pending-reboot",
            "Source": "system",
            "ApplyType": "dynamic",
            "AllowedValues": "enabled,disabled",
            "Description": "Enables auditing on cluster.",
            "ParameterValue": "disabled"
        },
        {
            "DataType": "string",
            "ParameterName": "tls",
            "IsModifiable": true,
            "ApplyMethod": "pending-reboot",
            "Source": "system",
            "ApplyType": "static",
            "AllowedValues": "disabled,enabled",
            "Description": "Config to enable/disable TLS",
            "ParameterValue": "enabled"
        },
        {
            "DataType": "string",
            "ParameterName": "ttl_monitor",
            "IsModifiable": true,
            "ApplyMethod": "pending-reboot",
            "Source": "user",
            "ApplyType": "dynamic",
            "AllowedValues": "disabled,enabled",
            "Description": "Enables TTL Monitoring",
            "ParameterValue": "enabled"
        }
    ]
}
```

For more information, see Describing Amazon DocumentDB cluster parameter groups in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbClusterParameters in *AWS CLI Command Reference*.

`describe-db-cluster-snapshot-attributes`

The following code example shows how to use `describe-db-cluster-snapshot-attributes`.

AWS CLI

To list an Amazon DocumentDB snapshot attribute names and values

The following `describe-db-cluster-snapshot-attributes` example lists the attribute names and values for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.

```
aws docdb describe-db-cluster-snapshot-attributes \
    --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": []
            }
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
    }
}
```

For more information, see DescribeDBClusterSnapshotAttributes in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbClusterSnapshotAttributes in *AWS CLI Command Reference*.

`describe-db-cluster-snapshots`

The following code example shows how to use `describe-db-cluster-snapshots`.

AWS CLI

To describe Amazon DocumentDB snapshots

The following `describe-db-cluster-snapshots` example displays details for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.

```
aws docdb describe-db-cluster-snapshots \
    --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
    "DBClusterSnapshots": [
        {
            "AvailabilityZones": [
                "us-west-2a",
                "us-west-2b",
                "us-west-2c",
                "us-west-2d"
            ],
            "Status": "available",
            "DBClusterSnapshotArn": "arn:aws:rds:us-west-2:123456789012:cluster-
snapshot:sample-cluster-snapshot",
            "SnapshotCreateTime": "2019-03-15T20:41:26.515Z",
            "SnapshotType": "manual",
            "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
            "DBClusterIdentifier": "sample-cluster",
            "MasterUsername": "master-user",
            "StorageEncrypted": false,
            "VpcId": "vpc-91280df6",
            "EngineVersion": "3.6.0",
            "PercentProgress": 100,
            "Port": 0,
            "Engine": "docdb",
            "ClusterCreateTime": "2019-03-15T20:29:58.836Z"
        }
    ]
}
```

For more information, see DescribeDBClusterSnapshots in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbClusterSnapshots in *AWS CLI Command Reference*.

`describe-db-clusters`

The following code example shows how to use `describe-db-clusters`.

AWS CLI

To get detailed information about one or more Amazon DocumentDB clusters.

The following `describe-db-clusters` example displays details for the Amazon DocumentDB cluster `sample-cluster`. By omitting the `--db-cluster-identifier` parameter you can get information of up to 100 clusters.

```
aws docdb describe-db-clusters \
    --db-cluster-identifier sample-cluster
```

Output:

```
{
    "DBClusters": [
        {
            "DBClusterParameterGroup": "default.docdb3.6",
            "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",

`describe-db-engine-versions`

The following code example shows how to use `describe-db-engine-versions`.

AWS CLI

To list available Amazon DocumentDB engine versions

The following `describe-db-engine-versions` example lists all available Amazon DocumentDB engine versions.

```
aws docdb describe-db-engine-versions \
    --engine docdb
```

Output:

```
{
    "DBEngineVersions": [
        {
            "DBEngineVersionDescription": "DocDB version 1.0.200837",
            "DBParameterGroupFamily": "docdb3.6",
            "EngineVersion": "3.6.0",
            "ValidUpgradeTarget": [],
            "DBEngineDescription": "Amazon DocumentDB (with MongoDB compatibility)",
            "SupportsLogExportsToCloudwatchLogs": true,
            "Engine": "docdb",
            "ExportableLogTypes": [
                "audit"
            ]
        }
    ]
}
```

For more information, see DescribeDBEngineVersions in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbEngineVersions in *AWS CLI Command Reference*.

`describe-db-instances`

The following code example shows how to use `describe-db-instances`.

AWS CLI

To find information about provisioned Amazon DocumentDB instances

The following `describe-db-instances` example displays details for about the Amazon DocumentDB instance `sample-cluster-instance`. By omitting the `--db-instance-identifier` parameter you get information on up to 100 instances.

```
aws docdb describe-db-instances \
    --db-instance-identifier sample-cluster-instance
```

Output:

```
{
    "DBInstances": [
        {
            "Endpoint": {
                "HostedZoneId": "ZNKXH85TT8WVW",
                "Address": "sample-cluster-instance.corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
                "Port": 27017
            },
            "PreferredBackupWindow": "00:00-00:30",
            "DBInstanceStatus": "available",
            "DBInstanceClass": "db.r4.large",
            "EnabledCloudwatchLogsExports": [
                "audit"
            ],
            "DBInstanceIdentifier": "sample-cluster-instance",
            "DBSubnetGroup": {

`describe-db-subnet-groups`

The following code example shows how to use `describe-db-subnet-groups`.

AWS CLI

To retrieve a list of Amazon DocumentDB subnet descriptions

The following `describe-db-subnet-groups` example describes details for the Amazon DocumentDB subnet named `default`.

```
aws docdb describe-db-subnet-groups \
    --db-subnet-group-name default
```

Output:

```
{
    "DBSubnetGroups": [
        {
            "VpcId": "vpc-91280df6",
            "DBSubnetGroupArn": "arn:aws:rds:us-west-2:123456789012:subgrp:default",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-4e26d263",
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    }
                },
                {
                    "SubnetIdentifier": "subnet-afc329f4",
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    }
                },
                {
                    "SubnetIdentifier": "subnet-53ab3636",
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2d"
                    }
                },
                {
                    "SubnetIdentifier": "subnet-991cb8d0",
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
```

```
                        "Name": "us-west-2b"
                    }
                }
            ],
            "DBSubnetGroupName": "default",
            "SubnetGroupStatus": "Complete",
            "DBSubnetGroupDescription": "default"
        }
    ]
}
```

For more information, see Describing an Amazon DocumentDB subnet group in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbSubnetGroups in *AWS CLI Command Reference*.

`describe-engine-default-cluster-parameters`

The following code example shows how to use `describe-engine-default-cluster-parameters`.

AWS CLI

To describe the default engine and system parameter information for Amazon DocumentDB

The following `describe-engine-default-cluster-parameters` example displays details for the default engine and system parameter information for the Amazon DocumentDB parameter group `docdb3.6`.

```
aws docdb describe-engine-default-cluster-parameters \
    --db-parameter-group-family docdb3.6
```

Output:

```
{
    "EngineDefaults": {
        "DBParameterGroupFamily": "docdb3.6",
        "Parameters": [
            {
                "ApplyType": "dynamic",
                "ParameterValue": "disabled",
```

```
                "Description": "Enables auditing on cluster.",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "enabled,disabled",
                "ParameterName": "audit_logs",
                "IsModifiable": true
            },
            {
                "ApplyType": "static",
                "ParameterValue": "enabled",
                "Description": "Config to enable/disable TLS",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "disabled,enabled",
                "ParameterName": "tls",
                "IsModifiable": true
            },
            {
                "ApplyType": "dynamic",
                "ParameterValue": "enabled",
                "Description": "Enables TTL Monitoring",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "disabled,enabled",
                "ParameterName": "ttl_monitor",
                "IsModifiable": true
            }
        ]
    }
}
```

For more information, see DescribeEngineDefaultClusterParameters in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeEngineDefaultClusterParameters in *AWS CLI Command Reference*.

`describe-event-categories`

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe all Amazon DocumentDB event categories

The following `describe-event-categories` example lists all categories for the Amazon DocumentDB event source type `db-instance`.

```
aws docdb describe-event-categories \
    --source-type db-cluster
```

Output:

```
{
    "EventCategoriesMapList": [
        {
            "SourceType": "db-cluster",
            "EventCategories": [
                "failover",
                "maintenance",
                "notification",
                "failure"
            ]
        }
    ]
}
```

For more information, see Viewing Amazon DocumentDB event categories in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeEventCategories in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To list Amazon DocumentDB events

The following `describe-events` example list all the Amazon DocumentDB events for the last 24 hours (1440 minutes).

```
aws docdb describe-events \
    --duration 1440
```

This command produces no output. Output:

```
{
    "Events": [
        {
            "EventCategories": [
                "failover"
            ],
            "Message": "Started cross AZ failover to DB instance: sample-cluster",

`describe-orderable-db-instance-options`

The following code example shows how to use `describe-orderable-db-instance-options`.

AWS CLI

To find the Amazon DocumentDB instance options you can order

The following `describe-orderable-db-instance-options` example lists all instance options for Amazon DocumentDB for a region.

```
aws docdb describe-orderable-db-instance-options \
    --engine docdb
```

Output:

```
{
    "OrderableDBInstanceOptions": [
```

```
        {
            "Vpc": true,
            "AvailabilityZones": [
                {
                    "Name": "us-west-2a"
                },
                {
                    "Name": "us-west-2b"
                },
                {
                    "Name": "us-west-2c"
                },
                {
                    "Name": "us-west-2d"
                }
            ],
            "EngineVersion": "3.6.0",
            "DBInstanceClass": "db.r4.16xlarge",
            "LicenseModel": "na",
            "Engine": "docdb"
        },
        {

                {
                    "Name": "us-west-2b"
                },
                {
                    "Name": "us-west-2c"
                },
                {
                    "Name": "us-west-2d"
                }
            ],
            "EngineVersion": "3.6.0",
            "DBInstanceClass": "db.r4.xlarge",
            "LicenseModel": "na",
            "Engine": "docdb"
        }
    ]
}
```

For more information, see Adding an Amazon DocumentDB Instance to a Cluster in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeOrderableDbInstanceOptions in *AWS CLI Command Reference*.

`describe-pending-maintenance-actions`

The following code example shows how to use `describe-pending-maintenance-actions`.

AWS CLI

To list your pending Amazon DocumentDB maintenance actions

The following `describe-pending-maintenance-actions` example lists all your pending Amazon DocumentDB maintenance actions.

```
aws docdb describe-pending-maintenance-actions
```

Output:

```
{
    "PendingMaintenanceActions": []
}
```

For more information, see Maintaining Amazon DocumentDB in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribePendingMaintenanceActions in *AWS CLI Command Reference*.

`failover-db-cluster`

The following code example shows how to use `failover-db-cluster`.

AWS CLI

To force an Amazon DocumentDB cluster to failover to a replica

The following `failover-db-cluster` example causes the primary instance in the Amazon DocumentDB cluster sample-cluster to failover to a replica.

```
aws docdb failover-db-cluster \
    --db-cluster-identifier sample-cluster
```

Output:

```
{
    "DBCluster": {
        "AssociatedRoles": [],
        "DBClusterIdentifier": "sample-cluster",
        "EngineVersion": "3.6.0",

west-2.docdb.amazonaws.com",
        "Engine": "docdb"
    }
}
```

For more information, see Amazon DocumentDB Failover in the *Amazon DocumentDB Developer Guide*.

- For API details, see FailoverDbCluster in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all the tags on an Amazon DocumentDB resource

The following `list-tags-for-resource` example lists all tags on the Amazon DocumentDB cluster `sample-cluster`.

```
aws docdb list-tags-for-resource \
    --resource-name arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster
```

Output:

```
{
    "TagList": [
        {
            "Key": "A",
            "Value": "ALPHA"
        },
```

```
        {
            "Key": "B",
            "Value": ""
        },
        {
            "Key": "C",
            "Value": "CHARLIE"
        }
    ]
}
```

For more information, see Listing Tags on an Amazon DocumentDB Resource in the *Amazon DocumentDB Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`modify-db-cluster-parameter-group`

The following code example shows how to use `modify-db-cluster-parameter-group`.

AWS CLI

To modify an Amazon DocumentDB DB cluster parameter group

The following `modify-db-cluster-parameter-group` example modifies the Amazon DocumentDB cluster parameter group `custom3-6-param-grp` by setting the two parameters `audit_logs` and `ttl_monitor` to enabled. The changes are applied at the next reboot.

```
aws docdb modify-db-cluster-parameter-group \
    --db-cluster-parameter-group-name custom3-6-param-grp \
    --
parameters ParameterName=audit_logs,ParameterValue=enabled,ApplyMethod=pending-
reboot ParameterName=ttl_monitor,ParameterValue=enabled,ApplyMethod=pending-reboot
```

Output:

```
{
    "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see Modifying an Amazon DocumentDB Cluster Parameter Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see ModifyDbClusterParameterGroup in *AWS CLI Command Reference*.

`modify-db-cluster-snapshot-attribute`

The following code example shows how to use `modify-db-cluster-snapshot-attribute`.

AWS CLI

Example 1: To add an attribute to an Amazon DocumentDB snapshot

The following `modify-db-cluster-snapshot-attribute` example adds four attribute values to an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
    --db-cluster-snapshot-identifier sample-cluster-snapshot \
    --attribute-name restore \
    --values-to-add 123456789111 123456789222 123456789333
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789111",
                    "123456789222",
                    "123456789333"
                ]
            }
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
    }
}
```

Example 2: To remove attributes from an Amazon DocumentDB snapshot

The following `modify-db-cluster-snapshot-attribute` example removes two attribute values from an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
```

```
    --db-cluster-snapshot-identifier sample-cluster-snapshot \
    --attribute-name restore \
    --values-to-remove 123456789222
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789111",
                    "123456789333"
                ]
            }
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
    }
}
```

For more information, see ModifyDBClusterSnapshotAttribute in the *Amazon DocumentDB Developer Guide*.

- For API details, see ModifyDbClusterSnapshotAttribute in *AWS CLI Command Reference*.

`modify-db-cluster`

The following code example shows how to use `modify-db-cluster`.

AWS CLI

To modify an Amazon DocumentDB cluster

The following `modify-db-cluster` example modifies the Amazon DocumentDB cluster `sample-cluster` by making the retention period for automatic backups 7 days, and changing the preferred windows for both backups and maintenance. All changes are applied at the next maintenance window.

```
aws docdb modify-db-cluster \
    --db-cluster-identifier sample-cluster \
    --no-apply-immediately \
```

```
    --backup-retention-period 7 \
    --preferred-backup-window 18:00-18:30 \
    --preferred-maintenance-window sun:20:00-sun:20:30
```

Output:

```
{
    "DBCluster": {
        "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
        "DBClusterMembers": [
            {
                "DBClusterParameterGroupStatus": "in-sync",
                "DBInstanceIdentifier": "sample-cluster",
                "IsClusterWriter": true,
                "PromotionTier": 1
            },
            {
                "DBClusterParameterGroupStatus": "in-sync",
                "DBInstanceIdentifier": "sample-cluster2",
                "IsClusterWriter": false,
                "PromotionTier": 2
            }
        ],
        "HostedZoneId": "ZNKXH85TT8WVW",
        "StorageEncrypted": false,
        "PreferredBackupWindow": "18:00-18:30",
        "MultiAZ": true,
        "EngineVersion": "3.6.0",
        "MasterUsername": "master-user",
        "ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",

            {
                "VpcSecurityGroupId": "sg-77186e0d",
                "Status": "active"
            }
        ],
        "Port": 27017
    }
}
```

For more information, see Modifying an Amazon DocumentDB Cluster in the *Amazon DocumentDB Developer Guide*.

- For API details, see ModifyDbCluster in *AWS CLI Command Reference*.

`modify-db-instance`

The following code example shows how to use `modify-db-instance`.

AWS CLI

To modify an Amazon DocumentDB instance

The following `modify-db-instance` example modifies the Amazon DocumentDB instance `sample-cluster2` by changing its instance class to `db.r4.4xlarge` and its promotion tier to 5. The changes are applied immediately but can only be seen after the instances status is available.

```
aws docdb modify-db-instance \
    --db-instance-identifier sample-cluster2 \
    --apply-immediately \
    --db-instance-class db.r4.4xlarge \
```

```
    --promotion-tier 5
```

Output:

```
{
    "DBInstance": {
        "EngineVersion": "3.6.0",
        "StorageEncrypted": false,
        "DBInstanceClass": "db.r4.large",

For more information, see Modifying an Amazon DocumentDB Instance in the *Amazon DocumentDB Developer Guide*.

- For API details, see ModifyDbInstance in *AWS CLI Command Reference*.

`modify-db-subnet-group`

The following code example shows how to use `modify-db-subnet-group`.

AWS CLI

To modify an Amazon DocumentDB subnet group

The following `modify-db-subnet-group` example modifies the subnet group `sample-subnet-group` by adding the specified subnets and a new description.

```
aws docdb modify-db-subnet-group \
    --db-subnet-group-name sample-subnet-group \
    --subnet-ids subnet-b3806e8f subnet-53ab3636 subnet-991cb8d0 \
    --db-subnet-group-description "New subnet description"
```

Output:

```
{
    "DBSubnetGroup": {
        "DBSubnetGroupName": "sample-subnet-group",
        "SubnetGroupStatus": "Complete",
        "DBSubnetGroupArn": "arn:aws:rds:us-west-2:123456789012:subgrp:sample-
subnet-group",
        "VpcId": "vpc-91280df6",
        "DBSubnetGroupDescription": "New subnet description",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-b3806e8f",
                "SubnetStatus": "Active",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                }
            },
            {
                "SubnetIdentifier": "subnet-53ab3636",
                "SubnetStatus": "Active",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2c"
                }
            },
            {
                "SubnetIdentifier": "subnet-991cb8d0",
```

```
                "SubnetStatus": "Active",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                }
            }
        ]
    }
}
```

For more information, see Modifying an Amazon DocumentDB Subnet Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see ModifyDbSubnetGroup in *AWS CLI Command Reference*.

`reboot-db-instance`

The following code example shows how to use `reboot-db-instance`.

AWS CLI

To reboot an Amazon DocumentDB instance

The following `reboot-db-instance` example reboots the Amazon DocumentDB instance `sample-cluster2`.

```
aws docdb reboot-db-instance \
    --db-instance-identifier sample-cluster2
```

This command produces no output. Output:

```
{
    "DBInstance": {
        "PreferredBackupWindow": "18:00-18:30",
        "DBInstanceIdentifier": "sample-cluster2",
        "VpcSecurityGroups": [
            {
                "Status": "active",
                "VpcSecurityGroupId": "sg-77186e0d"
            }
        ],
        "DBSubnetGroup": {
            "VpcId": "vpc-91280df6",
            "Subnets": [
```

```
                {
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    },
                    "SubnetIdentifier": "subnet-4e26d263"
                },
                {
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    },
                    "SubnetIdentifier": "subnet-afc329f4"
                },
                {
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2d"
                    },
                    "SubnetIdentifier": "subnet-53ab3636"
                },
                {
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2b"
                    },
                    "SubnetIdentifier": "subnet-991cb8d0"
                }
            ],
            "SubnetGroupStatus": "Complete",
            "DBSubnetGroupName": "default",
            "DBSubnetGroupDescription": "default"
        },
        "PendingModifiedValues": {},
        "Endpoint": {
            "Address": "sample-cluster2.corcjozrlsfc.us-west-2.docdb.amazonaws.com",

        "PromotionTier": 5,
        "BackupRetentionPeriod": 7,
        "DBClusterIdentifier": "sample-cluster",
        "PreferredMaintenanceWindow": "mon:08:39-mon:09:09",
        "PubliclyAccessible": false,
        "DBInstanceClass": "db.r4.4xlarge",
        "AvailabilityZone": "us-west-2d",
        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:sample-cluster2",
        "DBInstanceStatus": "rebooting"
    }
}
```

For more information, see Rebooting an Amazon DocumentDB ILnstance in the *Amazon DocumentDB Developer Guide*.

- For API details, see RebootDbInstance in *AWS CLI Command Reference*.

`remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI

To remove tags from an Amazon DocumentDB resource

The following `remove-tags-from-resource` example removes the tag with the key named `B` from the Amazon DocumentDB cluster `sample-cluster`.

```
aws docdb remove-tags-from-resource \
    --resource-name arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster \
    --tag-keys B
```

This command produces no output.

For more information, see Removing Tags from an Amazon DocumentDBResource in the *Amazon DocumentDB Developer Guide*.

- For API details, see RemoveTagsFromResource in *AWS CLI Command Reference*.

`reset-db-cluster-parameter-group`

The following code example shows how to use `reset-db-cluster-parameter-group`.

AWS CLI

Example 1: To reset the specified parameter value to its defaults in an Amazon DocumentDB parameter group

The following `reset-db-cluster-parameter-group` example resets the parameter `ttl_monitor` in the Amazon DocumentDB parameter group `custom3-6-param-grp` to its default value.

```
aws docdb reset-db-cluster-parameter-group \
    --db-cluster-parameter-group-name custom3-6-param-grp \
    --parameters ParameterName=ttl_monitor,ApplyMethod=immediate
```

Output:

```
{
    "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see title in the *Amazon DocumentDB Developer Guide*.

Example 2: To reset specified or all parameter values to their defaults in an Amazon DocumentDB parameter group

The following `reset-db-cluster-parameter-group` example resets all parameters in the Amazon DocumentDB parameter group `custom3-6-param-grp` to their default value.

```
aws docdb reset-db-cluster-parameter-group \
    --db-cluster-parameter-group-name custom3-6-param-grp \
    --reset-all-parameters
```

Output:

```
{
    "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see Resetting an Amazon DocumentDB Cluster Parameter Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see ResetDbClusterParameterGroup in *AWS CLI Command Reference*.

`restore-db-cluster-from-snapshot`

The following code example shows how to use `restore-db-cluster-from-snapshot`.

AWS CLI

To restore an Amazon DocumentDB cluster from an automatic or manual snapshot

The following `restore-db-cluster-from-snapshot` example creates a new Amazon DocumentDB cluster named `sample-cluster-2019-03-16-00-01-restored` from the snapshot `rds:sample-cluster-2019-03-16-00-01`.

```
aws docdb restore-db-cluster-from-snapshot \
    --db-cluster-identifier sample-cluster-2019-03-16-00-01-restored \
    --engine docdb \
    --snapshot-identifier rds:sample-cluster-2019-03-16-00-01
```

Output:

```
{
    "DBCluster": {
        "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "Engine": "docdb",
        "DBClusterMembers": [],
        "MultiAZ": false,
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2c",
            "us-west-2b"
        ],
        "StorageEncrypted": false,
        "ReaderEndpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-ro-
corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "Endpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-
corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "Port": 27017,
```

```
        "PreferredBackupWindow": "00:00-00:30",
        "DBSubnetGroup": "default",
        "DBClusterIdentifier": "sample-cluster-2019-03-16-00-01-restored",
        "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-
cluster-2019-03-16-00-01-restored",
        "DBClusterParameterGroup": "default.docdb3.6",
        "DbClusterResourceId": "cluster-XOO46Q3RH4LWSYNH3NMZKXPISU",
        "MasterUsername": "master-user",

            {
                "Status": "active",
                "VpcSecurityGroupId": "sg-77186e0d"
            }
        ]
    }
}
```

For more information, see Restoring from a Cluster Snapshot in the *Amazon DocumentDB Developer Guide*.

- For API details, see RestoreDbClusterFromSnapshot in *AWS CLI Command Reference*.

`restore-db-cluster-to-point-in-time`

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

AWS CLI

To restore an Amazon DocumentDB cluster to a point-in-time from a manual snapshot

The following `restore-db-cluster-to-point-in-time` example uses the `sample-cluster-snapshot` to create a new Amazon DocumentDB cluster, `sample-cluster-pit`, using the latest restorable time.

```
aws docdb restore-db-cluster-to-point-in-time \
    --db-cluster-identifier sample-cluster-pit \
    --source-db-cluster-identifier arn:aws:rds:us-
west-2:123456789012:cluster:sample-cluster \
```

```
    --use-latest-restorable-time
```

Output:

```
{
    "DBCluster": {
        "StorageEncrypted": false,
        "BackupRetentionPeriod": 3,
        "MasterUsername": "master-user",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "PreferredBackupWindow": "00:00-00:30",
        "MultiAZ": false,
        "DBClusterIdentifier": "sample-cluster-pit",
        "DBSubnetGroup": "default",
        "ClusterCreateTime": "2019-04-03T15:55:21.320Z",
        "AssociatedRoles": [],
        "DBClusterParameterGroup": "default.docdb3.6",
        "DBClusterMembers": [],
        "Status": "creating",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2d",
            "us-west-2b"
        ],
        "ReaderEndpoint": "sample-cluster-pit.cluster-ro-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
        "Port": 27017,
        "Engine": "docdb",
        "EngineVersion": "3.6.0",
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-77186e0d",
                "Status": "active"
            }
        ],
        "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
        "Endpoint": "sample-cluster-pit.cluster-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
        "DbClusterResourceId": "cluster-NLCABBXOSE2QPQ4GOLZIFWEPLM",
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster-
pit"
    }
}
```

For more information, see Restoring to a point in time in the *Amazon DocumentDB Developer Guide*.

- For API details, see RestoreDbClusterToPointInTime in *AWS CLI Command Reference*.

`start-db-cluster`

The following code example shows how to use `start-db-cluster`.

AWS CLI

To start a stopped Amazon DocumentDB cluster

The following `start-db-cluster` example starts the specified Amazon DocumentDB cluster.

```
aws docdb start-db-cluster \
    --db-cluster-identifier sample-cluster
```

Output:

```
{
    "DBCluster": {
        "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "Engine": "docdb",
        "DBClusterMembers": [],
        "MultiAZ": false,
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2c",
            "us-west-2d"
        ],
        "StorageEncrypted": false,
        "ReaderEndpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-ro-
corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "Endpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-
corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "Port": 27017,
        "PreferredBackupWindow": "00:00-00:30",
        "DBSubnetGroup": "default",
        "DBClusterIdentifier": "sample-cluster-2019-03-16-00-01-restored",
        "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
```

```
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-
cluster-2019-03-16-00-01-restored",
        "DBClusterParameterGroup": "default.docdb3.6",
        "DbClusterResourceId": "cluster-XOO46Q3RH4LWSYNH3NMZKXPISU",
        "MasterUsername": "master-user",
        "EngineVersion": "3.6.0",
        "BackupRetentionPeriod": 3,
        "AssociatedRoles": [],
        "Status": "creating",
        "VpcSecurityGroups": [
            {
                "Status": "active",
                "VpcSecurityGroupId": "sg-77186e0d"
            }
        ]
    }
}
```

For more information, see Stopping and Starting an Amazon DocumentDB Cluster in the *Amazon DocumentDB Developer Guide*.

- For API details, see StartDbCluster in *AWS CLI Command Reference*.

`stop-db-cluster`

The following code example shows how to use `stop-db-cluster`.

AWS CLI

To stop a running Amazon DocumentDB cluster

The following `stop-db-cluster` example stops the specified Amazon DocumentDB cluster.

```
aws docdb stop-db-cluster \
    --db-cluster-identifier sample-cluster
```

Output:

```
{
    "DBCluster": {
        "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
        "HostedZoneId": "ZNKXH85TT8WVW",
```

```
        "Engine": "docdb",
        "DBClusterMembers": [],
        "MultiAZ": false,
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2c",
            "us-west-2d"
        ],
        "StorageEncrypted": false,
        "ReaderEndpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-ro-

DynamoDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-get-item`

The following code example shows how to use `batch-get-item`.

AWS CLI

To retrieve multiple items from a table

The following `batch-get-item` example reads multiple items from the `MusicCollection` table using a batch of three `GetItem` requests, and requests the number of read capacity units consumed by the operation. The command returns only the `AlbumTitle` attribute.

```
aws dynamodb batch-get-item \
    --request-items file://request-items.json \
    --return-consumed-capacity TOTAL
```

Contents of `request-items.json`:

```
{
    "MusicCollection": {
        "Keys": [
            {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"}
            },
```

```
            {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
            },
            {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Scared of My Shadow"}
            }
        ],
        "ProjectionExpression":"AlbumTitle"
    }
}
```

Output:

```
{
    "Responses": {
        "MusicCollection": [
            {
                "AlbumTitle": {
                    "S": "Somewhat Famous"
                }
            },
            {
                "AlbumTitle": {
                    "S": "Blue Sky Blues"
                }
            },
            {
                "AlbumTitle": {
                    "S": "Louder Than Ever"
                }
            }
        ]
    },
    "UnprocessedKeys": {},
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 1.5
        }
    ]
}
```

For more information, see Batch Operations in the *Amazon DynamoDB Developer Guide*.

- For API details, see BatchGetItem in *AWS CLI Command Reference*.

`batch-write-item`

The following code example shows how to use `batch-write-item`.

AWS CLI

To add multiple items to a table

The following `batch-write-item` example adds three new items to the `MusicCollection` table using a batch of three `PutItem` requests. It also requests information about the number of write capacity units consumed by the operation and any item collections modified by the operation.

```
aws dynamodb batch-write-item \
    --request-items file://request-items.json \
    --return-consumed-capacity INDEXES \
    --return-item-collection-metrics SIZE
```

Contents of `request-items.json`:

```
{
    "MusicCollection": [
        {
            "PutRequest": {
                "Item": {
                    "Artist": {"S": "No One You Know"},
                    "SongTitle": {"S": "Call Me Today"},
                    "AlbumTitle": {"S": "Somewhat Famous"}
                }
            }
        },
        {
            "PutRequest": {
                "Item": {
                    "Artist": {"S": "Acme Band"},
                    "SongTitle": {"S": "Happy Day"},
                    "AlbumTitle": {"S": "Songs About Life"}
                }
```

```
            }
        },
        {
            "PutRequest": {
                "Item": {
                    "Artist": {"S": "No One You Know"},
                    "SongTitle": {"S": "Scared of My Shadow"},
                    "AlbumTitle": {"S": "Blue Sky Blues"}
                }
            }
        }
    ]
}
```

Output:

```
{
    "UnprocessedItems": {},
    "ItemCollectionMetrics": {
        "MusicCollection": [
            {
                "ItemCollectionKey": {
                    "Artist": {
                        "S": "No One You Know"
                    }
                },
                "SizeEstimateRangeGB": [
                    0.0,
                    1.0
                ]
            },
            {
                "ItemCollectionKey": {
                    "Artist": {
                        "S": "Acme Band"
                    }
                },
                "SizeEstimateRangeGB": [
                    0.0,
                    1.0
                ]
            }
        ]
```

```
    },
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 6.0,
            "Table": {
                "CapacityUnits": 3.0
            },
            "LocalSecondaryIndexes": {
                "AlbumTitleIndex": {
                    "CapacityUnits": 3.0
                }
            }
        }
    ]
}
```

For more information, see Batch Operations in the *Amazon DynamoDB Developer Guide*.

- For API details, see BatchWriteItem in *AWS CLI Command Reference*.

`create-backup`

The following code example shows how to use `create-backup`.

AWS CLI

To create a backup for an existing DynamoDB table

The following `create-backup` example creates a backup of the `MusicCollection` table.

```
aws dynamodb create-backup \
    --table-name MusicCollection \
    --backup-name MusicCollectionBackup
```

Output:

```
{
    "BackupDetails": {
        "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/
backup/01576616366715-b4e58d3a",
        "BackupName": "MusicCollectionBackup",
        "BackupSizeBytes": 0,
```

```
        "BackupStatus": "CREATING",
        "BackupType": "USER",
        "BackupCreationDateTime": 1576616366.715
    }
}
```

For more information, see Backup and restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateBackup in *AWS CLI Command Reference*.

`create-global-table`

The following code example shows how to use `create-global-table`.

AWS CLI

To create a global table

The following `create-global-table` example creates a global table from two identical tables in the specified, separate AWS Regions.

```
aws dynamodb create-global-table \
    --global-table-name MusicCollection \
    --replication-group RegionName=us-east-2 RegionName=us-east-1 \
    --region us-east-2
```

Output:

```
{
    "GlobalTableDescription": {
        "ReplicationGroup": [
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/
MusicCollection",
        "CreationDateTime": 1576625818.532,
        "GlobalTableStatus": "CREATING",
```

```
        "GlobalTableName": "MusicCollection"
    }
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateGlobalTable in *AWS CLI Command Reference*.

`create-table`

The following code example shows how to use `create-table`.

AWS CLI

Example 1: To create a table with tags

The following `create-table` example uses the specified attributes and key schema to create a table named `MusicCollection`. This table uses provisioned throughput and is encrypted at rest using the default AWS owned CMK. The command also applies a tag to the table, with a key of `Owner` and a value of `blueTeam`.

```
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-
definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S
 \
    --key-
schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
    --tags Key=Owner,Value=blueTeam
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
```

```
                "AttributeType": "S"
            }
        ],
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "WriteCapacityUnits": 5,
            "ReadCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "TableName": "MusicCollection",
        "TableStatus": "CREATING",
        "KeySchema": [
            {
                "KeyType": "HASH",
                "AttributeName": "Artist"
            },
            {
                "KeyType": "RANGE",
                "AttributeName": "SongTitle"
            }
        ],
        "ItemCount": 0,
        "CreationDateTime": "2020-05-26T16:04:41.627000-07:00",
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 2: To create a table in On-Demand Mode

The following `create-table` example creates a table called `MusicCollection` using on-demand mode, rather than provisioned throughput mode. This is useful for tables with unpredictable workloads.

```
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-
definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S
 \
```

```
    --key-
schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2020-05-27T11:44:10.807000-07:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 0,
            "WriteCapacityUnits": 0
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "BillingModeSummary": {
            "BillingMode": "PAY_PER_REQUEST"
        }
```

```
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 3: To create a table and encrypt it with a Customer Managed CMK

The following `create-table` example creates a table named `MusicCollection` and encrypts it using a customer managed CMK.

```
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-
definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S
 \
    --key-
schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
    --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
```

```
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2020-05-27T11:12:16.431000-07:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "SSEDescription": {
            "Status": "ENABLED",
            "SSEType": "KMS",
            "KMSMasterKeyArn": "arn:aws:kms:us-west-2:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 4: To create a table with a Local Secondary Index

The following `create-table` example uses the specified attributes and key schema to create a table named `MusicCollection` with a Local Secondary Index named `AlbumTitleIndex`.

```
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-
definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S Att
 \
    --key-
schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --local-secondary-indexes "[
            {
                \"IndexName\": \"AlbumTitleIndex\",
```

```
                \"KeySchema\": [
                    {\"AttributeName\": \"Artist\",\"KeyType\":\"HASH\"},
                    {\"AttributeName\": \"AlbumTitle\",\"KeyType\":\"RANGE\"}
                ],
                \"Projection\": {
                    \"ProjectionType\": \"INCLUDE\",
                    \"NonKeyAttributes\": [\"Genre\", \"Year\"]
                }
            }
        ]"
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
        "ProvisionedThroughput": {
```

```
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "LocalSecondaryIndexes": [
            {
                "IndexName": "AlbumTitleIndex",
                "KeySchema": [
                    {
                        "AttributeName": "Artist",
                        "KeyType": "HASH"
                    },
                    {
                        "AttributeName": "AlbumTitle",
                        "KeyType": "RANGE"
                    }
                ],
                "Projection": {
                    "ProjectionType": "INCLUDE",
                    "NonKeyAttributes": [
                        "Genre",
                        "Year"
                    ]
                },
                "IndexSizeBytes": 0,
                "ItemCount": 0,
                "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/index/AlbumTitleIndex"
            }
        ]
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 5: To create a table with a Global Secondary Index

The following `create-table` example creates a table named `GameScores` with a Global Secondary Index called `GameTitleIndex`. The base table has a partition key of `UserId` and a sort key of `GameTitle`, allowing you to find an individual user's best score for a specific game efficiently, whereas the GSI has a partition key of `GameTitle` and a sort key of `TopScore`, allowing you to quickly find the overall highest score for a particular game.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S Att
 \
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --global-secondary-indexes "[
            {
                \"IndexName\": \"GameTitleIndex\",
                \"KeySchema\": [
                    {\"AttributeName\":\"GameTitle\",\"KeyType\":\"HASH\"},
                    {\"AttributeName\":\"TopScore\",\"KeyType\":\"RANGE\"}
                ],
                \"Projection\": {
                    \"ProjectionType\":\"INCLUDE\",
                    \"NonKeyAttributes\":[\"UserId\"]
                },
                \"ProvisionedThroughput\": {
                    \"ReadCapacityUnits\": 10,
                    \"WriteCapacityUnits\": 5
                }
            }
        ]"
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
```

```
                "AttributeName": "TopScore",
                "AttributeType": "N"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",

                    {
                        "AttributeName": "GameTitle",
                        "KeyType": "HASH"
                    },
                    {
                        "AttributeName": "TopScore",
                        "KeyType": "RANGE"
                    }
                ],
                "Projection": {
```

```
                    "ProjectionType": "INCLUDE",
                    "NonKeyAttributes": [
                        "UserId"
                    ]
                },
                "IndexStatus": "CREATING",
                "ProvisionedThroughput": {
                    "NumberOfDecreasesToday": 0,
                    "ReadCapacityUnits": 10,
                    "WriteCapacityUnits": 5
                },
                "IndexSizeBytes": 0,
                "ItemCount": 0,
                "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/index/GameTitleIndex"
            }
        ]
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 6: To create a table with multiple Global Secondary Indexes at once

The following `create-table` example creates a table named `GameScores` with two Global Secondary Indexes. The GSI schemas are passed via a file, rather than on the command line.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S Att
 \
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --global-secondary-indexes file://gsi.json
```

Contents of `gsi.json`:

```
[
    {
        "IndexName": "GameTitleIndex",
```

```
        "KeySchema": [
            {
                "AttributeName": "GameTitle",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "TopScore",
                "KeyType": "RANGE"
            }
        ],
        "Projection": {
            "ProjectionType": "ALL"
        },
        "ProvisionedThroughput": {
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        }
    },
    {
        "IndexName": "GameDateIndex",
        "KeySchema": [
            {
                "AttributeName": "GameTitle",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "Date",
                "KeyType": "RANGE"
            }
        ],
        "Projection": {
            "ProjectionType": "ALL"
        },
        "ProvisionedThroughput": {
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        }
    }
]
```

Output:

```
{
```

```
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Date",
                "AttributeType": "S"
            },
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "TopScore",
                "AttributeType": "N"
            },
            {
                "AttributeName": "UserId",

```

```
                },
                "IndexSizeBytes": 0,
                "ItemCount": 0,
                "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/index/GameDateIndex"
            }
        ]
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 7: To create a table with Streams enabled

The following `create-table` example creates a table called `GameScores` with DynamoDB Streams enabled. Both new and old images of each item will be written to the stream.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S
 \
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --stream-specification StreamEnabled=TRUE,StreamViewType=NEW_AND_OLD_IMAGES
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
```

```
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2020-05-27T10:49:34.056000-07:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "StreamSpecification": {
            "StreamEnabled": true,
            "StreamViewType": "NEW_AND_OLD_IMAGES"
        },
        "LatestStreamLabel": "2020-05-27T17:49:34.056",
        "LatestStreamArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/stream/2020-05-27T17:49:34.056"
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 8: To create a table with Keys-Only Stream enabled

The following `create-table` example creates a table called `GameScores` with DynamoDB Streams enabled. Only the key attributes of modified items are written to the stream.

```
aws dynamodb create-table \
    --table-name GameScores \
```

```
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S
 \
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --stream-specification StreamEnabled=TRUE,StreamViewType=KEYS_ONLY
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2023-05-25T18:45:34.140000+00:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
```

```
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "StreamSpecification": {
            "StreamEnabled": true,
            "StreamViewType": "KEYS_ONLY"
        },
        "LatestStreamLabel": "2023-05-25T18:45:34.140",
        "LatestStreamArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/stream/2023-05-25T18:45:34.140",
        "DeletionProtectionEnabled": false
    }
}
```

For more information, see Change data capture for DynamoDB Streams in the *Amazon DynamoDB Developer Guide*.

Example 9: To create a table with the Standard Infrequent Access class

The following `create-table` example creates a table called `GameScores` and assigns the Standard-Infrequent Access (DynamoDB Standard-IA) table class. This table class is optimized for storage being the dominant cost.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S
 \
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --table-class STANDARD_INFREQUENT_ACCESS
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
```

```
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2023-05-25T18:33:07.581000+00:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TableClassSummary": {
            "TableClass": "STANDARD_INFREQUENT_ACCESS"
        },
        "DeletionProtectionEnabled": false
    }
}
```

For more information, see Table classes in the *Amazon DynamoDB Developer Guide*.

Example 10: To Create a table with Delete Protection enabled

The following `create-table` example creates a table called `GameScores` and enables deletion protection.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S
 \
```

```
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --deletion-protection-enabled
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2023-05-25T23:02:17.093000+00:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DeletionProtectionEnabled": true
    }
```

```
}
```

For more information, see Using deletion protection in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateTable in *AWS CLI Command Reference*.

`delete-backup`

The following code example shows how to use `delete-backup`.

AWS CLI

To delete an existing DynamoDB backup

The following `delete-backup` example deletes the specified existing backup.

```
aws dynamodb delete-backup \
    --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/
backup/01576616366715-b4e58d3a
```

Output:

```
{
    "BackupDescription": {
        "BackupDetails": {
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01576616366715-b4e58d3a",
            "BackupName": "MusicCollectionBackup",
            "BackupSizeBytes": 0,
            "BackupStatus": "DELETED",
            "BackupType": "USER",
            "BackupCreationDateTime": 1576616366.715
        },
        "SourceTableDetails": {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "TableSizeBytes": 0,
            "KeySchema": [
                {
                    "AttributeName": "Artist",
                    "KeyType": "HASH"
```

```
                },
                {
                    "AttributeName": "SongTitle",
                    "KeyType": "RANGE"
                }
            ],
            "TableCreationDateTime": 1576615228.571,
            "ProvisionedThroughput": {
                "ReadCapacityUnits": 5,
                "WriteCapacityUnits": 5
            },
            "ItemCount": 0,
            "BillingMode": "PROVISIONED"
        },
        "SourceTableFeatureDetails": {}
    }
}
```

For more information, see Backup and restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteBackup in *AWS CLI Command Reference*.

`delete-item`

The following code example shows how to use `delete-item`.

AWS CLI

Example 1: To delete an item

The following `delete-item` example deletes an item from the `MusicCollection` table and requests details about the item that was deleted and the capacity used by the request.

```
aws dynamodb delete-item \
    --table-name MusicCollection \
    --key file://key.json \
    --return-values ALL_OLD \
    --return-consumed-capacity TOTAL \
    --return-item-collection-metrics SIZE
```

Contents of `key.json`:

```
{
    "Artist": {"S": "No One You Know"},
    "SongTitle": {"S": "Scared of My Shadow"}
}
```

Output:

```
{
    "Attributes": {
        "AlbumTitle": {
            "S": "Blue Sky Blues"
        },
        "Artist": {
            "S": "No One You Know"
        },
        "SongTitle": {
            "S": "Scared of My Shadow"
        }
    },
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 2.0
    },
    "ItemCollectionMetrics": {
        "ItemCollectionKey": {
            "Artist": {
                "S": "No One You Know"
            }
        },
        "SizeEstimateRangeGB": [
            0.0,
            1.0
        ]
    }
}
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

Example 2: To delete an item conditionally

The following `delete-item` example deletes an item from the `ProductCatalog` table only if its `ProductCategory` is either `Sporting Goods` or `Gardening Supplies` and its price is between 500 and 600. It returns details about the item that was deleted.

```
aws dynamodb delete-item \
    --table-name ProductCatalog \
    --key '{"Id":{"N":"456"}}' \
    --condition-expression "(ProductCategory IN (:cat1, :cat2)) and (#P between :lo
 and :hi)" \
    --expression-attribute-names file://names.json \
    --expression-attribute-values file://values.json \
    --return-values ALL_OLD
```

Contents of `names.json`:

```
{
    "#P": "Price"
}
```

Contents of `values.json`:

```
{
    ":cat1": {"S": "Sporting Goods"},
    ":cat2": {"S": "Gardening Supplies"},
    ":lo": {"N": "500"},
    ":hi": {"N": "600"}
}
```

Output:

```
{
    "Attributes": {
        "Id": {
            "N": "456"
        },
        "Price": {
            "N": "550"
        },
        "ProductCategory": {
            "S": "Sporting Goods"
        }
    }
```

```
}
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteItem in *AWS CLI Command Reference*.

`delete-table`

The following code example shows how to use `delete-table`.

AWS CLI

To delete a table

The following `delete-table` example deletes the `MusicCollection` table.

```
aws dynamodb delete-table \
    --table-name MusicCollection
```

Output:

```
{
    "TableDescription": {
        "TableStatus": "DELETING",
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableName": "MusicCollection",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "WriteCapacityUnits": 5,
            "ReadCapacityUnits": 5
        }
    }
}
```

For more information, see Deleting a Table in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteTable in *AWS CLI Command Reference*.

`describe-backup`

The following code example shows how to use `describe-backup`.

AWS CLI

To get information about an existing backup of a table

The following `describe-backup` example displays information about the specified existing backup.

```
aws dynamodb describe-backup \
    --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/
backup/01576616366715-b4e58d3a
```

Output:

```
{
    "BackupDescription": {
        "BackupDetails": {
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01576616366715-b4e58d3a",
            "BackupName": "MusicCollectionBackup",
            "BackupSizeBytes": 0,
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupCreationDateTime": 1576616366.715
        },
        "SourceTableDetails": {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "TableSizeBytes": 0,
            "KeySchema": [
                {
                    "AttributeName": "Artist",
                    "KeyType": "HASH"
                },
                {
                    "AttributeName": "SongTitle",
                    "KeyType": "RANGE"
                }
            ],
            "TableCreationDateTime": 1576615228.571,
            "ProvisionedThroughput": {
                "ReadCapacityUnits": 5,
```

```
                "WriteCapacityUnits": 5
            },
            "ItemCount": 0,
            "BillingMode": "PROVISIONED"
        },
        "SourceTableFeatureDetails": {}
    }
}
```

For more information, see Backup and restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeBackup in *AWS CLI Command Reference*.

`describe-continuous-backups`

The following code example shows how to use `describe-continuous-backups`.

AWS CLI

To get information about continuous backups for a DynamoDB table

The following `describe-continuous-backups` example displays details about the continuous backup settings for the `MusicCollection` table.

```
aws dynamodb describe-continuous-backups \
    --table-name MusicCollection
```

Output:

```
{
    "ContinuousBackupsDescription": {
        "ContinuousBackupsStatus": "ENABLED",
        "PointInTimeRecoveryDescription": {
            "PointInTimeRecoveryStatus": "DISABLED"
        }
    }
}
```

For more information, see Point-in-time backups for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeContinuousBackups in *AWS CLI Command Reference*.

`describe-contributor-insights`

The following code example shows how to use `describe-contributor-insights`.

AWS CLI

To view Contributor Insights settings for a DynamoDB table

The following `describe-contributor-insights` example displays the Contributor Insights settings for the `MusicCollection` table and the `AlbumTitle-index` global secondary index.

```
aws dynamodb describe-contributor-insights \
    --table-name MusicCollection \
    --index-name AlbumTitle-index
```

Output:

```
{
    "TableName": "MusicCollection",
    "IndexName": "AlbumTitle-index",
    "ContributorInsightsRuleList": [
        "DynamoDBContributorInsights-PKC-MusicCollection-1576629651520",
        "DynamoDBContributorInsights-SKC-MusicCollection-1576629651520",
        "DynamoDBContributorInsights-PKT-MusicCollection-1576629651520",
        "DynamoDBContributorInsights-SKT-MusicCollection-1576629651520"
    ],
    "ContributorInsightsStatus": "ENABLED",
    "LastUpdateDateTime": 1576629654.78
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeContributorInsights in *AWS CLI Command Reference*.

`describe-endpoints`

The following code example shows how to use `describe-endpoints`.

AWS CLI

To view regional endpoint information

The following `describe-endpoints` example displays details about the endpoints for the current AWS Region.

```
aws dynamodb describe-endpoints
```

Output:

```
{
    "Endpoints": [
        {
            "Address": "dynamodb.us-west-2.amazonaws.com",
            "CachePeriodInMinutes": 1440
        }
    ]
}
```

For more information, see Amazon DynamoDB endpoints and quotas in the *AWS General Reference* and Endpoint discovery in the *AWS SDKs and Tools Reference Guide*.

- For API details, see DescribeEndpoints in *AWS CLI Command Reference*.

`describe-global-table-settings`

The following code example shows how to use `describe-global-table-settings`.

AWS CLI

To get information about a DynamoDB global table's settings

The following `describe-global-table-settings` example displays the settings for the `MusicCollection` global table.

```
aws dynamodb describe-global-table-settings \
    --global-table-name MusicCollection
```

Output:

```
{
    "GlobalTableName": "MusicCollection",
    "ReplicaSettings": [
        {
```

```
            "RegionName": "us-east-1",
            "ReplicaStatus": "ACTIVE",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 5,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        },
        {
            "RegionName": "us-east-2",
            "ReplicaStatus": "ACTIVE",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 5,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        }
    ]
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeGlobalTableSettings in *AWS CLI Command Reference*.

`describe-global-table`

The following code example shows how to use `describe-global-table`.

AWS CLI

To display information about a DynamoDB global table

The following `describe-global-table` example displays details about the `MusicCollection` global table.

```
aws dynamodb describe-global-table \
    --global-table-name MusicCollection
```

Output:

```
{
    "GlobalTableDescription": {
        "ReplicationGroup": [
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/
MusicCollection",
        "CreationDateTime": 1576625818.532,
        "GlobalTableStatus": "ACTIVE",
        "GlobalTableName": "MusicCollection"
    }
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeGlobalTable in *AWS CLI Command Reference*.

`describe-limits`

The following code example shows how to use `describe-limits`.

AWS CLI

To view provisioned-capacity limits

The following `describe-limits` example displays provisioned-capacity limits for your account in the current AWS Region.

```
aws dynamodb describe-limits
```

Output:

```
{
    "AccountMaxReadCapacityUnits": 80000,
    "AccountMaxWriteCapacityUnits": 80000,
    "TableMaxReadCapacityUnits": 40000,
```

```
    "TableMaxWriteCapacityUnits": 40000
}
```

For more information, see Limits in DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeLimits in *AWS CLI Command Reference*.

`describe-table-replica-auto-scaling`

The following code example shows how to use `describe-table-replica-auto-scaling`.

AWS CLI

To view auto scaling settings across replicas of a global table

The following `describe-table-replica-auto-scaling` example displays auto scaling settings across replicas of the `MusicCollection` global table.

```
aws dynamodb describe-table-replica-auto-scaling \
    --table-name MusicCollection
```

Output:

```
{
    "TableAutoScalingDescription": {
        "TableName": "MusicCollection",
        "TableStatus": "ACTIVE",
        "Replicas": [
            {
                "RegionName": "us-east-1",
                "GlobalSecondaryIndexes": [],
                "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                    "MinimumUnits": 5,
                    "MaximumUnits": 40000,
                    "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/
aws-service-role/dynamodb.application-autoscaling.amazonaws.com/
AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
                    "ScalingPolicies": [
                        {
                            "PolicyName": "DynamoDBReadCapacityUtilization:table/
MusicCollection",
                            "TargetTrackingScalingPolicyConfiguration": {
                                "TargetValue": 70.0
```

```
                            }
                        }
                    ]
                },
                "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                    "MinimumUnits": 5,
                    "MaximumUnits": 40000,

                        {
                            "PolicyName": "DynamoDBWriteCapacityUtilization:table/
MusicCollection",
                            "TargetTrackingScalingPolicyConfiguration": {
                                "TargetValue": 70.0
                            }
                        }
                    ]
                },
                "ReplicaStatus": "ACTIVE"
            }
        ]
    }
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeTableReplicaAutoScaling in *AWS CLI Command Reference*.

`describe-table`

The following code example shows how to use `describe-table`.

AWS CLI

To describe a table

The following `describe-table` example describes the `MusicCollection` table.

```
aws dynamodb describe-table \
    --table-name MusicCollection
```

Output:

```
{
    "Table": {
        "AttributeDefinitions": [
            {
```

```
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "WriteCapacityUnits": 5,
            "ReadCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "TableName": "MusicCollection",
        "TableStatus": "ACTIVE",
        "KeySchema": [
            {
                "KeyType": "HASH",
                "AttributeName": "Artist"
            },
            {
                "KeyType": "RANGE",
                "AttributeName": "SongTitle"
            }
        ],
        "ItemCount": 0,
        "CreationDateTime": 1421866952.062
    }
}
```

For more information, see Describing a Table in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeTable in *AWS CLI Command Reference*.

`describe-time-to-live`

The following code example shows how to use `describe-time-to-live`.

AWS CLI

To view Time to Live settings for a table

The following `describe-time-to-live` example displays Time to Live settings for the `MusicCollection` table.

```
aws dynamodb describe-time-to-live \
    --table-name MusicCollection
```

Output:

```
{
    "TimeToLiveDescription": {
        "TimeToLiveStatus": "ENABLED",
        "AttributeName": "ttl"
    }
}
```

For more information, see Time to Live in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeTimeToLive in *AWS CLI Command Reference*.

`get-item`

The following code example shows how to use `get-item`.

AWS CLI

Example 1: To read an item in a table

The following `get-item` example retrieves an item from the `MusicCollection` table. The table has a hash-and-range primary key (`Artist` and `SongTitle`), so you must specify both of these attributes. The command also requests information about the read capacity consumed by the operation.

```
aws dynamodb get-item \
    --table-name MusicCollection \
    --key file://key.json \
    --return-consumed-capacity TOTAL
```

Contents of `key.json`:

```
{
```

```
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Output:

```
{
    "Item": {
        "AlbumTitle": {
            "S": "Songs About Life"
        },
        "SongTitle": {
            "S": "Happy Day"
        },
        "Artist": {
            "S": "Acme Band"
        }
    },
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 0.5
    }
}
```

For more information, see Reading an Item in the *Amazon DynamoDB Developer Guide*.

Example 2: To read an item using a consistent read

The following `get-item` example retrieves an item from the `MusicCollection` table using strongly consistent reads.

```
aws dynamodb get-item \
    --table-name MusicCollection \
    --key file://key.json \
    --consistent-read \
    --return-consumed-capacity TOTAL
```

Contents of `key.json`:

```
{
    "Artist": {"S": "Acme Band"},
```

```
    "SongTitle": {"S": "Happy Day"}
}
```

Output:

```
{
    "Item": {
        "AlbumTitle": {
            "S": "Songs About Life"
        },
        "SongTitle": {
            "S": "Happy Day"
        },
        "Artist": {
            "S": "Acme Band"
        }
    },
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 1.0
    }
}
```

For more information, see Reading an Item in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve specific attributes of an item

The following `get-item` example uses a projection expression to retrieve only three attributes of the desired item.

```
aws dynamodb get-item \
    --table-name ProductCatalog \
    --key '{"Id": {"N": "102"}}' \
    --projection-expression "#T, #C, #P" \
    --expression-attribute-names file://names.json
```

Contents of `names.json`:

```
{
    "#T": "Title",
    "#C": "ProductCategory",
    "#P": "Price"
```

```
}
```

Output:

```
{
    "Item": {
        "Price": {
            "N": "20"
        },
        "Title": {
            "S": "Book 102 Title"
        },
        "ProductCategory": {
            "S": "Book"
        }
    }
}
```

For more information, see Reading an Item in the *Amazon DynamoDB Developer Guide*.

- For API details, see GetItem in *AWS CLI Command Reference*.

`list-backups`

The following code example shows how to use `list-backups`.

AWS CLI

Example 1: To list all existing DynamoDB backups

The following `list-backups` example lists all of your existing backups.

```
aws dynamodb list-backups
```

Output:

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 170
        },
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-b2abc345",
            "BackupName": "MusicCollectionBackup2",
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 400
        }
    ]
}
```

For more information, see Backup and restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 2: To list user-created backups in a specific time range

The following `list-backups` example lists only backups of the `MusicCollection` table that were created by the user (not those automatically created by DynamoDB) with a creation date between January 1, 2020 and March 1, 2020.

```
aws dynamodb list-backups \
    --table-name MusicCollection \
    --time-range-lower-bound 1577836800 \
    --time-range-upper-bound 1583020800 \
    --backup-type USER
```

Output:

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 170
        }
    ]
}
```

For more information, see Backup and restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 3: To limit page size

The following `list-backups` example returns a list of all existing backups, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```
aws dynamodb list-backups \
    --page-size 1
```

Output:

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
```

```
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 170
        },
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-b2abc345",
            "BackupName": "MusicCollectionBackup2",
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 400
        }
    ]
}
```

For more information, see Backup and restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 4: To limit the number of items returned

The following `list-backups` example limits the number of items returned to 1. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-backups \
    --max-items 1
```

Output:

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
```

```
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 170
        }
    ],
    "NextToken":
 "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see Backup and restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 5: To retrieve the next page of results

The following `list-backups` example uses the `NextToken` value from a previous call to the `list-backups` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-backups \
    --starting-
token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-b2abc345",
            "BackupName": "MusicCollectionBackup2",
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 400
```

```
        }
    ]
}
```

For more information, see Backup and restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListBackups in *AWS CLI Command Reference*.

`list-contributor-insights`

The following code example shows how to use `list-contributor-insights`.

AWS CLI

Example 1: To view a list of Contributor Insights summaries

The following `list-contributor-insights` example displays a list of Contributor Insights summaries.

```
aws dynamodb list-contributor-insights
```

Output:

```
{
    "ContributorInsightsSummaries": [
        {
            "TableName": "MusicCollection",
            "IndexName": "AlbumTitle-index",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "ProductCatalog",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Forum",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Reply",
            "ContributorInsightsStatus": "ENABLED"
        },
```

```
        {
            "TableName": "Thread",
            "ContributorInsightsStatus": "ENABLED"
        }
    ]
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 2: To limit the number of items returned

The following `list-contributor-insights` example limits the number of items returned to 4. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-contributor-insights \
    --max-results 4
```

Output:

```
{
    "ContributorInsightsSummaries": [
        {
            "TableName": "MusicCollection",
            "IndexName": "AlbumTitle-index",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "ProductCatalog",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Forum",
            "ContributorInsightsStatus": "ENABLED"
        }
    ],
    "NextToken":
 "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve the next page of results

The following `list-contributor-insights` example uses the `NextToken` value from a previous call to the `list-contributor-insights` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-contributor-insights \
    --max-results 4 \
    --next-
token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
    "ContributorInsightsSummaries": [
        {
            "TableName": "Reply",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Thread",
            "ContributorInsightsStatus": "ENABLED"
        }
    ]
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListContributorInsights in *AWS CLI Command Reference*.

`list-global-tables`

The following code example shows how to use `list-global-tables`.

AWS CLI

To list existing DynamoDB global tables

The following `list-global-tables` example lists all of your existing global tables.

```
aws dynamodb list-global-tables
```

Output:

```
{
    "GlobalTables": [
        {
            "GlobalTableName": "MusicCollection",
            "ReplicationGroup": [
                {
                    "RegionName": "us-east-2"
                },
                {
                    "RegionName": "us-east-1"
                }
            ]
        }
    ]
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListGlobalTables in *AWS CLI Command Reference*.

`list-tables`

The following code example shows how to use `list-tables`.

AWS CLI

Example 1: To list tables

The following `list-tables` example lists all of the tables associated with the current AWS account and Region.

```
aws dynamodb list-tables
```

Output:

```
{
    "TableNames": [
```

```
        "Forum",
        "ProductCatalog",
        "Reply",
        "Thread"
    ]
}
```

For more information, see Listing Table Names in the *Amazon DynamoDB Developer Guide*.

Example 2: To limit page size

The following `list-tables` example returns a list of all existing tables, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```
aws dynamodb list-tables \
    --page-size 1
```

Output:

```
{
    "TableNames": [
        "Forum",
        "ProductCatalog",
        "Reply",
        "Thread"
    ]
}
```

For more information, see Listing Table Names in the *Amazon DynamoDB Developer Guide*.

Example 3: To limit the number of items returned

The following `list-tables` example limits the number of items returned to 2. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-tables \
    --max-items 2
```

Output:

```
{
    "TableNames": [
        "Forum",
        "ProductCatalog"
    ],
    "NextToken":
 "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see Listing Table Names in the *Amazon DynamoDB Developer Guide*.

Example 4: To retrieve the next page of results

The following `list-tables` example uses the `NextToken` value from a previous call to the `list-tables` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-tables \
    --starting-
token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
    "TableNames": [
        "Reply",
        "Thread"
    ]
}
```

For more information, see Listing Table Names in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListTables in *AWS CLI Command Reference*.

`list-tags-of-resource`

The following code example shows how to use `list-tags-of-resource`.

AWS CLI

Example 1: To list tags of a DynamoDB resource

The following `list-tags-of-resource` example displays tags for the `MusicCollection` table.

```
aws dynamodb list-tags-of-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection
```

Output:

```
{
    "Tags": [
        {
            "Key": "Owner",
            "Value": "blueTeam"
        },
        {
            "Key": "Environment",
            "Value": "Production"
        }
    ]
}
```

For more information, see Tagging for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 2: To limit the number of tags returned

The following `list-tags-of-resource` example limits the number of tags returned to 1. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-tags-of-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --max-items 1
```

Output:

```
{
    "Tags": [
        {
            "Key": "Owner",
            "Value": "blueTeam"
        }
    ],
```

```
    "NextToken":
 "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see Tagging for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve the next page of results

The following `list-tags-of-resource` example uses the `NextToken` value from a previous call to the `list-tags-of-resource` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-tags-of-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --starting-
token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
    "Tags": [
        {
            "Key": "Environment",
            "Value": "Production"
        }
    ]
}
```

For more information, see Tagging for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListTagsOfResource in *AWS CLI Command Reference*.

`put-item`

The following code example shows how to use `put-item`.

AWS CLI

Example 1: To add an item to a table

The following `put-item` example adds a new item to the *MusicCollection* table.

```
aws dynamodb put-item \
    --table-name MusicCollection \
    --item file://item.json \
    --return-consumed-capacity TOTAL \
    --return-item-collection-metrics SIZE
```

Contents of `item.json`:

```
{
    "Artist": {"S": "No One You Know"},
    "SongTitle": {"S": "Call Me Today"},
    "AlbumTitle": {"S": "Greatest Hits"}
}
```

Output:

```
{
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 1.0
    },
    "ItemCollectionMetrics": {
        "ItemCollectionKey": {
            "Artist": {
                "S": "No One You Know"
            }
        },
        "SizeEstimateRangeGB": [
            0.0,
            1.0
        ]
    }
}
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

Example 2: To conditionally overwrite an item in a table

The following `put-item` example overwrites an existing item in the `MusicCollection` table only if that existing item has an `AlbumTitle` attribute with a value of `Greatest Hits`. The command returns the previous value of the item.

```
aws dynamodb put-item \
    --table-name MusicCollection \
    --item file://item.json \
    --condition-expression "#A = :A" \
    --expression-attribute-names file://names.json \
    --expression-attribute-values file://values.json \
    --return-values ALL_OLD
```

Contents of `item.json`:

```
{
    "Artist": {"S": "No One You Know"},
    "SongTitle": {"S": "Call Me Today"},
    "AlbumTitle": {"S": "Somewhat Famous"}
}
```

Contents of `names.json`:

```
{
    "#A": "AlbumTitle"
}
```

Contents of `values.json`:

```
{
    ":A": {"S": "Greatest Hits"}
}
```

Output:

```
{
    "Attributes": {
        "AlbumTitle": {
            "S": "Greatest Hits"
        },
        "Artist": {
            "S": "No One You Know"
        },
        "SongTitle": {
            "S": "Call Me Today"
        }
```

```
    }
}
```

If the key already exists, you should see the following output:

```
A client error (ConditionalCheckFailedException) occurred when calling the PutItem
 operation: The conditional request failed.
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

- For API details, see PutItem in *AWS CLI Command Reference*.

`query`

The following code example shows how to use `query`.

AWS CLI

Example 1: To query a table

The following `query` example queries items in the `MusicCollection` table. The table has a hash-and-range primary key (`Artist` and `SongTitle`), but this query only specifies the hash key value. It returns song titles by the artist named "No One You Know".

```
aws dynamodb query \
    --table-name MusicCollection \
    --projection-expression "SongTitle" \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json \
    --return-consumed-capacity TOTAL
```

Contents of `expression-attributes.json`:

```
{
    ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
```

```
    "Items": [
        {
            "SongTitle": {
                "S": "Call Me Today"
            }
        },
        {
            "SongTitle": {
                "S": "Scared of My Shadow"
            }
        }
    ],
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 0.5
    }
}
```

For more information, see Working with Queries in DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 2: To query a table using strongly consistent reads and traverse the index in descending order

The following `query` example performs the same query as the first example, but returns results in reverse order and uses strongly consistent reads.

```
aws dynamodb query \
    --table-name MusicCollection \
    --projection-expression "SongTitle" \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json \
    --consistent-read \
    --no-scan-index-forward \
    --return-consumed-capacity TOTAL
```

Contents of `expression-attributes.json`:

```
{
    ":v1": {"S": "No One You Know"}
```

```
}
```

Output:

```
{
    "Items": [
        {
            "SongTitle": {
                "S": "Scared of My Shadow"
            }
        },
        {
            "SongTitle": {
                "S": "Call Me Today"
            }
        }
    ],
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 1.0
    }
}
```

For more information, see Working with Queries in DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 3: To filter out specific results

The following `query` example queries the `MusicCollection` but excludes results with specific values in the `AlbumTitle` attribute. Note that this does not affect the `ScannedCount` or `ConsumedCapacity`, because the filter is applied after the items have been read.

```
aws dynamodb query \
    --table-name MusicCollection \
    --key-condition-expression "#n1 = :v1" \
    --filter-expression "NOT (#n2 IN (:v2, :v3))" \
    --expression-attribute-names file://names.json \
    --expression-attribute-values file://values.json \
    --return-consumed-capacity TOTAL
```

Contents of `values.json`:

```
{
    ":v1": {"S": "No One You Know"},
    ":v2": {"S": "Blue Sky Blues"},
    ":v3": {"S": "Greatest Hits"}
}
```

Contents of `names.json`:

```
{
    "#n1": "Artist",
    "#n2": "AlbumTitle"
}
```

Output:

```
{
    "Items": [
        {
            "AlbumTitle": {
                "S": "Somewhat Famous"
            },
            "Artist": {
                "S": "No One You Know"
            },
            "SongTitle": {
                "S": "Call Me Today"
            }
        }
    ],
    "Count": 1,
    "ScannedCount": 2,
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 0.5
    }
}
```

For more information, see Working with Queries in DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 4: To retrieve only an item count

The following `query` example retrieves a count of items matching the query, but does not retrieve any of the items themselves.

```
aws dynamodb query \
    --table-name MusicCollection \
    --select COUNT \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json
```

Contents of `expression-attributes.json`:

```
{
    ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": null
}
```

For more information, see Working with Queries in DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 5: To query an index

The following `query` example queries the local secondary index `AlbumTitleIndex`. The query returns all attributes from the base table that have been projected into the local secondary index. Note that when querying a local secondary index or global secondary index, you must also provide the name of the base table using the `table-name` parameter.

```
aws dynamodb query \
    --table-name MusicCollection \
    --index-name AlbumTitleIndex \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json \
```

```
    --select ALL_PROJECTED_ATTRIBUTES \
    --return-consumed-capacity INDEXES
```

Contents of `expression-attributes.json`:

```
{
    ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
    "Items": [
        {
            "AlbumTitle": {
                "S": "Blue Sky Blues"
            },
            "Artist": {
                "S": "No One You Know"
            },
            "SongTitle": {
                "S": "Scared of My Shadow"
            }
        },
        {
            "AlbumTitle": {
                "S": "Somewhat Famous"
            },
            "Artist": {
                "S": "No One You Know"
            },
            "SongTitle": {
                "S": "Call Me Today"
            }
        }
    ],
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 0.5,
        "Table": {
            "CapacityUnits": 0.0
```

```
        },
        "LocalSecondaryIndexes": {
            "AlbumTitleIndex": {
                "CapacityUnits": 0.5
            }
        }
    }
}
```

For more information, see Working with Queries in DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see Query in *AWS CLI Command Reference*.

`restore-table-from-backup`

The following code example shows how to use `restore-table-from-backup`.

AWS CLI

To restore a DynamoDB table from an existing backup

The following `restore-table-from-backup` example restores the specified table from an existing backup.

```
aws dynamodb restore-table-from-backup \
    --target-table-name MusicCollection \
    --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/
backup/01576616366715-b4e58d3a
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
```

```
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection2",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": 1576618274.326,
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection2",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "BillingModeSummary": {
            "BillingMode": "PROVISIONED"
        },
        "RestoreSummary": {
            "SourceBackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01576616366715-b4e58d3a",
            "SourceTableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "RestoreDateTime": 1576616366.715,
            "RestoreInProgress": true
        }
    }
}
```

For more information, see Backup and restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see RestoreTableFromBackup in *AWS CLI Command Reference*.

`restore-table-to-point-in-time`

The following code example shows how to use `restore-table-to-point-in-time`.

AWS CLI

To restore a DynamoDB table to a point in time

The following `restore-table-to-point-in-time` example restores the `MusicCollection` table to the specified point in time.

```
aws dynamodb restore-table-to-point-in-time \
    --source-table-name MusicCollection \
    --target-table-name MusicCollectionRestore \
    --restore-date-time 1576622404.0
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollectionRestore",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": 1576623311.86,
```

```
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollectionRestore",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "BillingModeSummary": {
            "BillingMode": "PROVISIONED"
        },
        "RestoreSummary": {
            "SourceTableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "RestoreDateTime": 1576622404.0,
            "RestoreInProgress": true
        }
    }
}
```

For more information, see Point-in-time backups for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see RestoreTableToPointInTime in *AWS CLI Command Reference*.

`scan`

The following code example shows how to use `scan`.

AWS CLI

To scan a table

The following `scan` example scans the entire `MusicCollection` table, and then narrows the results to songs by the artist "No One You Know". For each item, only the album title and song title are returned.

```
aws dynamodb scan \
    --table-name MusicCollection \
    --filter-expression "Artist = :a" \
    --projection-expression "#ST, #AT" \
```

```
    --expression-attribute-names file://expression-attribute-names.json \
    --expression-attribute-values file://expression-attribute-values.json
```

Contents of `expression-attribute-names.json`:

```
{
    "#ST": "SongTitle",
    "#AT":"AlbumTitle"
}
```

Contents of `expression-attribute-values.json`:

```
{
    ":a": {"S": "No One You Know"}
}
```

Output:

```
{
    "Count": 2,
    "Items": [
        {
            "SongTitle": {
                "S": "Call Me Today"
            },
            "AlbumTitle": {
                "S": "Somewhat Famous"
            }
        },
        {
            "SongTitle": {
                "S": "Scared of My Shadow"
            },
            "AlbumTitle": {
                "S": "Blue Sky Blues"
            }
        }
    ],
    "ScannedCount": 3,
    "ConsumedCapacity": null
}
```

For more information, see Working with Scans in DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see Scan in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a DynamoDB resource

The following `tag-resource` example adds a tag key/value pair to the `MusicCollection` table.

```
aws dynamodb tag-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --tags Key=Owner,Value=blueTeam
```

This command produces no output.

For more information, see Tagging for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`transact-get-items`

The following code example shows how to use `transact-get-items`.

AWS CLI

To retrieve multiple items atomically from one or more tables

The following `transact-get-items` example retrieves multiple items atomically.

```
aws dynamodb transact-get-items \
    --transact-items file://transact-items.json \
    --return-consumed-capacity TOTAL
```

Contents of `transact-items.json`:

```
[
    {
        "Get": {
            "Key": {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
            },
            "TableName": "MusicCollection"
        }
    },
    {
        "Get": {
            "Key": {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"}
            },
            "TableName": "MusicCollection"
        }
    }
]
```

Output:

```
{
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 4.0,
            "ReadCapacityUnits": 4.0
        }
    ],
    "Responses": [
        {
            "Item": {
                "AlbumTitle": {
                    "S": "Songs About Life"
                },
                "Artist": {
                    "S": "Acme Band"
                },
                "SongTitle": {
                    "S": "Happy Day"
                }
```

```
            }
        },
        {
            "Item": {
                "AlbumTitle": {
                    "S": "Somewhat Famous"
                },
                "Artist": {
                    "S": "No One You Know"
                },
                "SongTitle": {
                    "S": "Call Me Today"
                }
            }
        }
    ]
}
```

For more information, see Managing Complex Workflows with DynamoDB Transactions in the *Amazon DynamoDB Developer Guide*.

- For API details, see TransactGetItems in *AWS CLI Command Reference*.

`transact-write-items`

The following code example shows how to use `transact-write-items`.

AWS CLI

Example 1: To write items atomically to one or more tables

The following `transact-write-items` example updates one item and deletes another. The operation fails if either operation fails, or if either item contains a `Rating` attribute.

```
aws dynamodb transact-write-items \
    --transact-items file://transact-items.json \
    --return-consumed-capacity TOTAL \
    --return-item-collection-metrics SIZE
```

Contents of `transact-items.json`:

```
[
```

```
    {
        "Update": {
            "Key": {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
            },
            "UpdateExpression": "SET AlbumTitle = :newval",
            "ExpressionAttributeValues": {
                ":newval": {"S": "Updated Album Title"}
            },
            "TableName": "MusicCollection",
            "ConditionExpression": "attribute_not_exists(Rating)"
        }
    },
    {
        "Delete": {
            "Key": {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"}
            },
            "TableName": "MusicCollection",
            "ConditionExpression": "attribute_not_exists(Rating)"
        }
    }
]
```

Output:

```
{
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 10.0,
            "WriteCapacityUnits": 10.0
        }
    ],
    "ItemCollectionMetrics": {
        "MusicCollection": [
            {
                "ItemCollectionKey": {
                    "Artist": {
                        "S": "No One You Know"
                    }
```

```
                },
                "SizeEstimateRangeGB": [
                    0.0,
                    1.0
                ]
            },
            {
                "ItemCollectionKey": {
                    "Artist": {
                        "S": "Acme Band"
                    }
                },
                "SizeEstimateRangeGB": [
                    0.0,
                    1.0
                ]
            }
        ]
    }
}
```

For more information, see Managing Complex Workflows with DynamoDB Transactions in the *Amazon DynamoDB Developer Guide*.

Example 2: To write items atomically using a client request token

The following `transact-write-items` example uses a client request token to make the call to `transact-write-items` idempotent, meaning that multiple calls have the same effect as one single call.

```
aws dynamodb transact-write-items \
    --transact-items file://transact-items.json \
    --client-request-token abc123
```

Contents of `transact-items.json`:

```
[
    {
        "Update": {
            "Key": {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
```

```
            },
            "UpdateExpression": "SET AlbumTitle = :newval",
            "ExpressionAttributeValues": {
                ":newval": {"S": "Updated Album Title"}
            },
            "TableName": "MusicCollection",
            "ConditionExpression": "attribute_not_exists(Rating)"
        }
    },
    {
        "Delete": {
            "Key": {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"}
            },
            "TableName": "MusicCollection",
            "ConditionExpression": "attribute_not_exists(Rating)"
        }
    }
]
```

This command produces no output.

For more information, see Managing Complex Workflows with DynamoDB Transactions in the *Amazon DynamoDB Developer Guide*.

- For API details, see TransactWriteItems in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a DynamoDB resource

The following `untag-resource` example removes the tag with the key `Owner` from the `MusicCollection` table.

```
aws dynamodb untag-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --tag-keys Owner
```

This command produces no output.

For more information, see Tagging for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-continuous-backups`

The following code example shows how to use `update-continuous-backups`.

AWS CLI

To update continuous backup settings for a DynamoDB table

The following `update-continuous-backups` example enables point-in-time recovery for the `MusicCollection` table.

```
aws dynamodb update-continuous-backups \
    --table-name MusicCollection \
    --point-in-time-recovery-specification PointInTimeRecoveryEnabled=true
```

Output:

```
{
    "ContinuousBackupsDescription": {
        "ContinuousBackupsStatus": "ENABLED",
        "PointInTimeRecoveryDescription": {
            "PointInTimeRecoveryStatus": "ENABLED",
            "EarliestRestorableDateTime": 1576622404.0,
            "LatestRestorableDateTime": 1576622404.0
        }
    }
}
```

For more information, see Point-in-time backups for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateContinuousBackups in *AWS CLI Command Reference*.

`update-contributor-insights`

The following code example shows how to use `update-contributor-insights`.

AWS CLI

To enable Contributor Insights on a table

The following `update-contributor-insights` example enables Contributor Insights on the `MusicCollection` table and the `AlbumTitle-index` global secondary index.

```
aws dynamodb update-contributor-insights \
    --table-name MusicCollection \
    --index-name AlbumTitle-index \
    --contributor-insights-action ENABLE
```

Output:

```
{
    "TableName": "MusicCollection",
    "IndexName": "AlbumTitle-index",
    "ContributorInsightsStatus": "ENABLING"
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateContributorInsights in *AWS CLI Command Reference*.

`update-global-table-settings`

The following code example shows how to use `update-global-table-settings`.

AWS CLI

To update provisioned write capacity settings on a DynamoDB global table

The following `update-global-table-settings` example sets the provisioned write capacity of the `MusicCollection` global table to 15.

```
aws dynamodb update-global-table-settings \
    --global-table-name MusicCollection \
    --global-table-provisioned-write-capacity-units 15
```

Output:

```
{
    "GlobalTableName": "MusicCollection",
    "ReplicaSettings": [
        {
            "RegionName": "eu-west-1",
            "ReplicaStatus": "UPDATING",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 10,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        },
        {
            "RegionName": "us-east-1",
            "ReplicaStatus": "UPDATING",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 10,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        },
        {
            "RegionName": "us-east-2",
            "ReplicaStatus": "UPDATING",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 10,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        }
    ]
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateGlobalTableSettings in *AWS CLI Command Reference*.

`update-global-table`

The following code example shows how to use `update-global-table`.

AWS CLI

To update a DynamoDB global table

The following `update-global-table` example adds a replica in the specified Region to the `MusicCollection` global table.

```
aws dynamodb update-global-table \
    --global-table-name MusicCollection \
    --replica-updates Create={RegionName=eu-west-1}
```

Output:

```
{
    "GlobalTableDescription": {
        "ReplicationGroup": [
            {
                "RegionName": "eu-west-1"
            },
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/
MusicCollection",
        "CreationDateTime": 1576625818.532,
        "GlobalTableStatus": "ACTIVE",
        "GlobalTableName": "MusicCollection"
    }
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateGlobalTable in *AWS CLI Command Reference*.

update-item

The following code example shows how to use update-item.

AWS CLI

Example 1: To update an item in a table

The following update-item example updates an item in the MusicCollection table. It adds a new attribute (Year) and modifies the AlbumTitle attribute. All of the attributes in the item, as they appear after the update, are returned in the response.

```
aws dynamodb update-item \
    --table-name MusicCollection \
    --key file://key.json \
    --update-expression "SET #Y = :y, #AT = :t" \
    --expression-attribute-names file://expression-attribute-names.json \
    --expression-attribute-values file://expression-attribute-values.json  \
    --return-values ALL_NEW \
    --return-consumed-capacity TOTAL \
    --return-item-collection-metrics SIZE
```

Contents of key.json:

```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Contents of expression-attribute-names.json:

```
{
    "#Y":"Year", "#AT":"AlbumTitle"
}
```

Contents of expression-attribute-values.json:

```
{
    ":y":{"N": "2015"},
    ":t":{"S": "Louder Than Ever"}
}
```

Output:

```
{
    "Attributes": {
        "AlbumTitle": {
            "S": "Louder Than Ever"
        },
        "Awards": {
            "N": "10"
        },
        "Artist": {
            "S": "Acme Band"
        },
        "Year": {
            "N": "2015"
        },
        "SongTitle": {
            "S": "Happy Day"
        }
    },
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 3.0
    },
    "ItemCollectionMetrics": {
        "ItemCollectionKey": {
            "Artist": {
                "S": "Acme Band"
            }
        },
        "SizeEstimateRangeGB": [
            0.0,
            1.0
        ]
    }
}
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

Example 2: To update an item conditionally

The following `update-item` example updates an item in the `MusicCollection` table, but only if the existing item does not already have a `Year` attribute.

```
aws dynamodb update-item \
    --table-name MusicCollection \
    --key file://key.json \
    --update-expression "SET #Y = :y, #AT = :t" \
    --expression-attribute-names file://expression-attribute-names.json \
    --expression-attribute-values file://expression-attribute-values.json  \
    --condition-expression "attribute_not_exists(#Y)"
```

Contents of `key.json`:

```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Contents of `expression-attribute-names.json`:

```
{
    "#Y":"Year",
    "#AT":"AlbumTitle"
}
```

Contents of `expression-attribute-values.json`:

```
{
    ":y":{"N": "2015"},
    ":t":{"S": "Louder Than Ever"}
}
```

This command produces no output. DynamoDB updates the item only if it does not already have a `Year` attribute. If the item already has a `Year` attribute, the command fails with the following error.

```
An error occurred (ConditionalCheckFailedException) when calling the UpdateItem
 operation: The conditional request failed
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateItem in *AWS CLI Command Reference*.

update-table-replica-auto-scaling

The following code example shows how to use update-table-replica-auto-scaling.

AWS CLI

To update auto scaling settings across replicas of a global table

The following update-table-replica-auto-scaling example updates write capacity auto scaling settings across replicas of the specified global table.

```
aws dynamodb update-table-replica-auto-scaling \
    --table-name MusicCollection \
    --provisioned-write-capacity-auto-scaling-update file://auto-scaling-policy.json
```

Contents of auto-scaling-policy.json:

```
{
    "MinimumUnits": 10,
    "MaximumUnits": 100,
    "AutoScalingDisabled": false,
    "ScalingPolicyUpdate": {
        "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",
        "TargetTrackingScalingPolicyConfiguration": {
            "TargetValue": 80
        }
    }
}
```

Output:

```
{
    "TableAutoScalingDescription": {
        "TableName": "MusicCollection",
        "TableStatus": "ACTIVE",
        "Replicas": [
            {
                "RegionName": "eu-central-1",
                "GlobalSecondaryIndexes": [],
                "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                    "MinimumUnits": 5,
                    "MaximumUnits": 40000,
```

```
                    "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/
aws-service-role/dynamodb.application-autoscaling.amazonaws.com/
AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
                    "ScalingPolicies": [
                        {
                            "PolicyName": "DynamoDBReadCapacityUtilization:table/
MusicCollection",
                            "TargetTrackingScalingPolicyConfiguration": {
                                "TargetValue": 70.0
                            }
                        }
                    ]
                },
                "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                    "MinimumUnits": 10,
                    "MaximumUnits": 100,
                    "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/
aws-service-role/dynamodb.application-autoscaling.amazonaws.com/
AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
                    "ScalingPolicies": [
                        {
                            "PolicyName": "DynamoDBWriteCapacityUtilization:table/
MusicCollection",
                            "TargetTrackingScalingPolicyConfiguration": {
                                "TargetValue": 80.0
                            }
                        }
                    ]
                },
                "ReplicaStatus": "ACTIVE"
            },
            {
                "RegionName": "us-east-1",
                "GlobalSecondaryIndexes": [],

    }
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateTableReplicaAutoScaling in *AWS CLI Command Reference*.

`update-table`

The following code example shows how to use `update-table`.

AWS CLI

Example 1: To modify a table's billing mode

The following `update-table` example increases the provisioned read and write capacity on the `MusicCollection` table.

```
aws dynamodb update-table \
    --table-name MusicCollection \
    --billing-mode PROVISIONED \
    --provisioned-throughput ReadCapacityUnits=15,WriteCapacityUnits=10
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "UPDATING",
        "CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
        "ProvisionedThroughput": {
            "LastIncreaseDateTime": "2020-07-28T13:18:18.921000-07:00",
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 15,
            "WriteCapacityUnits": 10
        },
        "TableSizeBytes": 182,
        "ItemCount": 2,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "BillingModeSummary": {
            "BillingMode": "PROVISIONED",
            "LastUpdateToPayPerRequestDateTime": "2020-07-28T13:14:48.366000-07:00"
        }
```

```
    }
}
```

For more information, see Updating a Table in the *Amazon DynamoDB Developer Guide*.

Example 2: To create a global secondary index

The following `update-table` example adds a global secondary index to the `MusicCollection` table.

```
aws dynamodb update-table \
    --table-name MusicCollection \
    --attribute-definitions AttributeName=AlbumTitle,AttributeType=S \
    --global-secondary-index-updates file://gsi-updates.json
```

Contents of `gsi-updates.json`:

```
[
    {
        "Create": {
            "IndexName": "AlbumTitle-index",
            "KeySchema": [
                {
                    "AttributeName": "AlbumTitle",
                    "KeyType": "HASH"
                }
            ],
            "ProvisionedThroughput": {
                "ReadCapacityUnits": 10,
                "WriteCapacityUnits": 10
            },
            "Projection": {
                "ProjectionType": "ALL"
            }
        }
    }
]
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
```

```
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "UPDATING",
        "CreationDateTime": "2020-05-26T15:59:49.473000-07:00",

                    "WriteCapacityUnits": 10
                },
                "IndexSizeBytes": 0,
                "ItemCount": 0,
                "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/index/AlbumTitle-index"
            }
        ]
    }
}
```

For more information, see Updating a Table in the *Amazon DynamoDB Developer Guide*.

Example 3: To enable DynamoDB Streams on a table

The following `update-table` example enables DynamoDB Streams on the `MusicCollection` table.

```
aws dynamodb update-table \
    --table-name MusicCollection \
    --stream-specification StreamEnabled=true,StreamViewType=NEW_IMAGE
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
```

```
            },
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "UPDATING",
        "CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
        "ProvisionedThroughput": {
            "LastIncreaseDateTime": "2020-07-28T12:59:17.537000-07:00",
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 15,
            "WriteCapacityUnits": 10
        },

            }
        ],
        "StreamSpecification": {
```

```
            "StreamEnabled": true,
            "StreamViewType": "NEW_IMAGE"
        },
        "LatestStreamLabel": "2020-07-28T21:53:39.112",
        "LatestStreamArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/stream/2020-07-28T21:53:39.112"
    }
}
```

For more information, see Updating a Table in the *Amazon DynamoDB Developer Guide*.

Example 4: To enable server-side encryption

The following `update-table` example enables server-side encryption on the `MusicCollection` table.

```
aws dynamodb update-table \
    --table-name MusicCollection \
    --sse-specification Enabled=true,SSEType=KMS
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
```

```
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "ACTIVE",
        "CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
        "ProvisionedThroughput": {
            "LastIncreaseDateTime": "2020-07-28T12:59:17.537000-07:00",
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 15,

For more information, see Updating a Table in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateTable in *AWS CLI Command Reference*.

`update-time-to-live`

The following code example shows how to use `update-time-to-live`.

AWS CLI

To update Time to Live settings on a table

The following `update-time-to-live` example enables Time to Live on the specified table.

```
aws dynamodb update-time-to-live \
    --table-name MusicCollection \
    --time-to-live-specification Enabled=true,AttributeName=ttl
```

Output:

```
{
    "TimeToLiveSpecification": {
        "Enabled": true,
        "AttributeName": "ttl"
    }
}
```

For more information, see Time to Live in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateTimeToLive in *AWS CLI Command Reference*.

DynamoDB Streams examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB Streams.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`describe-stream`

The following code example shows how to use `describe-stream`.

AWS CLI

To get information about a DynamoDB stream

The following `describe-stream` example displays information about the specific DynamoDB stream.

```
aws dynamodbstreams describe-stream \
    --stream-arn arn:aws:dynamodb:us-west-2:123456789012:table/Music/
stream/2019-10-22T18:02:01.576
```

Output:

```
{
    "StreamDescription": {
        "StreamArn": "arn:aws:dynamodb:us-west-2:123456789012:table/Music/
stream/2019-10-22T18:02:01.576",
        "StreamLabel": "2019-10-22T18:02:01.576",
        "StreamStatus": "ENABLED",
        "StreamViewType": "NEW_AND_OLD_IMAGES",
        "CreationRequestDateTime": 1571767321.571,
        "TableName": "Music",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "Shards": [
            {
                "ShardId": "shardId-00000001571767321804-697ce3d2",
                "SequenceNumberRange": {
                    "StartingSequenceNumber": "400000000000642977831",
```

```
                    "EndingSequenceNumber": "400000000000642977831"
                }
            },
            {
                "ShardId": "shardId-00000001571780995058-40810d86",
                "SequenceNumberRange": {
                    "StartingSequenceNumber": "757400000000005655171150"
                },
                "ParentShardId": "shardId-00000001571767321804-697ce3d2"
            }
        ]
    }
}
```

For more information, see Capturing Table Activity with DynamoDB Streams in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeStream in *AWS CLI Command Reference*.

`get-records`

The following code example shows how to use `get-records`.

AWS CLI

To get records from a Dynamodb stream

The following `get-records` example retrieves records using the specified Amazon DynamoDB shard iterator.

```
aws dynamodbstreams get-records \
    --shard-iterator "arn:aws:dynamodb:us-west-2:123456789012:table/Music/
stream/2019-10-22T18:02:01.576|1|

- For API details, see GetRecords in *AWS CLI Command Reference*.

`get-shard-iterator`

The following code example shows how to use `get-shard-iterator`.

AWS CLI

To get a shard iterator

The following `get-shard-iterator` example retrieves a shard iterator for the specified shard.

```
aws dynamodbstreams get-shard-iterator \
    --stream-arn arn:aws:dynamodb:us-west-2:12356789012:table/Music/
stream/2019-10-22T18:02:01.576 \
    --shard-id shardId-00000001571780995058-40810d86 \
    --shard-iterator-type LATEST
```

Output:

```
{
    "ShardIterator": "arn:aws:dynamodb:us-west-2:123456789012:table/Music/
stream/2019-10-22T18:02:01.576|1|

- For API details, see GetShardIterator in *AWS CLI Command Reference*.

`list-streams`

The following code example shows how to use `list-streams`.

AWS CLI

To list DynamoDB streams

The following `list-streams` example lists all existing Amazon DynamoDB streams within the default AWS Region.

```
aws dynamodbstreams list-streams
```

Output:

```
{
    "Streams": [
        {
            "StreamArn": "arn:aws:dynamodb:us-west-2:123456789012:table/Music/
stream/2019-10-22T18:02:01.576",
            "TableName": "Music",
            "StreamLabel": "2019-10-22T18:02:01.576"
        }
    ]
}
```

For more information, see Capturing Table Activity with DynamoDB Streams in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListStreams in *AWS CLI Command Reference*.

Amazon EC2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-address-transfer`

The following code example shows how to use `accept-address-transfer`.

AWS CLI

To accept an Elastic IP address transferred to your account

The following `accept-address-transfer` example accepts the transfer of the specified Elastic IP address to your account.

```
aws ec2 accept-address-transfer \
    --address 100.21.184.216
```

Output:

```
{
    "AddressTransfer": {
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
        "TransferAccountId": "123456789012",
        "TransferOfferExpirationTimestamp": "2023-02-22T20:51:10.000Z",
        "TransferOfferAcceptedTimestamp": "2023-02-22T22:52:54.000Z",
        "AddressTransferStatus": "accepted"
    }
}
```

For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

- For API details, see AcceptAddressTransfer in *AWS CLI Command Reference*.

`accept-reserved-instances-exchange-quote`

The following code example shows how to use `accept-reserved-instances-exchange-quote`.

AWS CLI

To perform a Convertible Reserved Instance exchange

The following `accept-reserved-instances-exchange-quote` example performs an exchange of the specified Convertible Reserved Instances.

```
aws ec2 accept-reserved-instances-exchange-quote \
    --reserved-instance-ids a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --target-configurations OfferingId=a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "ExchangeId": "riex-e68ed3c1-8bc8-4c17-af77-811afexample"
}
```

For more information, see Exchange Convertible Reserved Instances in the *Amazon EC2 User Guide*.

- For API details, see AcceptReservedInstancesExchangeQuote in *AWS CLI Command Reference*.

`accept-transit-gateway-peering-attachment`

The following code example shows how to use `accept-transit-gateway-peering-attachment`.

AWS CLI

To accept a transit gateway peering attachment

The following `accept-transit-gateway-peering-attachment` example accepts the specified transit gateway peering attachment. The `--region` parameter specifies the Region that the accepter transit gateway is located in.

```
aws ec2 accept-transit-gateway-peering-attachment \
    --transit-gateway-attachment-id tgw-attach-4455667788aabbccd \
    --region us-east-2
```

Output:

```
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "pending",
        "CreationTime": "2019-12-09T11:38:31.000Z"
    }
}
```

For more information, see Transit Gateway Peering Attachments in the *Transit Gateways Guide*.

- For API details, see AcceptTransitGatewayPeeringAttachment in *AWS CLI Command Reference*.

`accept-transit-gateway-vpc-attachment`

The following code example shows how to use `accept-transit-gateway-vpc-attachment`.

AWS CLI

To accept a request to attach a VPC to a transit gateway.

The following `accept-transit-gateway-vpc-attachment` example accepts the request forte specified attachment.

```
aws ec2 accept-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
```

```
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8ffd50fEXAMPLE",
        "VpcOwnerId": "123456789012",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Transit Gateway Attachments to a VPC in the *Transit Gateways Guide*.

- For API details, see AcceptTransitGatewayVpcAttachment in *AWS CLI Command Reference*.

`accept-vpc-endpoint-connections`

The following code example shows how to use `accept-vpc-endpoint-connections`.

AWS CLI

To accept an interface endpoint connection request

The following `accept-vpc-endpoint-connections` example accepts the specified endpoint connection request for the specified endpoint service.

```
aws ec2 accept-vpc-endpoint-connections \
    --service-id vpce-svc-03d5ebb7d9579a2b3 \
    --vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```
{
    "Unsuccessful": []
}
```

For more information, see Configure an endpoint service in the *AWS PrivateLink Guide*.

- For API details, see AcceptVpcEndpointConnections in *AWS CLI Command Reference*.

`accept-vpc-peering-connection`

The following code example shows how to use `accept-vpc-peering-connection`.

AWS CLI

To accept a VPC peering connection

The following `accept-vpc-peering-connection` example accepts the specified VPC peering connection request.

```
aws ec2 accept-vpc-peering-connection \
    --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
    "VpcPeeringConnection": {
        "Status": {
            "Message": "Provisioning",
            "Code": "provisioning"
        },
        "Tags": [],
        "AccepterVpcInfo": {
            "OwnerId": "123456789012",
            "VpcId": "vpc-44455566",
            "CidrBlock": "10.0.1.0/28"
        },
        "VpcPeeringConnectionId": "pcx-1a2b3c4d",
        "RequesterVpcInfo": {
            "OwnerId": "123456789012",
            "VpcId": "vpc-111abc45",
            "CidrBlock": "10.0.0.0/28"
        }
    }
}
```

For more information, see Accept or reject a VPC peering connection in the *Amazon VPC Peering Guide*.

- For API details, see AcceptVpcPeeringConnection in *AWS CLI Command Reference*.

`advertise-byoip-cidr`

The following code example shows how to use `advertise-byoip-cidr`.

AWS CLI

To advertise an address range

The following `advertise-byoip-cidr` example advertises the specified public IPv4 address range.

```
aws ec2 advertise-byoip-cidr \
    --cidr 203.0.113.25/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
        "State": "provisioned"
    }
}
```

For more information, see Bring your own IP addresses (BYOIP) to Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see AdvertiseByoipCidr in *AWS CLI Command Reference*.

`allocate-address`

The following code example shows how to use `allocate-address`.

AWS CLI

Example 1: To allocate an Elastic IP address from Amazon's address pool

The following `allocate-address` example allocates an Elastic IP address. Amazon EC2 selects the address from Amazon's address pool.

```
aws ec2 allocate-address
```

Output:

```
{
    "PublicIp": "70.224.234.241",
    "AllocationId": "eipalloc-01435ba59eEXAMPLE",
    "PublicIpv4Pool": "amazon",
    "NetworkBorderGroup": "us-west-2",
    "Domain": "vpc"
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 2: To allocate an Elastic IP address and associate it with a network border group

The following `allocate-address` example allocates an Elastic IP address and associates it with the specified network border group.

```
aws ec2 allocate-address \
    --network-border-group us-west-2-lax-1
```

Output:

```
{
    "PublicIp": "70.224.234.241",
    "AllocationId": "eipalloc-e03dd489ceEXAMPLE",
    "PublicIpv4Pool": "amazon",
    "NetworkBorderGroup": "us-west-2-lax-1",
    "Domain": "vpc"
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 3: To allocate an Elastic IP address from an address pool that you own

The following `allocate-address` example allocates an Elastic IP address from an address pool that you have brought to your Amazon Web Services account. Amazon EC2 selects the address from the address pool.

```
aws ec2 allocate-address \
```

```
    --public-ipv4-pool ipv4pool-ec2-1234567890abcdef0
```

Output:

```
{
    "AllocationId": "eipalloc-02463d08ceEXAMPLE",
    "NetworkBorderGroup": "us-west-2",
    "CustomerOwnedIp": "18.218.95.81",
    "CustomerOwnedIpv4Pool": "ipv4pool-ec2-1234567890abcdef0",
    "Domain": "vpc"
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 4: To allocate an Elastic IP address from an IPAM pool

The following `allocate-address` example allocates a specific /32 Elastic IP address from an Amazon VPC IP Address Manager (IPAM) pool.

```
aws ec2 allocate-address \
    --ipam-pool-id ipam-pool-1234567890abcdef0 \
    --address 192.0.2.0
```

Output:

```
{
    "PublicIp": "192.0.2.0",
    "AllocationId": "eipalloc-abcdef01234567890",
    "PublicIpv4Pool": "ipam-pool-1234567890abcdef0",
    "NetworkBorderGroup": "us-west-2",
    "Domain": "vpc"
}
```

For more information, see Allocate sequential Elastic IP addresses from an IPAM pool in the *Amazon VPC IPAM User Guide*.

- For API details, see AllocateAddress in *AWS CLI Command Reference*.

`allocate-hosts`

The following code example shows how to use `allocate-hosts`.

AWS CLI

Example 1: To allocate a Dedicated Host

The following `allocate-hosts` example allocates a single Dedicated Host in the `us-west-2a` Availability Zone, onto which you can launch `m5.large` instances. By default, the Dedicated Host accepts only target instance launches, and does not support host recovery.

```
aws ec2 allocate-hosts \
    --instance-type m5.large \
    --availability-zone us-west-2a \
    --quantity 1
```

Output:

```
{
    "HostIds": [
        "h-07879acf49EXAMPLE"
    ]
}
```

Example 2: To allocate a Dedicated Host with auto-placement and host recovery enabled

The following `allocate-hosts` example allocates a single Dedicated Host in the `us-west-2a` Availability Zone with auto-placement and host recovery enabled.

```
aws ec2 allocate-hosts \
    --instance-type m5.large \
    --availability-zone us-west-2a \
    --auto-placement on \
    --host-recovery on \
    --quantity 1
```

Output:

```
{
    "HostIds": [
        "h-07879acf49EXAMPLE"
    ]
}
```

Example 3: To allocate a Dedicated Host with tags

The following `allocate-hosts` example allocates a single Dedicated Host and applies a tag with a key named `purpose` and a value of `production`.

```
aws ec2 allocate-hosts \
    --instance-type m5.large \
    --availability-zone us-west-2a \
    --quantity 1 \
    --tag-specifications 'ResourceType=dedicated-
host,Tags={Key=purpose,Value=production}'
```

Output:

```
{
    "HostIds": [
        "h-07879acf49EXAMPLE"
    ]
}
```

For more information, see Allocate a Dedicated Host in the *Amazon EC2 User Guide*.

- For API details, see AllocateHosts in *AWS CLI Command Reference*.

`allocate-ipam-pool-cidr`

The following code example shows how to use `allocate-ipam-pool-cidr`.

AWS CLI

To allocate a CIDR from an IPAM pool

The following `allocate-ipam-pool-cidr` example allocates a CIDR from an IPAM pool.

For Linux, use the following command.

```
aws ec2 allocate-ipam-pool-cidr \
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --netmask-length 24
```

For Windows, use the following command.

```
aws ec2 allocate-ipam-pool-cidr ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
```

```
    --netmask-length 24
```

Output:

```
{
    "IpamPoolAllocation": {
        "Cidr": "10.0.0.0/24",
        "IpamPoolAllocationId": "ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfbd",
        "ResourceType": "custom",
        "ResourceOwner": "123456789012"
    }
}
```

For more information, see Manually allocate a CIDR to a pool to reserve IP address space in the *Amazon VPC IPAM User Guide*.

- For API details, see AllocateIpamPoolCidr in *AWS CLI Command Reference*.

`apply-security-groups-to-client-vpn-target-network`

The following code example shows how to use `apply-security-groups-to-client-vpn-target-network`.

AWS CLI

To apply security groups to a target network for a Client VPN endpoint

The following `apply-security-groups-to-client-vpn-target-network` example applies security group `sg-01f6e627a89f4db32` to the association between the specified target network and Client VPN endpoint.

```
aws ec2 apply-security-groups-to-client-vpn-target-network \
    --security-group-ids sg-01f6e627a89f4db32 \
    --vpc-id vpc-0e2110c2f324332e0 \
    --client-vpn-endpoint-id cvpn-endpoint-123456789012abcde
```

Output:

```
{
    "SecurityGroupIds": [
        "sg-01f6e627a89f4db32"
```

```
    ]
}
```

For more information, see Target Networks in the *AWS Client VPN Administrator Guide*.

- For API details, see ApplySecurityGroupsToClientVpnTargetNetwork in *AWS CLI Command Reference*.

`assign-ipv6-addresses`

The following code example shows how to use `assign-ipv6-addresses`.

AWS CLI

Example 1: To assign specific IPv6 addresses to a network interface

The following `assign-ipv6-addresses` example assigns the specified IPv6 addresses to the specified network interface.

```
aws ec2 assign-ipv6-addresses \
    --network-interface-id eni-38664473 \
    --ipv6-
addresses 2001:db8:1234:1a00:3304:8879:34cf:4071 2001:db8:1234:1a00:9691:9503:25ad:1761
```

Output:

```
{
    "AssignedIpv6Addresses": [
        "2001:db8:1234:1a00:3304:8879:34cf:4071",
        "2001:db8:1234:1a00:9691:9503:25ad:1761"
    ],
    "NetworkInterfaceId": "eni-38664473"
}
```

For more information, see Manage the IPv6 addresses for your EC2 instances in the *Amazon EC2 User Guide*.

Example 2: To assign IPv6 addresses that Amazon selects to a network interface

The following `assign-ipv6-addresses` example assigns two IPv6 addresses to the specified network interface. Amazon automatically assigns these IPv6 addresses from the available IPv6 addresses in the IPv6 CIDR block range of the subnet.

```
aws ec2 assign-ipv6-addresses \
    --network-interface-id eni-38664473 \
    --ipv6-address-count 2
```

Output:

```
{
    "AssignedIpv6Addresses": [
        "2001:db8:1234:1a00:3304:8879:34cf:4071",
        "2001:db8:1234:1a00:9691:9503:25ad:1761"
    ],
    "NetworkInterfaceId": "eni-38664473"
}
```

For more information, see Manage the IPv6 addresses for your EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see AssignIpv6Addresses in *AWS CLI Command Reference*.

`assign-private-ip-addresses`

The following code example shows how to use `assign-private-ip-addresses`.

AWS CLI

Example 1: To assign a specific secondary private IP address to a network interface

The following `assign-private-ip-addresses` example assigns the specified secondary private IP address to the specified network interface.

```
aws ec2 assign-private-ip-addresses \
    --network-interface-id eni-e5aa89a3 \
    --private-ip-addresses 10.0.0.82
```

Output:

```
{
    "NetworkInterfaceId": "eni-e5aa89a3",
    "AssignedPrivateIpAddresses": [
        {
            "PrivateIpAddress": "10.0.0.82"
```

```
        }
    ]
}
```

For more information, see Secondary IP addresses for your EC2 instances in the *Amazon EC2 User Guide*.

Example 2: To assign secondary private IP addresses that Amazon EC2 selects to a network interface

The following `assign-private-ip-addresses` example assigns two secondary private IP addresses to the specified network interface. Amazon EC2 automatically assigns these IP addresses from the available IP addresses in the CIDR block range of the subnet the network interface is associated with.

```
aws ec2 assign-private-ip-addresses \
    --network-interface-id eni-e5aa89a3 \
    --secondary-private-ip-address-count 2
```

Output:

```
{
    "NetworkInterfaceId": "eni-e5aa89a3",
    "AssignedPrivateIpAddresses": [
        {
            "PrivateIpAddress": "10.0.0.93"
        },
        {
            "PrivateIpAddress": "10.0.0.147"
        }
    ]
}
```

For more information, see Secondary IP addresses for your EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see AssignPrivateIpAddresses in *AWS CLI Command Reference*.

`assign-private-nat-gateway-address`

The following code example shows how to use `assign-private-nat-gateway-address`.

AWS CLI

To assign private IP addresses to your private NAT gateway

The following `assign-private-nat-gateway-address` example assigns two private IP addresses to the specified private NAT gateway.

```
aws ec2 assign-private-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \
    --private-ip-address-count 2
```

Output:

```
{
    "NatGatewayId": "nat-1234567890abcdef0",
    "NatGatewayAddresses": [
        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "IsPrimary": false,
            "Status": "assigning"
        },
        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "IsPrimary": false,
            "Status": "assigning"
        }
    ]
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see AssignPrivateNatGatewayAddress in *AWS CLI Command Reference*.

`associate-address`

The following code example shows how to use `associate-address`.

AWS CLI

Example 1: To associate an Elastic IP address with an instance

The following `associate-address` example associates an Elastic IP address with the specified EC2 instance.

```
aws ec2 associate-address \
    --instance-id i-0b263919b6498b123 \
    --allocation-id eipalloc-64d5890a
```

Output:

```
{
    "AssociationId": "eipassoc-2bebb745"
}
```

Example 2: To associate an Elastic IP address with a network interface

The following `associate-address` example associates the specified Elastic IP address with the specified network interface.

```
aws ec2 associate-address \
    --allocation-id eipalloc-64d5890a \
    --network-interface-id eni-1a2b3c4d
```

Output:

```
{
    "AssociationId": "eipassoc-2bebb745"
}
```

Example 3: To associate an Elastic IP address with a private IP address

The following `associate-address` example associates the specified Elastic IP address with the specified private IP address in the specified network interface.

```
aws ec2 associate-address \
    --allocation-id eipalloc-64d5890a \
    --network-interface-id eni-1a2b3c4d \
    --private-ip-address 10.0.0.85
```

Output:

```
{
    "AssociationId": "eipassoc-2bebb745"
```

```
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

- For API details, see AssociateAddress in *AWS CLI Command Reference*.

`associate-client-vpn-target-network`

The following code example shows how to use `associate-client-vpn-target-network`.

AWS CLI

To associate a target network with a Client VPN endpoint

The following `associate-client-vpn-target-network` example associates a subnet with the specified Client VPN endpoint.

```
aws ec2 associate-client-vpn-target-network \
    --subnet-id subnet-0123456789abcabca \
    --client-vpn-endpoint-id cvpn-endpoint-123456789012abcde
```

Output:

```
{
    "AssociationId": "cvpn-assoc-12312312312312312",
    "Status": {
        "Code": "associating"
    }
}
```

For more information, see Target Networks in the *AWS Client VPN Administrator Guide*.

- For API details, see AssociateClientVpnTargetNetwork in *AWS CLI Command Reference*.

`associate-dhcp-options`

The following code example shows how to use `associate-dhcp-options`.

AWS CLI

Example 1: To associate a DHCP options set with your VPC

The following `associate-dhcp-options` example associates the specified DHCP options set with the specified VPC.

```
aws ec2 associate-dhcp-options \
    --dhcp-options-id dopt-d9070ebb \
    --vpc-id vpc-a01106c2
```

This command produces no output.

For more information, see Work with DHCP option sets in the *Amazon VPC User Guide*.

Example 2: To associate the default DHCP options set with your VPC

The following `associate-dhcp-options` example associates the default DHCP options set with the specified VPC.

```
aws ec2 associate-dhcp-options \
    --dhcp-options-id default \
    --vpc-id vpc-a01106c2
```

This command produces no output.

For more information, see Work with DHCP option sets in the *Amazon VPC User Guide*.

- For API details, see AssociateDhcpOptions in *AWS CLI Command Reference*.

`associate-iam-instance-profile`

The following code example shows how to use `associate-iam-instance-profile`.

AWS CLI

To associate an IAM instance profile with an instance

The following `associate-iam-instance-profile` example associates an IAM instance profile named `admin-role` with instance `i-123456789abcde123`.

```
aws ec2 associate-iam-instance-profile \
    --instance-id i-123456789abcde123 \
    --iam-instance-profile Name=admin-role
```

Output:

```
{
    "IamInstanceProfileAssociation": {
        "InstanceId": "i-123456789abcde123",
        "State": "associating",
        "AssociationId": "iip-assoc-0e7736511a163c209",
        "IamInstanceProfile": {
            "Id": "AIPAJBLK7RKJKWDXVHIEC",
            "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
        }
    }
}
```

For more information, see Attach an IAM role to an instance in the *Amazon EC2 User Guide*.

- For API details, see AssociateIamInstanceProfile in *AWS CLI Command Reference*.

`associate-instance-event-window`

The following code example shows how to use `associate-instance-event-window`.

AWS CLI

Example 1: To associate one or more instances with an event window

The following `associate-instance-event-window` example associates one or more instances with an event window.

```
aws ec2 associate-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [
```

```
                "i-1234567890abcdef0",
                "i-0598c7d356eba48d7"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

For more information about event window constraints, see Considerations in the *Amazon EC2 User Guide*.

Example 2: To associate instance tags with an event window

The following `associate-instance-event-window` example associates instance tags with an event window. Enter an `instance-event-window-id` parameter to specify the event window. To associate instance tags, specify the `association-target` parameter, and for the parameter value, specify one or more tags.

```
aws ec2 associate-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [
                {
                    "Key": "k2",
                    "Value": "v2"
                },
                {
                    "Key": "k1",
                    "Value": "v1"
                }
```

```
            ],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

For more information about event window constraints, see Considerations in the *Amazon EC2 User Guide*.

Example 3: To associate a Dedicated Host with an event window

The following `associate-instance-event-window` example associates a Dedicated Host with an event window. Enter an `instance-event-window-id` parameter to specify the event window. To associate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one of more Dedicated Host IDs.

```
aws ec2 associate-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "DedicatedHostIds=h-029fa35a02b99801d"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": [
                "h-029fa35a02b99801d"
            ]
        },
        "State": "creating"
    }
}
```

For more information about event window constraints, see Considerations in the *Amazon EC2 User Guide*.

- For API details, see AssociateInstanceEventWindow in *AWS CLI Command Reference*.

`associate-ipam-resource-discovery`

The following code example shows how to use `associate-ipam-resource-discovery`.

AWS CLI

To associate a resource discovery with an IPAM

The following `associate-ipam-resource-discovery` example associates a resource discovery with an IPAM. In this example, you are an IPAM delegated admin and a resource discovery has been created and shared with you by another AWS account so that you can use IPAM to manage and monitor resource CIDRs owned by the other account.

Note

To complete this request, you'll need the resource discovery ID which you can get with describe-ipam-resource-discoveries and the IPAM ID which you can get with describe-ipams.The resource discovery that you are associating must have first been shared with your account using AWS RAM.The `--region` you enter must match the home Region of the IPAM you are associating it with.

To associate the resource discovery with the IPAM, run the following command.

```
aws ec2 associate-ipam-resource-discovery \
    --ipam-id ipam-005f921c17ebd5107 \
    --ipam-resource-discovery-id ipam-res-disco-03e0406de76a044ee \
    --tag-specifications 'ResourceType=ipam-resource-discovery,Tags=[{Key=cost-center,Value=cc123}]' \
    --region us-west-2
```

Output:

```
{
    "IpamResourceDiscoveryAssociation": {
        "OwnerId": "123456789012",
        "IpamResourceDiscoveryAssociationId": "ipam-res-disco-assoc-04382a6346357cf82",
        "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::123456789012:ipam-resource-discovery-association/ipam-res-disco-assoc-04382a6346357cf82",
```

```
        "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
        "IpamId": "ipam-005f921c17ebd5107",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-005f921c17ebd5107",
        "IpamRegion": "us-west-2",
        "IsDefault": false,
        "ResourceDiscoveryStatus": "active",
        "State": "associate-in-progress",
        "Tags": []
    }
}
```

Once you associate a resource discovery, you can monitor and/or manage the IP addresses of resources created by the other accounts. For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see AssociateIpamResourceDiscovery in *AWS CLI Command Reference*.

`associate-nat-gateway-address`

The following code example shows how to use `associate-nat-gateway-address`.

AWS CLI

To associate an Elastic IP address with a public NAT gateway

The following `associate-nat-gateway-address` example associates the specified Elastic IP address with the specified public NAT gateway. AWS automatically assigns a secondary private IPv4 address.

```
aws ec2 associate-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \
    --allocation-ids eipalloc-0be6ecac95EXAMPLE
```

Output:

```
{
    "NatGatewayId": "nat-1234567890abcdef0",
    "NatGatewayAddresses": [
        {
            "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
            "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
            "IsPrimary": false,
```

```
            "Status": "associating"
        }
    ]
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see AssociateNatGatewayAddress in *AWS CLI Command Reference*.

`associate-route-table`

The following code example shows how to use `associate-route-table`.

AWS CLI

To associate a route table with a subnet

The following `associate-route-table` example associates the specified route table with the specified subnet.

```
aws ec2 associate-route-table \
    --route-table-id rtb-22574640 \
    --subnet-id subnet-9d4a7b6c
```

Output:

```
{
    "AssociationId": "rtbassoc-781d0d1a"
}
```

For more information, see Subnet route tables in the *Amazon VPC User Guide*.

- For API details, see AssociateRouteTable in *AWS CLI Command Reference*.

`associate-security-group-vpc`

The following code example shows how to use `associate-security-group-vpc`.

AWS CLI

To associate a security group with another VPC

The following `associate-security-group-vpc` example associates the specified security group with the specified VPC.

```
aws ec2 associate-security-group-vpc \
    --group-id sg-04dbb43907d3f8a78 \
    --vpc-id vpc-0bf4c2739bc05a694
```

Output:

```
{
    "State": "associating"
}
```

For more information, see Associate security groups with multiple VPCs in the *Amazon VPC User Guide*.

- For API details, see AssociateSecurityGroupVpc in *AWS CLI Command Reference*.

`associate-subnet-cidr-block`

The following code example shows how to use `associate-subnet-cidr-block`.

AWS CLI

To associate an IPv6 CIDR block with a subnet

The following `associate-subnet-cidr-block` example associates an IPv6 CIDR block with the specified subnet.

```
aws ec2 associate-subnet-cidr-block \
    --subnet-id subnet-5f46ec3b \
    --ipv6-cidr-block 2001:db8:1234:1a00::/64
```

Output:

```
{
    "SubnetId": "subnet-5f46ec3b",
    "Ipv6CidrBlockAssociation": {
        "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
        "AssociationId": "subnet-cidr-assoc-3aa54053",
        "Ipv6CidrBlockState": {
```

```
            "State": "associating"
        }
    }
}
```

For more information, see Add or remove an IPv6 CIDR block from your subnet in the *Amazon VPC User Guide*.

- For API details, see AssociateSubnetCidrBlock in *AWS CLI Command Reference*.

`associate-transit-gateway-multicast-domain`

The following code example shows how to use `associate-transit-gateway-multicast-domain`.

AWS CLI

To associate a transit gateway with a multicast domain

The following `associate-transit-gateway-multicast-domain` example associates the specified subnet and attachment with the specified multicast domain.

```
aws ec2 associate-transit-gateway-multicast-domain \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --transit-gateway-attachment-id tgw-attach-028c1dd0f8f5cbe8e \
    --subnet-ids subnet-000de86e3b49c932a \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
    "Associations": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8f5cbe8e",
        "ResourceId": "vpc-01128d2c240c09bd5",
        "ResourceType": "vpc",
        "Subnets": [
            {
                "SubnetId": "subnet-000de86e3b49c932a",
                "State": "associating"
            }
        ]
```

```
    }
}
```

For more information, see Multicast domains in the *Transit Gateways Guide*.

- For API details, see AssociateTransitGatewayMulticastDomain in *AWS CLI Command Reference*.

`associate-transit-gateway-route-table`

The following code example shows how to use `associate-transit-gateway-route-table`.

AWS CLI

To associate a transit gateway route table with a transit gateway attachment

The following `associate-transit-gateway-route-table` example associates the specified transit gateway route table with the specified VPC attachment.

```
aws ec2 associate-transit-gateway-route-table \
    --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \
    --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```
{
    "Association": {
        "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
        "ResourceId": "vpc-0065acced4EXAMPLE",
        "ResourceType": "vpc",
        "State": "associating"
    }
}
```

For more information, see Associate a Transit Gateway Route Table in the *AWS Transit Gateways Guide*.

- For API details, see AssociateTransitGatewayRouteTable in *AWS CLI Command Reference*.

`associate-vpc-cidr-block`

The following code example shows how to use `associate-vpc-cidr-block`.

AWS CLI

Example 1: To associate an Amazon-provided IPv6 CIDR block with a VPC

The following `associate-vpc-cidr-block` example associates an IPv6 CIDR block with the specified VPC.

```
aws ec2 associate-vpc-cidr-block \
    --amazon-provided-ipv6-cidr-block \
    --ipv6-cidr-block-network-border-group us-west-2-lax-1  \
    --vpc-id vpc-8EXAMPLE
```

Output:

```
{
    "Ipv6CidrBlockAssociation": {
        "AssociationId": "vpc-cidr-assoc-0838ce7d9dEXAMPLE",
        "Ipv6CidrBlockState": {
            "State": "associating"
        },
        "NetworkBorderGroup": "us-west-2-lax-1"
    },
    "VpcId": "vpc-8EXAMPLE"
}
```

For more information, see Add or remove a CIDR block from your VPC in the *Amazon VPC User Guide*.

Example 2: To associate an additional IPv4 CIDR block with a VPC

The following `associate-vpc-cidr-block` example associates the IPv4 CIDR block `10.2.0.0/16` with the specified VPC.

```
aws ec2 associate-vpc-cidr-block \
    --vpc-id vpc-1EXAMPLE \
    --cidr-block 10.2.0.0/16
```

Output:

```
{
    "CidrBlockAssociation": {
```

```
        "AssociationId": "vpc-cidr-assoc-2EXAMPLE",
        "CidrBlock": "10.2.0.0/16",
        "CidrBlockState": {
            "State": "associating"
        }
    },
    "VpcId": "vpc-1EXAMPLE"
}
```

For more information, see Add or remove a CIDR block from your VPC in the *Amazon VPC User Guide*.

- For API details, see AssociateVpcCidrBlock in *AWS CLI Command Reference*.

`attach-classic-link-vpc`

The following code example shows how to use `attach-classic-link-vpc`.

AWS CLI

To link (attach) an EC2-Classic instance to a VPC

The following `attach-classic-link-vpc` example links instance i-1234567890abcdef0 to VPC vpc-88888888 through the VPC security group sg-12312312.

```
aws ec2 attach-classic-link-vpc \
    --instance-id i-1234567890abcdef0 \
    --vpc-id vpc-88888888 \
    --groups sg-12312312
```

Output:

```
{
    "Return": true
}
```

- For API details, see AttachClassicLinkVpc in *AWS CLI Command Reference*.

`attach-internet-gateway`

The following code example shows how to use `attach-internet-gateway`.

AWS CLI

To attach an internet gateway to your VPC

The following `attach-internet-gateway` example attaches the specified internet gateway to the specific VPC.

```
aws ec2 attach-internet-gateway \
    --internet-gateway-id igw-0d0fb496b3EXAMPLE \
    --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see Internet gateways in the *Amazon VPC User Guide*.

- For API details, see AttachInternetGateway in *AWS CLI Command Reference*.

`attach-network-interface`

The following code example shows how to use `attach-network-interface`.

AWS CLI

Example 1: To attach a network interface to an instance

The following `attach-network-interface` example attaches the specified network interface to the specified instance.

```
aws ec2 attach-network-interface \
    --network-interface-id eni-0dc56a8d4640ad10a \
    --instance-id i-1234567890abcdef0 \
    --device-index 1
```

Output:

```
{
    "AttachmentId": "eni-attach-01a8fc87363f07cf9"
}
```

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

Example 2: To attach a network interface to an instance with multiple network cards

The following `attach-network-interface` example attaches the specified network interface to the specified instance and network card.

```
aws ec2 attach-network-interface \
    --network-interface-id eni-07483b1897541ad83 \
    --instance-id i-01234567890abcdef \
    --network-card-index 1 \
    --device-index 1
```

Output:

```
{
    "AttachmentId": "eni-attach-0fbd7ee87a88cd06c"
}
```

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

- For API details, see AttachNetworkInterface in *AWS CLI Command Reference*.

`attach-verified-access-trust-provider`

The following code example shows how to use `attach-verified-access-trust-provider`.

AWS CLI

To attach a trust provider to an instance

The following `attach-verified-access-trust-provider` example attaches the specified Verified Access trust provider to the specified Verified Access instance.

```
aws ec2 attach-verified-access-trust-provider \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
```

```
        "Description": "",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:00:38"
    },
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "",
        "VerifiedAccessTrustProviders": [
            {
                "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
                "TrustProviderType": "user",
                "UserTrustProviderType": "iam-identity-center"
            }
        ],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-25T18:27:56"
    }
}
```

For more information, see Verified Access instances in the *AWS Verified Access User Guide*.

- For API details, see AttachVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

`attach-volume`

The following code example shows how to use `attach-volume`.

AWS CLI

To attach a volume to an instance

The following `attach-volume` example attaches a volume (`vol-1234567890abcdef0`) to an instance (`i-01474ef662b89480`) as `/dev/sdf`.

```
aws ec2 attach-volume \
    --volume-id vol-1234567890abcdef0 \
    --instance-id i-01474ef662b89480 \
    --device /dev/sdf
```

Output:

```
{
    "AttachTime": "2024-03-10T21:47:12.000Z",
    "InstanceId": "i-01474ef662b89480",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "attaching",
    "Device": "/dev/sdf"
}
```

For more information, see Attach an Amazon EBS volume to an Amazon EC2 instance in the *Amazon EBS User Guide*.

- For API details, see AttachVolume in *AWS CLI Command Reference*.

`attach-vpn-gateway`

The following code example shows how to use `attach-vpn-gateway`.

AWS CLI

To attach a virtual private gateway to your VPC

The following `attach-vpn-gateway` example attaches the specified virtual private gateway to the specified VPC.

```
aws ec2 attach-vpn-gateway \
    --vpn-gateway-id vgw-9a4cacf3 \
    --vpc-id vpc-a01106c2
```

Output:

```
{
    "VpcAttachment": {
        "State": "attaching",
        "VpcId": "vpc-a01106c2"
    }
}
```

For more information, see Get started with AWS Site-to-Site VPN in the *AWS Site-to-Site VPN User Guide*.

- For API details, see AttachVpnGateway in *AWS CLI Command Reference*.

`authorize-client-vpn-ingress`

The following code example shows how to use `authorize-client-vpn-ingress`.

AWS CLI

To add an authorization rule for a Client VPN endpoint

The following `authorize-client-vpn-ingress` example adds an ingress authorization rule that permits all clients to access the internet (`0.0.0.0/0`).

```
aws ec2 authorize-client-vpn-ingress \
    --client-vpn-endpoint-id cvpn-endpoint-123456789012abcde \
    --target-network-cidr 0.0.0.0/0 \
    --authorize-all-groups
```

Output:

```
{
    "Status": {
        "Code": "authorizing"
    }
}
```

For more information, see Authorization Rules in the *AWS Client VPN Administrator Guide*.

- For API details, see AuthorizeClientVpnIngress in *AWS CLI Command Reference*.

`authorize-security-group-egress`

The following code example shows how to use `authorize-security-group-egress`.

AWS CLI

Example 1: To add a rule that allows outbound traffic to a specific address range

The following `authorize-security-group-egress` example adds a rule that grants access to the specified address ranges on TCP port 80.

```
aws ec2 authorize-security-group-egress \
    --group-id sg-1234567890abcdef0 \
```

```
    --ip-permissions
 'IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0b15794cdb17bf29c",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": true,
            "IpProtocol": "tcp",
            "FromPort": 80,
            "ToPort": 80,
            "CidrIpv4": "10.0.0.0/16"
        }
    ]
}
```

Example 2: To add a rule that allows outbound traffic to a specific security group

The following `authorize-security-group-egress` example adds a rule that grants access to the specified security group on TCP port 80.

```
aws ec2 authorize-security-group-egress \
    --group-id sg-1234567890abcdef0 \
    --ip-permissions
 'IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs=[{GroupId=sg-0aad1c26bbeec5c22}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0b5dd815afcea9cc3",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": true,
            "IpProtocol": "tcp",
```

```
            "FromPort": 80,
            "ToPort": 80,
            "ReferencedGroupInfo": {
                "GroupId": "sg-0aad1c26bbeec5c22",
                "UserId": "123456789012"
            }
        }
    ]
}
```

For more information, see Security groups in the *Amazon VPC User Guide*.

- For API details, see AuthorizeSecurityGroupEgress in *AWS CLI Command Reference*.

`authorize-security-group-ingress`

The following code example shows how to use `authorize-security-group-ingress`.

AWS CLI

Example 1: To add a rule that allows inbound SSH traffic

The following `authorize-security-group-ingress` example adds a rule that allows inbound traffic on TCP port 22 (SSH).

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --protocol tcp \
    --port 22 \
    --cidr 203.0.113.0/24
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-01afa97ef3e1bedfc",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 22,
```

```
            "ToPort": 22,
            "CidrIpv4": "203.0.113.0/24"
        }
    ]
}
```

Example 2: To add a rule that allows inbound HTTP traffic from another security group

The following `authorize-security-group-ingress` example adds a rule that allows inbound access on TCP port 80 from the source security group `sg-1a2b3c4d`. The source group must be in the same VPC or in a peer VPC (requires a VPC peering connection). Incoming traffic is allowed based on the private IP addresses of instances that are associated with the source security group (not the public IP address or Elastic IP address).

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --protocol tcp \
    --port 80 \
    --source-group sg-1a2b3c4d
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-01f4be99110f638a7",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 80,
            "ToPort": 80,
            "ReferencedGroupInfo": {
                "GroupId": "sg-1a2b3c4d",
                "UserId": "123456789012"
            }
        }
    ]
}
```

Example 3: To add multiple rules in the same call

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add two inbound rules, one that enables inbound access on TCP port 3389 (RDP) and the other that enables ping/ICMP.

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --ip-permissions
 'IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges=[{CidrIp=172.31.0.0/16}]'
 'IpProtocol=icmp,FromPort=-1,ToPort=-1,IpRanges=[{CidrIp=172.31.0.0/16}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-00e06e5d3690f29f3",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 3389,
            "ToPort": 3389,
            "CidrIpv4": "172.31.0.0/16"
        },
        {
            "SecurityGroupRuleId": "sgr-0a133dd4493944b87",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv4": "172.31.0.0/16"
        }
    ]
}
```

Example 4: To add a rule for ICMP traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows the ICMP message `Destination`

`Unreachable: Fragmentation Needed and Don't Fragment was Set` (Type 3, Code 4) from anywhere.

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --ip-permissions
 'IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges=[{CidrIp=0.0.0.0/0}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0de3811019069b787",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "icmp",
            "FromPort": 3,
            "ToPort": 4,
            "CidrIpv4": "0.0.0.0/0"
        }
    ]
}
```

Example 5: To add a rule for IPv6 traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows SSH access (port 22) from the IPv6 range `2001:db8:1234:1a00::/64`.

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --ip-permissions
 'IpProtocol=tcp,FromPort=22,ToPort=22,Ipv6Ranges=[{CidrIpv6=2001:db8:1234:1a00::/64}]'
```

Output:

```
{
    "Return": true,
```

```
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0455bc68b60805563",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 22,
            "ToPort": 22,
            "CidrIpv6": "2001:db8:1234:1a00::/64"
        }
    ]
}
```

Example 6: To add a rule for ICMPv6 traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows ICMPv6 traffic from anywhere.

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --ip-permissions 'IpProtocol=icmpv6,Ipv6Ranges=[{CidrIpv6=::/0}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-04b612d9363ab6327",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "icmpv6",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv6": "::/0"
        }
    ]
}
```

Example 7: To add a rule with a description

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows RDP traffic from the specified IPv4 address range. The rule includes a description to help you identify it later.

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --ip-permissions
 'IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges=[{CidrIp=203.0.113.0/24,Description="RDP
 access from NY office"}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0397bbcc01e974db3",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 3389,
            "ToPort": 3389,
            "CidrIpv4": "203.0.113.0/24",
            "Description": "RDP access from NY office"
        }
    ]
}
```

Example 8: To add an inbound rule that uses a prefix list

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows all traffic for the CIDR ranges in the specified prefix list.

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-04a351bfe432d4e71 \
    --ip-permissions
 'IpProtocol=all,PrefixListIds=[{PrefixListId=pl-002dc3ec097de1514}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-09c74b32f677c6c7c",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "-1",
            "FromPort": -1,
            "ToPort": -1,
            "PrefixListId": "pl-0721453c7ac4ec009"
        }
    ]
}
```

For more information, see Security groups in the *Amazon VPC User Guide*.

- For API details, see AuthorizeSecurityGroupIngress in *AWS CLI Command Reference*.

`bundle-instance`

The following code example shows how to use `bundle-instance`.

AWS CLI

To bundle an instance

The following `bundle-instance` example bundles instance `i-1234567890abcdef0` to a bucket called `amzn-s3-demo-bucket`. Before you specify values for your access key IDs, review and follow the guidance in Manage access keys for IAM users in the *IAM User Guide*.

```
aws ec2 bundle-instance \
    --instance-id i-1234567890abcdef0 \
    --bucket amzn-s3-demo-bucket \
    --prefix winami \
    --owner-akid AK12AJEXAMPLE \
    --owner-sak example123example
```

Output:

```
{
```

```
    "BundleTask": {
        "UpdateTime": "2015-09-15T13:30:35.000Z",
        "InstanceId": "i-1234567890abcdef0",
        "Storage": {
            "S3": {
                "Prefix": "winami",
                "Bucket": "amzn-s3-demo-bucket"
            }
        },
        "State": "pending",
        "StartTime": "2015-09-15T13:30:35.000Z",
        "BundleId": "bun-294e041f"
    }
}
```

For more information, see AMI types and characteristics in Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see BundleInstance in *AWS CLI Command Reference*.

`cancel-bundle-task`

The following code example shows how to use `cancel-bundle-task`.

AWS CLI

To cancel a bundle task

The following `cancel-bundle-task` example cancels bundle task `bun-2a4e041c`.

```
aws ec2 cancel-bundle-task \
    --bundle-id bun-2a4e041c
```

Output:

```
{
    "BundleTask": {
        "UpdateTime": "2015-09-15T13:27:40.000Z",
        "InstanceId": "i-1234567890abcdef0",
        "Storage": {
            "S3": {
                "Prefix": "winami",
                "Bucket": "amzn-s3-demo-bucket"
```

```
            }
        },
        "State": "cancelling",
        "StartTime": "2015-09-15T13:24:35.000Z",
        "BundleId": "bun-2a4e041c"
    }
}
```

For more information, see AMI types and characteristics in Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see CancelBundleTask in *AWS CLI Command Reference*.

`cancel-capacity-reservation-fleets`

The following code example shows how to use `cancel-capacity-reservation-fleets`.

AWS CLI

To cancel a Capacity Reservation Fleet

The following `cancel-capacity-reservation-fleets` example cancels the specified Capacity Reservation Fleet and the capacity it reserves. When you cancel a Fleet, its status changes to `cancelled`, and it can no longer create new Capacity Reservations. Additionally, all of the individual Capacity Reservations in the Fleet are cancelled, and the instances that were previously running in the reserved capacity continue to run normally in shared capacity.

```
aws ec2 cancel-capacity-reservation-fleets \
    --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```
{
    "SuccessfulFleetCancellations": [
        {
            "CurrentFleetState": "cancelling",
            "PreviousFleetState": "active",
            "CapacityReservationFleetId": "crf-abcdef01234567890"
        }
    ],
    "FailedFleetCancellations": []
}
```

For more information about Capacity Reservation Fleets, see Capacity Reservation Fleets in the *Amazon EC2 User Guide*.

- For API details, see CancelCapacityReservationFleets in *AWS CLI Command Reference*.

`cancel-capacity-reservation`

The following code example shows how to use `cancel-capacity-reservation`.

AWS CLI

To cancel a capacity reservation

The following `cancel-capacity-reservation` example cancels the specified capacity reservation.

```
aws ec2 cancel-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```
{
    "Return": true
}
```

For more information, see Cancel a Capacity Reservation in the *Amazon EC2 User Guide*.

- For API details, see CancelCapacityReservation in *AWS CLI Command Reference*.

`cancel-conversion-task`

The following code example shows how to use `cancel-conversion-task`.

AWS CLI

To cancel an active conversion of an instance or a volume

The following `cancel-conversion-task` example cancels the upload associated with the task ID import-i-fh95npoc.

```
aws ec2 cancel-conversion-task \
```

```
    --conversion-task-id import-i-fh95npoc
```

This command produces no output.

For more information, see Import a VM as an EC2 instance using VM Import/Export in the *VM Import/Export User Guide*.

- For API details, see CancelConversionTask in *AWS CLI Command Reference*.

`cancel-export-task`

The following code example shows how to use `cancel-export-task`.

AWS CLI

To cancel an active export task

The following `cancel-export-task` example cancels an active export task with the task ID export-i-fgelt0i7.

```
aws ec2 cancel-export-task \
    --export-task-id export-i-fgelt0i7
```

This command produces no output.

For more information, see Export an EC2 instance as a VM using VM Import/Export in the *VM Import/Export User Guide*.

- For API details, see CancelExportTask in *AWS CLI Command Reference*.

`cancel-image-launch-permission`

The following code example shows how to use `cancel-image-launch-permission`.

AWS CLI

To cancel having an AMI shared with your Amazon Web Services account

The following `cancel-image-launch-permission` example removes your account from the specified AMI's launch permissions.

```
aws ec2 cancel-image-launch-permission \
```

```
    --image-id ami-0123456789example
```

Output:

```
{
    "Return": true
}
```

For more information, see Cancel having an AMI shared with your Amazon Web Services account in the *Amazon EC2 User Guide*.

- For API details, see CancelImageLaunchPermission in *AWS CLI Command Reference*.

`cancel-import-task`

The following code example shows how to use `cancel-import-task`.

AWS CLI

To cancel an import task

The following `cancel-import-task` example cancels the specified import image task.

```
aws ec2 cancel-import-task \
    --import-task-id import-ami-1234567890abcdef0
```

Output:

```
{
    "ImportTaskId": "import-ami-1234567890abcdef0",
    "PreviousState": "active",
    "State": "deleting"
}
```

For more information, see Monitor an import image task in the *VM Import/Export User Guide*.

- For API details, see CancelImportTask in *AWS CLI Command Reference*.

`cancel-reserved-instances-listing`

The following code example shows how to use `cancel-reserved-instances-listing`.

AWS CLI

To cancel a Reserved Instance listing

The following `cancel-reserved-instances-listing` example cancels the specified Reserved Instance listing.

```
aws ec2 cancel-reserved-instances-listing \
    --reserved-instances-listing-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ReservedInstancesListings": [
        {
            "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreateDate": "2024-05-14T18:12:30.000Z",
            "InstanceCounts": [
                {
                    "InstanceCount": 0,
                    "State": "available"
                },
                {
                    "InstanceCount": 0,
                    "State": "sold"
                },
                {
                    "InstanceCount": 3,
                    "State": "cancelled"
                },
                {
                    "InstanceCount": 0,
                    "State": "pending"
                }
            ],
            "PriceSchedules": [
                {
                    "Active": false,
                    "CurrencyCode": "USD",
                    "Price": 25.5,
                    "Term": 11
                }
            ],
```

```
            "ReservedInstancesId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ReservedInstancesListingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Status": "cancelled",
            "StatusMessage": "cancelled",
            "Tags": [],
            "UpdateDate": "2024-05-15T09:24:51.000Z"
        }
    ]
}
```

For more information, see Sell Reserved Instances for Amazon EC2 in the Reserved Instance Marketplace in the *Amazon EC2 User Guide*.

- For API details, see CancelReservedInstancesListing in *AWS CLI Command Reference*.

`cancel-spot-fleet-requests`

The following code example shows how to use `cancel-spot-fleet-requests`.

AWS CLI

Example 1: To cancel a Spot fleet request and terminate the associated instances

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request and terminates the associated On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --terminate-instances
```

Output:

```
{
    "SuccessfulFleetRequests": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "CurrentSpotFleetRequestState": "cancelled_terminating",
            "PreviousSpotFleetRequestState": "active"
        }
    ],
    "UnsuccessfulFleetRequests": []
}
```

Example 2: To cancel a Spot fleet request without terminating the associated instances

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request without terminating the associated On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --no-terminate-instances
```

Output:

```
{
    "SuccessfulFleetRequests": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "CurrentSpotFleetRequestState": "cancelled_running",
            "PreviousSpotFleetRequestState": "active"
        }
    ],
    "UnsuccessfulFleetRequests": []
}
```

For more information, see Cancel a Spot Fleet request in the *Amazon EC2 User Guide*.

- For API details, see CancelSpotFleetRequests in *AWS CLI Command Reference*.

`cancel-spot-instance-requests`

The following code example shows how to use `cancel-spot-instance-requests`.

AWS CLI

To cancel Spot Instance requests

The following `cancel-spot-instance-requests` example cancels a Spot Instance request.

```
aws ec2 cancel-spot-instance-requests \
    --spot-instance-request-ids sir-08b93456
```

Output:

```
{
```

```
    "CancelledSpotInstanceRequests": [
        {
            "State": "cancelled",
            "SpotInstanceRequestId": "sir-08b93456"
        }
    ]
}
```

For more information, see Cancel a Spot Instance request in the *Amazon EC2 User Guide*.

- For API details, see CancelSpotInstanceRequests in *AWS CLI Command Reference*.

`confirm-product-instance`

The following code example shows how to use `confirm-product-instance`.

AWS CLI

To confirm the product instance

The following `confirm-product-instance` example determines whether the specified product code is associated with the specified instance.

```
aws ec2 confirm-product-instance \
    --product-code 774F4FF8 \
    --instance-id i-1234567890abcdef0
```

Output:

```
{
    "OwnerId": "123456789012"
}
```

For more information, see Paid AMIs in the AWS Marketplace for Amazon EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see ConfirmProductInstance in *AWS CLI Command Reference*.

`copy-fpga-image`

The following code example shows how to use `copy-fpga-image`.

AWS CLI

To copy an Amazon FPGA image

The following `copy-fpga-image` example copies the specified AFI from the `us-east-1` region to the current region (`eu-west-1`).

```
aws ec2 copy-fpga-image \
    --name copy-afi \
    --source-fpga-image-id afi-0d123e123bfc85abc \
    --source-region us-east-1 \
    --region eu-west-1
```

Output:

```
{
    "FpgaImageId": "afi-06b12350a123fbabc"
}
```

For more information, see Specifications for Amazon EC2 accelerated computing instances in the *Amazon EC2 Instance Types Guide*.

- For API details, see CopyFpgaImage in *AWS CLI Command Reference*.

`copy-image`

The following code example shows how to use `copy-image`.

AWS CLI

Example 1: To copy an AMI to another Region

The following `copy-image` example copies the specified AMI from the `us-west-2` Region to the `us-east-1` Region and adds a short description.

```
aws ec2 copy-image \
    --region us-east-1 \
    --name ami-name \
    --source-region us-west-2 \
    --source-image-id ami-0abcdef1234567890 \
    --description "This is my copied image."
```

Output:

```
{
    "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see Copy an AMI in the *Amazon EC2 User Guide*.

Example 2: To copy an AMI to another Region and encrypt the backing snapshot

The following `copy-image` example copies the specified AMI from the `us-west-2` Region to the current Region and encrypts the backing snapshot using the specified KMS key.

```
aws ec2 copy-image \
    --source-region us-west-2 \
    --name ami-name \
    --source-image-id ami-0abcdef1234567890 \
    --encrypted \
    --kms-key-id alias/my-kms-key
```

Output:

```
{
    "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see Copy an AMI in the *Amazon EC2 User Guide*.

Example 3: To include your user-defined AMI tags when copying an AMI

The following `copy-image` example uses the `--copy-image-tags` parameter to copy your user-defined AMI tags when copying the AMI.

```
aws ec2 copy-image \
    --region us-east-1 \
    --name ami-name \
    --source-region us-west-2 \
    --source-image-id ami-0abcdef1234567890 \
    --description "This is my copied image." \
    --copy-image-tags
```

Output:

```
{
    "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see Copy an AMI in the *Amazon EC2 User Guide*.

- For API details, see CopyImage in *AWS CLI Command Reference*.

`copy-snapshot`

The following code example shows how to use `copy-snapshot`.

AWS CLI

Example 1: To copy a snapshot to another Region

The following `copy-snapshot` example copies the specified snapshot from the `us-west-2` Region to the `us-east-1` Region and adds a short description.

```
aws ec2 copy-snapshot \
    --region us-east-1 \
    --source-region us-west-2 \
    --source-snapshot-id snap-0abcdef1234567890 \
    --description 'This is my copied snapshot.'
```

Output:

```
{
    "SnapshotId": "snap-0abcdef1234567890"
}
```

Example 2: To copy an unencrypted snapshot and encrypt the new snapshot

The following `copy-snapshot` example copies the specified unencrypted snapshot from the `us-west-2` Region to the current Region and encrypts the new snapshot using the specified KMS key.

```
aws ec2 copy-snapshot \
    --source-region us-west-2 \
```

```
    --source-snapshot-id snap-0abcdef1234567890 \
    --encrypted \
    --kms-key-id alias/my-kms-key
```

Output:

```
{
    "SnapshotId": "snap-0abcdef1234567890"
}
```

For more information, see Copy an Amazon EBS snapshot in the *Amazon EBS User Guide*.

- For API details, see CopySnapshot in *AWS CLI Command Reference*.

`create-capacity-reservation-fleet`

The following code example shows how to use `create-capacity-reservation-fleet`.

AWS CLI

To create a Capacity Reservation Fleet

The following `create-capacity-reservation-fleet` example creates a Capacity Reservation Fleet for the instance type specified in the request, up to the specified total target capacity. The number of instances for which the Capacity Reservation Fleet reserves capacity depends on the total target capacity and instance type weights that you specify in the request. Specify the instance types to use and a priority for each of the designated instance types.

```
aws ec2 create-capacity-reservation-fleet \
    --total-target-capacity 24 \
    --allocation-strategy prioritized \
    --instance-match-criteria open \
    --tenancy default \
    --end-date 2022-12-31T23:59:59.000Z \
    --instance-type-specifications file://instanceTypeSpecification.json
```

Contents of `instanceTypeSpecification.json`:

```
[
    {
        "InstanceType": "m5.xlarge",
```

```
        "InstancePlatform": "Linux/UNIX",
        "Weight": 3.0,
        "AvailabilityZone":"us-west-2a",
        "EbsOptimized": true,
        "Priority" : 1
    }
]
```

Output:

```
{
    "State": "submitted",
    "TotalFulfilledCapacity": 0.0,
    "CapacityReservationFleetId": "crf-abcdef01234567890",
    "TotalTargetCapacity": 24
}
```

For more information about Capacity Reservation Fleets, see Capacity Reservation Fleets in the *Amazon EC2 User Guide*.

For more information about instance type weight and total target capacity, see Instance type weight and Total target capacity in the *Amazon EC2 User Guide*.

For more information about designating priority for specified instance types, see Allocation strategy and Instance type priority in the *Amazon EC2 User Guide*.

- For API details, see CreateCapacityReservationFleet in *AWS CLI Command Reference*.

`create-capacity-reservation`

The following code example shows how to use `create-capacity-reservation`.

AWS CLI

Example 1: To create a Capacity Reservation

The following `create-capacity-reservation` example creates a capacity reservation in the `us-west-2a` Availability Zone, into which you can launch three `t2.medium` instances running a Linux/Unix operating system. By default, the capacity reservation is created with open instance matching criteria and no support for ephemeral storage, and it remains active until you manually cancel it.

```
aws ec2 create-capacity-reservation \
    --availability-zone us-west-2a \
    --instance-type t2.medium \
    --instance-platform Linux/UNIX \
    --instance-count 3
```

Output:

```
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "unlimited",
        "AvailabilityZone": "us-west-2a",
        "InstanceMatchCriteria": "open",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T09:27:35.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "t2.medium"
    }
}
```

Example 2: To create a Capacity Reservation that automatically ends at a specified date/time

The following `create-capacity-reservation` example creates a capacity reservation in the `us-west-2a` Availability Zone, into which you can launch three `m5.large` instances running a Linux/Unix operating system. This capacity reservation automatically ends on 08/31/2019 at 23:59:59.

```
aws ec2 create-capacity-reservation \
    --availability-zone us-west-2a \
    --instance-type m5.large \
    --instance-platform Linux/UNIX \
    --instance-count 3 \
    --end-date-type limited \
    --end-date 2019-08-31T23:59:59Z
```

Output:

```
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "limited",
        "AvailabilityZone": "us-west-2a",
        "EndDate": "2019-08-31T23:59:59.000Z",
        "InstanceMatchCriteria": "open",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T10:15:53.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "m5.large"
    }
}
```

Example 3: To create a Capacity Reservation that accepts only targeted instance launches

The following `create-capacity-reservation` example creates a capacity reservation that accepts only targeted instance launches.

```
aws ec2 create-capacity-reservation \
    --availability-zone us-west-2a \
    --instance-type m5.large \
    --instance-platform Linux/UNIX \
    --instance-count 3 \
    --instance-match-criteria targeted
```

Output:

```
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "unlimited",
        "AvailabilityZone": "us-west-2a",
        "InstanceMatchCriteria": "targeted",
        "EphemeralStorage": false,
```

```
        "CreateDate": "2019-08-16T10:21:57.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "m5.large"
    }
}
```

For more information, see Create a Capacity Reservation in the *Amazon EC2 User Guide*.

- For API details, see CreateCapacityReservation in *AWS CLI Command Reference*.

`create-carrier-gateway`

The following code example shows how to use `create-carrier-gateway`.

AWS CLI

To create a carrier gateway

The following `create-carrier-gateway` example creates a carrier gateway for the specified VPC.

```
aws ec2 create-carrier-gateway \
    --vpc-id vpc-0c529aEXAMPLE1111
```

Output:

```
{
    "CarrierGateway": {
        "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
        "VpcId": "vpc-0c529aEXAMPLE1111",
        "State": "pending",
        "OwnerId": "123456789012"
    }
}
```

For more information, see Carrier gateways in the *AWS Wavelength User Guide*.

- For API details, see CreateCarrierGateway in *AWS CLI Command Reference*.

`create-client-vpn-endpoint`

The following code example shows how to use `create-client-vpn-endpoint`.

AWS CLI

To create a Client VPN endpoint

The following `create-client-vpn-endpoint` example creates a Client VPN endpoint that uses mutual authentication and specifies a value for the client CIDR block.

```
aws ec2 create-client-vpn-endpoint \
    --client-cidr-block "172.31.0.0/16" \
    --server-certificate-arn arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --authentication-options Type=certificate-
authentication,MutualAuthentication={ClientRootCertificateChainArn=arn:aws:acm:us-
west-2:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222} \
    --connection-log-options Enabled=false
```

Output:

```
{
    "ClientVpnEndpointId": "cvpn-endpoint-123456789012abcde",
    "Status": {
        "Code": "pending-associate"
    },
    "DnsName": "cvpn-endpoint-123456789012abcde.prod.clientvpn.us-
west-2.amazonaws.com"
}
```

For more information, see Client VPN Endpoints in the *AWS Client VPN Administrator Guide*.

- For API details, see CreateClientVpnEndpoint in *AWS CLI Command Reference*.

`create-client-vpn-route`

The following code example shows how to use `create-client-vpn-route`.

AWS CLI

To create a route for a Client VPN endpoint

The following `create-client-vpn-route` example adds a route to the internet (`0.0.0.0/0`) for the specified subnet of the Client VPN endpoint.

```
aws ec2 create-client-vpn-route \
    --client-vpn-endpoint-id cvpn-endpoint-123456789012abcde \
    --destination-cidr-block 0.0.0.0/0  \
    --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```
{
    "Status": {
        "Code": "creating"
    }
}
```

For more information, see Routes in the *AWS Client VPN Administrator Guide*.

- For API details, see CreateClientVpnRoute in *AWS CLI Command Reference*.

`create-coip-cidr`

The following code example shows how to use `create-coip-cidr`.

AWS CLI

To create a range of customer-owned IP (CoIP) addresses

The following `create-coip-cidr` example creates the specified range of CoIP addresses in the specified CoIP pool.

```
aws ec2 create-coip-cidr \
    --cidr 15.0.0.0/24 \
    --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{
    "CoipCidr": {
        "Cidr": "15.0.0.0/24",
```

```
        "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
    }
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.

- For API details, see CreateCoipCidr in *AWS CLI Command Reference*.

`create-coip-pool`

The following code example shows how to use `create-coip-pool`.

AWS CLI

To create a pool of customer-owned IP (CoIP) addresses

The following `create-coip-pool` example creates a CoIP pool for CoIP addresses in the specified local gateway route table.

```
aws ec2 create-coip-pool \
    --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

Output:

```
{
    "CoipPool": {
        "PoolId": "ipv4pool-coip-1234567890abcdefg",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "PoolArn": "arn:aws:ec2:us-west-2:123456789012:coip-pool/ipv4pool-
coip-1234567890abcdefg"
    }
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.

- For API details, see CreateCoipPool in *AWS CLI Command Reference*.

`create-customer-gateway`

The following code example shows how to use `create-customer-gateway`.

AWS CLI

To create a customer gateway

The following `create-customer-gateway` example creates a customer gateway with the specified IP address for its outside interface.

```
aws ec2 create-customer-gateway \
    --type ipsec.1 \
    --public-ip 12.1.2.3 \
    --bgp-asn 65534
```

Output:

```
{
    "CustomerGateway": {
        "CustomerGatewayId": "cgw-0e11f167",
        "IpAddress": "12.1.2.3",
        "State": "available",
        "Type": "ipsec.1",
        "BgpAsn": "65534"
    }
}
```

For more information, see AWS Site-to-Site VPN customer gateway devices in the *AWS Site-to-Site VPN User Guide*.

- For API details, see CreateCustomerGateway in *AWS CLI Command Reference*.

`create-default-subnet`

The following code example shows how to use `create-default-subnet`.

AWS CLI

To create a default subnet

The following `create-default-subnet` example creates a default subnet in Availability Zone `us-west-2a`.

```
aws ec2 create-default-subnet \
```

```
    --availability-zone us-west-2a
```

Output:

```
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
        "Tags": [],
        "AvailableIpAddressCount": 4091,
        "DefaultForAz": true,
        "Ipv6CidrBlockAssociationSet": [],
        "VpcId": "vpc-1a2b3c4d",
        "State": "available",
        "MapPublicIpOnLaunch": true,
        "SubnetId": "subnet-1122aabb",
        "CidrBlock": "172.31.32.0/20",
        "AssignIpv6AddressOnCreation": false
    }
}
```

For more information, see Work with your default VPC and default subnets in the *Amazon VPC User Guide*.

- For API details, see CreateDefaultSubnet in *AWS CLI Command Reference*.

`create-default-vpc`

The following code example shows how to use `create-default-vpc`.

AWS CLI

To create a default VPC

The following `create-default-vpc` example creates a default VPC.

```
aws ec2 create-default-vpc
```

Output:

```
{
    "Vpc": {
```

```
        "VpcId": "vpc-8eaae5ea",
        "InstanceTenancy": "default",
        "Tags": [],
        "Ipv6CidrBlockAssociationSet": [],
        "State": "pending",
        "DhcpOptionsId": "dopt-af0c32c6",
        "CidrBlock": "172.31.0.0/16",
        "IsDefault": true
    }
}
```

For more information, see Work with your default VPC and default subnets in the *Amazon VPC User Guide*.

- For API details, see CreateDefaultVpc in *AWS CLI Command Reference*.

`create-dhcp-options`

The following code example shows how to use `create-dhcp-options`.

AWS CLI

To create a set of DHCP options

The following `create-dhcp-options` example creates a set of DHCP options that specifies the domain name, the domain name servers, and the NetBIOS node type.

```
aws ec2 create-dhcp-options \
    --dhcp-configurations "Key=domain-name-
servers,Values=10.2.5.1,10.2.5.2" "Key=domain-name,Values=example.com" "Key=netbios-
node-type,Values=2"
```

Output:

```
{
    "DhcpOptions": {
        "DhcpConfigurations": [
            {
                "Key": "domain-name",
                "Values": [
                    {
                        "Value": "example.com"
```

```
                    }
                ]
            },
            {
                "Key": "domain-name-servers",
                "Values": [
                    {
                        "Value": "10.2.5.1"
                    },
                    {
                        "Value": "10.2.5.2"
                    }
                ]
            },
            {
                "Key": "netbios-node-type",
                "Values": [
                    {
                        "Value": "2"
                    }
                ]
            }
        ],
        "DhcpOptionsId": "dopt-06d52773eff4c55f3"
    }
}
```

For more information, see DHCP option sets in Amazon VPC in the *Amazon VPC User Guide*.

- For API details, see CreateDhcpOptions in *AWS CLI Command Reference*.

`create-egress-only-internet-gateway`

The following code example shows how to use `create-egress-only-internet-gateway`.

AWS CLI

To create an egress-only Internet gateway

The following `create-egress-only-internet-gateway` example creates an egress-only Internet gateway for the specified VPC.

```
aws ec2 create-egress-only-internet-gateway \
```

```
    --vpc-id vpc-0c62a468
```

Output:

```
{
    "EgressOnlyInternetGateway": {
        "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
        "Attachments": [
            {
                "State": "attached",
                "VpcId": "vpc-0c62a468"
            }
        ]
    }
}
```

For more information, see Enable outbound IPv6 traffic using an egress-only internet gateway in the *Amazon VPC User Guide*.

- For API details, see CreateEgressOnlyInternetGateway in *AWS CLI Command Reference*.

`create-fleet`

The following code example shows how to use `create-fleet`.

AWS CLI

Example 1: To create an EC2 Fleet that launches Spot Instances as the default purchasing model

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is `spot`, which results in the fleet launching 2 Spot Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
    --cli-input-json file://file_name.json
```

Contents of `file_name.json`:

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Output:

```
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

For more information, see Create an EC2 Fleet in the *Amazon EC2 User Guide*.

Example 2: To create an EC2 Fleet that launches On-Demand Instances as the default purchasing model

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is `on-demand`, which results in the fleet launching 2 On-Demand Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
    --cli-input-json file://file_name.json
```

Contents of `file_name.json`:

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "on-demand"
    }
}
```

Output:

```
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

For more information, see Create an EC2 Fleet in the *Amazon EC2 User Guide*.

Example 3: To create an EC2 Fleet that launches On-Demand Instances as the primary capacity

The following `create-fleet` example creates an EC2 Fleet that specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing model is `spot`. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfil the total target capacity. The purchasing model for the difference is calculated as `TotalTargetCapacity` - `OnDemandTargetCapacity` = `DefaultTargetCapacityType`, which results in the fleet launching 1 Spot Instance.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
    --cli-input-json file://file_name.json
```

Contents of `file_name.json`:

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "OnDemandTargetCapacity": 1,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Output:

```
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

For more information, see Create an EC2 Fleet in the *Amazon EC2 User Guide*.

Example 4: To create an EC2 Fleet that launches Spot Instances using the lowest-price allocation strategy

The following `create-fleet` example creates an EC2 Fleet using the `lowest-price` allocation strategy. If the allocation strategy for Spot Instances is not specified, the default allocation strategy, which is `lowest-price`, is used. The three launch specifications, which override the launch template, have different instance types but the same weighted capacity and subnet. The total target capacity is 2 instances and the default purchasing model is `spot`. The EC2 Fleet launches 2 Spot Instances using the instance type of the launch specification with the lowest price.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
    --cli-input-json file://file_name.json
```

Contents of `file_name.json`:

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "c4.large",
                    "WeightedCapacity": 1,
                    "SubnetId": "subnet-a4f6c5d3"
                },
                {
                    "InstanceType": "c3.large",
                    "WeightedCapacity": 1,
                    "SubnetId": "subnet-a4f6c5d3"
                },
                {
                    "InstanceType": "c5.large",
                    "WeightedCapacity": 1,
                    "SubnetId": "subnet-a4f6c5d3"
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Output:

```
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

For more information, see Use allocation strategies to determine how EC2 Fleet or Spot Fleet fulfills Spot and On-Demand capacity in the *Amazon EC2 User Guide*.

- For API details, see CreateFleet in *AWS CLI Command Reference*.

`create-flow-logs`

The following code example shows how to use `create-flow-logs`.

AWS CLI

Example 1: To create a flow log

The following `create-flow-logs` example creates a flow log that captures all rejected traffic for the specified network interface. The flow logs are delivered to a log group in CloudWatch Logs using the permissions in the specified IAM role.

```
aws ec2 create-flow-logs \
    --resource-type NetworkInterface \
    --resource-ids eni-11223344556677889 \
    --traffic-type REJECT \
    --log-group-name my-flow-logs \
    --deliver-logs-permission-arn arn:aws:iam::123456789012:role/publishFlowLogs
```

Output:

```
{
    "ClientToken": "so0eNA2uSHUNlHI0S2cJ305GuIX1CezaRdGtexample",
    "FlowLogIds": [
        "fl-12345678901234567"
    ],
    "Unsuccessful": []
}
```

For more information, see VPC Flow Logs in the *Amazon VPC User Guide*.

Example 2: To create a flow log with a custom format

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--log-format` parameter specifies a custom format for the flow log records. To run this command on Windows, change the single quotes (') to double quotes (").

```
aws ec2 create-flow-logs \
```

```
    --resource-type VPC \
    --resource-ids vpc-00112233344556677 \
    --traffic-type ALL \
    --log-destination-type s3 \
    --log-destination arn:aws:s3:::amzn-s3-demo-bucket/my-custom-flow-logs/ \
    --log-format '${version} ${vpc-id} ${subnet-id} ${instance-id} ${srcaddr}
 ${dstaddr} ${srcport} ${dstport} ${protocol} ${tcp-flags} ${type} ${pkt-srcaddr}
 ${pkt-dstaddr}'
```

Output:

```
{
    "ClientToken": "so0eNA2uSHUNlHI0S2cJ305GuIX1CezaRdGtexample",
    "FlowLogIds": [
        "fl-1a2b3c4d5e6f7a8b9"
    ],
    "Unsuccessful": []
}
```

For more information, see VPC Flow Logs in the *Amazon VPC User Guide*.

Example 3: To create a flow log with a one-minute maximum aggregation interval

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--max-aggregation-interval` parameter specifies a maximum aggregation interval of 60 seconds (1 minute).

```
aws ec2 create-flow-logs \
    --resource-type VPC \
    --resource-ids vpc-00112233344556677 \
    --traffic-type ALL \
    --log-destination-type s3 \
    --log-destination arn:aws:s3:::amzn-s3-demo-bucket/my-custom-flow-logs/ \
    --max-aggregation-interval 60
```

Output:

```
{
    "ClientToken": "so0eNA2uSHUNlHI0S2cJ305GuIX1CezaRdGtexample",
    "FlowLogIds": [
        "fl-0a1b2c3d4e5f6a7b8"
```

```
    ],
    "Unsuccessful": []
}
```

For more information, see VPC Flow Logs in the *Amazon VPC User Guide*.

- For API details, see CreateFlowLogs in *AWS CLI Command Reference*.

`create-fpga-image`

The following code example shows how to use `create-fpga-image`.

AWS CLI

To create an Amazon FPGA image

The following `create-fpga-image` example creates an AFI from the specified tarball in the specified bucket.

```
aws ec2 create-fpga-image \
    --name my-afi \
    --description test-afi \
    --input-storage-location Bucket=my-fpga-
bucket,Key=dcp/17_12_22-103226.Developer_CL.tar \
    --logs-storage-location Bucket=my-fpga-bucket,Key=logs
```

Output:

```
{
    "FpgaImageId": "afi-0d123e123bfc85abc",
    "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc"
}
```

For more information, see Specifications for Amazon EC2 accelerated computing instances in the *Amazon EC2 Instance Types Guide*.

- For API details, see CreateFpgaImage in *AWS CLI Command Reference*.

`create-image`

The following code example shows how to use `create-image`.

AWS CLI

Example 1: To create an AMI from an Amazon EBS-backed instance

The following `create-image` example creates an AMI from the specified instance.

```
aws ec2 create-image \
    --instance-id i-1234567890abcdef0 \
    --name "My server" \
    --description "An AMI for my server"
```

Output:

```
{
    "ImageId": "ami-abcdef01234567890"
}
```

For more information about specifying a block device mapping for your AMI, see Specifying a block device mapping for an AMI in the *Amazon EC2 User Guide*.

Example 2: To create an AMI from an Amazon EBS-backed instance without reboot

The following `create-image` example creates an AMI and sets the --no-reboot parameter, so that the instance is not rebooted before the image is created.

```
aws ec2 create-image \
    --instance-id i-1234567890abcdef0 \
    --name "My server" \
    --no-reboot
```

Output:

```
{
    "ImageId": "ami-abcdef01234567890"
}
```

For more information about specifying a block device mapping for your AMI, see Specifying a block device mapping for an AMI in the *Amazon EC2 User Guide*.

Example 3: To tag an AMI and snapshots on creation

The following `create-image` example creates an AMI, and tags the AMI and the snapshots with the same tag `cost-center=cc123`.

```
aws ec2 create-image \
    --instance-id i-1234567890abcdef0 \
    --name "My server" \
    --tag-specifications "ResourceType=image,Tags=[{Key=cost-
center,Value=cc123}]" "ResourceType=snapshot,Tags=[{Key=cost-center,Value=cc123}]"
```

Output:

```
{
    "ImageId": "ami-abcdef01234567890"
}
```

For more information about tagging your resources on creation, see Add tags on resource creation in the *Amazon EC2 User Guide*.

- For API details, see CreateImage in *AWS CLI Command Reference*.

`create-instance-connect-endpoint`

The following code example shows how to use `create-instance-connect-endpoint`.

AWS CLI

To create an EC2 Instance Connect Endpoint

The following `create-instance-connect-endpoint` example creates an EC2 Instance Connect Endpoint in the specified subnet.

```
aws ec2 create-instance-connect-endpoint \
    --subnet-id subnet-0123456789example
```

Output:

```
{
    "InstanceConnectEndpoint": {
        "VpcId": "vpc-0123abcd",
        "InstanceConnectEndpointArn": "arn:aws:ec2:us-west-2:123456789012:instance-
connect-endpoint/eice-0123456789example",
```

```
        "AvailabilityZone": "us-west-2a",
        "NetworkInterfaceIds": [
            "eni-0123abcd"
        ],
        "PreserveClientIp": true,
        "Tags": [],
        "FipsDnsName": "eice-0123456789example.0123abcd.fips.ec2-instance-connect-
endpoint.us-west-2.amazonaws.com",
        "StateMessage": "",
        "State": "create-complete",
        "DnsName": "eice-0123456789example.0123abcd.ec2-instance-connect-
endpoint.us-west-2.amazonaws.com",
        "SubnetId": "subnet-0123abcd",
        "OwnerId": "123456789012",
        "SecurityGroupIds": [
            "sg-0123abcd"
        ],
        "InstanceConnectEndpointId": "eice-0123456789example",
        "CreatedAt": "2023-04-07T15:43:53.000Z"
    }
}
```

For more information, see Create an EC2 Instance Connect Endpoint in the *Amazon EC2 User Guide*.

- For API details, see CreateInstanceConnectEndpoint in *AWS CLI Command Reference*.

`create-instance-event-window`

The following code example shows how to use `create-instance-event-window`.

AWS CLI

Example 1: To create an event window with a time range

The following `create-instance-event-window` example creates an event window with a time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 create-instance-event-window \
    --time-ranges StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8 \
    --tag-specifications "ResourceType=instance-event-
window,Tags=[{Key=K1,Value=V1}]" \
```

```
    --name myEventWindowName
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            }
        ],
        "Name": "myEventWindowName",
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For event window constraints, see Considerations in the *Amazon EC2 User Guide*.

Example 2: To create an event window with a cron expression

The following `create-instance-event-window` example creates an event window with a cron expression. You can't also specify the `time-range` parameter.

```
aws ec2 create-instance-event-window \
    --cron-expression "* 21-23 * * 2,3" \
    --tag-specifications "ResourceType=instance-event-
window,Tags=[{Key=K1,Value=V1}]" \
    --name myEventWindowName
```

Output:

```
{
```

```
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For event window constraints, see Considerations in the *Amazon EC2 User Guide*.

- For API details, see CreateInstanceEventWindow in *AWS CLI Command Reference*.

`create-instance-export-task`

The following code example shows how to use `create-instance-export-task`.

AWS CLI

To export an instance

The following `create-instance-export-task` example creates a task to export the instance i-1234567890abcdef0 to the Amazon S3 bucket myexportbucket.

```
aws ec2 create-instance-export-task \
    --description "RHEL5 instance" \
    --instance-id i-1234567890abcdef0 \
    --target-environment vmware \
    --export-to-s3-
task DiskImageFormat=vmdk,ContainerFormat=ova,S3Bucket=myexportbucket,S3Prefix=RHEL5
```

Output:

```
{
    "ExportTask": {
        "State": "active",
        "InstanceExportDetails": {
```

```
            "InstanceId": "i-1234567890abcdef0",
            "TargetEnvironment": "vmware"
        },
        "ExportToS3Task": {
            "S3Bucket": "myexportbucket",
            "S3Key": "RHEL5export-i-fh8sjjsq.ova",
            "DiskImageFormat": "vmdk",
            "ContainerFormat": "ova"
        },
        "Description": "RHEL5 instance",
        "ExportTaskId": "export-i-fh8sjjsq"
    }
}
```

For more information, see Export an EC2 instance as a VM using VM Import/Export in the *VM Import/Export User Guide*.

- For API details, see CreateInstanceExportTask in *AWS CLI Command Reference*.

`create-internet-gateway`

The following code example shows how to use `create-internet-gateway`.

AWS CLI

To create an internet gateway

The following `create-internet-gateway` example creates an internet gateway with the tag `Name=my-igw`.

```
aws ec2 create-internet-gateway \
    --tag-specifications ResourceType=internet-gateway,Tags=[{Key=Name,Value=my-igw}]
```

Output:

```
{
    "InternetGateway": {
        "Attachments": [],
        "InternetGatewayId": "igw-0d0fb496b3994d755",
        "OwnerId": "123456789012",
        "Tags": [
```

```
            {
                "Key": "Name",
                "Value": "my-igw"
            }
        ]
    }
}
```

For more information, see Internet gateways in the *Amazon VPC User Guide*.

- For API details, see CreateInternetGateway in *AWS CLI Command Reference*.

`create-ipam-pool`

The following code example shows how to use `create-ipam-pool`.

AWS CLI

To create an IPAM pool

The following `create-ipam-pool` example creates an IPAM pool.

For Linux, use the following command.

```
aws ec2 create-ipam-pool \
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
    --address-family ipv4 \
    --auto-import \
    --allocation-min-netmask-length 16 \
    --allocation-max-netmask-length 26 \
    --allocation-default-netmask-length 24 \
    --allocation-resource-tags "Key=Environment,Value=Preprod" \
    --tag-specifications 'ResourceType=ipam-pool,Tags=[{Key=Name,Value="Preprod
 pool"}]'
```

For Windows, use the following command.

```
aws ec2 create-ipam-pool ^
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
    --address-family ipv4 ^
    --auto-import ^
    --allocation-min-netmask-length 16 ^
```

```
    --allocation-max-netmask-length 26 ^
    --allocation-default-netmask-length 24 ^
    --allocation-resource-tags "Key=Environment,Value=Preprod" ^
    --tag-specifications ResourceType=ipam-pool,Tags=[{Key=Name,Value="Preprod
 pool"}]
```

Output:

```
{
    "IpamPool": {
        "OwnerId": "123456789012",
        "IpamPoolId": "ipam-pool-0533048da7d823723",
        "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-0533048da7d823723",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
        "IpamScopeType": "private",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-west-2",
        "Locale": "None",
        "PoolDepth": 1,
        "State": "create-in-progress",
        "AutoImport": true,
        "AddressFamily": "ipv4",
        "AllocationMinNetmaskLength": 16,
        "AllocationMaxNetmaskLength": 26,
        "AllocationDefaultNetmaskLength": 24,
        "AllocationResourceTags": [
            {
                "Key": "Environment",
                "Value": "Preprod"
            }
        ],
        "Tags": [
            {
                "Key": "Name",
                "Value": "Preprod pool"
            }
        ]
    }
}
```

For more information, see Plan for IP address provisioning in the *Amazon VPC IPAM User Guide*.

- For API details, see CreateIpamPool in *AWS CLI Command Reference*.

`create-ipam-resource-discovery`

The following code example shows how to use `create-ipam-resource-discovery`.

AWS CLI

To create a resource discovery

The following `create-ipam-resource-discovery` example creates an IPAM resource discovery. In this example, you're a delegated IPAM admin who wants to create and share a resource discovery with the IPAM admin in another AWS Organization so that the admin in the other organization can manage and monitor the IP addresses of resources in your organization.

Important

This example includes both the `--region` and `--operating-regions` options because, while they are optional, they must be configured in a particular way to successfully integrate a resource discovery with an IPAM. * `--operating-regions` must match the Regions where you have resources that you want IPAM to discover. If there are Regions where you do not want IPAM to manage the IP addresses (for example for compliance reasons), do not include them. * `--region` must match the home Region of the IPAM you want to associate it with. You must create the resource discovery in the same Region that the IPAM was created in. For example, if the IPAM you are associating with was created in us-east-1, include `--region us-east-1` in the request.Both the `--region` and `--operating-regions` options default to the Region you're running the command in if you don't specify them.

In this example, the operating Regions of the IPAM we're integrating with include `us-west-1`, `us-west-2`, and `ap-south-1`. When we create the resource discovery, we want IPAM to discover the resource IP addresses in `us-west-1` and `us-west-2` but not `ap-south-1`. So we are including only `--operating-regions RegionName='us-west-1' RegionName='us-west-2'` in the request.

To create the resource discovery, use the following command.

```
aws ec2 create-ipam-resource-discovery \
    --description 'Example-resource-discovery' \
    --tag-specifications 'ResourceType=ipam-resource-discovery,Tags=[{Key=cost-
center,Value=cc123}]' \
```

```
    --operating-regions RegionName='us-west-1' RegionName='us-west-2' \
    --region us-east-1
```

Output:

```
{
    "IpamResourceDiscovery":{
        "OwnerId": "123456789012",
        "IpamResourceDiscoveryId": "ipam-res-disco-0257046d8aa78b8bc",
        "IpamResourceDiscoveryArn": "arn:aws:ec2::123456789012:ipam-resource-
discovery/ipam-res-disco-0257046d8aa78b8bc",
        "IpamResourceDiscoveryRegion": "us-east-1",
        "Description": "'Example-resource-discovery'",
        "OperatingRegions":[
            {"RegionName": "us-west-1"},
            {"RegionName": "us-west-2"},
            {"RegionName": "us-east-1"}
        ],
        "IsDefault": false,
        "State": "create-in-progress",
        "Tags": [
            {
                "Key": "cost-center",
                "Value": "cc123"
            }
        ]
    }
}
```

Once you create a resource discovery, you may want to share it with another IPAM delegated admin, which you can do with create-resource-share. For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see CreateIpamResourceDiscovery in *AWS CLI Command Reference*.

`create-ipam-scope`

The following code example shows how to use `create-ipam-scope`.

AWS CLI

To create an IPAM scope

The following `create-ipam-scope` example creates an IPAM scope.

For Linux, use the following command.

```
aws ec2 create-ipam-scope \
    --ipam-id ipam-08440e7a3acde3908 \
    --description "Example description" \
    --tag-specifications 'ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example
 name value"}]'
```

For Windows, use the following command.

```
aws ec2 create-ipam-scope ^
    --ipam-id ipam-08440e7a3acde3908 ^
    --description "Example description" ^
    --tag-specifications ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example name
 value"}]
```

Output:

```
{
    "IpamScope": {
        "OwnerId": "123456789012",
        "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-01c1ebab2b63bd7e4",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-west-2",
        "IpamScopeType": "private",
        "IsDefault": false,
        "Description": "Example description",
        "PoolCount": 0,
        "State": "create-in-progress",
        "Tags": [
            {
                "Key": "Name",
                "Value": "Example name value"
            }
        ]
    }
}
```

For more information, see Create additional scopes in the *Amazon VPC IPAM User Guide*.

- For API details, see CreateIpamScope in *AWS CLI Command Reference*.

`create-ipam`

The following code example shows how to use `create-ipam`.

AWS CLI

To create an IPAM

The following `create-ipam` example creates an IPAM.

For Linux, use the following command.

```
aws ec2 create-ipam \
    --description "Example description" \
    --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" \
    --tag-specifications 'ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]'
```

For Windows, use the following command.

```
aws ec2 create-ipam ^
    --description "Example description" ^
    --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" ^
    --tag-specifications ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]
```

Output:

```
{
    "Ipam": {
        "OwnerId": "123456789012",
        "IpamId": "ipam-036486dfa6af58ee0",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
        "IpamRegion": "us-east-1",
        "PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
        "PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
        "ScopeCount": 2,
        "OperatingRegions": [
            {
                "RegionName": "us-east-2"
```

```
            },
            {
                "RegionName": "us-west-1"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "State": "create-in-progress",
        "Tags": [
            {
                "Key": "Name",
                "Value": "ExampleIPAM"
            }
        ]
    }
}
```

For more information, see Create an IPAM in the *Amazon VPC IPAM User Guide*.

- For API details, see CreateIpam in *AWS CLI Command Reference*.

`create-key-pair`

The following code example shows how to use `create-key-pair`.

AWS CLI

To create a key pair

The following `create-key-pair` example creates a key pair named `MyKeyPair`.

```
aws ec2 create-key-pair \
    --key-name MyKeyPair
```

The output is an ASCII version of the private key and key fingerprint. You need to save the key to a file.

Output:

```
{
    "KeyFingerprint": "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",
```

```
    "KeyMaterial": "-----BEGIN RSA PRIVATE KEY-----\nEXAMPLEKEYMATERIAL\n-----END
 RSA PRIVATE KEY-----",
    "KeyName": "MyKeyPair",
    "KeyPairId": "key-0b94643da6EXAMPLE"
}
```

For more information, see Creating, displaying, and deleting Amazon EC2 key pairs in the AWS CLI in the *AWS Command Line Interface User Guide*.

- For API details, see CreateKeyPair in *AWS CLI Command Reference*.

`create-launch-template-version`

The following code example shows how to use `create-launch-template-version`.

AWS CLI

To create a launch template version

The following `create-launch-template-version` example creates a new launch template version based on version 1 of the launch template and specifies a different AMI ID.

```
aws ec2 create-launch-template-version \
    --launch-template-id lt-0abcd1234567890ab \
    --version-description WebVersion2 \
    --source-version 1 \
    --launch-template-data '{"ImageId":"ami-c998b6b2"}'
```

Output:

```
{
    "LaunchTemplateVersion": {
        "VersionDescription": "WebVersion2",
        "LaunchTemplateId": "lt-0abcd1234567890ab",
        "LaunchTemplateName": "WebServers",
        "VersionNumber": 2,
        "CreatedBy": "arn:aws:iam::123456789012:root",
        "LaunchTemplateData": {
            "ImageId": "ami-c998b6b2",
            "InstanceType": "t2.micro",
            "NetworkInterfaces": [
                {
                    "Ipv6Addresses": [
```

```
                        {
                            "Ipv6Address": "2001:db8:1234:1a00::123"
                        }
                    ],
                    "DeviceIndex": 0,
                    "SubnetId": "subnet-7b16de0c",
                    "AssociatePublicIpAddress": true
                }
            ]
        },
        "DefaultVersion": false,
        "CreateTime": "2017-12-01T13:35:46.000Z"
    }
}
```

For more information, see Modify a launch template (manage launch template versions) in the *Amazon EC2 User Guide*.

- For API details, see CreateLaunchTemplateVersion in *AWS CLI Command Reference*.

`create-launch-template`

The following code example shows how to use `create-launch-template`.

AWS CLI

Example 1: To create a launch template

The following `create-launch-template` example creates a launch template that specifies the subnet in which to launch the instance , assigns a public IP address and an IPv6 address to the instance, and creates a tag for the instance.

```
aws ec2 create-launch-template \
    --launch-template-name TemplateForWebServer \
    --version-description WebVersion1 \
    --launch-template-data '{"NetworkInterfaces":
[{"AssociatePublicIpAddress":true,"DeviceIndex":0,"Ipv6AddressCount":1,"SubnetId":"subnet-7b
[{"ResourceType":"instance","Tags":[{"Key":"purpose","Value":"webserver"}]}]}'
```

Output:

```
{
```

```
    "LaunchTemplate": {
        "LatestVersionNumber": 1,
        "LaunchTemplateId": "lt-01238c059e3466abc",
        "LaunchTemplateName": "TemplateForWebServer",
        "DefaultVersionNumber": 1,
        "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
        "CreateTime": "2019-01-27T09:13:24.000Z"
    }
}
```

For more information, see Store instance launch parameters in Amazon EC2 launch templates in the *Amazon EC2 User Guide*. For information about quoting JSON-formatted parameters, see Using quotation marks and literals with strings in the AWS CLI in the *AWS Command Line Interface User Guide*.

Example 2: To create a launch template for Amazon EC2 Auto Scaling

The following `create-launch-template` example creates a launch template with multiple tags and a block device mapping to specify an additional EBS volume when an instance launches. Specify a value for `Groups` that corresponds to security groups for the VPC that your Auto Scaling group will launch instances into. Specify the VPC and subnets as properties of the Auto Scaling group.

```
aws ec2 create-launch-template \
    --launch-template-name TemplateForAutoScaling \
    --version-description AutoScalingVersion1 \
    --launch-template-data '{"NetworkInterfaces":
[{"DeviceIndex":0,"AssociatePublicIpAddress":true,"Groups":
["sg-7c227019,sg-903004f8"],"DeleteOnTermination":true}],"ImageId":"ami-
b42209de","InstanceType":"m4.large","TagSpecifications":
[{"ResourceType":"instance","Tags":[{"Key":"environment","Value":"production"},
{"Key":"purpose","Value":"webserver"}]},{"ResourceType":"volume","Tags":
[{"Key":"environment","Value":"production"},{"Key":"cost-
center","Value":"cc123"}]}],"BlockDeviceMappings":[{"DeviceName":"/dev/sda1","Ebs":
{"VolumeSize":100}}]}'
```

Output:

```
{
    "LaunchTemplate": {
        "LatestVersionNumber": 1,
```

```
        "LaunchTemplateId": "lt-0123c79c33a54e0abc",
        "LaunchTemplateName": "TemplateForAutoScaling",
        "DefaultVersionNumber": 1,
        "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
        "CreateTime": "2019-04-30T18:16:06.000Z"
    }
}
```

For more information, see Create a launch template for an Auto Scaling group in the *Amazon EC2 Auto Scaling User Guide*. For information about quoting JSON-formatted parameters, see Using quotation marks and literals with strings in the AWS CLI in the *AWS Command Line Interface User Guide*.

Example 3: To create a launch template that specifies encryption of EBS volumes

The following `create-launch-template` example creates a launch template that includes encrypted EBS volumes created from an unencrypted snapshot. It also tags the volumes during creation. If encryption by default is disabled, you must specify the `"Encrypted"` option as shown in the following example. If you use the `"KmsKeyId"` option to specify a customer managed CMK, you also must specify the `"Encrypted"` option even if encryption by default is enabled.

```
aws ec2 create-launch-template \
    --launch-template-name TemplateForEncryption \
    --launch-template-data file://config.json
```

Contents of `config.json`:

```
{
    "BlockDeviceMappings":[
        {
            "DeviceName":"/dev/sda1",
            "Ebs":{
                "VolumeType":"gp2",
                "DeleteOnTermination":true,
                "SnapshotId":"snap-0abcdef1234567890",
                "Encrypted":true,
                "KmsKeyId":"arn:aws:kms:us-west-2:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            }
        }
```

```
    ],
    "ImageId":"ami-00068cd7555f543d5",
    "InstanceType":"c5.large",
    "TagSpecifications":[
        {
            "ResourceType":"volume",
            "Tags":[
                {
                    "Key":"encrypted",
                    "Value":"yes"
                }
            ]
        }
    ]
}
```

Output:

```
{
    "LaunchTemplate": {
        "LatestVersionNumber": 1,
        "LaunchTemplateId": "lt-0d5bd51bcf8530abc",
        "LaunchTemplateName": "TemplateForEncryption",
        "DefaultVersionNumber": 1,
        "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
        "CreateTime": "2020-01-07T19:08:36.000Z"
    }
}
```

For more information, see Create an Amazon EBS volume and Enable Amazon EBS encryption by default in the *Amazon EBS User Guide*.

- For API details, see CreateLaunchTemplate in *AWS CLI Command Reference*.

`create-local-gateway-route-table-virtual-interface-group-association`

The following code example shows how to use `create-local-gateway-route-table-virtual-interface-group-association`.

AWS CLI

To associate a local gateway route table with a virtual interfaces (VIFs) group

The following `create-local-gateway-route-table-virtual-interface-group-association` example creates an association between the specified local gateway route table and VIF group.

```
aws ec2 create-local-gateway-route-table-virtual-interface-group-association \
    --local-gateway-route-table-id lgw-rtb-exampleidabcd1234 \
    --local-gateway-virtual-interface-group-id lgw-vif-grp-exampleid0123abcd
```

Output:

```
{
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
        "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-
assoc-exampleid12345678",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
        "LocalGatewayId": "lgw-exampleid11223344",
        "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-
gateway-route-table/lgw-rtb-exampleidabcd1234",
        "OwnerId": "123456789012",
        "State": "pending",
        "Tags": []
    }
}
```

For more information, see VIF group associations in the *AWS Outposts User Guide*.

- For API details, see CreateLocalGatewayRouteTableVirtualInterfaceGroupAssociation in *AWS CLI Command Reference*.

`create-local-gateway-route-table-vpc-association`

The following code example shows how to use `create-local-gateway-route-table-vpc-association`.

AWS CLI

To associate a VPC with a route table

The following `create-local-gateway-route-table-vpc-association` example associates the specified VPC with the specified local gateway route table.

```
aws ec2 create-local-gateway-route-table-vpc-association \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
    --vpc-id vpc-07ef66ac71EXAMPLE
```

Output:

```
{
    "LocalGatewayRouteTableVpcAssociation": {
        "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0ee765bcc8EXAMPLE",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
        "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
        "VpcId": "vpc-07ef66ac71EXAMPLE",
        "State": "associated"
    }
}
```

For more information, see Local gateway route tables in the *AWS Outposts User Guide*.

- For API details, see CreateLocalGatewayRouteTableVpcAssociation in *AWS CLI Command Reference*.

`create-local-gateway-route-table`

The following code example shows how to use `create-local-gateway-route-table`.

AWS CLI

To create a local gateway route table

The following `create-local-gateway-route-table` example creates a local gateway route table with the direct VPC routing mode.

```
aws ec2 create-local-gateway-route-table \
    --local-gateway-id lgw-1a2b3c4d5e6f7g8h9 \
    --mode direct-vpc-routing
```

Output:

```
{
    "LocalGatewayRouteTable": {
```

```
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-
gateway-route-table/lgw-rtb-abcdefg1234567890",
        "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
        "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-021345abcdef67890",
        "OwnerId": "123456789012",
        "State": "pending",
        "Tags": [],
        "Mode": "direct-vpc-routing"
    }
}
```

For more information, see Local gateway route tables in the *AWS Outposts User Guide*.

- For API details, see CreateLocalGatewayRouteTable in *AWS CLI Command Reference*.

`create-local-gateway-route`

The following code example shows how to use `create-local-gateway-route`.

AWS CLI

To create a static route for a local gateway route table

The following `create-local-gateway-route` example creates the specified route in the specified local gateway route table.

```
aws ec2 create-local-gateway-route \
    --destination-cidr-block 0.0.0.0/0 \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
    }
```

```
}
```

For more information, see Local gateway route tables in the *AWS Outposts User Guide*.

- For API details, see CreateLocalGatewayRoute in *AWS CLI Command Reference*.

`create-managed-prefix-list`

The following code example shows how to use `create-managed-prefix-list`.

AWS CLI

To create a prefix list

The following `create-managed-prefix-list` example creates an IPv4 prefix list with a maximum of 10 entries, and creates 2 entries in the prefix list.

```
aws ec2 create-managed-prefix-list \
    --address-family IPv4 \
    --max-entries 10 \
    --entries Cidr=10.0.0.0/16,Description=vpc-a Cidr=10.2.0.0/16,Description=vpc-b
 \
    --prefix-list-name vpc-cidrs
```

Output:

```
{
    "PrefixList": {
        "PrefixListId": "pl-0123456abcabcabc1",
        "AddressFamily": "IPv4",
        "State": "create-in-progress",
        "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
        "PrefixListName": "vpc-cidrs",
        "MaxEntries": 10,
        "Version": 1,
        "Tags": [],
        "OwnerId": "123456789012"
    }
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see CreateManagedPrefixList in *AWS CLI Command Reference*.

`create-nat-gateway`

The following code example shows how to use `create-nat-gateway`.

AWS CLI

Example 1: To create a public NAT gateway

The following `create-nat-gateway` example creates a public NAT gateway in the specified subnet and associates the Elastic IP address with the specified allocation ID. When you create a public NAT gateway, you must associate an Elastic IP address.

```
aws ec2 create-nat-gateway \
    --subnet-id subnet-0250c25a1fEXAMPLE \
    --allocation-id eipalloc-09ad461b0dEXAMPLE
```

Output:

```
{
    "NatGateway": {
        "CreateTime": "2021-12-01T22:22:38.000Z",
        "NatGatewayAddresses": [
            {
                "AllocationId": "eipalloc-09ad461b0dEXAMPLE"
            }
        ],
        "NatGatewayId": "nat-0c61bf8a12EXAMPLE",
        "State": "pending",
        "SubnetId": "subnet-0250c25a1fEXAMPLE",
        "VpcId": "vpc-0a60eb65b4EXAMPLE",
        "ConnectivityType": "public"
    }
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

Example 2: To create a private NAT gateway

The following `create-nat-gateway` example creates a private NAT gateway in the specified subnet. A private NAT gateway does not have an associated Elastic IP address.

```
aws ec2 create-nat-gateway \
    --subnet-id subnet-0250c25a1fEXAMPLE \
    --connectivity-type private
```

Output:

```
{
    "NatGateway": {
        "CreateTime": "2021-12-01T22:26:00.000Z",
        "NatGatewayAddresses": [
            {}
        ],
        "NatGatewayId": "nat-011b568379EXAMPLE",
        "State": "pending",
        "SubnetId": "subnet-0250c25a1fEXAMPLE",
        "VpcId": "vpc-0a60eb65b4EXAMPLE",
        "ConnectivityType": "private"
    }
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see CreateNatGateway in *AWS CLI Command Reference*.

`create-network-acl-entry`

The following code example shows how to use `create-network-acl-entry`.

AWS CLI

To create a network ACL entry

The following `create-network-acl-entry` example creates an entry for the specified network ACL. The rule allows ingress traffic from any IPv4 address (0.0.0.0/0) on UDP port 53 (DNS) into any associated subnet.

```
aws ec2 create-network-acl-entry \
    --network-acl-id acl-5fb85d36 \
    --ingress \
    --rule-number 100 \
    --protocol udp \
    --port-range From=53,To=53 \
```

```
    --cidr-block 0.0.0.0/0 \
    --rule-action allow
```

This command produces no output.

For more information, see Network ACL rules in the *Amazon VPC User Guide*.

The following `create-network-acl-entry` example creates a rule for the specified network ACL that allows ingress traffic from any IPv6 address (::/0) on TCP port 80 (HTTP).

```
aws ec2 create-network-acl-entry \
    --network-acl-id acl-5fb85d36 \
    --ingress \
    --rule-number 120 \
    --protocol tcp \
    --port-range From=80,To=80 \
    --ipv6-cidr-block ::/0 \
    --rule-action allow
```

This command produces no output.

For more information, see Network ACL rules in the *Amazon VPC User Guide*.

- For API details, see CreateNetworkAclEntry in *AWS CLI Command Reference*.

`create-network-acl`

The following code example shows how to use `create-network-acl`.

AWS CLI

To create a network ACL

The following `create-network-acl` example creates a network ACL for the specified VPC.

```
aws ec2 create-network-acl \
    --vpc-id vpc-a01106c2
```

Output:

```
{
```

```
    "NetworkAcl": {
        "Associations": [],
        "NetworkAclId": "acl-5fb85d36",
        "VpcId": "vpc-a01106c2",
        "Tags": [],
        "Entries": [
            {
                "CidrBlock": "0.0.0.0/0",
                "RuleNumber": 32767,
                "Protocol": "-1",
                "Egress": true,
                "RuleAction": "deny"
            },
            {
                "CidrBlock": "0.0.0.0/0",
                "RuleNumber": 32767,
                "Protocol": "-1",
                "Egress": false,
                "RuleAction": "deny"
            }
        ],
        "IsDefault": false
    }
}
```

For more information, see Create a network ACL for your VPC in the *Amazon VPC User Guide*.

- For API details, see CreateNetworkAcl in *AWS CLI Command Reference*.

`create-network-insights-access-scope`

The following code example shows how to use `create-network-insights-access-scope`.

AWS CLI

To create a Network Access Scope

The following `create-network-insights-access-scope` example creates a Network Access Scope.

```
aws ec2 create-network-insights-access-scope \
    --cli-input-json file://access-scope-file.json
```

Contents of `access-scope-file.json`:

```
{
    "MatchPaths": [
        {
            "Source": {
                "ResourceStatement": {
                    "Resources": [
                        "vpc-abcd12e3"
                    ]
                }
            }
        }
    ],
    "ExcludePaths": [
        {
            "Source": {
                "ResourceStatement": {
                    "ResourceTypes": [
                        "AWS::EC2::InternetGateway"
                    ]
                }
            }
        }
    ]
}
```

Output:

```
{
    "NetworkInsightsAccessScope": {
        "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
        "NetworkInsightsAccessScopeArn": "arn:aws:ec2:us-
west-2:123456789012:network-insights-access-scope/nis-123456789abc01234",
        "CreatedDate": "2022-01-25T19:20:28.796000+00:00",
        "UpdatedDate": "2022-01-25T19:20:28.797000+00:00"
    },
    "NetworkInsightsAccessScopeContent": {
        "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
        "MatchPaths": [
            {
                "Source": {
                    "ResourceStatement": {
```

```
                        "Resources": [
                            "vpc-abcd12e3"
                        ]
                    }
                }
            }
        ],
        "ExcludePaths": [
            {
                "Source": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::InternetGateway"
                        ]
                    }
                }
            }
        ]
    }
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see CreateNetworkInsightsAccessScope in *AWS CLI Command Reference*.

`create-network-insights-path`

The following code example shows how to use `create-network-insights-path`.

AWS CLI

To create a path

The following `create-network-insights-path` example creates a path. The source is the specified internet gateway and the destination is the specified EC2 instance. To determine whether the destination is reachable using the specified protocol and port, analyze the path using the `start-network-insights-analysis` command.

```
aws ec2 create-network-insights-path \
    --source igw-0797cccdc9d73b0e5 \
    --destination i-0495d385ad28331c7 \
```

```
    --destination-port 22 \
    --protocol TCP
```

Output:

```
{
    "NetworkInsightsPath": {
        "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
        "NetworkInsightsPathArn": "arn:aws:ec2:us-west-2:123456789012:network-
insights-path/nip-0b26f224f1d131fa8",
        "CreatedDate": "2021-01-20T22:43:46.933Z",
        "Source": "igw-0797cccdc9d73b0e5",
        "Destination": "i-0495d385ad28331c7",
        "Protocol": "tcp"
    }
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see CreateNetworkInsightsPath in *AWS CLI Command Reference*.

`create-network-interface-permission`

The following code example shows how to use `create-network-interface-permission`.

AWS CLI

To create a network interface permission

The following `create-network-interface-permission` example grants permission to account `123456789012` to attach network interface `eni-1a2b3c4d` to an instance.

```
aws ec2 create-network-interface-permission \
    --network-interface-id eni-1a2b3c4d \
    --aws-account-id 123456789012 \
    --permission INSTANCE-ATTACH
```

Output:

```
{
    "InterfacePermission": {
```

```
        "PermissionState": {
            "State": "GRANTED"
        },
        "NetworkInterfacePermissionId": "eni-perm-06fd19020ede149ea",
        "NetworkInterfaceId": "eni-1a2b3c4d",
        "Permission": "INSTANCE-ATTACH",
        "AwsAccountId": "123456789012"
    }
}
```

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

- For API details, see CreateNetworkInterfacePermission in *AWS CLI Command Reference*.

`create-network-interface`

The following code example shows how to use `create-network-interface`.

AWS CLI

Example 1: To specify an IPv4 address for a network interface

The following `create-network-interface` example creates a network interface for the specified subnet with the specified primary IPv4 address.

```
aws ec2 create-network-interface \
    --subnet-id subnet-00a24d0d67acf6333 \
    --description "my network interface" \
    --groups sg-09dfba7ed20cda78b \
    --private-ip-address 10.0.8.17
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my network interface",
        "Groups": [
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-09dfba7ed20cda78b"
            }
```

```
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
        "MacAddress": "06:6a:0f:9a:49:37",
        "NetworkInterfaceId": "eni-0492b355f0cf3b3f8",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.17",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-17.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.17"
            }
        ],
        "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": [],
        "VpcId": "vpc-02723a0feeeb9d57b"
    }
}
```

Example 2: To create a network interface with an IPv4 address and an IPv6 address

The following `create-network-interface` example creates a network interface for the specified subnet with an IPv4 address and an IPv6 address that are selected by Amazon EC2.

```
aws ec2 create-network-interface \
    --subnet-id subnet-00a24d0d67acf6333 \
    --description "my dual stack network interface" \
    --ipv6-address-count 1 \
    --groups sg-09dfba7ed20cda78b
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my dual stack network interface",
        "Groups": [
```

```
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-09dfba7ed20cda78b"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [
            {
                "Ipv6Address": "2600:1f13:cfe:3650:a1dc:237c:393a:4ba7",
                "IsPrimaryIpv6": false
            }
        ],
        "MacAddress": "06:b8:68:d2:b2:2d",
        "NetworkInterfaceId": "eni-05da417453f9a84bf",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.18",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.18"
            }
        ],
        "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": [],
        "VpcId": "vpc-02723a0feeeb9d57b",
        "Ipv6Address": "2600:1f13:cfe:3650:a1dc:237c:393a:4ba7"
    }
}
```

Example 3: To create a network interface with connection tracking configuration options

The following `create-network-interface` example creates a network interface and configures the idle connection tracking timeouts.

```
aws ec2 create-network-interface \
    --subnet-id subnet-00a24d0d67acf6333 \
    --groups sg-02e57dbcfe0331c1b \
```

```
    --connection-tracking-specification TcpEstablishedTimeout=86400,UdpTimeout=60
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "ConnectionTrackingConfiguration": {
            "TcpEstablishedTimeout": 86400,
            "UdpTimeout": 60
        },
        "Description": "",
        "Groups": [
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-02e57dbcfe0331c1b"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
        "MacAddress": "06:4c:53:de:6d:91",
        "NetworkInterfaceId": "eni-0c133586e08903d0b",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.94",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.94"
            }
        ],
        "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": [],
        "VpcId": "vpc-02723a0feeeb9d57b"
    }
}
```

Example 4: To create an Elastic Fabric Adapter

The following `create-network-interface` example creates an EFA.

```
aws ec2 create-network-interface \
    --interface-type efa \
    --subnet-id subnet-00a24d0d67acf6333 \
    --description "my efa" \
    --groups sg-02e57dbcfe0331c1b
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my efa",
        "Groups": [
            {
                "GroupName": "my-efa-sg",
                "GroupId": "sg-02e57dbcfe0331c1b"
            }
        ],
        "InterfaceType": "efa",
        "Ipv6Addresses": [],
        "MacAddress": "06:d7:a4:f7:4d:57",
        "NetworkInterfaceId": "eni-034acc2885e862b65",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.180",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.180"
            }
        ],
        "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": [],
        "VpcId": "vpc-02723a0feeeb9d57b"
    }
}
```

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

- For API details, see CreateNetworkInterface in *AWS CLI Command Reference*.

`create-placement-group`

The following code example shows how to use `create-placement-group`.

AWS CLI

Example 1: To create a placement group

The following `create-placement-group` example creates a placement group with the specified name.

```
aws ec2 create-placement-group \
    --group-name my-cluster \
    --strategy cluster
```

Output:

```
{
    "PlacementGroup": {
        "GroupName": "my-cluster",
        "State": "available",
        "Strategy": "cluster",
        "GroupId": "pg-0123456789example",
        "GroupArn": "arn:aws:ec2:us-west-2:123456789012:placement-group/my-cluster"
    }
}
```

For more information, see Placement groups for your Amazon EC2 instances in the *Amazon EC2 User Guide*.

Example 2: To create a partition placement group

The following `create-placement-group` example creates a partition placement group named `HDFS-Group-A` with five partitions.

```
aws ec2 create-placement-group \
    --group-name HDFS-Group-A \
```

```
    --strategy partition \
    --partition-count 5
```

Output:

```
{
    "PlacementGroup": {
        "GroupName": "HDFS-Group-A",
        "State": "available",
        "Strategy": "partition",
        "PartitionCount": 5,
        "GroupId": "pg-0abcdef1234example",
        "GroupArn": "arn:aws:ec2:us-west-2:123456789012:placement-group/HDFS-Group-
A"
    }
}
```

For more information, see Placement strategies for your placement groups in the *Amazon EC2 User Guide*.

- For API details, see CreatePlacementGroup in *AWS CLI Command Reference*.

`create-replace-root-volume-task`

The following code example shows how to use `create-replace-root-volume-task`.

AWS CLI

Example 1: To restore a root volume to its initial launch state

The following `create-replace-root-volume-task` example restores the root volume of instance i-0123456789abcdefa to its initial launch state.

```
aws ec2 create-replace-root-volume-task \
    --instance-id i-0123456789abcdefa
```

Output:

```
{
    "ReplaceRootVolumeTask":
    {
```

```
        "InstanceId": "i-0123456789abcdefa",
        "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
        "TaskState": "pending",
        "StartTime": "2022-03-14T15:06:38Z",
        "Tags": []
    }
}
```

Example 2: To restore a root volume to a specific snapshot

The following `create-replace-root-volume-task` example restores the root volume of instance i-0123456789abcdefa to snapshot snap-0abcdef1234567890.

```
aws ec2 create-replace-root-volume-task \
    --instance-id i-0123456789abcdefa \
    --snapshot-id  snap-0abcdef1234567890
```

Output:

```
{
    "ReplaceRootVolumeTask":
    {
        "InstanceId": "i-0123456789abcdefa",
        "ReplaceRootVolumeTaskId": "replacevol-0555566667777abcd",
        "TaskState": "pending",
        "StartTime": "2022-03-14T15:16:28Z",
        "Tags": []
    }
}
```

For more information, see Replace a root volume in the *Amazon EC2 User Guide*.

- For API details, see CreateReplaceRootVolumeTask in *AWS CLI Command Reference*.

`create-reserved-instances-listing`

The following code example shows how to use `create-reserved-instances-listing`.

AWS CLI

To list a Reserved Instance in the Reserved Instance Marketplace

The following `create-reserved-instances-listing` example creates a listing for the specified Reserved Instance in the Reserved Instance Marketplace.

```
aws ec2 create-reserved-instances-listing \
    --reserved-instances-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --instance-count 3 \
    --price-schedules CurrencyCode=USD,Price=25.50 \
    --client-token a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "ReservedInstancesListings": [
        {
            "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreateDate": "2024-05-14T18:12:30.000Z",
            "InstanceCounts": [
                {
                    "InstanceCount": 3,
                    "State": "available"
                },
                {
                    "InstanceCount": 0,
                    "State": "sold"
                },
                {
                    "InstanceCount": 0,
                    "State": "cancelled"
                },
                {
                    "InstanceCount": 0,
                    "State": "pending"
                }
            ],
            "PriceSchedules": [
                {
                    "Active": true,
                    "CurrencyCode": "USD",
                    "Price": 25.5,
                    "Term": 11
                }
            ],
            "ReservedInstancesId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
            "ReservedInstancesListingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Status": "active",
            "StatusMessage": "active",
            "Tags": [],
            "UpdateDate": "2024-05-14T18:12:30.000Z"
        }
    ]
}
```

For more information, see Sell Reserved Instances for Amazon EC2 in the Reserved Instance Marketplace in the *Amazon EC2 User Guide*.

- For API details, see CreateReservedInstancesListing in *AWS CLI Command Reference*.

`create-restore-image-task`

The following code example shows how to use `create-restore-image-task`.

AWS CLI

To restore an AMI from an S3 bucket

The following `create-restore-image-task` example restores an AMI from an S3 bucket. Use the values for `S3ObjectKey `` and ``Bucket` from the `describe-store-image-tasks` output, specify the object key of the AMI and the name of the S3 bucket to which the AMI was copied, and specify the name for the restored AMI. The name must be unique for AMIs in the Region for this account. The restored AMI will receive a new AMI ID.

```
aws ec2 create-restore-image-task \
    --object-key ami-1234567890abcdef0.bin \
    --bucket amzn-s3-demo-bucket \
    --name 'New AMI Name'
```

Output:

```
{
    "ImageId": "ami-0eab20fe36f83e1a8"
}
```

For more information, see Store and restore an AMI using S3 in the *Amazon EC2 User Guide*.

- For API details, see CreateRestoreImageTask in *AWS CLI Command Reference*.

`create-route-table`

The following code example shows how to use `create-route-table`.

AWS CLI

To create a route table

The following `create-route-table` example creates a route table for the specified VPC.

```
aws ec2 create-route-table \
    --vpc-id vpc-a01106c2
```

Output:

```
{
    "RouteTable": {
        "Associations": [],
        "RouteTableId": "rtb-22574640",
        "VpcId": "vpc-a01106c2",
        "PropagatingVgws": [],
        "Tags": [],
        "Routes": [
            {
                "GatewayId": "local",
                "DestinationCidrBlock": "10.0.0.0/16",
                "State": "active"
            }
        ]
    }
}
```

For more information, see Create a route table for your VPC in the *Amazon VPC User Guide*.

- For API details, see CreateRouteTable in *AWS CLI Command Reference*.

`create-route`

The following code example shows how to use `create-route`.

AWS CLI

To create a route

The following `create-route` example creates a route for the specified route table. The route matches all IPv4 traffic (`0.0.0.0/0`) and routes it to the specified Internet gateway.

```
aws ec2 create-route \
    --route-table-id rtb-22574640 \
    --destination-cidr-block 0.0.0.0/0 \
    --gateway-id igw-c0a643a9
```

Output:

```
{
    "Return": true
}
```

For more information, see Configure route tables in the *Amazon VPC User Guide*.

The following `create-route` example creates a route in route table rtb-g8ff4ea2. The route matches traffic for the IPv4 CIDR block 10.0.0.0/16 and routes it to VPC peering connection, pcx-1a2b3c4d. This route enables traffic to be directed to the peer VPC in the VPC peering connection.

```
aws ec2 create-route \
    --route-table-id rtb-g8ff4ea2 \
    --destination-cidr-block 10.0.0.0/16 \
    --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
    "Return": true
}
```

For more information, see Update your route tables for a VPC peering connection in the *Amazon VPC Peering Guide*.

The following `create-route` example creates a route in the specified route table that matches all IPv6 traffic (`::/0`) and routes it to the specified egress-only Internet gateway.

```
aws ec2 create-route \
```

```
    --route-table-id rtb-dce620b8 \
    --destination-ipv6-cidr-block ::/0 \
    --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f
```

Output:

```
{
    "Return": true
}
```

For more information, see Enable outbound IPv6 traffic using an egress-only internet gateway in the *Amazon VPC User Guide*.

- For API details, see CreateRoute in *AWS CLI Command Reference*.

`create-security-group`

The following code example shows how to use `create-security-group`.

AWS CLI

Example 1: To create a security group for EC2-Classic

The following `create-security-group` example creates a security group named `MySecurityGroup`.

```
aws ec2 create-security-group \
    --group-name MySecurityGroup \
    --description "My security group"
```

Output:

```
{
    "GroupId": "sg-903004f8"
}
```

For more information, see Amazon EC2 security groups for your EC2 instances in the *Amazon EC2 User Guide*.

Example 2: To create a security group for EC2-VPC

The following `create-security-group` example creates a security group named `MySecurityGroup` for the specified VPC.

```
aws ec2 create-security-group \
    --group-name MySecurityGroup \
    --description "My security group" \
    --vpc-id vpc-1a2b3c4d
```

Output:

```
{
    "GroupId": "sg-903004f8"
}
```

For more information, see Creating, configuring, and deleting Amazon EC2 security groups in the AWS CLI in the *AWS Command Line Interface User Guide*.

- For API details, see CreateSecurityGroup in *AWS CLI Command Reference*.

`create-snapshot`

The following code example shows how to use `create-snapshot`.

AWS CLI

Example 1: To create a snapshot

The following `create-snapshot` example creates a snapshot of the volume with a volume ID of `vol-1234567890abcdef0` and a short description to identify the snapshot.

```
aws ec2 create-snapshot \
    --volume-id vol-1234567890abcdef0 \
    --description "This is my root volume snapshot"
```

Output:

```
{
    "Description": "This is my root volume snapshot",
    "Tags": [],
    "Encrypted": false,
    "VolumeId": "vol-1234567890abcdef0",
```

```
    "State": "pending",
    "VolumeSize": 8,
    "StartTime": "2018-02-28T21:06:01.000Z",
    "Progress": "",
    "OwnerId": "123456789012",
    "SnapshotId": "snap-0abcdef1234567890"
}
```

For more information, see Create Amazon EBS snapshots in the *Amazon EBS User Guide*.

Example 2: To create a snapshot with tags

The following `create-snapshot` example creates a snapshot and applies two tags: purpose=prod and costcenter=123.

```
aws ec2 create-snapshot \
    --volume-id vol-1234567890abcdef0 \
    --description 'Prod backup' \
    --tag-specifications 'ResourceType=snapshot,Tags=[{Key=purpose,Value=prod},
{Key=costcenter,Value=123}]'
```

Output:

```
{
    "Description": "Prod backup",
    "Tags": [
        {
            "Value": "prod",
            "Key": "purpose"
        },
        {
            "Value": "123",
            "Key": "costcenter"
        }
    ],
    "Encrypted": false,
    "VolumeId": "vol-1234567890abcdef0",
    "State": "pending",
    "VolumeSize": 8,
    "StartTime": "2018-02-28T21:06:06.000Z",
    "Progress": "",
    "OwnerId": "123456789012",
    "SnapshotId": "snap-09ed24a70bc19bbe4"
```

```
}
```

For more information, see Create Amazon EBS snapshots in the *Amazon EBS User Guide*.

- For API details, see CreateSnapshot in *AWS CLI Command Reference*.

`create-snapshots`

The following code example shows how to use `create-snapshots`.

AWS CLI

Example 1: To create a multi-volume snapshot

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0 \
    --description "This is snapshot of a volume from my-instance"
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "This is snapshot of a volume from my-instance",
            "Tags": [],
            "Encrypted": false,
            "VolumeId": "vol-0a01d2d5a34697479",
            "State": "pending",
            "VolumeSize": 16,
            "StartTime": "2019-08-05T16:58:19.000Z",
            "Progress": "",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-07f30e3909aa0045e"
        },
        {
            "Description": "This is snapshot of a volume from my-instance",
            "Tags": [],
            "Encrypted": false,
            "VolumeId": "vol-02d0d4947008cb1a2",
            "State": "pending",
```

```
            "VolumeSize": 20,
            "StartTime": "2019-08-05T16:58:19.000Z",
            "Progress": "",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-0ec20b602264aad48"
        }
    ]
}
```

For more information, see Create Amazon EBS snapshots in the *Amazon EBS User Guide*.

Example 2: To create a multi-volume snapshot with tags from the source volume

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and copies the tags from each volume to its corresponding snapshot.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0 \
    --copy-tags-from-source volume \
    --description "This is snapshot of a volume from my-instance"
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "This is snapshot of a volume from my-instance",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-volume"
                }
            ],
            "Encrypted": false,
            "VolumeId": "vol-02d0d4947008cb1a2",
            "State": "pending",
            "VolumeSize": 20,
            "StartTime": "2019-08-05T16:53:04.000Z",
            "Progress": "",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-053bfaeb821a458dd"
        }
    ]
```

```
}
```

For more information, see Create Amazon EBS snapshots in the *Amazon EBS User Guide*.

Example 3: To create a multi-volume snapshot not including the root volume

The following `create-snapshots` example creates a snapshot of all volumes attached to the specified instance except for the root volume.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0,ExcludeBootVolume=true
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "",
            "Tags": [],
            "Encrypted": false,
            "VolumeId": "vol-02d0d4947008cb1a2",
            "State": "pending",
            "VolumeSize": 20,
            "StartTime": "2019-08-05T17:02:41.000Z",
            "Progress": "",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-0a1b2c3d4e5f67890"
        }
    ]
}
```

For more information, see Create Amazon EBS snapshots in the *Amazon EBS User Guide*.

Example 4: To create a multi-volume snapshot and add tags

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and adds two tags to each snapshot.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0 \
    --tag-specifications 'ResourceType=snapshot,Tags=[{Key=Name,Value=backup},
{Key=costcenter,Value=123}]'
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "backup"
                },
                {
                    "Key": "costcenter",
                    "Value": "123"
                }
            ],
            "Encrypted": false,
            "VolumeId": "vol-0a01d2d5a34697479",
            "State": "pending",
            "VolumeSize": 16,
            "StartTime": "2019-08-05T17:05:12.000Z",
            "Progress": "",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-01234567890abcdef"
        },
        {
            "Description": "",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "backup"
                },
                {
                    "Key": "costcenter",
                    "Value": "123"
                }
            ],
            "Encrypted": false,
            "VolumeId": "vol-02d0d4947008cb1a2",
            "State": "pending",
            "VolumeSize": 20,
            "StartTime": "2019-08-05T17:05:12.000Z",
            "Progress": "",
            "OwnerId": "123456789012",
```

```
            "SnapshotId": "snap-0fedcba9876543210"
        }
    ]
}
```

For more information, see Create Amazon EBS snapshots in the *Amazon EBS User Guide*.

- For API details, see CreateSnapshots in *AWS CLI Command Reference*.

`create-spot-datafeed-subscription`

The following code example shows how to use `create-spot-datafeed-subscription`.

AWS CLI

To create a Spot Instance data feed

The following `create-spot-datafeed-subscription` example creates a Spot Instance data feed.

```
aws ec2 create-spot-datafeed-subscription \
    --bucket amzn-s3-demo-bucket \
    --prefix spot-data-feed
```

Output:

```
{
    "SpotDatafeedSubscription": {
        "Bucket": "amzn-s3-demo-bucket",
        "OwnerId": "123456789012",
        "Prefix": "spot-data-feed",
        "State": "Active"
    }
}
```

The data feed is stored in the Amazon S3 bucket that you specified. The file names for this data feed have the following format.

```
amzn-s3-demo-bucket.s3.amazonaws.com/spot-data-feed/123456789012.YYYY-MM-DD-
HH.n.abcd1234.gz
```

For more information, see Track your Spot Instance costs using the Spot Instance data feed in the *Amazon EC2 User Guide*.

- For API details, see CreateSpotDatafeedSubscription in *AWS CLI Command Reference*.

`create-store-image-task`

The following code example shows how to use `create-store-image-task`.

AWS CLI

To store an AMI in an S3 bucket

The following `create-store-image-task` example stores an AMI in an S3 bucket. Specify the ID of the AMI and the name of the S3 bucket in which to store the AMI.

```
aws ec2 create-store-image-task \
    --image-id ami-1234567890abcdef0 \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "ObjectKey": "ami-1234567890abcdef0.bin"
}
```

For more information, see Store and restore an AMI using S3 in the *Amazon EC2 User Guide*.

- For API details, see CreateStoreImageTask in *AWS CLI Command Reference*.

`create-subnet-cidr-reservation`

The following code example shows how to use `create-subnet-cidr-reservation`.

AWS CLI

To create a subnet CIDR reservation

The following `create-subnet-cidr-reservation` example creates a subnet CIDR reservation for the specified subnet and CIDR range.

```
aws ec2 create-subnet-cidr-reservation \
```

```
    --subnet-id subnet-03c51e2eEXAMPLE \
    --reservation-type prefix \
    --cidr 10.1.0.20/26
```

Output:

```
{
    "SubnetCidrReservation": {
        "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
        "SubnetId": "subnet-03c51e2e6cEXAMPLE",
        "Cidr": "10.1.0.16/28",
        "ReservationType": "prefix",
        "OwnerId": "123456789012"
    }
}
```

For more information, see Subnet CIDR reservations in the *Amazon VPC User Guide*.

- For API details, see CreateSubnetCidrReservation in *AWS CLI Command Reference*.

`create-subnet`

The following code example shows how to use `create-subnet`.

AWS CLI

Example 1: To create a subnet with an IPv4 CIDR block only

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv4 CIDR block.

```
aws ec2 create-subnet \
    --vpc-id vpc-081ec835f3EXAMPLE \
    --cidr-block 10.0.0.0/24 \
    --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv4-only-
subnet}]
```

Output:

```
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
```

```
        "AvailabilityZoneId": "usw2-az2",
        "AvailableIpAddressCount": 251,
        "CidrBlock": "10.0.0.0/24",
        "DefaultForAz": false,
        "MapPublicIpOnLaunch": false,
        "State": "available",
        "SubnetId": "subnet-0e99b93155EXAMPLE",
        "VpcId": "vpc-081ec835f3EXAMPLE",
        "OwnerId": "123456789012",
        "AssignIpv6AddressOnCreation": false,
        "Ipv6CidrBlockAssociationSet": [],
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-ipv4-only-subnet"
            }
        ],
        "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0e99b93155EXAMPLE"
    }
}
```

Example 2: To create a subnet with both IPv4 and IPv6 CIDR blocks

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv4 and IPv6 CIDR blocks.

```
aws ec2 create-subnet \
    --vpc-id vpc-081ec835f3EXAMPLE \
    --cidr-block 10.0.0.0/24 \
    --ipv6-cidr-block 2600:1f16:cfe:3660::/64 \
    --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv4-ipv6-
subnet}]
```

Output:

```
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
        "AvailabilityZoneId": "usw2-az2",
        "AvailableIpAddressCount": 251,
        "CidrBlock": "10.0.0.0/24",
        "DefaultForAz": false,
```

```
        "MapPublicIpOnLaunch": false,
        "State": "available",
        "SubnetId": "subnet-0736441d38EXAMPLE",
        "VpcId": "vpc-081ec835f3EXAMPLE",
        "OwnerId": "123456789012",
        "AssignIpv6AddressOnCreation": false,
        "Ipv6CidrBlockAssociationSet": [
            {
                "AssociationId": "subnet-cidr-assoc-06c5f904499fcc623",
                "Ipv6CidrBlock": "2600:1f13:cfe:3660::/64",
                "Ipv6CidrBlockState": {
                    "State": "associating"
                }
            }
        ],
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-ipv4-ipv6-subnet"
            }
        ],
        "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0736441d38EXAMPLE"
    }
}
```

Example 3: To create a subnet with an IPv6 CIDR block only

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv6 CIDR block.

```
aws ec2 create-subnet \
    --vpc-id vpc-081ec835f3EXAMPLE \
    --ipv6-native \
    --ipv6-cidr-block 2600:1f16:115:200::/64 \
    --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv6-only-
subnet}]
```

Output:

```
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
```

```
        "AvailabilityZoneId": "usw2-az2",
        "AvailableIpAddressCount": 0,
        "DefaultForAz": false,
        "MapPublicIpOnLaunch": false,
        "State": "available",
        "SubnetId": "subnet-03f720e7deEXAMPLE",
        "VpcId": "vpc-081ec835f3EXAMPLE",
        "OwnerId": "123456789012",
        "AssignIpv6AddressOnCreation": true,
        "Ipv6CidrBlockAssociationSet": [
            {
                "AssociationId": "subnet-cidr-assoc-01ef639edde556709",
                "Ipv6CidrBlock": "2600:1f13:cfe:3660::/64",
                "Ipv6CidrBlockState": {
                    "State": "associating"
                }
            }
        ],
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-ipv6-only-subnet"
            }
        ],
        "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-03f720e7deEXAMPLE"
    }
}
```

For more information, see VPCs and subnets in the *Amazon VPC User Guide*.

- For API details, see CreateSubnet in *AWS CLI Command Reference*.

`create-tags`

The following code example shows how to use `create-tags`.

AWS CLI

Example 1: To add a tag to a resource

The following `create-tags` example adds the tag `Stack=production` to the specified image, or overwrites an existing tag for the AMI where the tag key is `Stack`.

```
aws ec2 create-tags \
    --resources ami-1234567890abcdef0 \
    --tags Key=Stack,Value=production
```

This command produces no output.

Example 2: To add tags to multiple resources

The following `create-tags` example adds (or overwrites) two tags for an AMI and an instance. One of the tags has a key (`webserver`) but no value (value is set to an empty string). The other tag has a key (`stack`) and a value (`Production`).

```
aws ec2 create-tags \
    --resources ami-1a2b3c4d i-1234567890abcdef0 \
    --tags Key=webserver,Value=   Key=stack,Value=Production
```

This command produces no output.

Example 3: To add tags containing special characters

The following `create-tags` examples add the tag `[Group]=test` for an instance. The square brackets ([and]) are special characters, and must be escaped. The following examples also use the line continuation character appropriate for each environment.

If you are using Windows, surround the element that has special characters with double quotes ("), and then precede each double quote character with a backslash (\) as follows.

```
aws ec2 create-tags ^
    --resources i-1234567890abcdef0 ^
    --tags Key=\"[Group]\",Value=test
```

This command produces no output.

If you are using Windows PowerShell, surround the element the value that has special characters with double quotes ("), precede each double quote character with a backslash (\), and then surround the entire key and value structure with single quotes (') as follows.

```
aws ec2 create-tags `
    --resources i-1234567890abcdef0 `
    --tags 'Key=\"[Group]\",Value=test'
```

This command produces no output.

If you are using Linux or OS X, surround the element that has special characters with double quotes ("), and then surround the entire key and value structure with single quotes (') as follows.

```
aws ec2 create-tags \
    --resources i-1234567890abcdef0 \
    --tags 'Key="[Group]",Value=test'
```

This command produces no output.

For more information, see Tag your Amazon EC2 resources in the *Amazon EC2 User Guide*.

- For API details, see CreateTags in *AWS CLI Command Reference*.

`create-traffic-mirror-filter-rule`

The following code example shows how to use `create-traffic-mirror-filter-rule`.

AWS CLI

To create a filter rule for incoming TCP traffic

The following `create-traffic-mirror-filter-rule` example creates a rule that you can use to mirror all incoming TCP traffic. Before you run this command, use `create-traffic-mirror-filter` to create the the traffic mirror filter.

```
aws ec2 create-traffic-mirror-filter-rule \
    --description 'TCP Rule' \
    --destination-cidr-block 0.0.0.0/0  \
    --protocol 6 \
    --rule-action accept \
    --rule-number 1 \
    --source-cidr-block 0.0.0.0/0 \
    --traffic-direction ingress \
    --traffic-mirror-filter-id tmf-04812ff784b25ae67
```

Output:

```
{
    "TrafficMirrorFilterRule": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "TrafficMirrorFilterId": "tmf-04812ff784b25ae67",
```

```
        "TrafficMirrorFilterRuleId": "tmfr-02d20d996673f3732",
        "SourceCidrBlock": "0.0.0.0/0",
        "TrafficDirection": "ingress",
        "Description": "TCP Rule",
        "RuleNumber": 1,
        "RuleAction": "accept",
        "Protocol": 6
    },
    "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create a traffic mirror filter in the *Traffic Mirroring Guide*.

- For API details, see CreateTrafficMirrorFilterRule in *AWS CLI Command Reference*.

`create-traffic-mirror-filter`

The following code example shows how to use `create-traffic-mirror-filter`.

AWS CLI

To create a traffic mirror filter

The following `create-traffic-mirror-filter` example creates a traffic mirror filter. After you create the filter, use `create-traffic-mirror-filter-rule` to add rules.

```
aws ec2 create-traffic-mirror-filter \
    --description 'TCP Filter'
```

Output:

```
{
    "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "TrafficMirrorFilter": {
        "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
        "Description": "TCP Filter",
        "EgressFilterRules": [],
        "IngressFilterRules": [],
        "Tags": [],
        "NetworkServices": []
    }
}
```

For more information, see Create a traffic mirror filter in the *Traffic Mirroring Guide*.

- For API details, see CreateTrafficMirrorFilter in *AWS CLI Command Reference*.

`create-traffic-mirror-session`

The following code example shows how to use `create-traffic-mirror-session`.

AWS CLI

To create a traffic mirror session

The following `create-traffic-mirror-session` example creates a traffic mirror session for the specified source and target for 25 bytes of the packet.

```
aws ec2 create-traffic-mirror-session \
    --description 'example session' \
    --traffic-mirror-target-id tmt-07f75d8feeEXAMPLE \
    --network-interface-id eni-070203f901EXAMPLE \
    --session-number 1  \
    --packet-length 25 \
    --traffic-mirror-filter-id tmf-04812ff784EXAMPLE
```

Output:

```
{
    "TrafficMirrorSession": {
        "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
        "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
        "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
        "NetworkInterfaceId": "eni-070203f901EXAMPLE",
        "OwnerId": "123456789012",
        "PacketLength": 25,
        "SessionNumber": 1,
        "VirtualNetworkId": 7159709,
        "Description": "example session",
        "Tags": []
    },
    "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create a traffic mirror session in the *Traffic Mirroring Guide*.

- For API details, see CreateTrafficMirrorSession in *AWS CLI Command Reference*.

`create-traffic-mirror-target`

The following code example shows how to use `create-traffic-mirror-target`.

AWS CLI

Example 1: To create a Network Load Balancer traffic mirror target

The following `create-traffic-mirror-target` example creates a Network Load Balancer traffic mirror target.

```
aws ec2 create-traffic-mirror-target \
    --description 'Example Network Load Balancer Target' \
    --network-load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/NLB/7cdec873EXAMPLE
```

Output:

```
{
    "TrafficMirrorTarget": {
        "Type": "network-load-balancer",
        "Tags": [],
        "Description": "Example Network Load Balancer Target",
        "OwnerId": "123456789012",
        "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/NLB/7cdec873EXAMPLE",
        "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE"
    },
    "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Example 2: To create a network traffic mirror target

The following `create-traffic-mirror-target` example creates a network interface Traffic Mirror target.

```
aws ec2 create-traffic-mirror-target \
    --description 'Network interface target' \
    --network-interface-id eni-eni-01f6f631eEXAMPLE
```

Output:

```
{
    "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "TrafficMirrorTarget": {
        "Description": "Network interface target",
        "NetworkInterfaceId": "eni-01f6f631eEXAMPLE",
        "TrafficMirrorTargetId": "tmt-02dcdbe2abEXAMPLE",
        "OwnerId": "123456789012",
        "Type": "network-interface",
        "Tags": []
    }
}
```

For more information, see Create a traffic mirror target in the *Traffic Mirroring Guide*.

- For API details, see CreateTrafficMirrorTarget in *AWS CLI Command Reference*.

`create-transit-gateway-connect-peer`

The following code example shows how to use `create-transit-gateway-connect-peer`.

AWS CLI

To create a Transit Gateway Connect peer

The following `create-transit-gateway-connect-peer` example creates a Connect peer.

```
aws ec2 create-transit-gateway-connect-peer \
    --transit-gateway-attachment-id tgw-attach-0f0927767cEXAMPLE \
    --peer-address 172.31.1.11 \
    --inside-cidr-blocks 169.254.6.0/29
```

Output:

```
{
    "TransitGatewayConnectPeer": {
        "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
        "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
        "State": "pending",
        "CreationTime": "2021-10-13T03:35:17.000Z",
        "ConnectPeerConfiguration": {
            "TransitGatewayAddress": "10.0.0.234",
```

```
            "PeerAddress": "172.31.1.11",
            "InsideCidrBlocks": [
                "169.254.6.0/29"
            ],
            "Protocol": "gre",
            "BgpConfigurations": [
                {
                    "TransitGatewayAsn": 64512,
                    "PeerAsn": 64512,
                    "TransitGatewayAddress": "169.254.6.2",
                    "PeerAddress": "169.254.6.1",
                    "BgpStatus": "down"
                },
                {
                    "TransitGatewayAsn": 64512,
                    "PeerAsn": 64512,
                    "TransitGatewayAddress": "169.254.6.3",
                    "PeerAddress": "169.254.6.1",
                    "BgpStatus": "down"
                }
            ]
        }
    }
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayConnectPeer in *AWS CLI Command Reference*.

`create-transit-gateway-connect`

The following code example shows how to use `create-transit-gateway-connect`.

AWS CLI

To create a transit gateway Connect attachment

The following `create-transit-gateway-connect` example creates a Connect attachment, with the "gre" protocol, for the specified attachment.

```
aws ec2 create-transit-gateway-connect \
    --transport-transit-gateway-attachment-id tgw-attach-0a89069f57EXAMPLE \
```

```
    --options "Protocol=gre"
```

Output:

```
{
    "TransitGatewayConnect": {
        "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
        "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "pending",
        "CreationTime": "2021-03-09T19:59:17+00:00",
        "Options": {
            "Protocol": "gre"
        }
    }
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayConnect in *AWS CLI Command Reference*.

`create-transit-gateway-multicast-domain`

The following code example shows how to use `create-transit-gateway-multicast-domain`.

AWS CLI

Example 1: To create an IGMP multicast domain

The following `create-transit-gateway-multicast-domain` example creates a multicast domain for the specified transit gateway. With static sources disabled, any instances in subnets associated with the multicast domain can send multicast traffic. If at least one member uses the IGMP protocol, you must enable IGMPv2 support.

```
aws ec2 create-transit-gateway-multicast-domain \
    --transit-gateway-id tgw-0bf0bffefaEXAMPLE \
    --options StaticSourcesSupport=disable,Igmpv2Support=enable
```

Output:

```
{
```

```
    "TransitGatewayMulticastDomain": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c9e29e2a7EXAMPLE",
        "TransitGatewayId": "tgw-0bf0bffefaEXAMPLE",
        "TransitGatewayMulticastDomainArn": "arn:aws:ec2:us-
west-2:123456789012:transit-gateway-multicast-domain/tgw-mcast-
domain-0c9e29e2a7EXAMPLE",
        "OwnerId": "123456789012",
        "Options": {
            "Igmpv2Support": "enable",
            "StaticSourcesSupport": "disable",
            "AutoAcceptSharedAssociations": "disable"
        },
        "State": "pending",
        "CreationTime": "2021-09-29T22:17:13.000Z"
    }
}
```

Example 2: To create a static multicast domain

The following `create-transit-gateway-multicast-domain` example creates a multicast domain for the specified transit gateway. With static sources enabled, you must statically add sources.

```
aws ec2 create-transit-gateway-multicast-domain \
    --transit-gateway-id tgw-0bf0bffefaEXAMPLE \
    --options StaticSourcesSupport=enable,Igmpv2Support=disable
```

Output:

```
{
    "TransitGatewayMulticastDomain": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
        "TransitGatewayId": "tgw-0bf0bffefaEXAMPLE",
        "TransitGatewayMulticastDomainArn": "arn:aws:ec2:us-
west-2:123456789012:transit-gateway-multicast-domain/tgw-mcast-
domain-000fb24d04EXAMPLE",
        "OwnerId": "123456789012",
        "Options": {
            "Igmpv2Support": "disable",
            "StaticSourcesSupport": "enable",
            "AutoAcceptSharedAssociations": "disable"
        },
        "State": "pending",
```

```
        "CreationTime": "2021-09-29T22:20:19.000Z"
    }
}
```

For more information, see Multicast domains in AWS Transit Gateway in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayMulticastDomain in *AWS CLI Command Reference*.

`create-transit-gateway-peering-attachment`

The following code example shows how to use `create-transit-gateway-peering-attachment`.

AWS CLI

To create a transit gateway peering attachment

The following `create-transit-gateway-peering-attachment` example creates a peering attachment request between the two specified transit gateways.

```
aws ec2 create-transit-gateway-peering-attachment \
    --transit-gateway-id tgw-123abc05e04123abc \
    --peer-transit-gateway-id tgw-11223344aabbcc112 \
    --peer-account-id 123456789012 \
    --peer-region us-east-2
```

Output:

```
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
```

```
        "State": "initiatingRequest",
        "CreationTime": "2019-12-09T11:38:05.000Z"
    }
}
```

For more information, see Transit Gateway Peering Attachments in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayPeeringAttachment in *AWS CLI Command Reference*.

`create-transit-gateway-policy-table`

The following code example shows how to use `create-transit-gateway-policy-table`.

AWS CLI

To create a transit gateway policy table

The following `create-transit-gateway-policy-table` example creates a transit gateway policy table for the specified transit gateway.

```
aws ec2 create-transit-gateway-policy-table \
    --transit-gateway-id tgw-067f8505c18f0bd6e
```

Output:

```
{
    "TransitGatewayPolicyTable": {
        "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
        "TransitGatewayId": "tgw-067f8505c18f0bd6e",
        "State": "pending",
        "CreationTime": "2023-11-28T16:36:43+00:00"
    }
}
```

For more information, see Transit gateway policy tables in the *Transit Gateway User Guide*.

- For API details, see CreateTransitGatewayPolicyTable in *AWS CLI Command Reference*.

`create-transit-gateway-prefix-list-reference`

The following code example shows how to use `create-transit-gateway-prefix-list-reference`.

AWS CLI

To create a reference to a prefix list

The following `create-transit-gateway-prefix-list-reference` example creates a reference to the specified prefix list in the specified transit gateway route table.

```
aws ec2 create-transit-gateway-prefix-list-reference \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --prefix-list-id pl-11111122222222333 \
    --transit-gateway-attachment-id tgw-attach-aaaaaabbbbbb11111
```

Output:

```
{
    "TransitGatewayPrefixListReference": {
        "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
        "PrefixListId": "pl-11111122222222333",
        "PrefixListOwnerId": "123456789012",
        "State": "pending",
        "Blackhole": false,
        "TransitGatewayAttachment": {
            "TransitGatewayAttachmentId": "tgw-attach-aaaaaabbbbbb11111",
            "ResourceType": "vpc",
            "ResourceId": "vpc-0a1b2c3d4e5f6a7b8"
        }
    }
}
```

For more information, see Create a prefix list reference in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayPrefixListReference in *AWS CLI Command Reference*.

`create-transit-gateway-route-table`

The following code example shows how to use `create-transit-gateway-route-table`.

AWS CLI

To create a Transit Gateway Route Table

The following `create-transit-gateway-route-table` example creates a route table for the specified transit gateway.

```
aws ec2 create-transit-gateway-route-table \
    --transit-gateway-id tgw-0262a0e521EXAMPLE
```

Output:

```
{
    "TransitGatewayRouteTable": {
        "TransitGatewayRouteTableId": "tgw-rtb-0960981be7EXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "State": "pending",
        "DefaultAssociationRouteTable": false,
        "DefaultPropagationRouteTable": false,
        "CreationTime": "2019-07-10T19:01:46.000Z"
    }
}
```

For more information, see Create a transit gateway route table in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayRouteTable in *AWS CLI Command Reference*.

`create-transit-gateway-route`

The following code example shows how to use `create-transit-gateway-route`.

AWS CLI

To create a transit gateway route

The following `create-transit-gateway-route` example creates a route, with the specified destination, for the specified route table.

```
aws ec2 create-transit-gateway-route \
    --destination-cidr-block 10.0.2.0/24 \
    --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
    --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "10.0.2.0/24",
```

```
        "TransitGatewayAttachments": [
            {
                "ResourceId": "vpc-0065acced4EXAMPLE",
                "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
                "ResourceType": "vpc"
            }
        ],
        "Type": "static",
        "State": "active"
    }
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayRoute in *AWS CLI Command Reference*.

`create-transit-gateway-vpc-attachment`

The following code example shows how to use `create-transit-gateway-vpc-attachment`.

AWS CLI

Example 1: To associate a transit gateway with a VPC

The following `create-transit-gateway-vpc-attachment` example creates a transit gateway attachment to the specified VPC.

```
aws ec2 create-transit-gateway-vpc-attachment \
    --transit-gateway-id tgw-0262a0e521EXAMPLE \
    --vpc-id vpc-07e8ffd50f49335df \
    --subnet-ids subnet-0752213d59EXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8ffd50fEXAMPLE",
        "VpcOwnerId": "123456789012",
        "State": "pending",
        "SubnetIds": [
```

```
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Create a transit gateway attachment to a VPC in the *Transit Gateways Guide*.

Example 2: To associate a transit gateway with multiple subnets in a VPC

The following `create-transit-gateway-vpc-attachment` example creates a transit gateway attachment to the specified VPC and subnets.

```
aws ec2 create-transit-gateway-vpc-attachment \
    --transit-gateway-id tgw-02f776b1a7EXAMPLE  \
    --vpc-id vpc-3EXAMPLE \
    --subnet-ids "subnet-dEXAMPLE" "subnet-6EXAMPLE"
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0e141e0bebEXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "VpcId": "vpc-3EXAMPLE",
        "VpcOwnerId": "123456789012",
        "State": "pending",
        "SubnetIds": [
            "subnet-6EXAMPLE",
            "subnet-dEXAMPLE"
        ],
        "CreationTime": "2019-12-17T20:07:52.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
```

```
}
```

For more information, see Create a transit gateway attachment to a VPC in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayVpcAttachment in *AWS CLI Command Reference*.

`create-transit-gateway`

The following code example shows how to use `create-transit-gateway`.

AWS CLI

To create a transit gateway

The following `create-transit-gateway` example creates a transit gateway.

```
aws ec2 create-transit-gateway \
    --description MyTGW \
    --
options AmazonSideAsn=64516,AutoAcceptSharedAttachments=enable,DefaultRouteTableAssociation=
```

Output:

```
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-0262a0e521EXAMPLE",
        "State": "pending",
        "OwnerId": "123456789012",
        "Description": "MyTGW",
        "CreationTime": "2019-07-10T14:02:12.000Z",
        "Options": {
            "AmazonSideAsn": 64516,
            "AutoAcceptSharedAttachments": "enable",
            "DefaultRouteTableAssociation": "enable",
            "AssociationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
            "DefaultRouteTablePropagation": "enable",
            "PropagationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
            "VpnEcmpSupport": "enable",
            "DnsSupport": "enable"
        }
```

```
    }
}
```

For more information, see Create a transit gateway in the *Transit Gateways Guide*.

- For API details, see CreateTransitGateway in *AWS CLI Command Reference*.

`create-verified-access-endpoint`

The following code example shows how to use `create-verified-access-endpoint`.

AWS CLI

To create a Verified Access endpoint

The following `create-verified-access-endpoint` example creates a Verified Access endpoint for the specified Verified Access group. The specified network interface and security group must belong to the same VPC.

```
aws ec2 create-verified-access-endpoint \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --endpoint-type network-interface \
    --attachment-type vpc \
    --domain-certificate-arn arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --application-domain example.com \
    --endpoint-domain-prefix my-ava-app \
    --security-group-ids sg-004915970c4c8f13a \
    --network-interface-
options NetworkInterfaceId=eni-0aec70418c8d87a0f,Protocol=https,Port=443 \
    --tag-specifications ResourceType=verified-access-
endpoint,Tags=[{Key=Name,Value=my-va-endpoint}]
```

Output:

```
{
    "VerifiedAccessEndpoint": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndpointType": "network-interface",
```

```
        "AttachmentType": "vpc",
        "DomainCertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "EndpointDomain": "my-ava-
app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-
west-2.amazonaws.com",
        "SecurityGroupIds": [
            "sg-004915970c4c8f13a"
        ],
        "NetworkInterfaceOptions": {
            "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
            "Protocol": "https",
            "Port": 443
        },
        "Status": {
            "Code": "pending"
        },
        "Description": "",
        "CreationTime": "2023-08-25T20:54:43",
        "LastUpdatedTime": "2023-08-25T20:54:43",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-va-endpoint"
            }
        ]
    }
}
```

For more information, see Verified Access endpoints in the *AWS Verified Access User Guide*.

- For API details, see CreateVerifiedAccessEndpoint in *AWS CLI Command Reference*.

`create-verified-access-group`

The following code example shows how to use `create-verified-access-group`.

AWS CLI

To create a Verified Access group

The following `create-verified-access-group` example creates a Verified Access group for the specified Verified Access instance.

```
aws ec2 create-verified-access-group \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --tag-specifications ResourceType=verified-access-
group,Tags=[{Key=Name,Value=my-va-group}]
```

Output:

```
{
    "VerifiedAccessGroup": {
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "",
        "Owner": "123456789012",
        "VerifiedAccessGroupArn": "arn:aws:ec2:us-west-2:123456789012:verified-
access-group/vagr-0dbe967baf14b7235",
        "CreationTime": "2023-08-25T19:55:19",
        "LastUpdatedTime": "2023-08-25T19:55:19",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-va-group"
            }
        ]
    }
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see CreateVerifiedAccessGroup in *AWS CLI Command Reference*.

`create-verified-access-instance`

The following code example shows how to use `create-verified-access-instance`.

AWS CLI

To create a Verified Access instance

The following `create-verified-access-instance` example creates a Verified Access instance with a Name tag.

```
aws ec2 create-verified-access-instance \
```

```
    --tag-specifications ResourceType=verified-access-
instance,Tags=[{Key=Name,Value=my-va-instance}]
```

Output:

```
{
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "",
        "VerifiedAccessTrustProviders": [],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-25T18:27:56",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-va-instance"
            }
        ]
    }
}
```

For more information, see Verified Access instances in the *AWS Verified Access User Guide*.

- For API details, see CreateVerifiedAccessInstance in *AWS CLI Command Reference*.

`create-verified-access-trust-provider`

The following code example shows how to use `create-verified-access-trust-provider`.

AWS CLI

To create a Verified Access trust provider

The following `create-verified-access-trust-provider` example sets up a Verified Access trust provider using AWS Identity Center.

```
aws ec2 create-verified-access-trust-provider \
    --trust-provider-type user \
    --user-trust-provider-type iam-identity-center \
    --policy-reference-name idc \
    --tag-specifications ResourceType=verified-access-trust-
provider,Tags=[{Key=Name,Value=my-va-trust-provider}]
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T18:40:36",
        "LastUpdatedTime": "2023-08-25T18:40:36",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-va-trust-provider"
            }
        ]
    }
}
```

For more information, see Trust providers for Verified Access in the *AWS Verified Access User Guide*.

- For API details, see CreateVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

`create-volume`

The following code example shows how to use `create-volume`.

AWS CLI

Example 1: To create an empty General Purpose SSD (gp2) volume

The following `create-volume` example creates an 80 GiB General Purpose SSD (gp2) volume in the specified Availability Zone. Note that the current Region must be `us-west-2`, or you can add the `--region` parameter to specify the Region for the command.

```
aws ec2 create-volume \
    --volume-type gp2 \
    --size 80 \
    --availability-zone us-west-2a
```

Output:

```
{
    "AvailabilityZoneId": "use1-az1",
    "AvailabilityZone": "us-west-2a",
    "Tags": [],
    "Encrypted": false,
    "VolumeType": "gp2",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 240,
    "SnapshotId": "",
    "CreateTime": "2025-03-12T19:21:34.000Z",
    "Size": 80
}
```

If you do not specify a volume type, the default volume type is gp2.

```
aws ec2 create-volume \
    --size 80 \
    --availability-zone us-west-2a
```

For more information, see Create an Amazon EBS volume in the *Amazon EBS User Guide*.

Example 2: To create a Provisioned IOPS SSD (io1) volume from a snapshot

The following `create-volume` example creates a Provisioned IOPS SSD (io1) volume with 1000 provisioned IOPS in the specified Availability Zone using the specified snapshot.

```
aws ec2 create-volume \
    --volume-type io1 \
    --iops 1000 \
    --snapshot-id snap-0abcdef1234567890 \
    --availability-zone us-west-2a
```

Output:

```
{
    "AvailabilityZoneId": "use1-az1",
    "AvailabilityZone": "us-west-2a",
    "Tags": [],
```

```
    "Encrypted": false,
    "VolumeType": "io1",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 1000,
    "SnapshotId": "snap-0abcdef1234567890",
    "CreateTime": "2025-03-12T19:21:34.000Z",
    "Size": 500
}
```

For more information, see Create an Amazon EBS volume in the *Amazon EBS User Guide*.

Example 3: To create an encrypted volume

The following `create-volume` example creates an encrypted volume using the default CMK for EBS encryption. If encryption by default is disabled, you must specify the `--encrypted` parameter as follows.

```
aws ec2 create-volume \
    --size 80 \
    --encrypted \
    --availability-zone us-west-2a
```

Output:

```
{
    "AvailabilityZoneId": "use1-az1",
    "AvailabilityZone": "us-west-2a",
    "Tags": [],
    "Encrypted": true,
    "VolumeType": "gp2",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 240,
    "SnapshotId": "",
    "CreateTime": "2025-03-12T19:21:34.000Z",
    "Size": 80
}
```

If encryption by default is enabled, the following example command creates an encrypted volume, even without the `--encrypted` parameter.

```
aws ec2 create-volume \
    --size 80 \
    --availability-zone us-west-2a
```

If you use the `--kms-key-id` parameter to specify a customer managed CMK, you must specify the `--encrypted` parameter even if encryption by default is enabled.

```
aws ec2 create-volume \
    --volume-type gp2 \
    --size 80 \
    --encrypted \
    --kms-key-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --availability-zone us-west-2a
```

For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

Example 4: To create a volume with tags

The following `create-volume` example creates a volume and adds two tags.

```
aws ec2 create-volume \
    --availability-zone us-west-2a \
    --volume-type gp2 \
    --size 80 \
    --tag-specifications 'ResourceType=volume,Tags=[{Key=purpose,Value=production},
{Key=cost-center,Value=cc123}]'
```

Output:

```
{
    "AvailabilityZoneId": "use1-az1",
    "AvailabilityZone": "us-west-2a",
    "Tags": [
        {
            "Key": "purpose",
            "Value": "production"
        },
        {
            "Key": "cost-center",
            "Value": "cc123"
        }
```

```
    ],
    "Encrypted": false,
    "VolumeType": "gp2",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 240,
    "SnapshotId": "",
    "CreateTime": "2025-03-12T19:21:34.000Z",
    "Size": 80
}
```

For more information, see Create an Amazon EBS volume in the *Amazon EBS User Guide*.

- For API details, see CreateVolume in *AWS CLI Command Reference*.

`create-vpc-endpoint-connection-notification`

The following code example shows how to use `create-vpc-endpoint-connection-notification`.

AWS CLI

To create an endpoint connection notification

The following `create-vpc-endpoint-connection-notification` example creates a notification for a specific endpoint service that alerts you when interface endpoints have connected to your service and when endpoints have been accepted for your service.

```
aws ec2 create-vpc-endpoint-connection-notification \
    --connection-notification-arn arn:aws:sns:us-
west-2:123456789012:VpceNotification \
    --connection-events Connect Accept \
    --service-id vpce-svc-1237881c0d25a3abc
```

Output:

```
{
    "ConnectionNotification": {
        "ConnectionNotificationState": "Enabled",
        "ConnectionNotificationType": "Topic",
        "ServiceId": "vpce-svc-1237881c0d25a3abc",
```

```
        "ConnectionEvents": [
            "Accept",
            "Connect"
        ],
        "ConnectionNotificationId": "vpce-nfn-008776de7e03f5abc",
        "ConnectionNotificationArn": "arn:aws:sns:us-
west-2:123456789012:VpceNotification"
    }
}
```

For more information, see Receive alerts for endpoint service events in the *AWS PrivateLink User Guide*.

- For API details, see CreateVpcEndpointConnectionNotification in *AWS CLI Command Reference*.

`create-vpc-endpoint-service-configuration`

The following code example shows how to use `create-vpc-endpoint-service-configuration`.

AWS CLI

Example 1: To create an endpoint service configuration for an interface endpoint

The following `create-vpc-endpoint-service-configuration` example creates a VPC endpoint service configuration using the Network Load Balancer `nlb-vpce`. This example also specifies that requests to connect to the service through an interface endpoint must be accepted.

```
aws ec2 create-vpc-endpoint-service-configuration \
    --network-load-balancer-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/nlb-vpce/e94221227f1ba532 \
    --acceptance-required
```

Output:

```
{
    "ServiceConfiguration": {
        "ServiceType": [
            {
```

```
                "ServiceType": "Interface"
            }
        ],
        "NetworkLoadBalancerArns": [
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/net/
nlb-vpce/e94221227f1ba532"
        ],
        "ServiceName": "com.amazonaws.vpce.us-west-2.vpce-svc-03d5ebb7d9579a2b3",
        "ServiceState": "Available",
        "ServiceId": "vpce-svc-03d5ebb7d9579a2b3",
        "AcceptanceRequired": true,
        "AvailabilityZones": [
            "us-west-2d"
        ],
        "BaseEndpointDnsNames": [
            "vpce-svc-03d5ebb7d9579a2b3.us-west-2.vpce.amazonaws.com"
        ]
    }
}
```

For more information, see Create an endpoint service in the *AWS PrivateLink User Guide*.

Example 2: To create an endpoint service configuration for a Gateway Load Balancer endpoint

The following `create-vpc-endpoint-service-configuration` example creates a VPC endpoint service configuration using the Gateway Load Balancer `GWLBService`. Requests to connect to the service through a Gateway Load Balancer endpoint are automatically accepted.

```
aws ec2 create-vpc-endpoint-service-configuration \
    --gateway-load-balancer-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/gwy/GWLBService/1a2b3c4d5e6f7a8b \
    --no-acceptance-required
```

Output:

```
{
    "ServiceConfiguration": {
        "ServiceType": [
            {
                "ServiceType": "GatewayLoadBalancer"
            }
```

```
        ],
        "ServiceId": "vpce-svc-123123a1c43abc123",
        "ServiceName": "com.amazonaws.vpce.us-west-2.vpce-svc-123123a1c43abc123",
        "ServiceState": "Available",
        "AvailabilityZones": [
            "us-west-2d"
        ],
        "AcceptanceRequired": false,
        "ManagesVpcEndpoints": false,
        "GatewayLoadBalancerArns": [
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/gwy/
GWLBService/1a2b3c4d5e6f7a8b"
        ]
    }
}
```

For more information, see Create a Gateway Load Balancer endpoint service in the *AWS PrivateLink User Guide*.

- For API details, see CreateVpcEndpointServiceConfiguration in *AWS CLI Command Reference*.

`create-vpc-endpoint`

The following code example shows how to use `create-vpc-endpoint`.

AWS CLI

Example 1: To create a gateway endpoint

The following `create-vpc-endpoint` example creates a gateway VPC endpoint between VPC `vpc-1a2b3c4d` and Amazon S3 in the `us-west-2` region, and associates route table `rtb-11aa22bb` with the endpoint.

```
aws ec2 create-vpc-endpoint \
    --vpc-id vpc-1a2b3c4d \
    --service-name com.amazonaws.us-west-2.s3 \
    --route-table-ids rtb-11aa22bb
```

Output:

```
{
```

```
    "VpcEndpoint": {
        "PolicyDocument": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"\",
\"Effect\":\"Allow\",\"Principal\":\"*\",\"Action\":\"*\",\"Resource\":\"*\"}]}",
        "VpcId": "vpc-1a2b3c4d",
        "State": "available",
        "ServiceName": "com.amazonaws.us-west-2.s3",
        "RouteTableIds": [
            "rtb-11aa22bb"
        ],
        "VpcEndpointId": "vpc-1a2b3c4d",
        "CreationTimestamp": "2015-05-15T09:40:50Z"
    }
}
```

For more information, see Create a gateway endpoint in the *AWS PrivateLink User Guide*.

Example 2: To create an interface endpoint

The following `create-vpc-endpoint` example creates an interface VPC endpoint between VPC `vpc-1a2b3c4d` and Amazon S3 in the `us-west-2` region. The command creates the endpoint in subnet `subnet-1a2b3c4d`, associates it with security group `sg-1a2b3c4d`, and adds a tag with a key of "Service" and a Value of "S3".

```
aws ec2 create-vpc-endpoint \
    --vpc-id vpc-1a2b3c4d \
    --vpc-endpoint-type Interface \
    --service-name com.amazonaws.us-west-2.s3 \
    --subnet-ids subnet-7b16de0c \
    --security-group-ids sg-1a2b3c4d \
    --tag-specifications ResourceType=vpc-endpoint,Tags=[{Key=service,Value=S3}]
```

Output:

```
{
    "VpcEndpoint": {
        "VpcEndpointId": "vpce-1a2b3c4d5e6f1a2b3",
        "VpcEndpointType": "Interface",
        "VpcId": "vpc-1a2b3c4d",
        "ServiceName": "com.amazonaws.us-west-2.s3",
        "State": "pending",
        "RouteTableIds": [],
        "SubnetIds": [
```

```
            "subnet-1a2b3c4d"
        ],
        "Groups": [
            {
                "GroupId": "sg-1a2b3c4d",
                "GroupName": "default"
            }
        ],
        "PrivateDnsEnabled": false,
        "RequesterManaged": false,
        "NetworkInterfaceIds": [
            "eni-0b16f0581c8ac6877"
        ],
        "DnsEntries": [
            {
                "DnsName": "*.vpce-1a2b3c4d5e6f1a2b3-9hnenorg.s3.us-
west-2.vpce.amazonaws.com",
                "HostedZoneId": "Z7HUB22UULQXV"
            },
            {
                "DnsName": "*.vpce-1a2b3c4d5e6f1a2b3-9hnenorg-us-west-2c.s3.us-
west-2.vpce.amazonaws.com",
                "HostedZoneId": "Z7HUB22UULQXV"
            }
        ],
        "CreationTimestamp": "2021-03-05T14:46:16.030000+00:00",
        "Tags": [
            {
                "Key": "service",
                "Value": "S3"
            }
        ],
        "OwnerId": "123456789012"
    }
}
```

For more information, see Create an interface VPC endpoint in the *AWS PrivateLink User Guide*.

Example 3: To create a Gateway Load Balancer endpoint

The following `create-vpc-endpoint` example creates a Gateway Load Balancer endpoint between VPC `vpc-1a2b3c4d5e6f7a8b9` and and a service that is configured using a Gateway Load Balancer.

```
aws ec2 create-vpc-endpoint \
    --service-name com.amazonaws.vpce.us-west-2.vpce-svc-123123a1c43abc123 \
    --vpc-endpoint-type GatewayLoadBalancer \
    --vpc-id vpc-1a2b3c4d5e6f7a8b9 \
    --subnet-ids subnet-0011aabbcc2233445
```

Output:

```
{
    "VpcEndpoint": {
        "VpcEndpointId": "vpce-aabbaabbaabbaabba",
        "VpcEndpointType": "GatewayLoadBalancer",
        "VpcId": "vpc-1a2b3c4d5e6f7a8b9",
        "ServiceName": "com.amazonaws.vpce.us-west-2.vpce-svc-123123a1c43abc123",
        "State": "pending",
        "SubnetIds": [
            "subnet-0011aabbcc2233445"
        ],
        "RequesterManaged": false,
        "NetworkInterfaceIds": [
            "eni-01010120203030405"
        ],
        "CreationTimestamp": "2020-11-11T08:06:03.522Z",
        "OwnerId": "123456789012"
    }
}
```

For more information, see Gateway Load Balancer endpoints in the *AWS PrivateLink User Guide*.

Example 4: To create a resource endpoint

The following `create-vpc-endpoint` example creates a resource endpoint.

```
aws ec2 create-vpc-endpoint \
    --vpc-endpoint-type Resource \
    --vpc-id vpc-1a2b3c4d5e6f7a8b9 \
    --subnet-ids subnet-0011aabbcc2233445 \
    --resource-configuration-arn arn:aws:vpc-lattice-us-
east-1:123456789012:resourceconfiguration/rcfg-0123abcde98765432
```

Output:

```
{
    "VpcEndpoint": {
        "VpcEndpointId": "vpce-00939a7ed9EXAMPLE",
        "VpcEndpointType": "Resource",
        "VpcId": "vpc-1a2b3c4d5e6f7a8b9",
        "State": "Pending",
        "SubnetIds": [
            "subnet-0011aabbcc2233445"
        ],
        "Groups": [
            {
                "GroupId": "sg-03e2f15fbfc09b000",
                "GroupName": "default"
            }
        ],
        "IpAddressType": "IPV4",
        "PrivateDnsEnabled": false,
        "CreationTimestamp": "2025-02-06T23:38:49.525000+00:00",
        "Tags": [],
        "OwnerId": "123456789012",
        "ResourceConfigurationArn": "arn:aws:vpc-lattice:us-
west-2:123456789012:resourceconfiguration/rcfg-0123abcde98765432"
    }
}
```

For more information, see Resource endpoints in the *AWS PrivateLink User Guide*.

Example 5: To create a service network endpoint

The following `create-vpc-endpoint` example creates a service network endpoint.

```
aws ec2 create-vpc-endpoint \
    --vpc-endpoint-type ServiceNetwork \
    --vpc-id vpc-1a2b3c4d5e6f7a8b9 \
    --subnet-ids subnet-0011aabbcc2233445 \
    --service-network-arn arn:aws:vpc-lattice:us-west-2:123456789012:servicenetwork/
sn-0101abcd5432abcd0 \
    --security-group-ids sg-0123456789012abcd
```

Output:

```
{
```

```
    "VpcEndpoint": {
        "VpcEndpointId": "vpce-0f00567fa8EXAMPLE",
        "VpcEndpointType": "ServiceNetwork",
        "VpcId": "vpc-1a2b3c4d5e6f7a8b9",
        "State": "Pending",
        "SubnetIds": [
            "subnet-0011aabbcc2233445"
        ],
        "Groups": [
            {
                "GroupId": "sg-0123456789012abcd",
                "GroupName": "my-security-group"
            }
        ],
        "IpAddressType": "IPV4",
        "PrivateDnsEnabled": false,
        "CreationTimestamp": "2025-02-06T23:44:20.449000+00:00",
        "Tags": [],
        "OwnerId": "123456789012",
        "ServiceNetworkArn": "arn:aws:vpc-lattice:us-
west-2:123456789012:servicenetwork/sn-0101abcd5432abcd0"
    }
}
```

For more information, see Service network endpoints in the *AWS PrivateLink User Guide*.

- For API details, see CreateVpcEndpoint in *AWS CLI Command Reference*.

`create-vpc-peering-connection`

The following code example shows how to use `create-vpc-peering-connection`.

AWS CLI

Example 1: To create a VPC peering connection between your VPCs

The following `create-vpc-peering-connection` example requests a peering connection between your VPCs vpc-1a2b3c4d and vpc-11122233.

```
aws ec2 create-vpc-peering-connection \
    --vpc-id vpc-1a2b3c4d \
    --peer-vpc-id vpc-11122233
```

Output:

```
{
    "VpcPeeringConnection": {
        "Status": {
            "Message": "Initiating Request to 123456789012",
            "Code": "initiating-request"
        },
        "Tags": [],
        "RequesterVpcInfo": {
            "OwnerId": "123456789012",
            "VpcId": "vpc-1a2b3c4d",
            "CidrBlock": "10.0.0.0/28"
        },
        "VpcPeeringConnectionId": "pcx-111aaa111",
        "ExpirationTime": "2014-04-02T16:13:36.000Z",
        "AccepterVpcInfo": {
            "OwnerId": "123456789012",
            "VpcId": "vpc-11122233"
        }
    }
}
```

For more information, see Create a VPC peering connection in the *Amazon VPC Peering Guide*.

Example 2: To create a VPC peering connection with a VPC in another account

The following `create-vpc-peering-connection` example requests a peering connection between your VPC (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs to AWS account 123456789111.

```
aws ec2 create-vpc-peering-connection \
    --vpc-id vpc-1a2b3c4d \
    --peer-vpc-id vpc-11122233 \
    --peer-owner-id 123456789111
```

Output:

```
{
    "VpcPeeringConnection": {
        "Status": {
            "Message": "Initiating Request to 123456789111",
```

```
            "Code": "initiating-request"
        },
        "Tags": [],
        "RequesterVpcInfo": {
            "OwnerId": "123456789012",
            "VpcId": "vpc-1a2b3c4d",
            "CidrBlock": "10.0.0.0/28"
        },
        "VpcPeeringConnectionId": "pcx-222bbb222",
        "ExpirationTime": "2014-04-02T16:13:36.000Z",
        "AccepterVpcInfo": {
            "OwnerId": "123456789111",
            "VpcId": "vpc-11122233"
        }
    }
}
```

For more information, see Create a VPC peering connection in the *Amazon VPC Peering Guide*.

Example 3: To create a VPC peering connection with a VPC in a different region

The following `create-vpc-peering-connection` example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) in your account in the `us-west-2` region.

```
aws ec2 create-vpc-peering-connection \
    --vpc-id vpc-1a2b3c4d \
    --peer-vpc-id vpc-11122233 \
    --peer-region us-west-2
```

Output:

```
{
    "VpcPeeringConnection": {
        "Status": {
            "Message": "Initiating Request to 123456789012",
            "Code": "initiating-request"
        },
        "Tags": [],
        "RequesterVpcInfo": {
            "OwnerId": "123456789012",
            "VpcId": "vpc-1a2b3c4d",
```

```
            "CidrBlock": "10.0.0.0/28"
        },
        "VpcPeeringConnectionId": "pcx-333ccc333",
        "ExpirationTime": "2014-04-02T16:13:36.000Z",
        "AccepterVpcInfo": {
            "OwnerId": "123456789012",
            "VpcId": "vpc-11122233",
            "Region": "us-west-2"
        }
    }
}
```

The following `create-vpc-peering-connection` example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs to AWS account 123456789111 that's in the `us-west-2` region.

```
aws ec2 create-vpc-peering-connection \
    --vpc-id vpc-1a2b3c4d \
    --peer-vpc-id vpc-11122233 \
    --peer-owner-id 123456789111 \
    --peer-region us-west-2
```

Output:

```
{
    "VpcPeeringConnection": {
        "Status": {
            "Message": "Initiating Request to 123456789111",
            "Code": "initiating-request"
        },
        "Tags": [],
        "RequesterVpcInfo": {
            "OwnerId": "123456789012",
            "VpcId": "vpc-1a2b3c4d",
            "CidrBlock": "10.0.0.0/28"
        },
        "VpcPeeringConnectionId": "pcx-444ddd444",
        "ExpirationTime": "2014-04-02T16:13:36.000Z",
        "AccepterVpcInfo": {
            "OwnerId": "123456789111",
            "VpcId": "vpc-11122233",
            "Region": "us-west-2"
```

```
        }
    }
}
```

For more information, see Create a VPC peering connection in the *Amazon VPC Peering Guide*.

- For API details, see CreateVpcPeeringConnection in *AWS CLI Command Reference*.

`create-vpc`

The following code example shows how to use `create-vpc`.

AWS CLI

Example 1: To create a VPC

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and a Name tag.

```
aws ec2 create-vpc \
    --cidr-block 10.0.0.0/16 \
    --tag-specifications ResourceType=vpc,Tags=[{Key=Name,Value=MyVpc}]
```

Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-5EXAMPLE",
        "State": "pending",
        "VpcId": "vpc-0a60eb65b4EXAMPLE",
        "OwnerId": "123456789012",
        "InstanceTenancy": "default",
        "Ipv6CidrBlockAssociationSet": [],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-07501b79ecEXAMPLE",
                "CidrBlock": "10.0.0.0/16",
                "CidrBlockState": {
                    "State": "associated"
                }
            }
```

```
        ],
        "IsDefault": false,
        "Tags": [
            {
                "Key": "Name",
                "Value": "MyVpc"
            }
        ]
    }
}
```

Example 2: To create a VPC with dedicated tenancy

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and dedicated tenancy.

```
aws ec2 create-vpc \
    --cidr-block 10.0.0.0/16 \
    --instance-tenancy dedicated
```

Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-19edf471",
        "State": "pending",
        "VpcId": "vpc-0a53287fa4EXAMPLE",
        "OwnerId": "123456789012",
        "InstanceTenancy": "dedicated",
        "Ipv6CidrBlockAssociationSet": [],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-00b24cc1c2EXAMPLE",
                "CidrBlock": "10.0.0.0/16",
                "CidrBlockState": {
                    "State": "associated"
                }
            }
        ],
        "IsDefault": false
    }
```

```
}
```

Example 3: To create a VPC with an IPv6 CIDR block

The following `create-vpc` example creates a VPC with an Amazon-provided IPv6 CIDR block.

```
aws ec2 create-vpc \
    --cidr-block 10.0.0.0/16 \
    --amazon-provided-ipv6-cidr-block
```

Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-dEXAMPLE",
        "State": "pending",
        "VpcId": "vpc-0fc5e3406bEXAMPLE",
        "OwnerId": "123456789012",
        "InstanceTenancy": "default",
        "Ipv6CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-068432c60bEXAMPLE",
                "Ipv6CidrBlock": "",
                "Ipv6CidrBlockState": {
                    "State": "associating"
                },
                "Ipv6Pool": "Amazon",
                "NetworkBorderGroup": "us-west-2"
            }
        ],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-0669f8f9f5EXAMPLE",
                "CidrBlock": "10.0.0.0/16",
                "CidrBlockState": {
                    "State": "associated"
                }
            }
        ],
        "IsDefault": false
    }
}
```

Example 4: To create a VPC with a CIDR from an IPAM pool

The following `create-vpc` example creates a VPC with a CIDR from an Amazon VPC IP Address Manager (IPAM) pool.

For Linux and macOS, use the following command.

```
aws ec2 create-vpc \
    --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 \
    --tag-specifications ResourceType=vpc,Tags='[{Key=Environment,Value="Preprod"},
{Key=Owner,Value="Build Team"}]'
```

For Windows, use the following command.

```
aws ec2 create-vpc ^
    --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 ^
    --tag-specifications ResourceType=vpc,Tags=[{Key=Environment,Value="Preprod"},
{Key=Owner,Value="Build Team"}]
```

Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.1.0/24",
        "DhcpOptionsId": "dopt-2afccf50",
        "State": "pending",
        "VpcId": "vpc-010e1791024eb0af9",
        "OwnerId": "123456789012",
        "InstanceTenancy": "default",
        "Ipv6CidrBlockAssociationSet": [],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-0a77de1d803226d4b",
                "CidrBlock": "10.0.1.0/24",
                "CidrBlockState": {
                    "State": "associated"
                }
            }
        ],
        "IsDefault": false,
        "Tags": [
            {
```

```
                "Key": "Environment",
                "Value": "Preprod"
            },
            {
                "Key": "Owner",
                "Value": "Build Team"
            }
        ]
    }
}
```

For more information, see Create a VPC that uses an IPAM pool CIDR in the *Amazon VPC IPAM User Guide*.

- For API details, see CreateVpc in *AWS CLI Command Reference*.

`create-vpn-connection-route`

The following code example shows how to use `create-vpn-connection-route`.

AWS CLI

To create a static route for a VPN connection

The following `create-vpn-connection-route` example creates a static route for the specified VPN connection.

```
aws ec2 create-vpn-connection-route \
    --vpn-connection-id vpn-40f41529 \
    --destination-cidr-block 11.12.0.0/16
```

This command produces no output.

For more information, see AWS Site-to-Site VPN routing options in the *AWS Site-to-Site VPN User Guide*.

- For API details, see CreateVpnConnectionRoute in *AWS CLI Command Reference*.

`create-vpn-connection`

The following code example shows how to use `create-vpn-connection`.

AWS CLI

Example 1: To create a VPN connection with dynamic routing

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway, and applies tags to the VPN connection. The output includes the configuration information for your customer gateway device, in XML format.

```
aws ec2 create-vpn-connection \
    --type ipsec.1 \
    --customer-gateway-id cgw-0abc1234def567890 \
    --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
    --tag-specifications 'ResourceType=vpn-connection,Tags=[{Key=Name,Value=BGP-VPN}]'
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-0abc1234def567890",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-1a2b3c4d5e6f7a8b9",
        "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": false,
            "LocalIpv4NetworkCidr": "0.0.0.0/0",
            "RemoteIpv4NetworkCidr": "0.0.0.0/0",
            "TunnelInsideIpVersion": "ipv4",
            "TunnelOptions": [
                {},
                {}
            ]
        },
        "Routes": [],
        "Tags": [
            {
                "Key": "Name",
                "Value": "BGP-VPN"
            }
```

```
        ]
    }
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

Example 2: To create a VPN connection with static routing

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway. The options specify static routing. The output includes the configuration information for your customer gateway device, in XML format.

```
aws ec2 create-vpn-connection \
    --type ipsec.1 \
    --customer-gateway-id cgw-0abc1234def567890 \
    --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
    --options "{\"StaticRoutesOnly\":true}"
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "..configuration information...",
        "CustomerGatewayId": "cgw-0abc1234def567890",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-1a2b3c4d5e6f7a8b9",
        "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": true,
            "LocalIpv4NetworkCidr": "0.0.0.0/0",
            "RemoteIpv4NetworkCidr": "0.0.0.0/0",
            "TunnelInsideIpVersion": "ipv4",
            "TunnelOptions": [
                {},
                {}
            ]
        },
        "Routes": [],
```

```
        "Tags": []
    }
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

Example 3: To create a VPN connection and specify your own inside CIDR and pre-shared key

The following `create-vpn-connection` example creates a VPN connection and specifies the inside IP address CIDR block and a custom pre-shared key for each tunnel. The specified values are returned in the `CustomerGatewayConfiguration` information.

```
aws ec2 create-vpn-connection \
    --type ipsec.1 \
    --customer-gateway-id cgw-0abc1234def567890 \
    --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
    --options
 TunnelOptions='[{TunnelInsideCidr=169.254.12.0/30,PreSharedKey=ExamplePreSharedKey1},
{TunnelInsideCidr=169.254.13.0/30,PreSharedKey=ExamplePreSharedKey2}]'
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "..configuration information...",
        "CustomerGatewayId": "cgw-0abc1234def567890",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-1a2b3c4d5e6f7a8b9",
        "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": false,
            "LocalIpv4NetworkCidr": "0.0.0.0/0",
            "RemoteIpv4NetworkCidr": "0.0.0.0/0",
            "TunnelInsideIpVersion": "ipv4",
            "TunnelOptions": [
                {
                    "OutsideIpAddress": "203.0.113.3",
                    "TunnelInsideCidr": "169.254.12.0/30",
                    "PreSharedKey": "ExamplePreSharedKey1"
```

```
                },
                {
                    "OutsideIpAddress": "203.0.113.5",
                    "TunnelInsideCidr": "169.254.13.0/30",
                    "PreSharedKey": "ExamplePreSharedKey2"
                }
            ]
        },
        "Routes": [],
        "Tags": []
    }
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

Example 4: To create a VPN connection that supports IPv6 traffic

The following `create-vpn-connection` example creates a VPN connection that supports IPv6 traffic between the specified transit gateway and specified customer gateway. The tunnel options for both tunnels specify that AWS must initiate the IKE negotiation.

```
aws ec2 create-vpn-connection \
    --type ipsec.1 \
    --transit-gateway-id tgw-12312312312312312 \
    --customer-gateway-id cgw-0abc1234def567890 \
    --options TunnelInsideIpVersion=ipv6,TunnelOptions=[{StartupAction=start},
{StartupAction=start}]
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "..configuration information...",
        "CustomerGatewayId": "cgw-0abc1234def567890",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-11111111122222222",
        "TransitGatewayId": "tgw-12312312312312312",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": false,
```

```
            "LocalIpv6NetworkCidr": "::/0",
            "RemoteIpv6NetworkCidr": "::/0",
            "TunnelInsideIpVersion": "ipv6",
            "TunnelOptions": [
                {
                    "OutsideIpAddress": "203.0.113.3",
                    "StartupAction": "start"
                },
                {
                    "OutsideIpAddress": "203.0.113.5",
                    "StartupAction": "start"
                }
            ]
        },
        "Routes": [],
        "Tags": []
    }
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

- For API details, see CreateVpnConnection in *AWS CLI Command Reference*.

`create-vpn-gateway`

The following code example shows how to use `create-vpn-gateway`.

AWS CLI

Example 1: To create a virtual private gateway

The following `create-vpn-gateway` example creates a virtual private gateway.

```
aws ec2 create-vpn-gateway \
    --type ipsec.1
```

Output:

```
{
    "VpnGateway": {
        "AmazonSideAsn": 64512,
        "State": "available",
```

```
        "Type": "ipsec.1",
        "VpnGatewayId": "vgw-9a4cacf3",
        "VpcAttachments": []
    }
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

Example 2: To create a virtual private gateway with a specific Amazon-side ASN

The following `create-vpn-gateway` example creates a virtual private gateway and specifies the Autonomous System Number (ASN) for the Amazon side of the BGP session.

```
aws ec2 create-vpn-gateway \
    --type ipsec.1 \
    --amazon-side-asn 65001
```

Output:

```
{
    "VpnGateway": {
        "AmazonSideAsn": 65001,
        "State": "available",
        "Type": "ipsec.1",
        "VpnGatewayId": "vgw-9a4cacf3",
        "VpcAttachments": []
    }
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

- For API details, see CreateVpnGateway in *AWS CLI Command Reference*.

`delete-carrier-gateway`

The following code example shows how to use `delete-carrier-gateway`.

AWS CLI

To delete your carrier gateway

The following `delete-carrier-gateway` example deletes the specified carrier gateway.

```
aws ec2 delete-carrier-gateway \
    --carrier-gateway-id cagw-0465cdEXAMPLE1111
```

Output:

```
{
    "CarrierGateway": {
        "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
        "VpcId": "vpc-0c529aEXAMPLE1111",
        "State": "deleting",
        "OwnerId": "123456789012"
    }
}
```

For more information, see Carrier gateways in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see DeleteCarrierGateway in *AWS CLI Command Reference*.

`delete-client-vpn-endpoint`

The following code example shows how to use `delete-client-vpn-endpoint`.

AWS CLI

To delete a Client VPN endpoint

The following `delete-client-vpn-endpoint` example deletes the specified Client VPN endpoint.

```
aws ec2 delete-client-vpn-endpoint \
    --client-vpn-endpoint-id cvpn-endpoint-0123456789abcdef0
```

Output:

```
{
    "Status": {
        "Code": "deleting"
    }
}
```

For more information, see Client VPN Endpoints in the *AWS Client VPN Administrator Guide*.

- For API details, see DeleteClientVpnEndpoint in *AWS CLI Command Reference*.

`delete-client-vpn-route`

The following code example shows how to use `delete-client-vpn-route`.

AWS CLI

To delete a route for a Client VPN endpoint

The following `delete-client-vpn-route` example deletes the `0.0.0.0/0` route for the specified subnet of a Client VPN endpoint.

```
aws ec2 delete-client-vpn-route \
    --client-vpn-endpoint-id cvpn-endpoint-0123456789abcdef0 \
    --destination-cidr-block 0.0.0.0/0 \
    --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```
{
    "Status": {
        "Code": "deleting"
    }
}
```

For more information, see Routes in the *AWS Client VPN Administrator Guide*.

- For API details, see DeleteClientVpnRoute in *AWS CLI Command Reference*.

`delete-coip-cidr`

The following code example shows how to use `delete-coip-cidr`.

AWS CLI

To delete a range of customer-owned IP (CoIP) addresses

The following `delete-coip-cidr` example deletes the specified range of CoIP addresses in the specified CoIP pool.

```
aws ec2 delete-coip-cidr \
    --cidr 14.0.0.0/24 \
    --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{
    "CoipCidr": {
        "Cidr": "14.0.0.0/24",
        "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
    }
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.

- For API details, see DeleteCoipCidr in *AWS CLI Command Reference*.

`delete-coip-pool`

The following code example shows how to use `delete-coip-pool`.

AWS CLI

To delete a pool of customer-owned IP (CoIP) addresses

The following `delete-coip-pool` example deletes a CoIP pool of CoIP addresses.

```
aws ec2 delete-coip-pool \
    --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{
    "CoipPool": {
        "PoolId": "ipv4pool-coip-1234567890abcdefg",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "PoolArn": "arn:aws:ec2:us-west-2:123456789012:coip-pool/ipv4pool-
coip-1234567890abcdefg"
    }
```

```
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.

- For API details, see DeleteCoipPool in *AWS CLI Command Reference*.

`delete-customer-gateway`

The following code example shows how to use `delete-customer-gateway`.

AWS CLI

To delete a customer gateway

The following `delete-customer-gateway` example deletes the specified customer gateway.

```
aws ec2 delete-customer-gateway \
    --customer-gateway-id cgw-0e11f167
```

This command produces no output.

For more information, see Delete an AWS Site-to-Site VPN connection and gateway in the *AWS Site-to-Site VPN User Guide*.

- For API details, see DeleteCustomerGateway in *AWS CLI Command Reference*.

`delete-dhcp-options`

The following code example shows how to use `delete-dhcp-options`.

AWS CLI

To delete a DHCP options set

The following `delete-dhcp-options` example deletes the specified DHCP options set.

```
aws ec2 delete-dhcp-options \
    --dhcp-options-id dopt-d9070ebb
```

This command produces no output.

For more information, see Work with DHCP option sets in the *Amazon VPC User Guide*.

- For API details, see DeleteDhcpOptions in *AWS CLI Command Reference*.

`delete-egress-only-internet-gateway`

The following code example shows how to use `delete-egress-only-internet-gateway`.

AWS CLI

To delete an egress-only Internet gateway

The following `delete-egress-only-internet-gateway` example deletes the specified egress-only Internet gateway.

```
aws ec2 delete-egress-only-internet-gateway \
    --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f
```

Output:

```
{
    "ReturnCode": true
}
```

For more information, see Enable outbound IPv6 traffic using an egress-only internet gateway in the *Amazon VPC User Guide*.

- For API details, see DeleteEgressOnlyInternetGateway in *AWS CLI Command Reference*.

`delete-fleets`

The following code example shows how to use `delete-fleets`.

AWS CLI

Example 1: To delete an EC2 Fleet and terminate the associated instances

The following `delete-fleets` example deletes the specified EC2 Fleet and terminates the associated On-Demand Instances and Spot Instances.

```
aws ec2 delete-fleets \
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --terminate-instances
```

Output:

```
{
    "SuccessfulFleetDeletions": [
        {
            "CurrentFleetState": "deleted_terminating",
            "PreviousFleetState": "active",
            "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
        }
    ],
    "UnsuccessfulFleetDeletions": []
}
```

For more information, see Delete an EC2 Fleet request and the instances in the fleet in the *Amazon EC2 User Guide*.

Example 2: To delete an EC2 Fleet without terminating the associated instances

The following `delete-fleets` example deletes the specified EC2 Fleet without terminating the associated On-Demand Instances and Spot Instances.

```
aws ec2 delete-fleets \
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --no-terminate-instances
```

Output:

```
{
    "SuccessfulFleetDeletions": [
        {
            "CurrentFleetState": "deleted_running",
            "PreviousFleetState": "active",
            "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
        }
    ],
    "UnsuccessfulFleetDeletions": []
}
```

For more information, see Delete an EC2 Fleet request and the instances in the fleet in the *Amazon EC2 User Guide*.

- For API details, see DeleteFleets in *AWS CLI Command Reference*.

`delete-flow-logs`

The following code example shows how to use `delete-flow-logs`.

AWS CLI

To delete a flow log

The following `delete-flow-logs` example deletes the specified flow log.

```
aws ec2 delete-flow-logs \
    --flow-log-ids fl-11223344556677889
```

Output:

```
{
    "Unsuccessful": []
}
```

For more information, see Work with flow logs in the *Amazon VPC User Guide*.

- For API details, see DeleteFlowLogs in *AWS CLI Command Reference*.

`delete-fpga-image`

The following code example shows how to use `delete-fpga-image`.

AWS CLI

To delete an Amazon FPGA image

The following `delete-fpga-image` example deletes the specified AFI.

```
aws ec2 delete-fpga-image \
    --fpga-image-id afi-06b12350a123fbabc
```

Output:

```
{
    "Return": true
```

```
}
```

For more information, see Specifications for Amazon EC2 accelerated computing instances in the *Amazon EC2 Instance Types Guide*.

- For API details, see DeleteFpgaImage in *AWS CLI Command Reference*.

`delete-instance-connect-endpoint`

The following code example shows how to use `delete-instance-connect-endpoint`.

AWS CLI

To delete an EC2 Instance Connect Endpoint

The following `delete-instance-connect-endpoint` example deletes the specified EC2 Instance Connect Endpoint.

```
aws ec2 delete-instance-connect-endpoint \
    --instance-connect-endpoint-id eice-03f5e49b83924bbc7
```

Output:

```
{
    "InstanceConnectEndpoint": {
        "OwnerId": "123456789012",
        "InstanceConnectEndpointId": "eice-0123456789example",
        "InstanceConnectEndpointArn": "arn:aws:ec2:us-west-2:123456789012:instance-
connect-endpoint/eice-0123456789example",
        "State": "delete-in-progress",
        "StateMessage": "",
        "NetworkInterfaceIds": [],
        "VpcId": "vpc-0123abcd",
        "AvailabilityZone": "us-west-2d",
        "CreatedAt": "2023-02-07T12:05:37+00:00",
        "SubnetId": "subnet-0123abcd"
    }
}
```

For more information, see Remove EC2 Instance Connect Endpoint in the *Amazon EC2 User Guide*.

- For API details, see DeleteInstanceConnectEndpoint in *AWS CLI Command Reference*.

`delete-instance-event-window`

The following code example shows how to use `delete-instance-event-window`.

AWS CLI

Example 1: To delete an event window

The following `delete-instance-event-window` example deletes an event window.

```
aws ec2 delete-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890
```

Output:

```
{
    "InstanceEventWindowState": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "State": "deleting"
    }
}
```

For information about event window constraints, see Considerations in the *Amazon EC2 User Guide*.

Example 2: To force delete an event window

The following `delete-instance-event-window` example force deletes an event window if the event window is currently associated with targets.

```
aws ec2 delete-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890 \
    --force-delete
```

Output:

```
{
    "InstanceEventWindowState": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "State": "deleting"
    }
}
```

For information about event window constraints, see Considerations in the *Amazon EC2 User Guide*.

- For API details, see DeleteInstanceEventWindow in *AWS CLI Command Reference*.

`delete-internet-gateway`

The following code example shows how to use `delete-internet-gateway`.

AWS CLI

To delete an internet gateway

The following `delete-internet-gateway` example deletes the specified internet gateway.

```
aws ec2 delete-internet-gateway \
    --internet-gateway-id igw-0d0fb496b3EXAMPLE
```

This command produces no output.

For more information, see Internet gateways in the *Amazon VPC User Guide*.

- For API details, see DeleteInternetGateway in *AWS CLI Command Reference*.

`delete-ipam-pool`

The following code example shows how to use `delete-ipam-pool`.

AWS CLI

To delete an IPAM pool

The following `delete-ipam-pool` example deletes an IPAM pool in your AWS account. In this example, you're an IPAM delegated admin who wants to delete an IPAM pool that you no longer need, but the pool has a CIDR provisioned to it. You cannot delete a pool if it has CIDRs provisioned to it unless you use the `--cascade` option, so you'll use `--cascade`.

To complete this request:

You'll need the IPAM pool ID which you can get with describe-ipam-pools.The `--region` must be the IPAM home Region.

To delete the pool, use the following command.

```
aws ec2 delete-ipam-pool \
    --ipam-pool-id ipam-pool-050c886a3ca41cd5b \
    --cascade \
    --region us-west-2
```

Output:

```
{
    "IpamPool": {
        "OwnerId": "123456789012",
        "IpamPoolId": "ipam-pool-050c886a3ca41cd5b",
        "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-050c886a3ca41cd5b",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-0a158dde35c51107b",
        "IpamScopeType": "private",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-005f921c17ebd5107",
        "IpamRegion": "us-west-2",
        "Locale": "None",
        "PoolDepth": 1,
        "State": "delete-in-progress",
        "Description": "example",
        "AutoImport": false,
        "AddressFamily": "ipv4",
        "AllocationMinNetmaskLength": 0,
        "AllocationMaxNetmaskLength": 32
    }
}
```

For more information, see Delete a pool in the *Amazon VPC IPAM User Guide*.

- For API details, see DeleteIpamPool in *AWS CLI Command Reference*.

`delete-ipam-resource-discovery`

The following code example shows how to use `delete-ipam-resource-discovery`.

AWS CLI

To delete a resource discovery

The following `delete-ipam-resource-discovery` example deletes a resource discovery. In this example, you're an IPAM delegated admin who wants to delete a non-default resource discovery that you created to share with another IPAM admin during the process of integrating IPAM with accounts outside of your organization.

To complete this request:

The `--region` must be the Region where you created the resource discovery.You cannot delete a default resource discovery if `"IsDefault": true`. A default resource discovery is one that is created automatically in the account that creates an IPAM. To delete a default resource discovery, you have to delete the IPAM.

To delete the resource discovery, use the following command.

```
aws ec2 delete-ipam-resource-discovery \
    --ipam-resource-discovery-id ipam-res-disco-0e39761475298ee0f \
    --region us-west-2
```

Output:

```
{
    "IpamResourceDiscovery": {
        "OwnerId": "123456789012",
        "IpamResourceDiscoveryId": "ipam-res-disco-0e39761475298ee0f",
        "IpamResourceDiscoveryArn": "arn:aws:ec2::123456789012:ipam-resource-
discovery/ipam-res-disco-0e39761475298ee0f",
        "IpamResourceDiscoveryRegion": "us-west-2",
        "OperatingRegions": [
            {
                "RegionName": "us-west-2"
            }
        ],
        "IsDefault": false,
        "State": "delete-in-progress"
    }
}
```

For more information about resource discoveries, see Work with resource discoveries in the *Amazon VPC IPAM User Guide*.

- For API details, see DeleteIpamResourceDiscovery in *AWS CLI Command Reference*.

`delete-ipam-scope`

The following code example shows how to use `delete-ipam-scope`.

AWS CLI

To delete an IPAM scope

The following `delete-ipam-scope` example deletes an IPAM.

```
aws ec2 delete-ipam-scope \
    --ipam-scope-id ipam-scope-01c1ebab2b63bd7e4
```

Output:

```
{
    "IpamScope": {
        "OwnerId": "123456789012",
        "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-01c1ebab2b63bd7e4",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-west-2",
        "IpamScopeType": "private",
        "IsDefault": false,
        "Description": "Example description",
        "PoolCount": 0,
        "State": "delete-in-progress"
    }
}
```

For more information, see Delete a scope in the *Amazon VPC IPAM User Guide*.

- For API details, see DeleteIpamScope in *AWS CLI Command Reference*.

`delete-ipam`

The following code example shows how to use `delete-ipam`.

AWS CLI

To delete an IPAM

The following `delete-ipam` example deletes an IPAM.

```
aws ec2 delete-ipam \
    --ipam-id ipam-036486dfa6af58ee0
```

Output:

```
{
    "Ipam": {
        "OwnerId": "123456789012",
        "IpamId": "ipam-036486dfa6af58ee0",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
        "IpamRegion": "us-west-2",
        "PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
        "PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
        "ScopeCount": 2,
        "OperatingRegions": [
            {
                "RegionName": "us-west-2"
            }
        ],
        "State": "delete-in-progress"
    }
}
```

For more information, see Delete an IPAM in the *Amazon VPC IPAM User Guide*.

- For API details, see DeleteIpam in *AWS CLI Command Reference*.

`delete-key-pair`

The following code example shows how to use `delete-key-pair`.

AWS CLI

To delete a key pair

The following `delete-key-pair` example deletes the specified key pair.

```
aws ec2 delete-key-pair \
    --key-name my-key-pair
```

Output:

```
{
    "Return": true,
    "KeyPairId": "key-03c8d3aceb53b507"
}
```

For more information, see Create and delete key pairs in the *AWS Command Line Interface User Guide*.

- For API details, see DeleteKeyPair in *AWS CLI Command Reference*.

`delete-launch-template-versions`

The following code example shows how to use `delete-launch-template-versions`.

AWS CLI

To delete a launch template version

The following `delete-launch-template-versions` example deletes the specified launch template version.

```
aws ec2 delete-launch-template-versions \
    --launch-template-id lt-0abcd1234567890ab \
    --versions 1
```

Output:

```
{
    "UnsuccessfullyDeletedLaunchTemplateVersions": [],
    "SuccessfullyDeletedLaunchTemplateVersions": [
        {
            "LaunchTemplateName": "TestVersion",
            "VersionNumber": 1,
            "LaunchTemplateId": "lt-0abcd1234567890ab"
        }
    ]
}
```

For more information, see Delete a launch template or a launch template version in the *Amazon EC2 User Guide*.

- For API details, see DeleteLaunchTemplateVersions in *AWS CLI Command Reference*.

`delete-launch-template`

The following code example shows how to use `delete-launch-template`.

AWS CLI

To delete a launch template

The following `delete-launch-template` example deletes the specified launch template.

```
aws ec2 delete-launch-template \
    --launch-template-id lt-0abcd29075EXAMPLE
```

Output:

```
{
    "LaunchTemplate": {
        "LatestVersionNumber": 2,
        "LaunchTemplateId": "lt-0abcd29075EXAMPLE",
        "LaunchTemplateName": "TestTemplate",
        "DefaultVersionNumber": 2,
        "CreatedBy": "arn:aws:iam::123456789012:root",
        "CreateTime": "2017-11-23T16:46:25.000Z"
    }
}
```

For more information, see Delete a launch template or a launch template version in the *Amazon EC2 User Guide*.

- For API details, see DeleteLaunchTemplate in *AWS CLI Command Reference*.

`delete-local-gateway-route-table-virtual-interface-group-association`

The following code example shows how to use `delete-local-gateway-route-table-virtual-interface-group-association`.

AWS CLI

To disassociate a local gateway route table from a virtual interfaces (VIFs) group

The following `delete-local-gateway-route-table-virtual-interface-group-association` example deletes the association between the specified local gateway route table and VIF group.

```
aws ec2 delete-local-gateway-route-table-virtual-interface-group-association \
    --local-gateway-route-table-virtual-interface-group-association-id lgw-vif-grp-assoc-exampleid12345678
```

Output:

```
{
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
        "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-exampleid12345678",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
        "LocalGatewayId": "lgw-exampleid11223344",
        "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-gateway-route-table/lgw-rtb-exampleidabcd1234",
        "OwnerId": "123456789012",
        "State": "disassociating",
        "Tags": []
    }
}
```

For more information, see VIF group associations in the *AWS Outposts User Guide*.

- For API details, see DeleteLocalGatewayRouteTableVirtualInterfaceGroupAssociation in *AWS CLI Command Reference*.

`delete-local-gateway-route-table-vpc-association`

The following code example shows how to use `delete-local-gateway-route-table-vpc-association`.

AWS CLI

To disassociate a local gateway route table from a VPC

The following `delete-local-gateway-route-table-vpc-association` example deletes the association between the specified local gateway route table and VPC.

```
aws ec2 delete-local-gateway-route-table-vpc-association \
    --local-gateway-route-table-vpc-association-id vpc-example0123456789
```

Output:

```
{
    "LocalGatewayRouteTableVpcAssociation": {
        "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-abcd1234wxyz56789",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-
gateway-route-table/lgw-rtb-abcdefg1234567890",
        "LocalGatewayId": "lgw-exampleid01234567",
        "VpcId": "vpc-example0123456789",
        "OwnerId": "123456789012",
        "State": "disassociating"
    }
}
```

For more information, see VPC associations in the *AWS Outposts User Guide*.

- For API details, see DeleteLocalGatewayRouteTableVpcAssociation in *AWS CLI Command Reference*.

`delete-local-gateway-route-table`

The following code example shows how to use `delete-local-gateway-route-table`.

AWS CLI

To delete a local gateway route table

The following `delete-local-gateway-route-table` example creates a local gateway route table with the direct VPC routing mode.

```
aws ec2 delete-local-gateway-route-table \
    --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

Output:

```
{
    "LocalGatewayRouteTable": {
```

```
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-
gateway-route-table/lgw-rtb-abcdefg1234567890",
        "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
        "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-021345abcdef67890",
        "OwnerId": "123456789012",
        "State": "deleting",
        "Tags": [],
        "Mode": "direct-vpc-routing"
    }
}
```

For more information, see Local gateway route tables in the *AWS Outposts User Guide*.

- For API details, see DeleteLocalGatewayRouteTable in *AWS CLI Command Reference*.

`delete-local-gateway-route`

The following code example shows how to use `delete-local-gateway-route`.

AWS CLI

To delete a route from a local gateway route table

The following `delete-local-gateway-route` example deletes the specified route from the specified local gateway route table.

```
aws ec2 delete-local-gateway-route \
    --destination-cidr-block 0.0.0.0/0 \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
    }
```

```
}
```

For more information, see Local gateway route tables in the *AWS Outposts User Guide*.

- For API details, see DeleteLocalGatewayRoute in *AWS CLI Command Reference*.

`delete-managed-prefix-list`

The following code example shows how to use `delete-managed-prefix-list`.

AWS CLI

To delete a prefix list

The following `delete-managed-prefix-list` example deletes the specified prefix list.

```
aws ec2 delete-managed-prefix-list \
    --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
    "PrefixList": {
        "PrefixListId": "pl-0123456abcabcabc1",
        "AddressFamily": "IPv4",
        "State": "delete-in-progress",
        "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
        "PrefixListName": "test",
        "MaxEntries": 10,
        "Version": 1,
        "OwnerId": "123456789012"
    }
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see DeleteManagedPrefixList in *AWS CLI Command Reference*.

`delete-nat-gateway`

The following code example shows how to use `delete-nat-gateway`.

AWS CLI

To delete a NAT gateway

The following `delete-nat-gateway` example deletes NAT gateway `nat-04ae55e711cec5680`.

```
aws ec2 delete-nat-gateway \
    --nat-gateway-id nat-04ae55e711cec5680
```

Output:

```
{
    "NatGatewayId": "nat-04ae55e711cec5680"
}
```

For more information, see Work with NAT gateways in the *Amazon VPC User Guide*.

- For API details, see DeleteNatGateway in *AWS CLI Command Reference*.

`delete-network-acl-entry`

The following code example shows how to use `delete-network-acl-entry`.

AWS CLI

To delete a network ACL entry

The following `delete-network-acl-entry` example deletes ingress rule number 100 from the specified network ACL.

```
aws ec2 delete-network-acl-entry \
    --network-acl-id acl-5fb85d36 \
    --ingress \
    --rule-number 100
```

This command produces no output.

For more information, see Network ACL rules in the *Amazon VPC User Guide*.

- For API details, see DeleteNetworkAclEntry in *AWS CLI Command Reference*.

`delete-network-acl`

The following code example shows how to use `delete-network-acl`.

AWS CLI

To delete a network ACL

The following `delete-network-acl` example deletes the specified network ACL.

```
aws ec2 delete-network-acl \
    --network-acl-id acl-5fb85d36
```

This command produces no output.

For more information, see Delete a network ACL for your VPC in the *Amazon VPC User Guide*.

- For API details, see DeleteNetworkAcl in *AWS CLI Command Reference*.

`delete-network-insights-access-scope-analysis`

The following code example shows how to use `delete-network-insights-access-scope-analysis`.

AWS CLI

To delete a Network Access Scope analysis

The following `delete-network-insights-access-scope-analysis` example deletes the specified Network Access Scope analysis.

```
aws ec2 delete-network-insights-access-scope-analysis \
    --network-insights-access-scope-analysis-id nisa-01234567891abcdef
```

Output:

```
{
    "NetworkInsightsAccessScopeAnalysisId": "nisa-01234567891abcdef"
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see DeleteNetworkInsightsAccessScopeAnalysis in *AWS CLI Command Reference*.

`delete-network-insights-access-scope`

The following code example shows how to use `delete-network-insights-access-scope`.

AWS CLI

To delete a Network Access Scope

The following `delete-network-insights-access-scope` example deletes the specified Network Access Scope.

```
aws ec2 delete-network-insights-access-scope \
    --network-insights-access-scope-id nis-123456789abc01234
```

Output:

```
{
    "NetworkInsightsAccessScopeId": "nis-123456789abc01234"
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see DeleteNetworkInsightsAccessScope in *AWS CLI Command Reference*.

`delete-network-insights-analysis`

The following code example shows how to use `delete-network-insights-analysis`.

AWS CLI

To delete a path analysis

The following `delete-network-insights-analysis` example deletes the specified analysis.

```
aws ec2 delete-network-insights-analysis \
```

```
    --network-insights-analysis-id nia-02207aa13eb480c7a
```

Output:

```
{
    "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a"
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see DeleteNetworkInsightsAnalysis in *AWS CLI Command Reference*.

`delete-network-insights-path`

The following code example shows how to use `delete-network-insights-path`.

AWS CLI

To delete a path

The following `delete-network-insights-path` example deletes the specified path. Before you can delete a path, you must delete all its analyses using the `delete-network-insights-analysis` command.

```
aws ec2 delete-network-insights-path \
    --network-insights-path-id nip-0b26f224f1d131fa8
```

Output:

```
{
    "NetworkInsightsPathId": "nip-0b26f224f1d131fa8"
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see DeleteNetworkInsightsPath in *AWS CLI Command Reference*.

`delete-network-interface-permission`

The following code example shows how to use `delete-network-interface-permission`.

AWS CLI

To delete a network interface permission

The following `delete-network-interface-permission` example deletes the specified network interface permission.

```
aws ec2 delete-network-interface-permission \
    --network-interface-permission-id eni-perm-06fd19020ede149ea
```

Output:

```
{
    "Return": true
}
```

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

- For API details, see DeleteNetworkInterfacePermission in *AWS CLI Command Reference*.

`delete-network-interface`

The following code example shows how to use `delete-network-interface`.

AWS CLI

To delete a network interface

The following `delete-network-interface` example deletes the specified network interface.

```
aws ec2 delete-network-interface \
    --network-interface-id eni-e5aa89a3
```

This command produces no output.

For more information, see Delete a network interface in the *Amazon EC2 User Guide*.

- For API details, see DeleteNetworkInterface in *AWS CLI Command Reference*.

`delete-placement-group`

The following code example shows how to use `delete-placement-group`.

AWS CLI

To delete a placement group

The following `delete-placement-group` example deletes the specified placement group.

```
aws ec2 delete-placement-group \
    --group-name my-cluster
```

This command produces no output.

For more information, see Delete a placement group in the *Amazon EC2 User Guide*.

- For API details, see DeletePlacementGroup in *AWS CLI Command Reference*.

`delete-queued-reserved-instances`

The following code example shows how to use `delete-queued-reserved-instances`.

AWS CLI

To delete a queued purchase

The following `delete-queued-reserved-instances` example deletes the specified Reserved Instance, which was queued for purchase.

```
aws ec2 delete-queued-reserved-instances \
    --reserved-instances-ids a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "SuccessfulQueuedPurchaseDeletions": [
        {
            "ReservedInstancesId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ],
    "FailedQueuedPurchaseDeletions": []
}
```

For more information, see Cancel a queued purchase in the *Amazon EC2 User Guide*.

- For API details, see DeleteQueuedReservedInstances in *AWS CLI Command Reference*.

`delete-route-table`

The following code example shows how to use `delete-route-table`.

AWS CLI

To delete a route table

The following `delete-route-table` example deletes the specified route table.

```
aws ec2 delete-route-table \
    --route-table-id rtb-22574640
```

This command produces no output.

For more information, see Configure route tables in the *Amazon VPC User Guide*.

- For API details, see DeleteRouteTable in *AWS CLI Command Reference*.

`delete-route`

The following code example shows how to use `delete-route`.

AWS CLI

To delete a route

The following `delete-route` example deletes the specified route from the specified route table.

```
aws ec2 delete-route \
    --route-table-id rtb-22574640 \
    --destination-cidr-block 0.0.0.0/0
```

This command produces no output.

For more information, see Add, modify, and remove routes in the *Amazon VPC User Guide*.

- For API details, see DeleteRoute in *AWS CLI Command Reference*.

delete-security-group

The following code example shows how to use `delete-security-group`.

AWS CLI

Example 1: To delete a security group (EC2-Classic)

The following `delete-security-group` example deletes the security group named `MySecurityGroup`.

```
aws ec2 delete-security-group \
    --group-name MySecurityGroup
```

Output:

```
{
    "Return": true,
    "GroupId": "sg-1a2b3c4d"
}
```

For more information, see Delete an Amazon EC2 security group in the *Amazon EC2 User Guide*.

Example 2: To delete a security group (EC2-VPC)

The following `delete-security-group` example deletes the security group with the ID `sg-903004f8`. Note that you can't reference a security group for EC2-VPC by name.

```
aws ec2 delete-security-group \
    --group-id sg-903004f8
```

Output:

```
{
    "Return": true,
    "GroupId": "sg-903004f8"
}
```

For more information, see Delete an Amazon EC2 security group in the *Amazon EC2 User Guide* and Creating, configuring, and deleting Amazon EC2 security groups in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see DeleteSecurityGroup in *AWS CLI Command Reference*.

`delete-snapshot`

The following code example shows how to use `delete-snapshot`.

AWS CLI

To delete a snapshot

The following `delete-snapshot` example deletes a snapshot with the snapshot ID of `snap-1234567890abcdef0`.

```
aws ec2 delete-snapshot \
    --snapshot-id snap-1234567890abcdef0
```

This command produces no output.

For more information, see Delete an Amazon EBS snapshot in the *Amazon EBS User Guide*.

- For API details, see DeleteSnapshot in *AWS CLI Command Reference*.

`delete-spot-datafeed-subscription`

The following code example shows how to use `delete-spot-datafeed-subscription`.

AWS CLI

To cancel a Spot Instance data feed subscription

The following `delete-spot-datafeed-subscription` example deletes a Spot data feed subscription for the account.

```
aws ec2 delete-spot-datafeed-subscription
```

This command produces no output.

For more information, see Track your Spot Instance costs using the Spot Instance data feed in the *Amazon EC2 User Guide*.

- For API details, see DeleteSpotDatafeedSubscription in *AWS CLI Command Reference*.

`delete-subnet-cidr-reservation`

The following code example shows how to use `delete-subnet-cidr-reservation`.

AWS CLI

To delete a subnet CIDR reservation

The following `delete-subnet-cidr-reservation` example deletes the specified subnet CIDR reservation.

```
aws ec2 delete-subnet-cidr-reservation \
    --subnet-cidr-reservation-id scr-044f977c4eEXAMPLE
```

Output:

```
{
    "DeletedSubnetCidrReservation": {
        "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
        "SubnetId": "subnet-03c51e2e6cEXAMPLE",
        "Cidr": "10.1.0.16/28",
        "ReservationType": "prefix",
        "OwnerId": "123456789012"
    }
}
```

For more information, see Subnet CIDR reservations in the *Amazon VPC User Guide*.

- For API details, see DeleteSubnetCidrReservation in *AWS CLI Command Reference*.

`delete-subnet`

The following code example shows how to use `delete-subnet`.

AWS CLI

To delete a subnet

The following `delete-subnet` example deletes the specified subnet.

```
aws ec2 delete-subnet \
    --subnet-id subnet-9d4a7b6c
```

This command produces no output.

For more information, see Delete a subnet in the *Amazon VPC User Guide*.

- For API details, see DeleteSubnet in *AWS CLI Command Reference*.

`delete-tags`

The following code example shows how to use `delete-tags`.

AWS CLI

Example 1: To delete a tag from a resource

The following `delete-tags` example deletes the tag `Stack=Test` from the specified image. When you specify both a value and a key name, the tag is deleted only if the tag's value matches the specified value.

```
aws ec2 delete-tags \
    --resources ami-1234567890abcdef0 \
    --tags Key=Stack,Value=Test
```

This command produces no output.

It's optional to specify the value for a tag. The following `delete-tags` example deletes the tag with the key name `purpose` from the specified instance, regardless of the tag value for the tag.

```
aws ec2 delete-tags \
    --resources i-1234567890abcdef0 \
    --tags Key=purpose
```

This command produces no output.

If you specify the empty string as the tag value, the tag is deleted only if the tag's value is the empty string. The following `delete-tags` example specifies the empty string as the tag value for the tag to delete.

```
aws ec2 delete-tags \
    --resources i-1234567890abcdef0 \
    --tags Key=Name,Value=
```

This command produces no output.

For more information, see Tag your Amazon EC2 resources in the *Amazon EC2 User Guide*.

Example 2: To delete a tag from multiple resources

The following `delete-tags` example deletes the tag``Purpose=Test`` from both an instance and an AMI. As shown in the previous example, you can omit the tag value from the command.

```
aws ec2 delete-tags \
    --resources i-1234567890abcdef0 ami-1234567890abcdef0 \
    --tags Key=Purpose
```

This command produces no output.

For more information, see Tag your Amazon EC2 resources in the *Amazon EC2 User Guide*.

- For API details, see DeleteTags in *AWS CLI Command Reference*.

`delete-traffic-mirror-filter-rule`

The following code example shows how to use `delete-traffic-mirror-filter-rule`.

AWS CLI

To delete a traffic mirror filter rule

The following `delete-traffic-mirror-filter-rule` example deletes the specified traffic mirror filter rule.

```
aws ec2 delete-traffic-mirror-filter-rule \
    --traffic-mirror-filter-rule-id tmfr-081f71283bEXAMPLE
```

Output:

```
{
```

```
    "TrafficMirrorFilterRuleId": "tmfr-081f71283bEXAMPLE"
}
```

For more information, see Create, modify, or delete a traffic mirror filter in the *AWS Traffic Mirroring Guide*.

- For API details, see DeleteTrafficMirrorFilterRule in *AWS CLI Command Reference*.

`delete-traffic-mirror-filter`

The following code example shows how to use `delete-traffic-mirror-filter`.

AWS CLI

To delete a traffic mirror filter

The following `delete-traffic-mirror-filter` example deletes the specified traffic mirror filter.

```
aws ec2 delete-traffic-mirror-filter \
    --traffic-mirror-filter-id tmf-0be0b25fcdEXAMPLE
```

Output:

```
{
    "TrafficMirrorFilterId": "tmf-0be0b25fcdEXAMPLE"
}
```

For more information, see Create, modify, or delete a traffic mirror filter in the *AWS Traffic Mirroring Guide*.

- For API details, see DeleteTrafficMirrorFilter in *AWS CLI Command Reference*.

`delete-traffic-mirror-session`

The following code example shows how to use `delete-traffic-mirror-session`.

AWS CLI

To delete a traffic mirror session

The following `delete-traffic-mirror-session` example deletes the specified traffic mirror-session.

```
aws ec2 delete-traffic-mirror-session \
    --traffic-mirror-session-id tms-0af3141ce5EXAMPLE
```

Output:

```
{
    "TrafficMirrorSessionId": "tms-0af3141ce5EXAMPLE"
}
```

For more information, see Create, modify, or delete a traffic mirror session in the *AWS Traffic Mirroring Guide*.

- For API details, see DeleteTrafficMirrorSession in *AWS CLI Command Reference*.

`delete-traffic-mirror-target`

The following code example shows how to use `delete-traffic-mirror-target`.

AWS CLI

To delete a traffic mirror target

The following `delete-traffic-mirror-target` example deletes the specified traffic mirror target.

```
aws ec2 delete-traffic-mirror-target \
    --traffic-mirror-target-id tmt-060f48ce9EXAMPLE
```

Output:

```
{
    "TrafficMirrorTargetId": "tmt-060f48ce9EXAMPLE"
}
```

For more information, see Create or delete a traffic mirror target in the *AWS Traffic Mirroring Guide*.

- For API details, see DeleteTrafficMirrorTarget in *AWS CLI Command Reference*.

delete-transit-gateway-connect-peer

The following code example shows how to use `delete-transit-gateway-connect-peer`.

AWS CLI

To delete a Transit Gateway Connect peer

The following `delete-transit-gateway-connect-peer` example deletes the specified Connect peer.

```
aws ec2 delete-transit-gateway-connect-peer \
    --transit-gateway-connect-peer-id tgw-connect-peer-0666adbac4EXAMPLE
```

Output:

```
{
    "TransitGatewayConnectPeer": {
        "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
        "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
        "State": "deleting",
        "CreationTime": "2021-10-13T03:35:17.000Z",
        "ConnectPeerConfiguration": {
            "TransitGatewayAddress": "10.0.0.234",
            "PeerAddress": "172.31.1.11",
            "InsideCidrBlocks": [
                "169.254.6.0/29"
            ],
            "Protocol": "gre",
            "BgpConfigurations": [
                {
                    "TransitGatewayAsn": 64512,
                    "PeerAsn": 64512,
                    "TransitGatewayAddress": "169.254.6.2",
                    "PeerAddress": "169.254.6.1",
                    "BgpStatus": "down"
                },
                {
                    "TransitGatewayAsn": 64512,
                    "PeerAsn": 64512,
                    "TransitGatewayAddress": "169.254.6.3",
                    "PeerAddress": "169.254.6.1",
                    "BgpStatus": "down"
```

```
                }
            ]
        }
    }
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayConnectPeer in *AWS CLI Command Reference*.

`delete-transit-gateway-connect`

The following code example shows how to use `delete-transit-gateway-connect`.

AWS CLI

To delete a transit gateway Connect attachment

The following `delete-transit-gateway-connect` example deletes the specified Connect attachment.

```
aws ec2 delete-transit-gateway-connect \
    --transit-gateway-attachment-id tgw-attach-037012e5dcEXAMPLE
```

Output:

```
{
    "TransitGatewayConnect": {
        "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
        "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "deleting",
        "CreationTime": "2021-03-09T19:59:17+00:00",
        "Options": {
            "Protocol": "gre"
        }
    }
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayConnect in *AWS CLI Command Reference*.

`delete-transit-gateway-multicast-domain`

The following code example shows how to use `delete-transit-gateway-multicast-domain`.

AWS CLI

To delete a transit gateway multicast domain

The following `delete-transit-gateway-multicast-domain` example deletes the specified multicast domain.

```
aws ec2 delete-transit-gateway-multicast-domain \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
    "TransitGatewayMulticastDomain": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-02bb79002bEXAMPLE",
        "TransitGatewayId": "tgw-0d88d2d0d5EXAMPLE",
        "State": "deleting",
        "CreationTime": "2019-11-20T22:02:03.000Z"
    }
}
```

For more information, see Delete a multicast domain in AWS Transit Gateway in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayMulticastDomain in *AWS CLI Command Reference*.

`delete-transit-gateway-peering-attachment`

The following code example shows how to use `delete-transit-gateway-peering-attachment`.

AWS CLI

To delete a transit gateway peering attachment

The following `delete-transit-gateway-peering-attachment` example deletes the specified transit gateway peering attachment.

```
aws ec2 delete-transit-gateway-peering-attachment \
    --transit-gateway-attachment-id tgw-attach-4455667788aabbccd
```

Output:

```
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "deleting",
        "CreationTime": "2019-12-09T11:38:31.000Z"
    }
}
```

For more information, see Transit Gateway Peering Attachments in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayPeeringAttachment in *AWS CLI Command Reference*.

`delete-transit-gateway-policy-table`

The following code example shows how to use `delete-transit-gateway-policy-table`.

AWS CLI

To delete a transit gateway policy table

The following `delete-transit-gateway-policy-table` example deletes the specified transit gateway policy table.

```
aws ec2 delete-transit-gateway-policy-table \
```

```
    --transit-gateway-policy-table-id tgw-ptb-0a16f134b78668a81
```

Output:

```
{
    "TransitGatewayPolicyTable": {
        "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
        "TransitGatewayId": "tgw-067f8505c18f0bd6e",
        "State": "deleting",
        "CreationTime": "2023-11-28T16:36:43+00:00",
        "Tags": []
    }
}
```

For more information, see Transit gateway policy tables in the *Transit Gateway User Guide*.

- For API details, see DeleteTransitGatewayPolicyTable in *AWS CLI Command Reference*.

`delete-transit-gateway-prefix-list-reference`

The following code example shows how to use `delete-transit-gateway-prefix-list-reference`.

AWS CLI

To delete a prefix list reference

The following `delete-transit-gateway-prefix-list-reference` example deletes the specified prefix list reference.

```
aws ec2 delete-transit-gateway-prefix-list-reference \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --prefix-list-id pl-11111122222222333
```

Output:

```
{
    "TransitGatewayPrefixListReference": {
        "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
        "PrefixListId": "pl-11111122222222333",
        "PrefixListOwnerId": "123456789012",
        "State": "deleting",
```

```
        "Blackhole": false,
        "TransitGatewayAttachment": {
            "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",
            "ResourceType": "vpc",
            "ResourceId": "vpc-1122334455aabbccd"
        }
    }
}
```

For more information, see Delete a prefix list reference in AWS Transit Gateway in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayPrefixListReference in *AWS CLI Command Reference*.

`delete-transit-gateway-route-table`

The following code example shows how to use `delete-transit-gateway-route-table`.

AWS CLI

To delete a transit gateway route table

The following `delete-transit-gateway-route-table` example deletes the specified transit gateway route table.

```
aws ec2  delete-transit-gateway-route-table \
    --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE
```

Output:

```
{
    "TransitGatewayRouteTable": {
        "TransitGatewayRouteTableId": "tgw-rtb-0b6f6aaa01EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "deleting",
        "DefaultAssociationRouteTable": false,
        "DefaultPropagationRouteTable": false,
        "CreationTime": "2019-07-17T20:27:26.000Z"
    }
}
```

For more information, see Delete a transit gateway route table in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayRouteTable in *AWS CLI Command Reference*.

`delete-transit-gateway-route`

The following code example shows how to use `delete-transit-gateway-route`.

AWS CLI

To delete a CIDR block from a route table

The following `delete-transit-gateway-route` example deletes the CIDR block from the specified transit gateway route table.

```
aws ec2 delete-transit-gateway-route \
    --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
    --destination-cidr-block 10.0.2.0/24
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "10.0.2.0/24",
        "TransitGatewayAttachments": [
            {
                "ResourceId": "vpc-0065acced4EXAMPLE",
                "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
                "ResourceType": "vpc"
            }
        ],
        "Type": "static",
        "State": "deleted"
    }
}
```

For more information, see Delete a static route in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayRoute in *AWS CLI Command Reference*.

`delete-transit-gateway-vpc-attachment`

The following code example shows how to use `delete-transit-gateway-vpc-attachment`.

AWS CLI

To delete a transit gateway VPC attachment

The following `delete-transit-gateway-vpc-attachment` example deletes the specified VPC attachment.

```
aws ec2 delete-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-0d2c54bdbEXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0d2c54bdb3EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "VpcId": "vpc-0065acced4f61c651",
        "VpcOwnerId": "123456789012",
        "State": "deleting",
        "CreationTime": "2019-07-17T16:04:27.000Z"
    }
}
```

For more information, see Delete a VPC attachment in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayVpcAttachment in *AWS CLI Command Reference*.

`delete-transit-gateway`

The following code example shows how to use `delete-transit-gateway`.

AWS CLI

To delete a transit gateway

The following `delete-transit-gateway` example deletes the specified transit gateway.

```
aws ec2  delete-transit-gateway \
    --transit-gateway-id tgw-01f04542b2EXAMPLE
```

Output:

```
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-01f04542b2EXAMPLE",
        "State": "deleting",
        "OwnerId": "123456789012",
        "Description": "Example Transit Gateway",
        "CreationTime": "2019-08-27T15:04:35.000Z",
        "Options": {
            "AmazonSideAsn": 64515,
            "AutoAcceptSharedAttachments": "disable",
            "DefaultRouteTableAssociation": "enable",
            "AssociationDefaultRouteTableId": "tgw-rtb-0ce7a6948fEXAMPLE",
            "DefaultRouteTablePropagation": "enable",
            "PropagationDefaultRouteTableId": "tgw-rtb-0ce7a6948fEXAMPLE",
            "VpnEcmpSupport": "enable",
            "DnsSupport": "enable"
        }
    }
}
```

For more information, see Delete a transit gateway in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGateway in *AWS CLI Command Reference*.

`delete-verified-access-endpoint`

The following code example shows how to use `delete-verified-access-endpoint`.

AWS CLI

To delete a Verified Access endpoint

The following `delete-verified-access-endpoint` example deletes the specified Verified Access endpoint.

```
aws ec2 delete-verified-access-endpoint \
    --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```
{
```

```
    "VerifiedAccessEndpoint": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndpointType": "network-interface",
        "AttachmentType": "vpc",
        "DomainCertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "EndpointDomain": "my-ava-
app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-
west-2.amazonaws.com",
        "SecurityGroupIds": [
            "sg-004915970c4c8f13a"
        ],
        "NetworkInterfaceOptions": {
            "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
            "Protocol": "https",
            "Port": 443
        },
        "Status": {
            "Code": "deleting"
        },
        "Description": "Testing Verified Access",
        "CreationTime": "2023-08-25T20:54:43",
        "LastUpdatedTime": "2023-08-25T22:46:32"
    }
}
```

For more information, see Verified Access endpoints in the *AWS Verified Access User Guide*.

- For API details, see DeleteVerifiedAccessEndpoint in *AWS CLI Command Reference*.

`delete-verified-access-group`

The following code example shows how to use `delete-verified-access-group`.

AWS CLI

To delete a Verified Access group

The following `delete-verified-access-group` example deletes the specified Verified Access group.

```
aws ec2 delete-verified-access-group \
    --verified-access-group-id vagr-0dbe967baf14b7235
```

Output:

```
{
    "VerifiedAccessGroup": {
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "Owner": "123456789012",
        "VerifiedAccessGroupArn": "arn:aws:ec2:us-west-2:123456789012:verified-
access-group/vagr-0dbe967baf14b7235",
        "CreationTime": "2023-08-25T19:55:19",
        "LastUpdatedTime": "2023-08-25T22:49:03",
        "DeletionTime": "2023-08-26T00:58:31"
    }
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see DeleteVerifiedAccessGroup in *AWS CLI Command Reference*.

`delete-verified-access-instance`

The following code example shows how to use `delete-verified-access-instance`.

AWS CLI

To delete a Verified Access instance

The following `delete-verified-access-instance` example deletes the specified Verified Access instance.

```
aws ec2 delete-verified-access-instance \
    --verified-access-instance-id vai-0ce000c0b7643abea
```

Output:

```
{
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
```

```
        "Description": "Testing Verified Access",
        "VerifiedAccessTrustProviders": [],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-26T01:00:18"
    }
}
```

For more information, see Verified Access instances in the *AWS Verified Access User Guide*.

- For API details, see DeleteVerifiedAccessInstance in *AWS CLI Command Reference*.

`delete-verified-access-trust-provider`

The following code example shows how to use `delete-verified-access-trust-provider`.

AWS CLI

To delete a Verified Access trust provider

The following `delete-verified-access-trust-provider` example deletes the specified Verified Access trust provider.

```
aws ec2 delete-verified-access-trust-provider \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T18:40:36",
        "LastUpdatedTime": "2023-08-25T18:40:36"
    }
}
```

For more information, see Trust providers for Verified Access in the *AWS Verified Access User Guide*.

- For API details, see DeleteVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

`delete-volume`

The following code example shows how to use `delete-volume`.

AWS CLI

To delete a volume

The following `delete-volume` example deletes an available volume with the volume ID of `vol-049df61146c4d7901`.

```
aws ec2 delete-volume \
    --volume-id vol-049df61146c4d7901
```

This command produces no output.

For more information, see Delete an Amazon EBS volume in the *Amazon EBS User Guide*.

- For API details, see DeleteVolume in *AWS CLI Command Reference*.

`delete-vpc-endpoint-connection-notifications`

The following code example shows how to use `delete-vpc-endpoint-connection-notifications`.

AWS CLI

To delete an endpoint connection notification

The following `delete-vpc-endpoint-connection-notifications` example deletes the specified endpoint connection notification.

```
aws ec2 delete-vpc-endpoint-connection-notifications \
    --connection-notification-ids vpce-nfn-008776de7e03f5abc
```

Output:

```
{
    "Unsuccessful": []
}
```

For more information, see Receive alerts for endpoint service events in the *AWS PrivateLink User Guide*.

- For API details, see DeleteVpcEndpointConnectionNotifications in *AWS CLI Command Reference*.

`delete-vpc-endpoint-service-configurations`

The following code example shows how to use `delete-vpc-endpoint-service-configurations`.

AWS CLI

To delete an endpoint service configuration

The following `delete-vpc-endpoint-service-configurations` example deletes the specified endpoint service configuration.

```
aws ec2 delete-vpc-endpoint-service-configurations \
    --service-ids vpce-svc-03d5ebb7d9579a2b3
```

Output:

```
{
    "Unsuccessful": []
}
```

For more information, see Delete an endpoint service in the *AWS PrivateLink User Guide*.

- For API details, see DeleteVpcEndpointServiceConfigurations in *AWS CLI Command Reference*.

`delete-vpc-endpoints`

The following code example shows how to use `delete-vpc-endpoints`.

AWS CLI

To delete an endpoint

The following `delete-vpc-endpoints` example deletes endpoints vpce-aa22bb33 and vpce-1a2b3c4d. If the command is partially successful or unsuccessful, a list of unsuccessful items is returned. If the command succeeds, the returned list is empty.

```
aws ec2 delete-vpc-endpoints \
    --vpc-endpoint-ids vpce-aa22bb33 vpce-1a2b3c4d
```

Output:

```
{
    "Unsuccessful": []
}
```

For more information, see Delete an interface endpoint in the *AWS PrivateLink User Guide*.

- For API details, see DeleteVpcEndpoints in *AWS CLI Command Reference*.

`delete-vpc-peering-connection`

The following code example shows how to use `delete-vpc-peering-connection`.

AWS CLI

To delete a VPC peering connection

The following `delete-vpc-peering-connection` example deletes the specified VPC peering connection.

```
aws ec2 delete-vpc-peering-connection \
    --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
    "Return": true
}
```

For more information, see Delete a VPC peering connection in the *Amazon VPC Peering Guide*.

- For API details, see DeleteVpcPeeringConnection in *AWS CLI Command Reference*.

`delete-vpc`

The following code example shows how to use `delete-vpc`.

AWS CLI

To delete a VPC

The following `delete-vpc` example deletes the specified VPC.

```
aws ec2 delete-vpc \
    --vpc-id vpc-a01106c2
```

This command produces no output.

For more information, see Delete your VPC in the *Amazon VPC User Guide*.

- For API details, see DeleteVpc in *AWS CLI Command Reference*.

`delete-vpn-connection-route`

The following code example shows how to use `delete-vpn-connection-route`.

AWS CLI

To delete a static route from a VPN connection

The following `delete-vpn-connection-route` example deletes the specified static route from the specified VPN connection.

```
aws ec2 delete-vpn-connection-route \
    --vpn-connection-id vpn-40f41529 \
    --destination-cidr-block 11.12.0.0/16
```

This command produces no output.

For more information, see AWS Site-to-Site VPN routing options in the *AWS Site-to-Site VPN User Guide*.

- For API details, see DeleteVpnConnectionRoute in *AWS CLI Command Reference*.

`delete-vpn-connection`

The following code example shows how to use `delete-vpn-connection`.

AWS CLI

To delete a VPN connection

The following `delete-vpn-connection` example deletes the specified VPN connection.

```
aws ec2 delete-vpn-connection \
    --vpn-connection-id vpn-40f41529
```

This command produces no output.

For more information, see Delete an AWS Site-to-Site VPN connection in the *AWS Site-to-Site VPN User Guide*.

- For API details, see DeleteVpnConnection in *AWS CLI Command Reference*.

`delete-vpn-gateway`

The following code example shows how to use `delete-vpn-gateway`.

AWS CLI

To delete a virtual private gateway

The following `delete-vpn-gateway` example deletes the specified virtual private gateway.

```
aws ec2 delete-vpn-gateway \
    --vpn-gateway-id vgw-9a4cacf3
```

This command produces no output.

For more information, see Detach and delete a virtual private gateway in AWS Site-to-Site VPN in the *AWS Site-to-Site VPN User Guide*.

- For API details, see DeleteVpnGateway in *AWS CLI Command Reference*.

`deprovision-byoip-cidr`

The following code example shows how to use `deprovision-byoip-cidr`.

AWS CLI

To remove an IP address range from use

The following `deprovision-byoip-cidr` example removes the specified address range from use with AWS.

```
aws ec2 deprovision-byoip-cidr \
    --cidr 203.0.113.25/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "State": "pending-deprovision"
    }
}
```

For more information, see Bring your own IP addresses (BYOIP) to Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see DeprovisionByoipCidr in *AWS CLI Command Reference*.

`deprovision-ipam-pool-cidr`

The following code example shows how to use `deprovision-ipam-pool-cidr`.

AWS CLI

To deprovision an IPAM pool CIDR

The following `deprovision-ipam-pool-cidr` example deprovisions a CIDR provisioned to an IPAM pool.

The following command is for Linux.

```
aws ec2 deprovision-ipam-pool-cidr \
    --ipam-pool-id ipam-pool-02ec043a19bbe5d08 \
    --cidr 11.0.0.0/16
```

The following command is for Windows.

```
aws ec2 deprovision-ipam-pool-cidr ^
    --ipam-pool-id ipam-pool-02ec043a19bbe5d08 ^
```

```
    --cidr 11.0.0.0/16
```

Output:

```
{
    "IpamPoolCidr": {
        "Cidr": "11.0.0.0/16",
        "State": "pending-deprovision"
    }
}
```

For more information, see Deprovision pool CIDRs in the *Amazon VPC IPAM User Guide*.

- For API details, see DeprovisionIpamPoolCidr in *AWS CLI Command Reference*.

`deregister-image`

The following code example shows how to use `deregister-image`.

AWS CLI

To deregister an AMI

The following `deregister-image` example deregisters the specified AMI.

```
aws ec2 deregister-image \
    --image-id ami-4fa54026
```

Output:

```
{
    "Return": true
}
```

For more information, see Deregister an Amazon EC2 AMI in the *Amazon EC2 User Guide*.

- For API details, see DeregisterImage in *AWS CLI Command Reference*.

`deregister-instance-event-notification-attributes`

The following code example shows how to use `deregister-instance-event-notification-attributes`.

AWS CLI

Example 1: To remove all tags from event notifications

The following `deregister-instance-event-notification-attributes` example removes `IncludeAllTagsOfInstance=true`, which has the effect of setting `IncludeAllTagsOfInstance` to `false`.

```
aws ec2 deregister-instance-event-notification-attributes \
    --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [],
        "IncludeAllTagsOfInstance": true
    }
}
```

For more information, see Scheduled events for Amazon EC2 instances in the *Amazon EC2 User Guide*.

Example 2: To remove specific tags from event notifications

The following `deregister-instance-event-notification-attributes` example removes the specified tag from the tags included in event notifications. To describe the remaining tags included in event notifications, use `describe-instance-event-notification-attributes`.

```
aws ec2 deregister-instance-event-notification-attributes \
    --instance-tag-attribute InstanceTagKeys="tag-key2"
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [
            "tag-key2"
        ],
        "IncludeAllTagsOfInstance": false
```

```
    }
}
```

For more information, see Scheduled events for Amazon EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see DeregisterInstanceEventNotificationAttributes in *AWS CLI Command Reference*.

`deregister-transit-gateway-multicast-group-members`

The following code example shows how to use `deregister-transit-gateway-multicast-group-members`.

AWS CLI

To deregister group members from a multicast group

The following `deregister-transit-gateway-multicast-group-members` example deregisters the specified network interface group member from the transit gateway multicast group.

```
aws ec2 deregister-transit-gateway-multicast-group-members \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-0e246d3269EXAMPLE
```

Output:

```
{
    "DeregisteredMulticastGroupMembers": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
        "DeregisteredNetworkInterfaceIds": [
            "eni-0e246d3269EXAMPLE"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```

For more information, see Deregister members from a multicast group in AWS Transit Gateway in the *AWS Transit Gateways Users Guide*.

- For API details, see DeregisterTransitGatewayMulticastGroupMembers in *AWS CLI Command Reference*.

`deregister-transit-gateway-multicast-group-sources`

The following code example shows how to use `deregister-transit-gateway-multicast-group-sources`.

AWS CLI

To deregister a source from the transit gateway multicast group

The following `deregister-transit-gateway-multicast-group-sources` example deregisters the specified network interface group source from the multicast group.

```
aws ec2 deregister-transit-gateway-multicast-group-sources \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```
{
    "DeregisteredMulticastGroupSources": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "DeregisteredNetworkInterfaceIds": [
            "eni-07f290fc3c090cbae"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```

For more information, see Deregister sources from a multicast group in AWS Transit Gateway in the *AWS Transit Gateways User Guide*.

- For API details, see DeregisterTransitGatewayMulticastGroupSources in *AWS CLI Command Reference*.

`describe-account-attributes`

The following code example shows how to use `describe-account-attributes`.

AWS CLI

Example 1: To describe all the attributes for your AWS account

The following `describe-account-attributes` example describes the attributes for your AWS account.

```
aws ec2 describe-account-attributes
```

Output:

```
{
    "AccountAttributes": [
        {
            "AttributeName": "vpc-max-security-groups-per-interface",
            "AttributeValues": [
                {
                    "AttributeValue": "5"
                }
            ]
        },
        {
            "AttributeName": "max-instances",
            "AttributeValues": [
                {
                    "AttributeValue": "20"
                }
            ]
        },
        {
            "AttributeName": "supported-platforms",
            "AttributeValues": [
                {
                    "AttributeValue": "EC2"
                },
                {
                    "AttributeValue": "VPC"
                }
            ]
        },
        {
            "AttributeName": "default-vpc",
            "AttributeValues": [
```

```
                {
                    "AttributeValue": "none"
                }
            ]
        },
        {
            "AttributeName": "max-elastic-ips",
            "AttributeValues": [
                {
                    "AttributeValue": "5"
                }
            ]
        },
        {
            "AttributeName": "vpc-max-elastic-ips",
            "AttributeValues": [
                {
                    "AttributeValue": "5"
                }
            ]
        }
    ]
}
```

For more information, see Amazon EC2 service quotas in the *Amazon EC2 User Guide*.

Example 2: To describe a single attribute for your AWS account

The following `describe-account-attributes` example describes the `supported-platforms` attribute for your AWS account.

```
aws ec2 describe-account-attributes \
    --attribute-names supported-platforms
```

Output:

```
{
    "AccountAttributes": [
        {
            "AttributeName": "supported-platforms",
            "AttributeValues": [
                {
```

```
                    "AttributeValue": "EC2"
                },
                {
                    "AttributeValue": "VPC"
                }
            ]
        }
    ]
}
```

For more information, see Amazon EC2 service quotas in the *Amazon EC2 User Guide*.

- For API details, see DescribeAccountAttributes in *AWS CLI Command Reference*.

`describe-address-transfers`

The following code example shows how to use `describe-address-transfers`.

AWS CLI

To describe an Elastic IP address transfer

The following `describe-address-transfers` example describes the Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 describe-address-transfers \
    --allocation-ids eipalloc-09ad461b0d03f6aaf
```

Output:

```
{
    "AddressTransfers": [
        {
            "PublicIp": "100.21.184.216",
            "AllocationId": "eipalloc-09ad461b0d03f6aaf",
            "TransferAccountId": "123456789012",
            "TransferOfferExpirationTimestamp": "2023-02-22T22:51:01.000Z",
            "AddressTransferStatus": "pending"
        }
    ]
}
```

For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

- For API details, see DescribeAddressTransfers in *AWS CLI Command Reference*.

`describe-addresses-attribute`

The following code example shows how to use `describe-addresses-attribute`.

AWS CLI

To view the attributes of the domain name associated with an elastic IP address

The following `describe-addresses-attribute` example returns the attributes of the domain name associated with the elastic IP address.

The following command is for Linux.

```
aws ec2 describe-addresses-attribute \
    --allocation-ids eipalloc-abcdef01234567890 \
    --attribute domain-name
```

The following command is for Windows.

```
aws ec2 describe-addresses-attribute ^
    --allocation-ids eipalloc-abcdef01234567890 ^
    --attribute domain-name
```

Output:

```
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.com."
        }
    ]
}
```

To view the attributes of an elastic IP address, you must have first associated a domain name with the elastic IP address. For more information, see Create a reverse DNS record for email

on Amazon EC2 in the *Amazon EC2 User Guide*. To associate a domain name with an elastic IP address, see modify-address-attribute in the *AWS CLI Command Reference*.

- For API details, see DescribeAddressesAttribute in *AWS CLI Command Reference*.

`describe-addresses`

The following code example shows how to use `describe-addresses`.

AWS CLI

Example 1: To retrieve details about all of your Elastic IP addresses

The following `describe-addresses` example displays details about your Elastic IP addresses.

```
aws ec2 describe-addresses
```

Output:

```
{
    "Addresses": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PublicIp": "198.51.100.0",
            "PublicIpv4Pool": "amazon",
            "Domain": "standard"
        },
        {
            "Domain": "vpc",
            "PublicIpv4Pool": "amazon",
            "InstanceId": "i-1234567890abcdef0",
            "NetworkInterfaceId": "eni-12345678",
            "AssociationId": "eipassoc-12345678",
            "NetworkInterfaceOwnerId": "123456789012",
            "PublicIp": "203.0.113.0",
            "AllocationId": "eipalloc-12345678",
            "PrivateIpAddress": "10.0.1.241"
        }
    ]
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 2: To retrieve details your Elastic IP addresses for EC2-VPC

The following `describe-addresses` example displays details about your Elastic IP addresses for use with instances in a VPC.

```
aws ec2 describe-addresses \
    --filters "Name=domain,Values=vpc"
```

Output:

```
{
    "Addresses": [
        {
            "Domain": "vpc",
            "PublicIpv4Pool": "amazon",
            "InstanceId": "i-1234567890abcdef0",
            "NetworkInterfaceId": "eni-12345678",
            "AssociationId": "eipassoc-12345678",
            "NetworkInterfaceOwnerId": "123456789012",
            "PublicIp": "203.0.113.0",
            "AllocationId": "eipalloc-12345678",
            "PrivateIpAddress": "10.0.1.241"
        }
    ]
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 3: To retrieve details about an Elastic IP address specified by allocation ID

The following `describe-addresses` example displays details about the Elastic IP address with the specified allocation ID, which is associated with an instance in EC2-VPC.

```
aws ec2 describe-addresses \
    --allocation-ids eipalloc-282d9641
```

Output:

```
{
    "Addresses": [
        {
            "Domain": "vpc",
```

```
            "PublicIpv4Pool": "amazon",
            "InstanceId": "i-1234567890abcdef0",
            "NetworkInterfaceId": "eni-1a2b3c4d",
            "AssociationId": "eipassoc-123abc12",
            "NetworkInterfaceOwnerId": "1234567891012",
            "PublicIp": "203.0.113.25",
            "AllocationId": "eipalloc-282d9641",
            "PrivateIpAddress": "10.251.50.12"
        }
    ]
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 4: To retrieve details about an Elastic IP address specified by its VPC private IP address

The following `describe-addresses` example displays details about the Elastic IP address associated with a particular private IP address in EC2-VPC.

```
aws ec2 describe-addresses \
    --filters "Name=private-ip-address,Values=10.251.50.12"
```

Output:

```
{
    "Addresses": [
        {
            "Domain": "vpc",
            "PublicIpv4Pool": "amazon",
            "InstanceId": "i-1234567890abcdef0",
            "NetworkInterfaceId": "eni-1a2b3c4d",
            "AssociationId": "eipassoc-123abc12",
            "NetworkInterfaceOwnerId": "1234567891012",
            "PublicIp": "203.0.113.25",
            "AllocationId": "eipalloc-282d9641",
            "PrivateIpAddress": "10.251.50.12"
        }
    ]
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 5: To retrieve details about Elastic IP addresses in EC2-Classic

The following `describe-addresses` example displays details about your Elastic IP addresses for use in EC2-Classic.

```
aws ec2 describe-addresses \
    --filters "Name=domain,Values=standard"
```

Output:

```
{
    "Addresses": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PublicIp": "203.0.110.25",
            "PublicIpv4Pool": "amazon",
            "Domain": "standard"
        }
    ]
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 6: To retrieve details about an Elastic IP addresses specified by its public IP address

The following `describe-addresses` example displays details about the Elastic IP address with the value `203.0.110.25`, which is associated with an instance in EC2-Classic.

```
aws ec2 describe-addresses \
    --public-ips 203.0.110.25
```

Output:

```
{
    "Addresses": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PublicIp": "203.0.110.25",
            "PublicIpv4Pool": "amazon",
            "Domain": "standard"
        }
    ]
```

```
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

- For API details, see DescribeAddresses in *AWS CLI Command Reference*.

`describe-aggregate-id-format`

The following code example shows how to use `describe-aggregate-id-format`.

AWS CLI

To describe the longer ID format settings for all resource types in a Region

The following `describe-aggregate-id-format` example describes the overall long ID format status for the current Region. The `Deadline` value indicates that the deadlines for these resources to permanently switch from the short ID format to the long ID format expired. The `UseLongIdsAggregated` value indicates that all IAM users and IAM roles are configured to use long ID format for all resource types.

```
aws ec2 describe-aggregate-id-format
```

Output:

```
{
    "UseLongIdsAggregated": true,
    "Statuses": [
        {
            "Deadline": "2018-08-13T02:00:00.000Z",
            "Resource": "network-interface-attachment",
            "UseLongIds": true
        },
        {
            "Deadline": "2016-12-13T02:00:00.000Z",
            "Resource": "instance",
            "UseLongIds": true
        },
        {
            "Deadline": "2018-08-13T02:00:00.000Z",
            "Resource": "elastic-ip-association",
            "UseLongIds": true
        }
```

```
    ]
}
```

For more information, see Manage your Amazon EC2 resources in the *Amazon EC2 User Guide*.

- For API details, see DescribeAggregateIdFormat in *AWS CLI Command Reference*.

`describe-availability-zones`

The following code example shows how to use `describe-availability-zones`.

AWS CLI

To describe your Availability Zones

The following `describe-availability-zones` example displays details for the Availability Zones that are available to you. The response includes Availability Zones only for the current Region. In this example, it uses the profiles default `us-west-2` (Oregon) Region.

```
aws ec2 describe-availability-zones
```

Output:

```
{
    "AvailabilityZones": [
        {
            "State": "available",
            "OptInStatus": "opt-in-not-required",
            "Messages": [],
            "RegionName": "us-west-2",
            "ZoneName": "us-west-2a",
            "ZoneId": "usw2-az1",
            "GroupName": "us-west-2",
            "NetworkBorderGroup": "us-west-2"
        },
        {
            "State": "available",
            "OptInStatus": "opt-in-not-required",
            "Messages": [],
            "RegionName": "us-west-2",
            "ZoneName": "us-west-2b",
            "ZoneId": "usw2-az2",
            "GroupName": "us-west-2",
```

```
            "NetworkBorderGroup": "us-west-2"
        },
        {
            "State": "available",
            "OptInStatus": "opt-in-not-required",
            "Messages": [],
            "RegionName": "us-west-2",
            "ZoneName": "us-west-2c",
            "ZoneId": "usw2-az3",
            "GroupName": "us-west-2",
            "NetworkBorderGroup": "us-west-2"
        },
        {
            "State": "available",
            "OptInStatus": "opt-in-not-required",
            "Messages": [],
            "RegionName": "us-west-2",
            "ZoneName": "us-west-2d",
            "ZoneId": "usw2-az4",
            "GroupName": "us-west-2",
            "NetworkBorderGroup": "us-west-2"
        },
        {
            "State": "available",
            "OptInStatus": "opted-in",
            "Messages": [],
            "RegionName": "us-west-2",
            "ZoneName": "us-west-2-lax-1a",
            "ZoneId": "usw2-lax1-az1",
            "GroupName": "us-west-2-lax-1",
            "NetworkBorderGroup": "us-west-2-lax-1"
        }
    ]
}
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

- For API details, see DescribeAvailabilityZones in *AWS CLI Command Reference*.

`describe-aws-network-performance-metric-subscriptions`

The following code example shows how to use `describe-aws-network-performance-metric-subscriptions`.

AWS CLI

To describe your metric subscriptions

The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```
{
    "Subscriptions": [
        {
            "Source": "us-east-1",
            "Destination": "eu-west-1",
            "Metric": "aggregate-latency",
            "Statistic": "p50",
            "Period": "five-minutes"
        }
    ]
}
```

For more information, see Manage subscriptions in the *Infrastructure Performance User Guide*.

- For API details, see DescribeAwsNetworkPerformanceMetricSubscriptions in *AWS CLI Command Reference*.

`describe-bundle-tasks`

The following code example shows how to use `describe-bundle-tasks`.

AWS CLI

To describe your bundle tasks

The following `describe-bundle-tasks` example describes all of your bundle tasks.

```
aws ec2 describe-bundle-tasks
```

Output:

```
{
    "BundleTasks": [
        {
            "UpdateTime": "2015-09-15T13:26:54.000Z",
            "InstanceId": "i-1234567890abcdef0",
            "Storage": {
                "S3": {
                    "Prefix": "winami",
                    "Bucket": "amzn-s3-demo-bucket"
                }
            },
            "State": "bundling",
            "StartTime": "2015-09-15T13:24:35.000Z",
            "Progress": "3%",
            "BundleId": "bun-2a4e041c"
        }
    ]
}
```

For more information, see Create an Amazon S3-backed AMI in the *Amazon EC2 User Guide*.

- For API details, see DescribeBundleTasks in *AWS CLI Command Reference*.

`describe-byoip-cidrs`

The following code example shows how to use `describe-byoip-cidrs`.

AWS CLI

To describe your provisioned address ranges

The following `describe-byoip-cidrs` example displays details about the public IPv4 address ranges that you provisioned for use by AWS.

```
aws ec2 describe-byoip-cidrs \
    --max-results 5
```

Output:

```
{
    "ByoipCidrs": [
        {
```

```
            "Cidr": "203.0.113.25/24",
            "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
            "State": "provisioned"
        }
    ]
}
```

For more information, see Bring your own IP addresses (BYOIP) to Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see DescribeByoipCidrs in *AWS CLI Command Reference*.

`describe-capacity-reservation-fleets`

The following code example shows how to use `describe-capacity-reservation-fleets`.

AWS CLI

To view a Capacity Reservation Fleet

The following `describe-capacity-reservation-fleets` example lists configuration and capacity information for the specified Capacity Reservation Fleet. It also lists details about the individual Capacity Reservations that are inside the Fleet.

```
aws ec2 describe-capacity-reservation-fleets \
    --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```
{
    "CapacityReservationFleets": [
        {
            "State": "active",
            "EndDate": "2022-12-31T23:59:59.000Z",
            "InstanceMatchCriteria": "open",
            "Tags": [],
            "CapacityReservationFleetId": "crf-abcdef01234567890",
            "Tenancy": "default",
            "InstanceTypeSpecifications": [
                {
                    "CapacityReservationId": "cr-1234567890abcdef0",
                    "AvailabilityZone": "us-west-2a",
```

```
                    "FulfilledCapacity": 5.0,
                    "Weight": 1.0,
                    "CreateDate": "2022-07-02T08:34:33.398Z",
                    "InstancePlatform": "Linux/UNIX",
                    "TotalInstanceCount": 5,
                    "Priority": 1,
                    "EbsOptimized": true,
                    "InstanceType": "m5.xlarge"
                }
            ],
            "TotalTargetCapacity": 5,
            "TotalFulfilledCapacity": 5.0,
            "CreateTime": "2022-07-02T08:34:33.397Z",
            "AllocationStrategy": "prioritized"
        }
    ]
}
```

For more information about Capacity Reservation Fleets, see Capacity Reservation Fleets in the *Amazon EC2 User Guide*.

- For API details, see DescribeCapacityReservationFleets in *AWS CLI Command Reference*.

`describe-capacity-reservations`

The following code example shows how to use `describe-capacity-reservations`.

AWS CLI

Example 1: To describe one or more of your capacity reservations

The following `describe-capacity-reservations` example displays details about all of your capacity reservations in the current AWS Region.

```
aws ec2 describe-capacity-reservations
```

Output:

```
{
    "CapacityReservations": [
        {
            "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
            "OwnerId": "123456789111",
```

```
            "CapacityReservationArn": "arn:aws:ec2:us-west-2:123456789111:capacity-
reservation/cr-1234abcd56EXAMPLE",
            "AvailabilityZoneId": "use1-az2",
            "InstanceType": "c5.large",
            "InstancePlatform": "Linux/UNIX",
            "AvailabilityZone": "us-west-2a",
            "Tenancy": "default",
            "TotalInstanceCount": 1,
            "AvailableInstanceCount": 1,
            "EbsOptimized": true,
            "EphemeralStorage": false,
            "State": "active",
            "StartDate": "2024-10-23T15:00:24+00:00",
            "EndDateType": "unlimited",
            "InstanceMatchCriteria": "open",
            "CreateDate": "2024-10-23T15:00:24+00:00",
            "Tags": [],
            "CapacityAllocations": []
        },
        {
            "CapacityReservationId": "cr-abcdEXAMPLE9876ef ",
            "OwnerId": "123456789111",
            "CapacityReservationArn": "arn:aws:ec2:us-west-2:123456789111:capacity-
reservation/cr-abcdEXAMPLE9876ef",
            "AvailabilityZoneId": "use1-az2",
            "InstanceType": "c4.large",
            "InstancePlatform": "Linux/UNIX",
            "AvailabilityZone": "us-west-2a",
            "Tenancy": "default",
            "TotalInstanceCount": 1,
            "AvailableInstanceCount": 1,
            "EbsOptimized": true,
            "EphemeralStorage": false,
            "State": "cancelled",
            "StartDate": "2024-10-23T15:01:03+00:00",
            "EndDateType": "unlimited",
            "InstanceMatchCriteria": "open",
            "CreateDate": "2024-10-23T15:01:02+00:00",
            "Tags": [],
            "CapacityAllocations": []
        }
    ]
}
```

For more information, see View the state of a Capacity Reservation in the *Amazon EC2 User Guide*.

Example 2: To describe one or more of your capacity reservations

The following `describe-capacity-reservations` example displays details about the specified capacity reservation.

```
aws ec2 describe-capacity-reservations \
    --capacity-reservation-ids cr-1234abcd56EXAMPLE
```

Output:

```
{
    "CapacityReservations": [
        {
            "CapacityReservationId": "cr-abcdEXAMPLE9876ef ",
            "OwnerId": "123456789111",
            "CapacityReservationArn": "arn:aws:ec2:us-west-2:123456789111:capacity-
reservation/cr-abcdEXAMPLE9876ef",
            "AvailabilityZoneId": "use1-az2",
            "InstanceType": "c4.large",
            "InstancePlatform": "Linux/UNIX",
            "AvailabilityZone": "us-west-2a",
            "Tenancy": "default",
            "TotalInstanceCount": 1,
            "AvailableInstanceCount": 1,
            "EbsOptimized": true,
            "EphemeralStorage": false,
            "State": "active",
            "StartDate": "2024-10-23T15:01:03+00:00",
            "EndDateType": "unlimited",
            "InstanceMatchCriteria": "open",
            "CreateDate": "2024-10-23T15:01:02+00:00",
            "Tags": [],
            "CapacityAllocations": []
        }
    ]
}
```

For more information, see View the state of a Capacity Reservation in the *Amazon EC2 User Guide*.

- For API details, see DescribeCapacityReservations in *AWS CLI Command Reference*.

`describe-carrier-gateways`

The following code example shows how to use `describe-carrier-gateways`.

AWS CLI

To describe all carrier gateways

The following `describe-carrier-gateways` example lists all your carrier gateways.

```
aws ec2 describe-carrier-gateways
```

Output:

```
{
    "CarrierGateways": [
        {
            "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
            "VpcId": "vpc-0c529aEXAMPLE",
            "State": "available",
            "OwnerId": "123456789012",
            "Tags": [
                {

                    "Key": "example",
                    "Value": "tag"
                }
            ]
        }
    ]
}
```

For more information, see Carrier gateway for AWS Wavelength in the *AWS Wavelength Developer Guide*.

- For API details, see DescribeCarrierGateways in *AWS CLI Command Reference*.

`describe-classic-link-instances`

The following code example shows how to use `describe-classic-link-instances`.

AWS CLI

To describe linked EC2-Classic instances

The following `describe-classic-link-instances` example lists all of your linked EC2-Classic instances.

```
aws ec2 describe-classic-link-instances
```

Output:

```
{
    "Instances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "VpcId": "vpc-88888888",
            "Groups": [
                {
                    "GroupId": "sg-11122233"
                }
            ],
            "Tags": [
                {
                    "Value": "ClassicInstance",
                    "Key": "Name"
                }
            ]
        },
        {
            "InstanceId": "i-0598c7d356eba48d7",
            "VpcId": "vpc-12312312",
            "Groups": [
                {
                    "GroupId": "sg-aabbccdd"
                }
            ],
            "Tags": [
                {
                    "Value": "ClassicInstance2",
                    "Key": "Name"
                }
            ]
        }
```

```
    ]
}
```

The following `describe-classic-link-instances` example lists all of your linked EC2-Classic instances, and filters the response to include only instances that are linked to VPC vpc-88888888.

```
aws ec2 describe-classic-link-instances \
    --filters "Name=vpc-id,Values=vpc-88888888"
```

Output:

```
{
    "Instances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "VpcId": "vpc-88888888",
            "Groups": [
                {
                    "GroupId": "sg-11122233"
                }
            ],
            "Tags": [
                {
                    "Value": "ClassicInstance",
                    "Key": "Name"
                }
            ]
        }
    ]
}
```

- For API details, see DescribeClassicLinkInstances in *AWS CLI Command Reference*.

`describe-client-vpn-authorization-rules`

The following code example shows how to use `describe-client-vpn-authorization-rules`.

AWS CLI

To describe the authorization rules for a Client VPN endpoint

The following `describe-client-vpn-authorization-rules` example displays details about the authorization rules for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-authorization-rules \
    --client-vpn-endpoint-id cvpn-endpoint-123456789abcabcde
```

Output:

```
{
    "AuthorizationRules": [
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789abcabcde",
            "GroupId": "",
            "AccessAll": true,
            "DestinationCidr": "0.0.0.0/0",
            "Status": {
                "Code": "active"
            }
        }
    ]
}
```

For more information, see Authorization Rules in the *AWS Client VPN Administrator Guide*.

- For API details, see DescribeClientVpnAuthorizationRules in *AWS CLI Command Reference*.

`describe-client-vpn-connections`

The following code example shows how to use `describe-client-vpn-connections`.

AWS CLI

To describe the connections to a Client VPN endpoint

The following `describe-client-vpn-connections` example displays details about the client connections to the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-connections \
    --client-vpn-endpoint-id cvpn-endpoint-123456789abcabcde
```

Output:

```
{
    "Connections": [
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789abcabcde",

endpoints/cvpn-endpoint-123456789abcabcde",
            "ClientConnectOptions": {
                "Enabled": false
            }
        }
    ]
}
```

For more information, see Client VPN Endpoints in the *AWS Client VPN Administrator Guide*.

- For API details, see DescribeClientVpnEndpoints in *AWS CLI Command Reference*.

`describe-client-vpn-routes`

The following code example shows how to use `describe-client-vpn-routes`.

AWS CLI

To describe the routes for a Client VPN endpoint

The following `describe-client-vpn-routes` example displays details about the routes for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-routes \
```

```
    --client-vpn-endpoint-id cvpn-endpoint-123456789abcabcde
```

Output:

```
{
    "Routes": [
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789abcabcde",
            "DestinationCidr": "10.0.0.0/16",
            "TargetSubnet": "subnet-0123456789abcabca",
            "Type": "Nat",
            "Origin": "associate",
            "Status": {
                "Code": "active"
            },
            "Description": "Default Route"
        },
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789abcabcde",
            "DestinationCidr": "0.0.0.0/0",
            "TargetSubnet": "subnet-0123456789abcabca",
            "Type": "Nat",
            "Origin": "add-route",
            "Status": {
                "Code": "active"
            }
        }
    ]
}
```

For more information, see Routes in the *AWS Client VPN Administrator Guide*.

- For API details, see DescribeClientVpnRoutes in *AWS CLI Command Reference*.

`describe-client-vpn-target-networks`

The following code example shows how to use `describe-client-vpn-target-networks`.

AWS CLI

To describe the target networks for a Client VPN endpoint

The following `describe-client-vpn-target-networks` example displays details about the target networks for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-target-networks \
    --client-vpn-endpoint-id cvpn-endpoint-123456789abcabcde
```

Output:

```
{
    "ClientVpnTargetNetworks": [
        {
            "AssociationId": "cvpn-assoc-012e837060753dc3d",
            "VpcId": "vpc-11111222222333333",
            "TargetNetworkId": "subnet-0123456789abcabca",
            "ClientVpnEndpointId": "cvpn-endpoint-123456789abcabcde",
            "Status": {
                "Code": "associating"
            },
            "SecurityGroups": [
                "sg-0123456789aabcabc"
            ]
        }
    ]
}
```

For more information, see Target Networks in the *AWS Client VPN Administrator Guide*.

- For API details, see DescribeClientVpnTargetNetworks in *AWS CLI Command Reference*.

`describe-coip-pools`

The following code example shows how to use `describe-coip-pools`.

AWS CLI

To describe customer-owned IP address pools

The following `describe-coip-pools` example describes the customer-owned IP address pools in your AWS account.

```
aws ec2 describe-coip-pools
```

Output:

```
{
    "CoipPools": [
        {
            "PoolId": "ipv4pool-coip-123a45678bEXAMPLE",
            "PoolCidrs": [
                "0.0.0.0/0"
            ],
            "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
            "PoolArn": "arn:aws:ec2:us-west-2:123456789012:coip-pool/ipv4pool-
coip-123a45678bEXAMPLE"
        }
    ]
}
```

For more information, see Create a CoIP pool in the *AWS Outposts User Guide*.

- For API details, see DescribeCoipPools in *AWS CLI Command Reference*.

`describe-conversion-tasks`

The following code example shows how to use `describe-conversion-tasks`.

AWS CLI

To view the status of a conversion task

The following `describe-conversion-tasks` example returns the status of a conversion task with the ID import-i-ffvko9js.

```
aws ec2 describe-conversion-tasks \
    --conversion-task-ids import-i-ffvko9js
```

Output:

```
{
    "ConversionTasks": [
        {
            "ConversionTaskId": "import-i-ffvko9js",
            "ImportInstance": {
                "InstanceId": "i-1234567890abcdef0",
```

```
                "Volumes": [
                    {
                        "Volume": {
                            "Id": "vol-049df61146c4d7901",
                            "Size": 16
                        },
                        "Status": "completed",
                        "Image": {
                            "Size": 1300687360,
                            "ImportManifestUrl": "https://s3.amazonaws.com/
myimportbucket/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/RHEL5.vmdkmanifest.xml?

%2FJvEXAMPLE",
                            "Format": "VMDK"
                        },
                        "BytesConverted": 1300682960,
                        "AvailabilityZone": "us-west-2d"
                    }
                ]
            },
            "ExpirationTime": "2014-05-14T22:06:23Z",
            "State": "completed"
        }
    ]
}
```

For more information, see Import a VM as an EC2 instance using VM Import/Export in the *VM Import/Export User Guide*.

- For API details, see DescribeConversionTasks in *AWS CLI Command Reference*.

`describe-customer-gateways`

The following code example shows how to use `describe-customer-gateways`.

AWS CLI

Example 1: To describe your customer gateways

The following `describe-customer-gateways` example describes your customer gateways.

```
aws ec2 describe-customer-gateways
```

Output:

```
{
    "CustomerGateways": [
        {
            "CustomerGatewayId": "cgw-b4dc3961",
            "IpAddress": "203.0.113.12",
            "State": "available",
            "Type": "ipsec.1",
            "BgpAsn": "65000"
        },
        {
            "CustomerGatewayId": "cgw-0e11f167",
            "IpAddress": "12.1.2.3",
            "State": "available",
            "Type": "ipsec.1",
            "BgpAsn": "65534"
        }
    ]
}
```

For more information, see AWS Site-to-Site VPN customer gateway devices in the *AWS Site-to-Site VPN User Guide*.

Example 2: To describe a specific customer gateway

The following `describe-customer-gateways` example describes the specified customer gateway.

```
aws ec2 describe-customer-gateways \
    --customer-gateway-ids cgw-0e11f167
```

Output:

```
{
    "CustomerGateways": [
        {
            "CustomerGatewayId": "cgw-0e11f167",
            "IpAddress": "12.1.2.3",
            "State": "available",
            "Type": "ipsec.1",
            "BgpAsn": "65534"
```

```
        }
    ]
}
```

For more information, see AWS Site-to-Site VPN customer gateway devices in the *AWS Site-to-Site VPN User Guide*.

- For API details, see DescribeCustomerGateways in *AWS CLI Command Reference*.

`describe-dhcp-options`

The following code example shows how to use `describe-dhcp-options`.

AWS CLI

Example 1: To describe your DHCP options

The following `describe-dhcp-options` example retrieves details about your DHCP options.

```
aws ec2 describe-dhcp-options
```

Output:

```
{
    "DhcpOptions": [
        {
            "DhcpConfigurations": [
                {
                    "Key": "domain-name",
                    "Values": [
                        {
                            "Value": "us-west-2.compute.internal"
                        }
                    ]
                },
                {
                    "Key": "domain-name-servers",
                    "Values": [
                        {
                            "Value": "AmazonProvidedDNS"
                        }
                    ]
```

```
                }
            ],
            "DhcpOptionsId": "dopt-19edf471",
            "OwnerId": "123456789012"
        },
        {
            "DhcpConfigurations": [
                {
                    "Key": "domain-name",
                    "Values": [
                        {
                            "Value": "us-west-2.compute.internal"
                        }
                    ]
                },
                {
                    "Key": "domain-name-servers",
                    "Values": [
                        {
                            "Value": "AmazonProvidedDNS"
                        }
                    ]
                }
            ],
            "DhcpOptionsId": "dopt-fEXAMPLE",
            "OwnerId": "123456789012"
        }
    ]
}
```

For more information, see Working with DHCP Option Sets in the *AWS VPC User Guide*.

Example 2: To describe your DHCP options and filter the output

The following `describe-dhcp-options` example describes your DHCP options and uses a filter to return only DHCP options that have `example.com` for the domain name server. The example uses the `--query` parameter to display only the configuration information and ID in the output.

```
aws ec2 describe-dhcp-options \
    --filters Name=key,Values=domain-name-servers Name=value,Values=example.com \
    --query "DhcpOptions[*].[DhcpConfigurations,DhcpOptionsId]"
```

Output:

```
[
    [
        [
            {
                "Key": "domain-name",
                "Values": [
                    {
                        "Value": "example.com"
                    }
                ]
            },
            {
                "Key": "domain-name-servers",
                "Values": [
                    {
                        "Value": "172.16.16.16"
                    }
                ]
            }
        ],
        "dopt-001122334455667ab"
    ]
]
```

For more information, see Working with DHCP Option Sets in the *AWS VPC User Guide*.

- For API details, see DescribeDhcpOptions in *AWS CLI Command Reference*.

`describe-egress-only-internet-gateways`

The following code example shows how to use `describe-egress-only-internet-gateways`.

AWS CLI

To describe your egress-only Internet gateways

The following `describe-egress-only-internet-gateways` example describes your egress-only Internet gateways.

```
aws ec2 describe-egress-only-internet-gateways
```

Output:

```
{
    "EgressOnlyInternetGateways": [
        {
            "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
            "Attachments": [
                {
                    "State": "attached",
                    "VpcId": "vpc-0c62a468"
                }
            ]
        }
    ]
}
```

For more information, see Enable outbound IPv6 traffic using an egress-only internet gateway in the *Amazon VPC User Guide*.

- For API details, see DescribeEgressOnlyInternetGateways in *AWS CLI Command Reference*.

`describe-elastic-gpus`

The following code example shows how to use `describe-elastic-gpus`.

AWS CLI

To describe an Elastic GPU

The following `describe-elastic-gpus` example describes the specified Elastic GPU.

```
aws ec2 describe-elastic-gpus \
    --elastic-gpu-ids egpu-12345678901234567890abcdefghijkl
```

Output:

```
{
    "ElasticGpuSet": [
        {
            "ElasticGpuId": "egpu-12345678901234567890abcdefghijkl",
            "AvailabilityZone": "us-west-2a",
            "ElasticGpuType": "eg1.medium",
```

```
            "ElasticGpuHealth": {
                "Status": "OK"
            },
            "ElasticGpuState": "ATTACHED",
            "InstanceId": "i-1234567890abcdef0"
        }
    ]
}
```

- For API details, see DescribeElasticGpus in *AWS CLI Command Reference*.

`describe-export-image-tasks`

The following code example shows how to use `describe-export-image-tasks`.

AWS CLI

To monitor an export image task

The following `describe-export-image-tasks` example checks the status of the specified export image task. The resulting image file in Amazon S3 is `my-export-bucket/exports/export-ami-1234567890abcdef0.vmdk`.

```
aws ec2 describe-export-image-tasks \
    --export-image-task-ids export-ami-1234567890abcdef0
```

The following example output is for an export image task that is in progress.

Output:

```
{
    "ExportImageTasks": [
        {
            "ExportImageTaskId": "export-ami-1234567890abcdef0",
            "Progress": "21",
            "S3ExportLocation": {
                "S3Bucket": "my-export-bucket",
                "S3Prefix": "exports/"
            },
            "Status": "active",
            "StatusMessage": "updating"
        }
```

```
    ]
}
```

The following example output is for an export image task that is completed.

Output:

```
{
    "ExportImageTasks": [
        {
            "ExportImageTaskId": "export-ami-1234567890abcdef0",
            "S3ExportLocation": {
                "S3Bucket": "my-export-bucket",
                "S3Prefix": "exports/"
            },
            "Status": "completed"
        }
    ]
}
```

For more information, see Export a VM from an AMI in the *VM Import/Export User Guide*.

- For API details, see DescribeExportImageTasks in *AWS CLI Command Reference*.

`describe-export-tasks`

The following code example shows how to use `describe-export-tasks`.

AWS CLI

To list details about an instance export task

The following `describe-export-tasks` example describes the export task with ID export-i-fh8sjjsq.

```
aws ec2 describe-export-tasks \
    --export-task-ids export-i-fh8sjjsq
```

Output:

```
{
```

```
    "ExportTasks": [
        {
            "State": "active",
            "InstanceExportDetails": {
                "InstanceId": "i-1234567890abcdef0",
                "TargetEnvironment": "vmware"
            },
            "ExportToS3Task": {
                "S3Bucket": "myexportbucket",
                "S3Key": "RHEL5export-i-fh8sjjsq.ova",
                "DiskImageFormat": "vmdk",
                "ContainerFormat": "ova"
            },
            "Description": "RHEL5 instance",
            "ExportTaskId": "export-i-fh8sjjsq"
        }
    ]
}
```

For more information, see Export an EC2 instance as a VM using VM Import/Export in the *VM Import/Export User Guide*.

- For API details, see DescribeExportTasks in *AWS CLI Command Reference*.

`describe-fast-launch-images`

The following code example shows how to use `describe-fast-launch-images`.

AWS CLI

To describe the details for Windows AMIs that are configured for faster launching

The following `describe-fast-launch-images` example describes the details for each of the AMIs in your account that are configured for faster launching, including the resource type, the snapshot configuration, the launch template details, the maximum number of parallel launches, the AMI owner ID, the state of the fast launch configuration, the reason the state was changed, and the time that the state change occurred.

```
aws ec2 describe-fast-launch-images
```

Output:

```
{
    "FastLaunchImages": [
        {
            "ImageId": "ami-01234567890abcedf",
            "ResourceType": "snapshot",
            "SnapshotConfiguration": {},
            "LaunchTemplate": {
                "LaunchTemplateId": "lt-01234567890abcedf",
                "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-
a8c6215d-94e6-441b-9272-dbd1f87b07e2",
                "Version": "1"
            },
            "MaxParallelLaunches": 6,
            "OwnerId": "0123456789123",
            "State": "enabled",
            "StateTransitionReason": "Client.UserInitiated",
            "StateTransitionTime": "2022-01-27T22:20:06.552000+00:00"
        }
    ]
}
```

For more information about configuring a Windows AMI for faster launching, see Configure your AMI for faster launching in the *Amazon EC2 User Guide*.

- For API details, see DescribeFastLaunchImages in *AWS CLI Command Reference*.

`describe-fast-snapshot-restores`

The following code example shows how to use `describe-fast-snapshot-restores`.

AWS CLI

To describe fast snapshot restores

The following `describe-fast-snapshot-restores` example displays details for all fast snapshot restores with a state of `disabled`.

```
aws ec2 describe-fast-snapshot-restores \
    --filters Name=state,Values=disabled
```

Output:

```
{
    "FastSnapshotRestores": [
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-west-2c",
            "State": "disabled",
            "StateTransitionReason": "Client.UserInitiated - Lifecycle state
 transition",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.596Z",
            "OptimizingTime": "2020-01-25T23:58:25.573Z",
            "EnabledTime": "2020-01-25T23:59:29.852Z",
            "DisablingTime": "2020-01-26T00:40:56.069Z",
            "DisabledTime": "2020-01-26T00:41:27.390Z"
        }
    ]
}
```

The following `describe-fast-snapshot-restores` example describes all fast snapshot restores.

```
aws ec2 describe-fast-snapshot-restores
```

For more information, see Amazon EBS fast snapshot restore in the *Amazon EBS User Guide*.

- For API details, see DescribeFastSnapshotRestores in *AWS CLI Command Reference*.

`describe-fleet-history`

The following code example shows how to use `describe-fleet-history`.

AWS CLI

To describe EC2 Fleet history

The following `describe-fleet-history` example returns the history for the specified EC2 Fleet starting at the specified time. The output is for an EC2 Fleet with two running instances.

```
aws ec2 describe-fleet-history \
    --fleet-id fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --start-time 2020-09-01T00:00:00Z
```

Output:

```
{
    "HistoryRecords": [
        {
            "EventInformation": {
                "EventSubType": "submitted"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:05.000Z"
        },
        {
            "EventInformation": {
                "EventSubType": "active"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:15.000Z"
        },
        {
            "EventInformation": {
                "EventDescription": "t2.small, ami-07c8bc5c1ce9598c3, ...",
                "EventSubType": "progress"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        },
        {
            "EventInformation": {
                "EventDescription": "{\"instanceType\":\"t2.small\", ...}",
                "EventSubType": "launched",
                "InstanceId": "i-083a1c446e66085d2"
            },
            "EventType": "instanceChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        },
        {
            "EventInformation": {
                "EventDescription": "{\"instanceType\":\"t2.small\", ...}",
                "EventSubType": "launched",
                "InstanceId": "i-090db02406cc3c2d6"
            },
            "EventType": "instanceChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        }
```

```
    ],
    "LastEvaluatedTime": "2020-09-01T19:10:19.000Z",
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
    "StartTime": "2020-08-31T23:53:20.000Z"
}
```

For more information, see Work with EC2 Fleet in the *Amazon EC2 User Guide*.

- For API details, see DescribeFleetHistory in *AWS CLI Command Reference*.

`describe-fleet-instances`

The following code example shows how to use `describe-fleet-instances`.

AWS CLI

To describe the running instances for an EC2 Fleet

The following `describe-fleet-instances` example describes the running instances for the specified EC2 Fleet.

```
aws ec2 describe-fleet-instances \
    --fleet-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ActiveInstances": [
        {
            "InstanceId": "i-090db02406cc3c2d6",
            "InstanceType": "t2.small",
            "SpotInstanceRequestId": "sir-a43gtpfk",
            "InstanceHealth": "healthy"
        },
        {
            "InstanceId": "i-083a1c446e66085d2",
            "InstanceType": "t2.small",
            "SpotInstanceRequestId": "sir-iwcit2nj",
            "InstanceHealth": "healthy"
        }
    ],
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
```

```
}
```

For more information, see Work with EC2 Fleet in the *Amazon EC2 User Guide*.

- For API details, see DescribeFleetInstances in *AWS CLI Command Reference*.

`describe-fleets`

The following code example shows how to use `describe-fleets`.

AWS CLI

To describe an EC2 Fleet

The following `describe-fleets` example describes the specified EC2 Fleet.

```
aws ec2 describe-fleets \
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```
{
    "Fleets": [
        {
            "ActivityStatus": "pending_fulfillment",
            "CreateTime": "2020-09-01T18:26:05.000Z",
            "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
            "FleetState": "active",
            "ExcessCapacityTerminationPolicy": "termination",
            "FulfilledCapacity": 0.0,
            "FulfilledOnDemandCapacity": 0.0,
            "LaunchTemplateConfigs": [
                {
                    "LaunchTemplateSpecification": {
                        "LaunchTemplateId": "lt-0e632f2855a979cd5",
                        "Version": "1"
                    }
                }
            ],
            "TargetCapacitySpecification": {
                "TotalTargetCapacity": 2,
                "OnDemandTargetCapacity": 0,
                "SpotTargetCapacity": 2,
```

```
                "DefaultTargetCapacityType": "spot"
            },
            "TerminateInstancesWithExpiration": false,
            "Type": "maintain",
            "ReplaceUnhealthyInstances": false,
            "SpotOptions": {
                "AllocationStrategy": "lowestPrice",
                "InstanceInterruptionBehavior": "terminate",
                "InstancePoolsToUseCount": 1
            },
            "OnDemandOptions": {
                "AllocationStrategy": "lowestPrice"
            }
        }
    ]
}
```

For more information, see Work with EC2 Fleet in the *Amazon EC2 User Guide*.

- For API details, see DescribeFleets in *AWS CLI Command Reference*.

`describe-flow-logs`

The following code example shows how to use `describe-flow-logs`.

AWS CLI

Example 1: To describe all of your flow logs

The following `describe-flow-logs` example displays details for all of your flow logs.

```
aws ec2 describe-flow-logs
```

Output:

```
{
    "FlowLogs": [
        {
            "CreationTime": "2018-02-21T13:22:12.644Z",
            "DeliverLogsPermissionArn": "arn:aws:iam::123456789012:role/flow-logs-
role",
            "DeliverLogsStatus": "SUCCESS",
            "FlowLogId": "fl-aabbccdd112233445",
```

```
            "MaxAggregationInterval": 600,
            "FlowLogStatus": "ACTIVE",
            "LogGroupName": "FlowLogGroup",
            "ResourceId": "subnet-12345678901234567",
            "TrafficType": "ALL",
            "LogDestinationType": "cloud-watch-logs",
            "LogFormat": "${version} ${account-id} ${interface-id} ${srcaddr}
 ${dstaddr} ${srcport} ${dstport} ${protocol} ${packets} ${bytes} ${start} ${end}
 ${action} ${log-status}"
        },
        {
            "CreationTime": "2020-02-04T15:22:29.986Z",
            "DeliverLogsStatus": "SUCCESS",
            "FlowLogId": "fl-01234567890123456",
            "MaxAggregationInterval": 60,
            "FlowLogStatus": "ACTIVE",
            "ResourceId": "vpc-00112233445566778",
            "TrafficType": "ACCEPT",
            "LogDestinationType": "s3",
            "LogDestination": "arn:aws:s3:::amzn-s3-demo-bucket/custom",
            "LogFormat": "${version} ${vpc-id} ${subnet-id} ${instance-id}
 ${interface-id} ${account-id} ${type} ${srcaddr} ${dstaddr} ${srcport} ${dstport}
 ${pkt-srcaddr} ${pkt-dstaddr} ${protocol} ${bytes} ${packets} ${start} ${end}
 ${action} ${tcp-flags} ${log-status}"
        }
    ]
}
```

For more information, see Work with flow logs in the *Amazon VPC User Guide*.

Example 2: To describe a subset of your flow logs

The following `describe-flow-logs` example uses a filter to display details for only those flow logs that are in the specified log group in Amazon CloudWatch Logs.

```
aws ec2 describe-flow-logs \
    --filter "Name=log-group-name,Values=MyFlowLogs"
```

Output:

```
{
    "FlowLogs": [
        {
```

```
            "CreationTime": "2021-06-10T08:15:42.317Z",
            "DeliverLogsPermissionArn": "arn:aws:iam::123456789012:role/flow-logs-
role",
            "DeliverLogsStatus": "SUCCESS",
            "FlowLogId": "fl-1a2b3c4d5e6f7a8b9",
            "MaxAggregationInterval": 600,
            "FlowLogStatus": "ACTIVE",
            "LogGroupName": "MyFlowLogs",
            "ResourceId": "vpc-1a2b3c4d5e6f7a8b9",
            "TrafficType": "ALL",
            "LogDestinationType": "cloud-watch-logs",
            "LogFormat": "${version} ${account-id} ${interface-id} ${srcaddr}
 ${dstaddr} ${srcport} ${dstport} ${protocol} ${packets} ${bytes} ${start} ${end}
 ${action} ${log-status}"
        }
    ]
}
```

For more information, see Work with flow logs in the *Amazon VPC User Guide*.

- For API details, see DescribeFlowLogs in *AWS CLI Command Reference*.

`describe-fpga-image-attribute`

The following code example shows how to use `describe-fpga-image-attribute`.

AWS CLI

To describe the attributes of an Amazon FPGA image

The following `describe-fpga-image-attribute` example describes the load permissions for the specified AFI.

```
aws ec2 describe-fpga-image-attribute \
    --fpga-image-id afi-0d123e123bfc85abc \
    --attribute loadPermission
```

Output:

```
{
    "FpgaImageAttribute": {
        "FpgaImageId": "afi-0d123e123bfc85abc",
        "LoadPermissions": [
```

```
            {
                "UserId": "123456789012"
            }
        ]
    }
}
```

For more information, see Specifications for Amazon EC2 accelerated computing instances in the *Amazon EC2 Instance Types Guide*.

- For API details, see DescribeFpgaImageAttribute in *AWS CLI Command Reference*.

`describe-fpga-images`

The following code example shows how to use `describe-fpga-images`.

AWS CLI

To describe Amazon FPGA images

The following `describe-fpga-images` example describes AFIs that are owned by account `123456789012`.

```
aws ec2 describe-fpga-images \
    --filters Name=owner-id,Values=123456789012
```

Output:

```
{
    "FpgaImages": [
        {
            "UpdateTime": "2017-12-22T12:09:14.000Z",
            "Name": "my-afi",
            "PciId": {
                "SubsystemVendorId": "0xfedd",
                "VendorId": "0x1d0f",
                "DeviceId": "0xf000",
                "SubsystemId": "0x1d51"
            },
            "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc",
            "Public": false,
            "State": {
                "Code": "available"
```

```
            },
            "ShellVersion": "0x071417d3",
            "OwnerId": "123456789012",
            "FpgaImageId": "afi-0d123e123bfc85abc",
            "CreateTime": "2017-12-22T11:43:33.000Z",
            "Description": "my-afi"
        }
    ]
}
```

For more information, see Specifications for Amazon EC2 accelerated computing instances in the *Amazon EC2 Instance Types Guide*.

- For API details, see DescribeFpgaImages in *AWS CLI Command Reference*.

`describe-host-reservation-offerings`

The following code example shows how to use `describe-host-reservation-offerings`.

AWS CLI

To describe Dedicated Host Reservation offerings

The following `describe-host-reservation-offerings` example describes the Dedicated Host Reservations for the M4 instance family that are available to purchase.

```
aws ec2 describe-host-reservation-offerings \
    --filter Name=instance-family,Values=m4
```

Output:

```
{
    "OfferingSet": [
        {
            "HourlyPrice": "1.499",
            "OfferingId": "hro-03f707bf363b6b324",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "UpfrontPrice": "0.000",
            "Duration": 31536000
        },
        {
            "HourlyPrice": "1.045",
```

```
            "OfferingId": "hro-0ef9181cabdef7a02",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "UpfrontPrice": "0.000",
            "Duration": 94608000
        },
        {
            "HourlyPrice": "0.714",
            "OfferingId": "hro-04567a15500b92a51",
            "InstanceFamily": "m4",
            "PaymentOption": "PartialUpfront",
            "UpfrontPrice": "6254.000",
            "Duration": 31536000
        },
        {
            "HourlyPrice": "0.484",
            "OfferingId": "hro-0d5d7a9d23ed7fbfe",
            "InstanceFamily": "m4",
            "PaymentOption": "PartialUpfront",
            "UpfrontPrice": "12720.000",
            "Duration": 94608000
        },
        {
            "HourlyPrice": "0.000",
            "OfferingId": "hro-05da4108ca998c2e5",
            "InstanceFamily": "m4",
            "PaymentOption": "AllUpfront",
            "UpfrontPrice": "23913.000",
            "Duration": 94608000
        },
        {
            "HourlyPrice": "0.000",
            "OfferingId": "hro-0a9f9be3b95a3dc8f",
            "InstanceFamily": "m4",
            "PaymentOption": "AllUpfront",
            "UpfrontPrice": "12257.000",
            "Duration": 31536000
        }
    ]
}
```

For more information, see Amazon EC2 Dedicated Host pricing and billing in the *Amazon EC2 User Guide*.

- For API details, see DescribeHostReservationOfferings in *AWS CLI Command Reference*.

`describe-host-reservations`

The following code example shows how to use `describe-host-reservations`.

AWS CLI

To describe Dedicated Host Reservations in your account

The following `describe-host-reservations` example describes the Dedicated Host Reservations in your account.

```
aws ec2 describe-host-reservations
```

Output:

```
{
    "HostReservationSet": [
        {
            "Count": 1,
            "End": "2019-01-10T12:14:09Z",
            "HourlyPrice": "1.499",
            "InstanceFamily": "m4",
            "OfferingId": "hro-03f707bf363b6b324",
            "PaymentOption": "NoUpfront",
            "State": "active",
            "HostIdSet": [
                "h-013abcd2a00cbd123"
            ],
            "Start": "2018-01-10T12:14:09Z",
            "HostReservationId": "hr-0d418a3a4ffc669ae",
            "UpfrontPrice": "0.000",
            "Duration": 31536000
        }
    ]
}
```

For more information, see Amazon EC2 Dedicated Host pricing and billing in the *Amazon EC2 User Guide*.

- For API details, see DescribeHostReservations in *AWS CLI Command Reference*.

describe-hosts

The following code example shows how to use `describe-hosts`.

AWS CLI

To view details about Dedicated Hosts

The following `describe-hosts` example displays details for the `available` Dedicated Hosts in your AWS account.

```
aws ec2 describe-hosts \
    --filter "Name=state,Values=available"
```

Output:

```
{
    "Hosts": [
        {
            "HostId": "h-07879acf49EXAMPLE",
            "Tags": [
                {
                    "Value": "production",
                    "Key": "purpose"
                }
            ],
            "HostProperties": {
                "Cores": 48,
                "TotalVCpus": 96,
                "InstanceType": "m5.large",
                "Sockets": 2
            },
            "Instances": [],
            "State": "available",
            "AvailabilityZone": "us-west-2a",
            "AvailableCapacity": {
                "AvailableInstanceCapacity": [
                    {
                        "AvailableCapacity": 48,
                        "InstanceType": "m5.large",
                        "TotalCapacity": 48
                    }
                ],
```

```
                "AvailableVCpus": 96
            },
            "HostRecovery": "on",
            "AllocationTime": "2019-08-19T08:57:44.000Z",
            "AutoPlacement": "off"
        }
    ]
}
```

For more information, see Monitor the state of your Amazon EC2 Dedicated Hosts in the *Amazon EC2 User Guide*.

- For API details, see DescribeHosts in *AWS CLI Command Reference*.

`describe-iam-instance-profile-associations`

The following code example shows how to use `describe-iam-instance-profile-associations`.

AWS CLI

To describe IAM instance profile associations

The following `describe-iam-instance-profile-associations` example describes all of your IAM instance profile associations.

```
aws ec2 describe-iam-instance-profile-associations
```

Output:

```
{
    "IamInstanceProfileAssociations": [
        {
            "InstanceId": "i-09eb09efa73ec1dee",
            "State": "associated",
            "AssociationId": "iip-assoc-0db249b1f25fa24b8",
            "IamInstanceProfile": {
                "Id": "AIPAJVQN4F5WVLGCJDRGM",
                "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
            }
        },
        {
```

```
            "InstanceId": "i-0402909a2f4dffd14",
            "State": "associating",
            "AssociationId": "iip-assoc-0d1ec06278d29f44a",
            "IamInstanceProfile": {
                "Id": "AGJAJVQN4F5WVLGCJABCM",
                "Arn": "arn:aws:iam::123456789012:instance-profile/user1-role"
            }
        }
    ]
}
```

For more information, see IAM roles for Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see DescribeIamInstanceProfileAssociations in *AWS CLI Command Reference*.

`describe-id-format`

The following code example shows how to use `describe-id-format`.

AWS CLI

Example 1: To describe the ID format of a resource

The following `describe-id-format` example describes the ID format for security groups.

```
aws ec2 describe-id-format \
    --resource security-group
```

In the following example output, the `Deadline` value indicates that the deadline for this resource type to permanently switch from the short ID format to the long ID format expired at 00:00 UTC on August 15, 2018.

Output:

```
{
    "Statuses": [
        {
            "Deadline": "2018-08-15T00:00:00.000Z",
            "Resource": "security-group",
            "UseLongIds": true
        }
    ]
```

```
}
```

For more information, see Manage your Amazon EC2 resources in the *Amazon EC2 User Guide*.

Example 2: To describe the ID format for all resources

The following `describe-id-format` example describes the ID format for all resource types. All resource types that supported the short ID format were switched to use the long ID format.

```
aws ec2 describe-id-format
```

Output:

```
{
    "Statuses": [
        {
            "Deadline": "2016-12-15T00:00:00.000Z",
            "Resource": "instance",
            "UseLongIds": true
        },
        {
            "Deadline": "2018-08-15T00:00:00.000Z",
            "Resource": "network-interface",
            "UseLongIds": true
        },
        {
            "Deadline": "2018-08-15T00:00:00.000Z",
            "Resource": "security-group",
            "UseLongIds": true
        },
        {
            "Deadline": "2016-12-15T00:00:00.000Z",
            "Resource": "snapshot",
            "UseLongIds": true
        },
        {
            "Deadline": "2016-12-15T00:00:00.000Z",
            "Resource": "volume",
            "UseLongIds": true
        }
    ]
}
```

For more information, see Manage your Amazon EC2 resources in the *Amazon EC2 User Guide*.

- For API details, see DescribeIdFormat in *AWS CLI Command Reference*.

`describe-identity-id-format`

The following code example shows how to use `describe-identity-id-format`.

AWS CLI

Example 1: To describe the ID format for an IAM role

The following `describe-identity-id-format` example describes the ID format received by instances created by the IAM role `EC2Role` in your AWS account.

```
aws ec2 describe-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:role/my-iam-role \
    --resource instance
```

The following output indicates that instances created by this role receive IDs in long ID format.

Output:

```
{
    "Statuses": [
        {
            "Deadline": "2016-12-15T00:00:00Z",
            "Resource": "instance",
            "UseLongIds": true
        }
    ]
}
```

For more information, see Manage your Amazon EC2 resources in the *Amazon EC2 User Guide*.

Example 2: To describe the ID format for an IAM user

The following `describe-identity-id-format` example describes the ID format received by snapshots created by the IAM user `AdminUser` in your AWS account.

```
aws ec2 describe-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:user/AdminUser \
```

```
    --resource snapshot
```

The output indicates that snapshots created by this user receive IDs in long ID format.

Output:

```
{
    "Statuses": [
        {
            "Deadline": "2016-12-15T00:00:00Z",
            "Resource": "snapshot",
            "UseLongIds": true
        }
    ]
}
```

For more information, see Manage your Amazon EC2 resources in the *Amazon EC2 User Guide*.

- For API details, see DescribeIdentityIdFormat in *AWS CLI Command Reference*.

`describe-image-attribute`

The following code example shows how to use `describe-image-attribute`.

AWS CLI

Example 1: To describe the launch permissions for an AMI

The following `describe-image-attribute` example describes the launch permissions for the specified AMI.

```
aws ec2 describe-image-attribute \
    --image-id ami-5731123e \
    --attribute launchPermission
```

Output:

```
{
    "LaunchPermissions": [
        {
            "UserId": "123456789012"
```

```
        }
    ],
    "ImageId": "ami-5731123e"
}
```

For more information, see Share an AMI with specific AWS accounts in the *Amazon EC2 User Guide*.

Example 2: To describe the product codes for an AMI

The following `describe-image-attribute` example describes the product codes for the specified AMI. Note that this AMI has no product codes.

```
aws ec2 describe-image-attribute \
    --image-id ami-5731123e \
    --attribute productCodes
```

Output:

```
{
    "ProductCodes": [],
    "ImageId": "ami-5731123e"
}
```

For more information, see Paid AMIs in the AWS Marketplace for Amazon EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see DescribeImageAttribute in *AWS CLI Command Reference*.

`describe-images`

The following code example shows how to use `describe-images`.

AWS CLI

Example 1: To describe an AMI

The following `describe-images` example describes the specified AMI.

```
aws ec2 describe-images \
    --image-ids ami-1234567890EXAMPLE
```

Output:

```
{
    "Images": [
        {
            "VirtualizationType": "hvm",
            "Description": "Provided by Red Hat, Inc.",
            "PlatformDetails": "Red Hat Enterprise Linux",
            "EnaSupport": true,
            "Hypervisor": "xen",
            "State": "available",
            "SriovNetSupport": "simple",
            "ImageId": "ami-1234567890EXAMPLE",
            "UsageOperation": "RunInstances:0010",
            "BlockDeviceMappings": [
                {
                    "DeviceName": "/dev/sda1",
                    "Ebs": {
                        "SnapshotId": "snap-1234567890abcdef0",
                        "DeleteOnTermination": true,
                        "VolumeType": "gp2",
                        "VolumeSize": 10,
                        "Encrypted": false
                    }
                }
            ],
            "Architecture": "x86_64",
            "ImageLocation": "123456789012/RHEL-8.0.0_HVM-20190618-x86_64-1-Hourly2-
GP2",
            "RootDeviceType": "ebs",
            "OwnerId": "123456789012",
            "RootDeviceName": "/dev/sda1",
            "CreationDate": "2019-05-10T13:17:12.000Z",
            "Public": true,
            "ImageType": "machine",
            "Name": "RHEL-8.0.0_HVM-20190618-x86_64-1-Hourly2-GP2"
        }
    ]
}
```

For more information, see Amazon Machine Images (AMI) in the *Amazon EC2 User Guide*.

Example 2: To describe AMIs based on filters

The following `describe-images` example describes Windows AMIs provided by Amazon that are backed by Amazon EBS.

```
aws ec2 describe-images \
    --owners amazon \
    --filters "Name=platform,Values=windows" "Name=root-device-type,Values=ebs"
```

Output:

```
{
    "Images": [
        {
            "Architecture": "x86_64",
            "CreationDate": "2024-05-15T09:12:34.000Z",
            "ImageId": "ami-0abcdef1234567890",

            "RootDeviceType": "ebs",
            "SriovNetSupport": "simple",
            "VirtualizationType": "hvm"
        }
    ]
}
```

For additional examples using filters, see Listing and filtering your resources in the *Amazon EC2 User Guide*.

Example 3: To describe AMIs based on tags

The following `describe-images` example describes all AMIs that have the tag `Type=Custom`. The example uses the `--query` parameter to display only the AMI IDs.

```
aws ec2 describe-images \
    --filters "Name=tag:Type,Values=Custom" \
    --query 'Images[*].[ImageId]'
```

Output:

```
[
    [
        "ami-1234567890EXAMPLE"
    ],
    [
        "ami-0abcdef1234567890"
    ]
]
```

For additional examples using tag filters, see Working with tags in the *Amazon EC2 User Guide*.

- For API details, see DescribeImages in *AWS CLI Command Reference*.

`describe-import-image-tasks`

The following code example shows how to use `describe-import-image-tasks`.

AWS CLI

To monitor an import image task

The following `describe-import-image-tasks` example checks the status of the specified import image task.

```
aws ec2 describe-import-image-tasks \
    --import-task-ids import-ami-1234567890abcdef0
```

The following example output is for an import image task that is in progress.

Output:

```
{
    "ImportImageTasks": [
        {
            "ImportTaskId": "import-ami-1234567890abcdef0",
            "Progress": "28",
            "SnapshotDetails": [
                {
                    "DiskImageSize": 705638400.0,
                    "Format": "ova",
                    "Status": "completed",
                    "UserBucket": {
                        "S3Bucket": "my-import-bucket",
                        "S3Key": "vms/my-server-vm.ova"
                    }
                }
            ],
            "Status": "active",
            "StatusMessage": "converting"
        }
    ]
}
```

The following example output is for an import image task that is completed. The ID of the resulting AMI is provided by `ImageId`.

Output:

```
{
    "ImportImageTasks": [
        {
            "ImportTaskId": "import-ami-1234567890abcdef0",
            "ImageId": "ami-1234567890abcdef0",
```

```
            "SnapshotDetails": [
                {
                    "DiskImageSize": 705638400.0,
                    "Format": "ova",
                    "SnapshotId": "snap-1234567890abcdef0",
                    "Status": "completed",
                    "UserBucket": {
                        "S3Bucket": "my-import-bucket",
                        "S3Key": "vms/my-server-vm.ova"
                    }
                }
            ],
            "Status": "completed"
        }
    ]
}
```

For more information, see Import a VM to Amazon EC2 as an image using VM Import/Export in the *VM Import/Export User Guide*.

- For API details, see DescribeImportImageTasks in *AWS CLI Command Reference*.

`describe-import-snapshot-tasks`

The following code example shows how to use `describe-import-snapshot-tasks`.

AWS CLI

To monitor an import snapshot task

The following `describe-import-snapshot-tasks` example checks the status of the specified import snapshot task.

```
aws ec2 describe-import-snapshot-tasks \
    --import-task-ids import-snap-1234567890abcdef0
```

The following example output is for an import snapshot task that is in progress.

Output:

```
{
```

```
    "ImportSnapshotTasks": [
        {
            "Description": "My server VMDK",
            "ImportTaskId": "import-snap-1234567890abcdef0",
            "SnapshotTaskDetail": {
                "Description": "My server VMDK",
                "DiskImageSize": 705638400.0,
                "Format": "VMDK",
                "Progress": "42",
                "Status": "active",
                "StatusMessage": "downloading/converting",
                "UserBucket": {
                    "S3Bucket": "my-import-bucket",
                    "S3Key": "vms/my-server-vm.vmdk"
                }
            }
        }
    ]
}
```

The following example output is for an import snapshot task that is completed. The ID of the resulting snapshot is provided by `SnapshotId`.

Output:

```
{
    "ImportSnapshotTasks": [
        {
            "Description": "My server VMDK",
            "ImportTaskId": "import-snap-1234567890abcdef0",
            "SnapshotTaskDetail": {
                "Description": "My server VMDK",
                "DiskImageSize": 705638400.0,
                "Format": "VMDK",
                "SnapshotId": "snap-1234567890abcdef0",
                "Status": "completed",
                "UserBucket": {
                    "S3Bucket": "my-import-bucket",
                    "S3Key": "vms/my-server-vm.vmdk"
                }
            }
        }
    ]
```

```
}
```

For more information, see Import a disk as an EBS snapshot using VM Import/Export in the *VM Import/Export User Guide*.

- For API details, see DescribeImportSnapshotTasks in *AWS CLI Command Reference*.

`describe-instance-attribute`

The following code example shows how to use `describe-instance-attribute`.

AWS CLI

Example 1: To describe the instance type

The following `describe-instance-attribute` example describes the instance type of the specified instance.

```
aws ec2 describe-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --attribute instanceType
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "InstanceType": {
        "Value": "t1.micro"
    }
}
```

For more information, see Amazon EC2 instance type changes in the *Amazon EC2 User Guide*.

Example 2: To describe the disableApiTermination attribute

The following `describe-instance-attribute` example describes the `disableApiTermination` attribute of the specified instance.

```
aws ec2 describe-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --attribute disableApiTermination
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "DisableApiTermination": {
        "Value": false
    }
}
```

For more information, see Change instance termination protection in the *Amazon EC2 User Guide*.

Example 3: To describe the block device mapping for an instance

The following `describe-instance-attribute` example describes the `blockDeviceMapping` attribute of the specified instance.

```
aws ec2 describe-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --attribute blockDeviceMapping
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "BlockDeviceMappings": [
        {
            "DeviceName": "/dev/sda1",
            "Ebs": {
                "Status": "attached",
                "DeleteOnTermination": true,
                "VolumeId": "vol-049df61146c4d7901",
                "AttachTime": "2013-05-17T22:42:34.000Z"
            }
        },
        {
            "DeviceName": "/dev/sdf",
            "Ebs": {
                "Status": "attached",
                "DeleteOnTermination": false,
                "VolumeId": "vol-049df61146c4d7901",
                "AttachTime": "2013-09-10T23:07:00.000Z"
```

```
            }
        }
    ]
}
```

For more information, see Block device mappings for volumes on Amazon EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceAttribute in *AWS CLI Command Reference*.

`describe-instance-connect-endpoints`

The following code example shows how to use `describe-instance-connect-endpoints`.

AWS CLI

To describe an EC2 Instance Connect Endpoint

The following `describe-instance-connect-endpoints` example describes the specified EC2 Instance Connect Endpoint.

```
aws ec2 describe-instance-connect-endpoints \
    --instance-connect-endpoint-ids eice-0123456789example
```

Output:

```
{
    "InstanceConnectEndpoints": [
        {
            "OwnerId": "123456789012",
            "InstanceConnectEndpointId": "eice-0123456789example",
            "InstanceConnectEndpointArn": "arn:aws:ec2:us-
west-2:123456789012:instance-connect-endpoint/eice-0123456789example",
            "State": "create-complete",
            "StateMessage": "",
            "DnsName": "eice-0123456789example.b67b86ba.ec2-instance-connect-
endpoint.us-west-2.amazonaws.com",
            "NetworkInterfaceIds": [
                "eni-0123456789example"
            ],
            "VpcId": "vpc-0123abcd",
            "AvailabilityZone": "us-west-2d",
```

```
            "CreatedAt": "2023-02-07T12:05:37+00:00",
            "SubnetId": "subnet-0123abcd",
            "Tags": []
        }
    ]
}
```

For more information, see Create an EC2 Instance Connect Endpoint in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceConnectEndpoints in *AWS CLI Command Reference*.

`describe-instance-credit-specifications`

The following code example shows how to use `describe-instance-credit-specifications`.

AWS CLI

To describe the credit option for CPU usage of one or more instances

The following `describe-instance-credit-specifications` example describes the CPU credit option for the specified instance.

```
aws ec2 describe-instance-credit-specifications \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "InstanceCreditSpecifications": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CpuCredits": "unlimited"
        }
    ]
}
```

For more information, see Work with burstable performance instances in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceCreditSpecifications in *AWS CLI Command Reference*.

`describe-instance-event-notification-attributes`

The following code example shows how to use `describe-instance-event-notification-attributes`.

AWS CLI

To describe the tags for scheduled event notifications

The following `describe-instance-event-notification-attributes` example describes the tags to appear in scheduled event notifications.

```
aws ec2 describe-instance-event-notification-attributes
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [],
        "IncludeAllTagsOfInstance": true
    }
}
```

For more information, see Scheduled events for Amazon EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceEventNotificationAttributes in *AWS CLI Command Reference*.

`describe-instance-event-windows`

The following code example shows how to use `describe-instance-event-windows`.

AWS CLI

Example 1: To describe all event windows

The following `describe-instance-event-windows` example describes all event windows.

```
aws ec2 describe-instance-event-windows
```

Output:

```
{
    "InstanceEventWindows": [
        {
            "InstanceEventWindowId": "iew-0abcdef1234567890",
            "Name": "myEventWindowName",
            "CronExpression": "* 21-23 * * 2,3",
            "AssociationTarget": {
                "InstanceIds": [
                    "i-1234567890abcdef0",
                    "i-0598c7d356eba48d7"
                ],
                "Tags": [],
                "DedicatedHostIds": []
            },
            "State": "active",
            "Tags": []
        }
    ],
    "NextToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Example 2: To describe a specific event window

The following `describe-instance-event-windows` example describes a specific event by using the `instance-event-window` parameter to describe a specific event window.

```
aws ec2 describe-instance-event-windows \
    --instance-event-window-ids iew-0abcdef1234567890
```

Output:

```
{
    "InstanceEventWindows": [
        {
            "InstanceEventWindowId": "iew-0abcdef1234567890",
            "Name": "myEventWindowName",
            "CronExpression": "* 21-23 * * 2,3",
            "AssociationTarget": {
                "InstanceIds": [
                    "i-1234567890abcdef0",
                    "i-0598c7d356eba48d7"
                ],
```

```
                "Tags": [],
                "DedicatedHostIds": []
            },
            "State": "active",
            "Tags": []
        }
    ]
}
```

Example 3: To describe event windows that match one or more filters

The following `describe-instance-event-windows` example describes event windows that match one or more filters using the `filter` parameter. The `instance-id` filter is used to describe all of the event windows that are associated with the specified instance. When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the tags of the instance or Dedicated Host ID (if the instance is a Dedicated Host).

```
aws ec2 describe-instance-event-windows \
    --filters Name=instance-id,Values=i-1234567890abcdef0 \
    --max-results 100 \
    --next-token <next-token-value>
```

Output:

```
{
    "InstanceEventWindows": [
        {
            "InstanceEventWindowId": "iew-0dbc0adb66f235982",
            "TimeRanges": [
                {
                    "StartWeekDay": "sunday",
                    "StartHour": 2,
                    "EndWeekDay": "sunday",
                    "EndHour": 8
                }
            ],
            "Name": "myEventWindowName",
            "AssociationTarget": {
                "InstanceIds": [],
                "Tags": [],
                "DedicatedHostIds": [
```

```
                    "h-0140d9a7ecbd102dd"
                ]
            },
            "State": "active",
            "Tags": []
        }
    ]
}
```

In the example output, the instance is on a Dedicated Host, which is associated with the event window.

For event window constraints, see Considerations in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceEventWindows in *AWS CLI Command Reference*.

`describe-instance-image-metadata`

The following code example shows how to use `describe-instance-image-metadata`.

AWS CLI

Example 1: To describe the AMI metadata for all instances

The following `describe-instance-image-metadata` example describes the AMI metadata of all the instances in your AWS account.

```
aws ec2 describe-instance-image-metadata
```

Output:

```
{
    "InstanceImageMetadata": [
        {
            "InstanceId": "i-1234567890EXAMPLE",
            "InstanceType": "t2.micro",
            "LaunchTime": "2024-08-28T11:25:45+00:00",
            "AvailabilityZone": "us-west-2a",
            "State": {
                "Code": 16,
                "Name": "running"
            },
            "OwnerId": "123456789012",
```

```
            "Tags": [
                {
                    "Key": "MyTagName",
                    "Value": "my-tag-value"
                }
            ],
            "ImageMetadata": {
                "ImageId": "ami-0b752bf1df193a6c4",
                "Name": "al2023-ami-2023.5.20240819.0-kernel-6.1-x86_64",
                "OwnerId": "137112412989",
                "State": "available",
                "ImageOwnerAlias": "amazon",
                "CreationDate": "2023-01-25T17:20:40Z",
                "DeprecationTime": "2025-01-25T17:20:40Z",
                "IsPublic": true
            }
        }
    ],
    "NextToken": "...EXAMPLEwIAABAA2JHaFxLnEXAMPLE..."
}
```

For more information, see Amazon Machine Images in Amazon EC2 in the *Amazon EC2 User Guide*.

Example 2: To describe the AMI metadata for the specified instances

The following `describe-instance-image-metadata` example describes the AMI metadata for the specified instances.

```
aws ec2 describe-instance-image-metadata \
    --instance-ids i-1234567890EXAMPLE i-0987654321EXAMPLE
```

Output:

```
{
    "InstanceImageMetadata": [
        {
            "InstanceId": "i-1234567890EXAMPLE",
            "InstanceType": "t2.micro",
            "LaunchTime": "2024-08-28T11:25:45+00:00",
            "AvailabilityZone": "us-west-2a",
            "State": {
                "Code": 16,
```

```
                "Name": "running"
            },
            "OwnerId": "123456789012",
            "Tags": [
                {
                    "Key": "MyTagName",
                    "Value": "my-tag-value"
                }
            ],
            "ImageMetadata": {
                "ImageId": "ami-0b752bf1df193a6c4",
                "Name": "al2023-ami-2023.5.20240819.0-kernel-6.1-x86_64",
                "OwnerId": "137112412989",
                "State": "available",
                "ImageOwnerAlias": "amazon",
                "CreationDate": "2023-01-25T17:20:40Z",
                "DeprecationTime": "2025-01-25T17:20:40Z",
                "IsPublic": true
            }
        },
        {
            "InstanceId": "i-0987654321EXAMPLE",
            "InstanceType": "t2.micro",
            "LaunchTime": "2024-08-28T11:25:45+00:00",
            "AvailabilityZone": "us-west-2a",
            "State": {
                "Code": 16,
                "Name": "running"
            },
            "OwnerId": "123456789012",
            "Tags": [
                {
                    "Key": "MyTagName",
                    "Value": "my-tag-value"
                }
            ],
            "ImageMetadata": {

                "DeprecationTime": "2025-01-25T17:20:40Z",
```

```
                "IsPublic": true
            }
        }
    ]
}
```

For more information, see Amazon Machine Images in Amazon EC2 in the *Amazon EC2 User Guide*.

Example 3: To describe the AMI metadata for instances based on filters

The following `describe-instance-image-metadata` example describes the AMI metadata for `t2.nano` and `t2.micro` instances in the `us-west-2a` Availability Zone.

```
aws ec2 describe-instance-image-metadata \
    --filters Name=availability-zone,Values=us-west-2a Name=instance-
type,Values=t2.nano,t2.micro
```

Output:

```
{
    "InstanceImageMetadata": [
        {
            "InstanceId": "i-1234567890EXAMPLE",
            "InstanceType": "t2.micro",
            "LaunchTime": "2024-08-28T11:25:45+00:00",
            "AvailabilityZone": "us-west-2a",
            "State": {
                "Code": 16,
                "Name": "running"
            },
            "OwnerId": "123456789012",
            "Tags": [
                {
                    "Key": "MyTagName",
                    "Value": "my-tag-value"
                }
            ],
            "ImageMetadata": {
                "ImageId": "ami-0b752bf1df193a6c4",
                "Name": "al2023-ami-2023.5.20240819.0-kernel-6.1-x86_64",
                "OwnerId": "137112412989",
```

```
                "State": "available",
                "ImageOwnerAlias": "amazon",
                "CreationDate": "2023-01-25T17:20:40Z",
                "DeprecationTime": "2025-01-25T17:20:40Z",
                "IsPublic": true
            }
        },
        {
            "InstanceId": "i-0987654321EXAMPLE",
            "InstanceType": "t2.micro",
            "LaunchTime": "2024-08-28T11:25:45+00:00",
            "AvailabilityZone": "us-west-2a",
            "State": {
                "Code": 16,
                "Name": "running"
            },
            "OwnerId": "123456789012",
            "Tags": [
                {
                    "Key": "MyTagName",
                    "Value": "my-tag-value"
                }
            ],
            "ImageMetadata": {
                "ImageId": "ami-0b752bf1df193a6c4",

                "DeprecationTime": "2025-01-25T17:20:40Z",
                "IsPublic": true
            }
        }
    ],
    "NextToken": "...EXAMPLEV7ixRYHwIAABAA2JHaFxLnDAzpatfEXAMPLE..."
}
```

For more information, see Amazon Machine Images in Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceImageMetadata in *AWS CLI Command Reference*.

describe-instance-status

The following code example shows how to use `describe-instance-status`.

AWS CLI

To describe the status of an instance

The following `describe-instance-status` example describes the current status of the specified instance.

```
aws ec2 describe-instance-status \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "InstanceStatuses": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "InstanceState": {
                "Code": 16,
                "Name": "running"
            },
            "AvailabilityZone": "us-west-2d",
            "SystemStatus": {
                "Status": "ok",
                "Details": [
                    {
                        "Status": "passed",
                        "Name": "reachability"
                    }
                ]
            },
            "InstanceStatus": {
                "Status": "ok",
                "Details": [
                    {
                        "Status": "passed",
                        "Name": "reachability"
                    }
                ]
            }
```

```
        }
    ]
}
```

For more information, see Monitor the status of your instances in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceStatus in *AWS CLI Command Reference*.

`describe-instance-topology`

The following code example shows how to use `describe-instance-topology`.

AWS CLI

To describe the instance topology of all your instances

The following `describe-instance-topology` example describes the topology of all your instances that match the supported instance types for this command.

```
aws ec2 describe-instance-topology
```

Output:

```
{
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "my-ml-cpg",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "p4d.24xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
```

```
                "nn-3333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-3333333333example",
            "InstanceType": "trn1.32xlarge",
            "NetworkNodes": [
                "nn-1212121212example",
                "nn-1211122211example",
                "nn-1311133311example"
            ],
            "ZoneId": "usw2-az4",
            "AvailabilityZone": "us-west-2d"
        },
        {
            "InstanceId": "i-444444444example",
            "InstanceType": "trn1.2xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-5434334334example",
                "nn-1235301234example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

For more information, including more examples, see Amazon EC2 instance topology in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceTopology in *AWS CLI Command Reference*.

`describe-instance-type-offerings`

The following code example shows how to use `describe-instance-type-offerings`.

AWS CLI

Example 1: To list the instance types offered in a Region

The following `describe-instance-type-offerings` example lists the instance types offered in the Region configured as the default Region for the AWS CLI.

```
aws ec2 describe-instance-type-offerings
```

To list the instance types offered in a different Region, specify the Region using the `--region` parameter.

```
aws ec2 describe-instance-type-offerings \
    --region us-west-2
```

Output:

```
{
    "InstanceTypeOfferings": [
        {
            "InstanceType": "m5.2xlarge",
            "LocationType": "region",
            "Location": "us-west-2"
        },
        {
            "InstanceType": "t3.micro",
            "LocationType": "region",
            "Location": "us-west-2"
        }
    ]
}
```

For more information, see Find an Amazon EC2 instance type in the *Amazon EC2 User Guide*.

Example 2: To list the instance types offered in an Availability Zone

The following `describe-instance-type-offerings` example lists the instance types offered in the specified Availability Zone. The Availability Zone must be in the specified Region.

```
aws ec2 describe-instance-type-offerings \
    --location-type availability-zone \
    --filters Name=location,Values=us-west-2a \
    --region us-west-2
```

Output:

```
{
    "InstanceTypeOfferings": [
        {
            "InstanceType": "m5.2xlarge",
            "LocationType": "availability-zone",
            "Location": "us-west-2a"
        },
        {
            "InstanceType": "t3.micro",
            "LocationType": "availability-zone",
            "Location": "us-west-2a"
        }
    ]
}
```

For more information, see Find an Amazon EC2 instance type in the *Amazon EC2 User Guide*.

Example 3: To check whether an instance type is supported

The following `describe-instance-type-offerings` example indicates whether the `c5.xlarge` instance type is supported in the specified Region.

```
aws ec2 describe-instance-type-offerings \
    --filters Name=instance-type,Values=c5.xlarge \
    --region us-west-2
```

The following `describe-instance-type-offerings` example lists all C5 instance types that are supported in the specified Region.

```
aws ec2 describe-instance-type-offerings \
    --filters Name=instance-type,Values=c5* \
    --query "InstanceTypeOfferings[].InstanceType" \
    --region us-west-2
```

Output:

```
[
    "c5d.12xlarge",
    "c5d.9xlarge",
    "c5n.xlarge",
    "c5.xlarge",
    "c5d.metal",
```

```
    "c5n.metal",
    "c5.large",
    "c5d.2xlarge",
    "c5n.4xlarge",
    "c5.2xlarge",
    "c5n.large",
    "c5n.9xlarge",
    "c5d.large",
    "c5.18xlarge",
    "c5d.18xlarge",
    "c5.12xlarge",
    "c5n.18xlarge",
    "c5.metal",
    "c5d.4xlarge",
    "c5.24xlarge",
    "c5d.xlarge",
    "c5n.2xlarge",
    "c5d.24xlarge",
    "c5.9xlarge",
    "c5.4xlarge"
]
```

For more information, see Find an Amazon EC2 instance type in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceTypeOfferings in *AWS CLI Command Reference*.

`describe-instance-types`

The following code example shows how to use `describe-instance-types`.

AWS CLI

Example 1: To describe an instance type

The following `describe-instance-types` example displays details for the specified instance type.

```
aws ec2 describe-instance-types \
    --instance-types t2.micro
```

Output:

```
{
```

```
    "InstanceTypes": [
        {
            "InstanceType": "t2.micro",
            "CurrentGeneration": true,
            "FreeTierEligible": true,
            "SupportedUsageClasses": [
                "on-demand",
                "spot"
            ],
            "SupportedRootDeviceTypes": [
                "ebs"
            ],
            "BareMetal": false,
            "Hypervisor": "xen",
            "ProcessorInfo": {
                "SupportedArchitectures": [
                    "i386",
                    "x86_64"
                ],
                "SustainedClockSpeedInGhz": 2.5
            },
            "VCpuInfo": {
                "DefaultVCpus": 1,
                "DefaultCores": 1,
                "DefaultThreadsPerCore": 1,
                "ValidCores": [
                    1
                ],
                "ValidThreadsPerCore": [
                    1
                ]
            },
            "MemoryInfo": {
                "SizeInMiB": 1024
            },
            "InstanceStorageSupported": false,
            "EbsInfo": {
                "EbsOptimizedSupport": "unsupported",
                "EncryptionSupport": "supported"
            },
            "NetworkInfo": {
                "NetworkPerformance": "Low to Moderate",
                "MaximumNetworkInterfaces": 2,
                "Ipv4AddressesPerInterface": 2,
```

```
                "Ipv6AddressesPerInterface": 2,
                "Ipv6Supported": true,
                "EnaSupport": "unsupported"
            },
            "PlacementGroupInfo": {
                "SupportedStrategies": [
                    "partition",
                    "spread"
                ]
            },
            "HibernationSupported": false,
            "BurstablePerformanceSupported": true,
            "DedicatedHostsSupported": false,
            "AutoRecoverySupported": true
        }
    ]
}
```

For more information, see Amazon EC2 instance types in the *Amazon EC2 User Guide*.

Example 2: To filter the available instance types

The following `describe-instance-types` example lists the instance types that support hibernation. You can specify a filter to scope the results to instance types that have a specific characteristic.

```
aws ec2 describe-instance-types \
    --filters Name=hibernation-supported,Values=true \
    --query 'InstanceTypes[*].InstanceType'
```

Output:

```
[
    "m5.8xlarge",
    "r3.large",
    "c3.8xlarge",
    "r5.large",
    "m4.4xlarge",
    "c4.large",
    "m5.xlarge",
    "m4.xlarge",
    "c3.large",
    "c4.8xlarge",
```

```
    "c4.4xlarge",
    "c5.xlarge",
    "c5.12xlarge",
    "r5.4xlarge",
    "c5.4xlarge"
]
```

For more information, see Amazon EC2 instance types in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceTypes in *AWS CLI Command Reference*.

`describe-instances`

The following code example shows how to use `describe-instances`.

AWS CLI

Example 1: To describe an instance

The following `describe-instances` example describes the specified instance.

```
aws ec2 describe-instances \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "Reservations": [
        {
            "Groups": [],
            "Instances": [
                {
                    "AmiLaunchIndex": 0,
                    "ImageId": "ami-0abcdef1234567890",
                    "InstanceId": "i-1234567890abcdef0",
                    "InstanceType": "t3.nano",
                    "KeyName": "my-key-pair",
                    "LaunchTime": "2022-11-15T10:48:59+00:00",
                    "Monitoring": {
                        "State": "disabled"
                    },
                    "Placement": {
                        "AvailabilityZone": "us-west-2a",
```

```
                        "GroupName": "",
                        "Tenancy": "default"
                    },
                    "PrivateDnsName": "ip-10-0-0-157.us-west-2.compute.internal",

Example 2: To filter for instances with the specified type

The following `describe-instances` example uses filters to scope the results to instances of the specified type.

```
aws ec2 describe-instances \
    --filters Name=instance-type,Values=m5.large
```

Output:

```
{
    "Reservations": [
        {
            "Groups": [],
            "Instances": [

```

For more information, see List and filter using the CLI in the *Amazon EC2 User Guide*.

Example 3: To filter for instances with the specified type and Availability Zone

The following `describe-instances` example uses multiple filters to scope the results to instances with the specified type that are also in the specified Availability Zone.

```
aws ec2 describe-instances \
    --filters Name=instance-type,Values=t2.micro,t3.micro Name=availability-
zone,Values=us-west-2c
```

Output:

```
{
    "Reservations": [
        {
            "Groups": [],
            "Instances": [
                {
                    "AmiLaunchIndex": 0,
                    "ImageId": "ami-0abcdef1234567890",

                }
            }
```

```
            ],
            "OwnerId": "123456789012",
            "ReservationId": "r-0598c7d356eba48d7"
        }
    ]
}
```

Example 4: To filter for instances with the specified type and Availability Zone using a JSON file

The following `describe-instances` example uses a JSON input file to perform the same filtering as the previous example. When filters get more complicated, they can be easier to specify in a JSON file.

```
aws ec2 describe-instances \
    --filters file://filters.json
```

Contents of `filters.json`:

```
[
    {
        "Name": "instance-type",
        "Values": ["t2.micro", "t3.micro"]
    },
    {
        "Name": "availability-zone",
        "Values": ["us-west-2c"]
    }
]
```

Output:

```
{
    "Reservations": [
        {
            "Groups": [],
            "Instances": [
                {
                    "AmiLaunchIndex": 0,
                    "ImageId": "ami-0abcdef1234567890",
                    "InstanceId": "i-0598c7d356eba48d7",
                    "InstanceType": "t3.micro",
```

```
                    "KeyName": "my-key-pair",
                    "LaunchTime": "2022-11-15T10:48:59+00:00",

Example 5: To filter for instances with the specified Owner tag

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag key (Owner), regardless of the tag value.

```
aws ec2 describe-instances \
    --filters "Name=tag-key,Values=Owner"
```

Output:

```
{
    "Reservations": [
        {
            "Groups": [],

Example 6: To filter for instances with the specified my-team tag value

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag value (my-team), regardless of the tag key.

```
aws ec2 describe-instances \
    --filters "Name=tag-value,Values=my-team"
```

Output:

```
{
    "Reservations": [
        {
            "Groups": [],
            "Instances": [

Example 7: To filter for instances with the specified Owner tag and my-team value

The following `describe-instances` example uses tag filters to scope the results to instances that have the specified tag (Owner=my-team).

```
aws ec2 describe-instances \
    --filters "Name=tag:Owner,Values=my-team"
```

Output:

```
{
    "Reservations": [
        {

            "ReservationId": "r-1234567890abcdefg"
        }
    ]
}
```

Example 8: To display only instance and subnet IDs for all instances

The following `describe-instances` examples use the `--query` parameter to display only the instance and subnet IDs for all instances, in JSON format.

For Linux and macOS, use the following command.

```
aws ec2 describe-instances \
    --query 'Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}'
```

For Windows, use the following command.

```
aws ec2 describe-instances ^
    --query "Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}"
```

Output:

```
[
    {
        "Instance": "i-057750d42936e468a",
        "Subnet": "subnet-069beee9b12030077"
    },
    {
        "Instance": "i-001efd250faaa6ffa",
```

```
        "Subnet": "subnet-0b715c6b7db68927a"
    },
    {
        "Instance": "i-027552a73f021f3bd",
        "Subnet": "subnet-0250c25a1f4e15235"
    }
]
```

Example 9: To filter instances of the specified type and only display their instance IDs

The following `describe-instances` example uses filters to scope the results to instances of the specified type and the `--query` parameter to display only the instance IDs.

```
aws ec2 describe-instances \
    --filters "Name=instance-type,Values=t2.micro" \
    --query "Reservations[*].Instances[*].[InstanceId]" \
    --output text
```

Output:

```
i-031c0dc19de2fb70c
i-00d8bff789a736b75
i-0b715c6b7db68927a
i-0626d4edd54f1286d
i-00b8ae04f9f99908e
i-0fc71c25d2374130c
```

Example 10: To filter instances of the specified type and only display their instance IDs, Availability Zone, and the specified tag value

The following `describe-instances` examples display the instance ID, Availability Zone, and the value of the `Name` tag for instances that have a tag with the name `tag-key`, in table format.

For Linux and macOS, use the following command.

```
aws ec2 describe-instances \
    --filters Name=tag-key,Values=Name \
    --query 'Reservations[*].Instances[*].
{Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key==`"Name"`]|
[0].Value}' \
    --output table
```

For Windows, use the following command.

```
aws ec2 describe-instances ^
    --filters Name=tag-key,Values=Name ^
    --query "Reservations[*].Instances[*].
{Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key=='Name']|
[0].Value}" ^
    --output table
```

Output:

```
-------------------------------------------------------------
|                     DescribeInstances                     |
+--------------+-----------------------+--------------------+
|      AZ      |       Instance        |        Name        |
+--------------+-----------------------+--------------------+
|  us-west-2b  |  i-057750d42936e468a  |  my-prod-server    |
|  us-west-2a  |  i-001efd250faaa6ffa  |  test-server-1     |
|  us-west-2a  |  i-027552a73f021f3bd  |  test-server-2     |
+--------------+-----------------------+--------------------+
```

Example 11: To describe instances in a partition placement group

The following `describe-instances` example describes the specified instance. The output includes the placement information for the instance, which contains the placement group name and the partition number for the instance.

```
aws ec2 describe-instances \
    --instance-ids i-0123a4567abcd1234 \
    --query "Reservations[*].Instances[*].Placement"
```

Output:

```
[
    [
        {
            "AvailabilityZone": "us-west-2c",
            "GroupName": "HDFS-Group-A",
            "PartitionNumber": 3,
            "Tenancy": "default"
        }
```

```
    ]
]
```

For more information, see Describing instances in a placement group in the *Amazon EC2 User Guide*.

Example 12: To filter to instances with the specified placement group and partition number

The following `describe-instances` example filters the results to only those instances with the specified placement group and partition number.

```
aws ec2 describe-instances \
    --filters "Name=placement-group-name,Values=HDFS-Group-A" "Name=placement-partition-number,Values=7"
```

The following example output shows only the relevant information.

Output:

```
{
    "Reservations": [
        {
            "Instances": [
                {
                    "InstanceId": "i-0123a4567abcd1234",
                    "InstanceType": "r4.large",
                    "Placement": {
                        "AvailabilityZone": "us-west-2c",
                        "GroupName": "HDFS-Group-A",
                        "PartitionNumber": 7,
                        "Tenancy": "default"
                    }
                },
                {
                    "InstanceId": "i-9876a5432abcd9876",
                    "InstanceType": "r4.large",
                    "Placement": {
                        "AvailabilityZone": "us-west-2c",
                        "GroupName": "HDFS-Group-A",
                        "PartitionNumber": 7,
                        "Tenancy": "default"
                    }
                }
```

```
            ]
        }
    ]
}
```

For more information, see Describing instances in a placement group in the *Amazon EC2 User Guide*.

Example 13: To filter to instances that are configured to allow access to tags from instance metadata

The following `describe-instances` example filters the results to only those instances that are configured to allow access to instance tags from instance metadata.

```
aws ec2 describe-instances \
    --filters "Name=metadata-options.instance-metadata-tags,Values=enabled" \
    --query "Reservations[*].Instances[*].InstanceId" \
    --output text
```

Output:

```
i-1234567890abcdefg
i-abcdefg1234567890
i-11111111aaaaaaaaa
i-aaaaaaaa111111111
```

For more information, see Work with instance tags in instance metadata in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstances in *AWS CLI Command Reference*.

`describe-internet-gateways`

The following code example shows how to use `describe-internet-gateways`.

AWS CLI

To describe an internet gateway

The following `describe-internet-gateways` example describes the specified internet gateway.

```
aws ec2 describe-internet-gateways \
    --internet-gateway-ids igw-0d0fb496b3EXAMPLE
```

Output:

```
{
    "InternetGateways": [
        {
            "Attachments": [
                {
                    "State": "available",
                    "VpcId": "vpc-0a60eb65b4EXAMPLE"
                }
            ],
            "InternetGatewayId": "igw-0d0fb496b3EXAMPLE",
            "OwnerId": "123456789012",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-igw"
                }
            ]
        }
    ]
}
```

For more information, see Internet gateways in the *Amazon VPC User Guide*.

- For API details, see DescribeInternetGateways in *AWS CLI Command Reference*.

`describe-ipam-pool-allocations`

The following code example shows how to use `describe-ipam-pool-allocations`.

AWS CLI

Example 1: To describe all your IPAM pool allocations

The following `describe-ipam-pool-allocations` example describes all IPAM pool allocations owned by you.

For Linux, use the following command.

```
aws ec2 describe-ipam-pool-allocations
```

For Windows, use the following command.

```
aws ec2 describe-ipam-pool-allocations
```

Output:

```
{
    "IpamPoolAllocations": [
        {
            "Cidr": "10.0.0.0/24",
            "IpamPoolAllocationId": "ipam-pool-
alloc-018ecc28043b54ba38e2cd99943cebfbd",
            "Description": "Engineering team allocation",
            "ResourceType": "custom",
            "ResourceOwner": "123456789012",
            "Tags": []
        },
        {
            "Cidr": "10.0.1.0/24",
            "IpamPoolAllocationId": "ipam-pool-
alloc-0e6186d73999e47389266a5d6991e6220",
            "ResourceType": "custom",
            "ResourceOwner": "123456789012",
            "Tags": []
        }
    ]
}
```

Example 2: To describe a specific IPAM pool allocation

The following `describe-ipam-pool-allocations` example describes a specific IPAM pool allocation by its ID.

For Linux, use the following command.

```
aws ec2 describe-ipam-pool-allocations \
    --ipam-pool-allocation-ids ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfbd
```

For Windows, use the following command.

```
aws ec2 describe-ipam-pool-allocations ^
    --ipam-pool-allocation-ids ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfbd
```

Output:

```
{
    "IpamPoolAllocations": [
        {
            "Cidr": "10.0.0.0/24",
            "IpamPoolAllocationId": "ipam-pool-
alloc-018ecc28043b54ba38e2cd99943cebfbd",
            "Description": "Engineering team allocation",
            "ResourceType": "custom",
            "ResourceOwner": "123456789012",
            "Tags": []
        }
    ]
}
```

For more information, see View allocations for a pool in the *Amazon VPC IPAM User Guide*.

- For API details, see DescribeIpamPoolAllocations in *AWS CLI Command Reference*.

`describe-ipam-pools`

The following code example shows how to use `describe-ipam-pools`.

AWS CLI

To view the details for an IPAM pool

The following `describe-ipam-pools` example shows the details for pools.

For Linux, use the following command.

```
aws ec2 describe-ipam-pools \
    --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-
scope-02fc38cd4c48e7d38
```

For Windows, use the following command.

```
aws ec2 describe-ipam-pools ^
```

```
    --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-
scope-02fc38cd4c48e7d38
```

Output:

```
{
    "IpamPools": [
        {
            "OwnerId": "123456789012",
            "IpamPoolId": "ipam-pool-02ec043a19bbe5d08",
            "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-02ec043a19bbe5d08",
            "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
            "IpamScopeType": "private",
            "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
            "IpamRegion": "us-west-2",
            "Locale": "None",
            "PoolDepth": 1,
            "State": "create-complete",
            "AutoImport": true,
            "AddressFamily": "ipv4",
            "AllocationMinNetmaskLength": 16,
            "AllocationMaxNetmaskLength": 26,
            "AllocationDefaultNetmaskLength": 24,
            "AllocationResourceTags": [
                {
                    "Key": "Environment",
                    "Value": "Preprod"
                }
            ],
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "Preprod pool"
                }
            ]
        }
    ]
}
```

For more information, see How IPAM works in the *Amazon VPC IPAM User Guide*.

- For API details, see DescribeIpamPools in *AWS CLI Command Reference*.

describe-ipam-resource-discoveries

The following code example shows how to use `describe-ipam-resource-discoveries`.

AWS CLI

Example 1: To view complete details of resource discoveries

The following `describe-ipam-resource-discoveries` example lists the details of the resource discovery in your AWS account. You can have one resource discovery per AWS Region.

In this example, you're a delegated IPAM admin who wants to create and share a resource discovery with the IPAM admin in another AWS Organization so that the admin can manage and monitor the IP addresses of resources in your organization.

This example may be useful if:

You tried to create a resource discovery, but you got an error that you've reached your limit of 1. You realize that you may have already created a resource discovery and you want to view it in your account.You have resources in a Region that are not being discovered by the IPAM. You want to view the `--operating-regions` defined for the resource and ensure that you've added the right Region as an operating Region so that the resources there can be discovered.

To view the resource discovery in the `us-west-2` Region, use the following command.

```
aws ec2 describe-ipam-resource-discoveries
```

Output:

```
{
    "IpamResourceDiscoveries": [
        {
            "OwnerId": "123456789012",
            "IpamResourceDiscoveryId": "ipam-res-disco-0f8bdee9067137c0d",
            "IpamResourceDiscoveryArn": "arn:aws:ec2::123456789012:ipam-resource-
discovery/ipam-res-disco-0f8bdee9067137c0d",
            "IpamResourceDiscoveryRegion": "us-west-2",
            "OperatingRegions": [
                {
                    "RegionName": "us-west-2"
                }
            ],
            "IsDefault": false,
```

```
            "State": "create-complete",
            "Tags": []
    }
]
}
```

For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

Example 2: To view only resource discovery IDs

The following `describe-ipam-resource-discoveries` example lists the ID of the resource discovery in your AWS account. You can have one resource discovery per AWS Region.

```
aws ec2 describe-ipam-resource-discoveries \
    --query "IpamResourceDiscoveries[*].IpamResourceDiscoveryId"
```

Output:

```
[
    "ipam-res-disco-0481e39b242860333"
]
```

For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see DescribeIpamResourceDiscoveries in *AWS CLI Command Reference*.

`describe-ipam-resource-discovery-associations`

The following code example shows how to use `describe-ipam-resource-discovery-associations`.

AWS CLI

To view all resource discovery associations with your IPAM

The following `describe-ipam-resource-discovery-associations` example lists the resource discovery associations in your AWS account. In this example, you're a IPAM delegated admin who has associated resource discoveries with your IPAM to integrate other accounts with your IPAM. You've noticed that your IPAM is not discovering the resources in the operating

Regions of the resource discovery as expected. You want to check the status and state of the resource discovery to ensure that the account that created it is still active and the resource discovery is still being shared.

The `--region` must be the home Region of your IPAM.

```
aws ec2 describe-ipam-resource-discovery-associations \
    --region us-west-2
```

Output:

```
{
    "IpamResourceDiscoveryAssociations": [
        {
            "OwnerId": "123456789111",
            "IpamResourceDiscoveryAssociationId": "ipam-res-disco-
assoc-05e6b45eca5bf5cf7",
            "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::123456789111:ipam-
resource-discovery-association/ipam-res-disco-assoc-05e6b45eca5bf5cf7",
            "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
            "IpamId": "ipam-005f921c17ebd5107",
            "IpamArn": "arn:aws:ec2::123456789111:ipam/ipam-005f921c17ebd5107",
            "IpamRegion": "us-west-2",
            "IsDefault": true,
            "ResourceDiscoveryStatus": "active",
            "State": "associate-complete",
            "Tags": []
        },
        {
            "OwnerId": "123456789222",
            "IpamResourceDiscoveryAssociationId": "ipam-res-disco-
assoc-0dfd21ae189ab5f62",
            "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::123456789222:ipam-
resource-discovery-association/ipam-res-disco-assoc-0dfd21ae189ab5f62",
            "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
            "IpamId": "ipam-005f921c17ebd5107",
            "IpamArn": "arn:aws:ec2::123456789222:ipam/ipam-005f921c17ebd5107",
            "IpamRegion": "us-west-2",
            "IsDefault": false,
            "ResourceDiscoveryStatus": "active",
            "State": "create-complete",
            "Tags": []
        }
```

```
    ]
}
```

In this example, after running this command, you notice that you have one non-default resource discovery (`"IsDefault": false ``) that is ``"ResourceDiscoveryStatus": "not-found"` and `"State": "create-complete"`. The resource discovery owner's account has been closed. If, in another case, you notice that is `"ResourceDiscoveryStatus": "not-found"` and `"State": "associate-complete"`, this indicates that one of the following has happened:

The resource discovery was deleted by the resource discovery owner.The resource discovery owner unshared the resource discovery.

For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see DescribeIpamResourceDiscoveryAssociations in *AWS CLI Command Reference*.

`describe-ipam-scopes`

The following code example shows how to use `describe-ipam-scopes`.

AWS CLI

To view the details for an IPAM scope

The following `describe-ipam-scopes` example shows the details for scopes.

```
aws ec2 describe-ipam-scopes \
    --filters Name=owner-id,Values=123456789012 Name=ipam-
id,Values=ipam-08440e7a3acde3908
```

Output:

```
{
    "IpamScopes": [
        {
            "OwnerId": "123456789012",
            "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
            "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
```

```

                }
            ]
        }
    ]
}
```

For more information, see How IPAM works in the *Amazon VPC IPAM User Guide*.

- For API details, see DescribeIpamScopes in *AWS CLI Command Reference*.

`describe-ipams`

The following code example shows how to use `describe-ipams`.

AWS CLI

To view the details for an IPAM

The following `describe-ipams` example shows the details of an IPAM.

```
aws ec2 describe-ipams \
    --filters Name=owner-id,Values=123456789012
```

Output:

```
{
    "Ipams": [
        {
            "OwnerId": "123456789012",
            "IpamId": "ipam-08440e7a3acde3908",
            "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
            "IpamRegion": "us-east-1",
            "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
            "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
            "ScopeCount": 3,
            "OperatingRegions": [
                {
                    "RegionName": "us-east-1"
                },
                {
                    "RegionName": "us-east-2"
                },
                {
                    "RegionName": "us-west-1"
                }
            ],
            "State": "create-complete",
            "Tags": [
                {
```

```
                    "Key": "Name",
                    "Value": "ExampleIPAM"
                }
            ]
        }
    ]
}
```

For more information, see What is IPAM? in the *Amazon VPC IPAM User Guide*.

- For API details, see DescribeIpams in *AWS CLI Command Reference*.

`describe-ipv6-pools`

The following code example shows how to use `describe-ipv6-pools`.

AWS CLI

To describe your IPv6 address pools

The following `describe-ipv6-pools` example displays details for all of your IPv6 address pools.

```
aws ec2 describe-ipv6-pools
```

Output:

```
{
    "Ipv6Pools": [
        {
            "PoolId": "ipv6pool-ec2-012345abc12345abc",
            "PoolCidrBlocks": [
                {
                    "Cidr": "2001:db8:123::/48"
                }
            ],
            "Tags": [
                {
                    "Key": "pool-1",
                    "Value": "public"
                }
            ]
```

```
        }
    ]
}
```

For more information, see Bring your own IP addresses (BYOIP) to Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see DescribeIpv6Pools in *AWS CLI Command Reference*.

`describe-key-pairs`

The following code example shows how to use `describe-key-pairs`.

AWS CLI

To display a key pair

The following `describe-key-pairs` example displays information about the specified key pair.

```
aws ec2 describe-key-pairs \
    --key-names my-key-pair
```

Output:

```
{
    "KeyPairs": [
        {
            "KeyPairId": "key-0b94643da6EXAMPLE",
            "KeyFingerprint":
 "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",
            "KeyName": "my-key-pair",
            "KeyType": "rsa",
            "Tags": [],
            "CreateTime": "2022-05-27T21:51:16.000Z"
        }
    ]
}
```

For more information, see Describe public keys in the *Amazon EC2 User Guide*.

- For API details, see DescribeKeyPairs in *AWS CLI Command Reference*.

describe-launch-template-versions

The following code example shows how to use `describe-launch-template-versions`.

AWS CLI

To describe launch template versions

The following `describe-launch-template-versions` example describes the versions of the specified launch template.

```
aws ec2 describe-launch-template-versions \
    --launch-template-id lt-068f72b72934aff71
```

Output:

```
{
    "LaunchTemplateVersions": [
        {
            "LaunchTemplateId": "lt-068f72b72934aff71",
            "LaunchTemplateName": "Webservers",
            "VersionNumber": 3,
            "CreatedBy": "arn:aws:iam::123456789012:root",
            "LaunchTemplateData": {

        }
```

```
    ]
}
```

For more information, see Modify a launch template (manage launch template versions) in the *Amazon EC2 User Guide*.

- For API details, see DescribeLaunchTemplateVersions in *AWS CLI Command Reference*.

`describe-launch-templates`

The following code example shows how to use `describe-launch-templates`.

AWS CLI

To describe launch templates

The following `describe-launch-templates` example describes your launch templates.

```
aws ec2 describe-launch-templates
```

Output:

```
{
    "LaunchTemplates": [
        {
            "LatestVersionNumber": 2,
            "LaunchTemplateId": "lt-0e06d29075EXAMPLE",
            "LaunchTemplateName": "TemplateForWebServer",

            "CreatedBy": "arn:aws:sts::123456789012:assumed-role/AdminRole/
i-03ee35176e2e5aabc",
            "CreateTime": "2017-12-01T08:19:48.000Z"
        }
    ]
}
```

For more information, see Store instance launch parameters in Amazon EC2 launch templates in the *Amazon EC2 User Guide*.

- For API details, see DescribeLaunchTemplates in *AWS CLI Command Reference*.

`describe-local-gateway-route-table-virtual-interface-group-associations`

The following code example shows how to use `describe-local-gateway-route-table-virtual-interface-group-associations`.

AWS CLI

To describe associations between virtual interface groups and local gateway route tables

The following `describe-local-gateway-route-table-virtual-interface-group-associations` example describes the associations between virtual interface groups and local gateway route tables in your AWS account.

```
aws ec2 describe-local-gateway-route-table-virtual-interface-group-associations
```

Output:

```
{
```

```
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociations": [
        {
            "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-
grp-assoc-07145b276bEXAMPLE",
            "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
            "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
            "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
            "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-
gateway-route-table/lgw-rtb-059615ef7dEXAMPLE",
            "OwnerId": "123456789012",
            "State": "associated",
            "Tags": []
        }
    ]
}
```

For more information, see Working with local gateways in the *AWS Outposts User Guide*.

- For API details, see DescribeLocalGatewayRouteTableVirtualInterfaceGroupAssociations in *AWS CLI Command Reference*.

`describe-local-gateway-route-table-vpc-associations`

The following code example shows how to use `describe-local-gateway-route-table-vpc-associations`.

AWS CLI

To describe the associations between VPCs and local gateway route tables

The following `describe-local-gateway-route-table-vpc-associations` example displays information about the specified association between VPCs and local gateway route tables.

```
aws ec2 describe-local-gateway-route-table-vpc-associations \
    --local-gateway-route-table-vpc-association-ids lgw-vpc-assoc-0e0f27af15EXAMPLE
```

Output:

```
{
    "LocalGatewayRouteTableVpcAssociations": [
```

```
        {
            "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-
assoc-0e0f27af15EXAMPLE",
            "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
            "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
            "VpcId": "vpc-0efe9bde08EXAMPLE",
            "State": "associated"
        }
    ]
}
```

For more information, see Local gateway route tables in the *Outposts User Guide*.

- For API details, see DescribeLocalGatewayRouteTableVpcAssociations in *AWS CLI Command Reference*.

`describe-local-gateway-route-tables`

The following code example shows how to use `describe-local-gateway-route-tables`.

AWS CLI

To describe your Local Gateway Route Tables

The following `describe-local-gateway-route-tables` example displays details about the local gateway route tables.

```
aws ec2 describe-local-gateway-route-tables
```

Output:

```
{
    "LocalGatewayRouteTables": [
        {
            "LocalGatewayRouteTableId": "lgw-rtb-059615ef7deEXAMPLE",
            "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
            "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0dc11b66edEXAMPLE",
            "State": "available"
        }
    ]
```

```
}
```

For more information, see Local gateway route tables in the *AWS Outposts User Guide*.

- For API details, see DescribeLocalGatewayRouteTables in *AWS CLI Command Reference*.

`describe-local-gateway-virtual-interface-groups`

The following code example shows how to use `describe-local-gateway-virtual-interface-groups`.

AWS CLI

To describe local gateway virtual interface groups

The following `describe-local-gateway-virtual-interface-groups` example describes the local gateway virtual interface groups in your AWS account.

```
aws ec2 describe-local-gateway-virtual-interface-groups
```

Output:

```
{
    "LocalGatewayVirtualInterfaceGroups": [
        {
            "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
            "LocalGatewayVirtualInterfaceIds": [
                "lgw-vif-01a23bc4d5EXAMPLE",
                "lgw-vif-543ab21012EXAMPLE"
            ],
            "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
            "OwnerId": "123456789012",
            "Tags": []
        }
    ]
}
```

For more information, see Working with local gateways in the *AWS Outposts User Guide*.

- For API details, see DescribeLocalGatewayVirtualInterfaceGroups in *AWS CLI Command Reference*.

describe-local-gateway-virtual-interfaces

The following code example shows how to use `describe-local-gateway-virtual-interfaces`.

AWS CLI

To describe local gateway virtual interfaces

The following `describe-local-gateway-virtual-interfaces` example describes the local gateway virtual interfaces in your AWS account.

```
aws ec2 describe-local-gateway-virtual-interfaces
```

Output:

```
{
    "LocalGatewayVirtualInterfaces": [
        {
            "LocalGatewayVirtualInterfaceId": "lgw-vif-01a23bc4d5EXAMPLE",
            "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
            "Vlan": 2410,
            "LocalAddress": "0.0.0.0/0",
            "PeerAddress": "0.0.0.0/0",
            "LocalBgpAsn": 65010,
            "PeerBgpAsn": 65000,
            "OwnerId": "123456789012",
            "Tags": []
        },
        {
            "LocalGatewayVirtualInterfaceId": "lgw-vif-543ab21012EXAMPLE",
            "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
            "Vlan": 2410,
            "LocalAddress": "0.0.0.0/0",
            "PeerAddress": "0.0.0.0/0",
            "LocalBgpAsn": 65010,
            "PeerBgpAsn": 65000,
            "OwnerId": "123456789012",
            "Tags": []
        }
    ]
}
```

For more information, see Working with local gateways in the *AWS Outposts User Guide*.

- For API details, see DescribeLocalGatewayVirtualInterfaces in *AWS CLI Command Reference*.

`describe-local-gateways`

The following code example shows how to use `describe-local-gateways`.

AWS CLI

To describe your Local Gateways

The following `describe-local-gateways` example displays details for the local gateways that are available to you.

```
aws ec2 describe-local-gateways
```

Output:

```
{
    "LocalGateways": [
        {
            "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
            "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0dc11b66ed59f995a",
            "OwnerId": "123456789012",
            "State": "available"
        }
    ]
}
```

For more information, see Local gateways for your Outposts racks in the *AWS Outposts User Guide*.

- For API details, see DescribeLocalGateways in *AWS CLI Command Reference*.

`describe-locked-snapshots`

The following code example shows how to use `describe-locked-snapshots`.

AWS CLI

To describe the lock status of a snapshot

The following `describe-locked-snapshots` example describes the lock status of the specified snapshot.

```
aws ec2 describe-locked-snapshots \
    --snapshot-ids snap-0b5e733b4a8df6e0d
```

Output:

```
{
    "Snapshots": [
        {
            "OwnerId": "123456789012",
            "SnapshotId": "snap-0b5e733b4a8df6e0d",
            "LockState": "governance",
            "LockDuration": 365,
            "LockCreatedOn": "2024-05-05T00:56:06.208000+00:00",
            "LockDurationStartTime": "2024-05-05T00:56:06.208000+00:00",
            "LockExpiresOn": "2025-05-05T00:56:06.208000+00:00"
        }
    ]
}
```

For more information, see Snapshot lock in the *Amazon EBS User Guide*.

- For API details, see DescribeLockedSnapshots in *AWS CLI Command Reference*.

`describe-managed-prefix-lists`

The following code example shows how to use `describe-managed-prefix-lists`.

AWS CLI

To describe managed prefix lists

The following `describe-managed-prefix-lists` example describes the prefix lists owned by AWS account 123456789012.

```
aws ec2 describe-managed-prefix-lists \
    --filters Name=owner-id,Values=123456789012
```

Output:

```
{
    "PrefixLists": [
        {
            "PrefixListId": "pl-11223344556677aab",
            "AddressFamily": "IPv6",
            "State": "create-complete",
            "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-11223344556677aab",
            "PrefixListName": "vpc-ipv6-cidrs",
            "MaxEntries": 25,
            "Version": 1,
            "Tags": [],
            "OwnerId": "123456789012"
        },
        {
            "PrefixListId": "pl-0123456abcabcabc1",
            "AddressFamily": "IPv4",
            "State": "active",
            "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
            "PrefixListName": "vpc-cidrs",
            "MaxEntries": 10,
            "Version": 1,
            "Tags": [],
            "OwnerId": "123456789012"
        }
    ]
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see DescribeManagedPrefixLists in *AWS CLI Command Reference*.

`describe-moving-addresses`

The following code example shows how to use `describe-moving-addresses`.

AWS CLI

To describe your moving addresses

The following `describe-moving-addresses` example describes all of your moving Elastic IP addresses.

```
aws ec2 describe-moving-addresses
```

Output:

```
{
    "MovingAddressStatuses": [
        {
            "PublicIp": "198.51.100.0",
            "MoveStatus": "MovingToVpc"
        }
    ]
}
```

The following `describe-moving-addresses` example describes all addresses that are moving to the EC2-VPC platform.

```
aws ec2 describe-moving-addresses \
    --filters Name=moving-status,Values=MovingToVpc
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

- For API details, see DescribeMovingAddresses in *AWS CLI Command Reference*.

`describe-nat-gateways`

The following code example shows how to use `describe-nat-gateways`.

AWS CLI

Example 1: To describe a public NAT gateway

The following `describe-nat-gateways` example describes the specified public NAT gateway.

```
aws ec2 describe-nat-gateways \
    --nat-gateway-ids nat-01234567890abcdef
```

Output:

```
{
    "NatGateways": [
        {
```

```
            "CreateTime": "2023-08-25T01:56:51.000Z",
            "NatGatewayAddresses": [
                {
                    "AllocationId": "eipalloc-0790180cd2EXAMPLE",
                    "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
                    "PrivateIp": "10.0.0.211",
                    "PublicIp": "54.85.121.213",
                    "AssociationId": "eipassoc-04d295cc9b8815b24",
                    "IsPrimary": true,
                    "Status": "succeeded"
                },
                {
                    "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
                    "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
                    "PrivateIp": "10.0.0.74",
                    "PublicIp": "3.211.231.218",
                    "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
                    "IsPrimary": false,
                    "Status": "succeeded"
                }
            ],
            "NatGatewayId": "nat-01234567890abcdef",
            "State": "available",
            "SubnetId": "subnet-655eab5f08EXAMPLE",
            "VpcId": "vpc-098eb5ef58EXAMPLE",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "public-nat"
                }
            ],
            "ConnectivityType": "public"
        }
    ]
}
```

Example 2: To describe a private NAT gateway

The following `describe-nat-gateways` example describes the specified private NAT gateway.

```
aws ec2 describe-nat-gateways \
    --nat-gateway-ids nat-1234567890abcdef0
```

Output:

```
{
    "NatGateways": [
        {
            "CreateTime": "2023-08-25T00:50:05.000Z",
            "NatGatewayAddresses": [
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.240",
                    "IsPrimary": true,
                    "Status": "succeeded"
                },
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.33",
                    "IsPrimary": false,
                    "Status": "succeeded"
                },
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.197",
                    "IsPrimary": false,
                    "Status": "succeeded"
                }
            ],
            "NatGatewayId": "nat-1234567890abcdef0",
            "State": "available",
            "SubnetId": "subnet-08fc749671EXAMPLE",
            "VpcId": "vpc-098eb5ef58EXAMPLE",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "private-nat"
                }
            ],
            "ConnectivityType": "private"
        }
    ]
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see DescribeNatGateways in *AWS CLI Command Reference*.

describe-network-acls

The following code example shows how to use `describe-network-acls`.

AWS CLI

To describe your network ACLs

The following `describe-network-acls` example retrieves details about your network ACLs.

```
aws ec2 describe-network-acls
```

Output:

```
{
    "NetworkAcls": [
        {
            "Associations": [
                {
                    "NetworkAclAssociationId": "aclassoc-0c1679dc41EXAMPLE",
                    "NetworkAclId": "acl-0ea1f54ca7EXAMPLE",
                    "SubnetId": "subnet-0931fc2fa5EXAMPLE"
                }
            ],
            "Entries": [
                {
                    "CidrBlock": "0.0.0.0/0",
                    "Egress": true,

        }
    ]
}
```

For more information, see Network ACLs in the *AWS VPC User Guide*.

- For API details, see DescribeNetworkAcls in *AWS CLI Command Reference*.

`describe-network-insights-access-scope-analyses`

The following code example shows how to use `describe-network-insights-access-scope-analyses`.

AWS CLI

To describe Network Insights access scope analyses

The following `describe-network-insights-access-scope-analyses` example describes the access scope analysis in your AWS account.

```
aws ec2 describe-network-insights-access-scope-analyses
```

Output:

```
{
    "NetworkInsightsAccessScopeAnalyses": [

`describe-network-insights-access-scopes`

The following code example shows how to use `describe-network-insights-access-scopes`.

AWS CLI

To describe Network Insights access scopes

The following `describe-network-insights-access-scopes` example describes the access-scope analyses in your AWS account.

```
aws ec2 describe-network-insights-access-scopes
```

Output:

```
{
    "NetworkInsightsAccessScopes": [
        {
            "NetworkInsightsAccessScopeId": "nis-123456789111",
            "NetworkInsightsAccessScopeArn": "arn:aws:ec2:us-
west-2:123456789012:network-insights-access-scope/nis-123456789111",

            "UpdatedDate": "2021-11-29T21:12:41.416000+00:00",
            "Tags": []
        }
    ]
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see DescribeNetworkInsightsAccessScopes in *AWS CLI Command Reference*.

`describe-network-insights-analyses`

The following code example shows how to use `describe-network-insights-analyses`.

AWS CLI

To view the results of a path analysis

The following `describe-network-insights-analyses` example describes the specified analysis. In this example, the source is an internet gateway, the destination is an EC2 instance, and the protocol is TCP. The analysis succeeded (`Status` is `succeeded`) and the path is not reachable (`NetworkPathFound` is `false`). The explanation code `ENI_SG_RULES_MISMATCH`

indicates that the security group for the instance does not contain a rule that allows traffic on the destination port.

```
aws ec2 describe-network-insights-analyses \
    --network-insights-analysis-ids nia-02207aa13eb480c7a
```

Output:

```
{
    "NetworkInsightsAnalyses": [
        {
            "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
            "NetworkInsightsAnalysisArn": "arn:aws:ec2:us-

                }
            ],
            "Tags": []
        }
    ]
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see DescribeNetworkInsightsAnalyses in *AWS CLI Command Reference*.

`describe-network-insights-paths`

The following code example shows how to use `describe-network-insights-paths`.

AWS CLI

To describe a path

The following `describe-network-insights-paths` example describes the specified path.

```
aws ec2 describe-network-insights-paths \
    --network-insights-path-ids nip-0b26f224f1d131fa8
```

Output:

```
{
    "NetworkInsightsPaths": [
        {
            "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
            "NetworkInsightsPathArn": "arn:aws:ec2:us-west-2:123456789012:network-
insights-path/nip-0b26f224f1d131fa8",
            "CreatedDate": "2021-01-20T22:43:46.933Z",
            "Source": "igw-0797cccdc9d73b0e5",
            "Destination": "i-0495d385ad28331c7",
            "Protocol": "tcp"
        }
    ]
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see DescribeNetworkInsightsPaths in *AWS CLI Command Reference*.

`describe-network-interface-attribute`

The following code example shows how to use `describe-network-interface-attribute`.

AWS CLI

Example 1: To describe the attachment attribute of a network interface

The following `describe-network-interface-attribute` example describes the `attachment` attribute of the specified network interface.

```
aws ec2 describe-network-interface-attribute \
    --network-interface-id eni-686ea200 \
    --attribute attachment
```

Output:

```
{
    "NetworkInterfaceId": "eni-686ea200",
    "Attachment": {
        "Status": "attached",
        "DeviceIndex": 0,
        "AttachTime": "2015-05-21T20:02:20.000Z",
        "InstanceId": "i-1234567890abcdef0",
        "DeleteOnTermination": true,
        "AttachmentId": "eni-attach-43348162",
        "InstanceOwnerId": "123456789012"
    }
}
```

For more information, see Modify network interface attributes in the *Amazon EC2 User Guide*.

Example 2: To describe the description attribute of a network interface

The following `describe-network-interface-attribute` example describes the `description` attribute of the specified network interface.

```
aws ec2 describe-network-interface-attribute \
    --network-interface-id eni-686ea200 \
    --attribute description
```

Output:

```
{
    "NetworkInterfaceId": "eni-686ea200",
    "Description": {
        "Value": "My description"
    }
}
```

For more information, see Modify network interface attributes in the *Amazon EC2 User Guide*.

Example 3: To describe the groupSet attribute of a network interface

The following `describe-network-interface-attribute` example describes the `groupSet` attribute of the specified network interface.

```
aws ec2 describe-network-interface-attribute \
    --network-interface-id eni-686ea200 \
    --attribute groupSet
```

Output:

```
{
    "NetworkInterfaceId": "eni-686ea200",
    "Groups": [
        {
            "GroupName": "my-security-group",
            "GroupId": "sg-903004f8"
        }
    ]
}
```

For more information, see Modify network interface attributes in the *Amazon EC2 User Guide*.

Example 4: To describe the sourceDestCheck attribute of a network interface

The following `describe-network-interface-attribute` example describes the `sourceDestCheck` attribute of the specified network interface.

```
aws ec2 describe-network-interface-attribute \
    --network-interface-id eni-686ea200 \
    --attribute sourceDestCheck
```

Output:

```
{
    "NetworkInterfaceId": "eni-686ea200",
    "SourceDestCheck": {
        "Value": true
    }
}
```

For more information, see Modify network interface attributes in the *Amazon EC2 User Guide*.

- For API details, see DescribeNetworkInterfaceAttribute in *AWS CLI Command Reference*.

`describe-network-interface-permissions`

The following code example shows how to use `describe-network-interface-permissions`.

AWS CLI

To describe your network interface permissions

The following `describe-network-interface-permissions` example describes all of your network interface permissions.

```
aws ec2 describe-network-interface-permissions
```

Output:

```
{
    "NetworkInterfacePermissions": [
        {
            "PermissionState": {
                "State": "GRANTED"
            },
            "NetworkInterfacePermissionId": "eni-perm-06fd19020ede149ea",
            "NetworkInterfaceId": "eni-b909511a",
            "Permission": "INSTANCE-ATTACH",
            "AwsAccountId": "123456789012"
        }
    ]
}
```

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

- For API details, see DescribeNetworkInterfacePermissions in *AWS CLI Command Reference*.

`describe-network-interfaces`

The following code example shows how to use `describe-network-interfaces`.

AWS CLI

To describe your network interfaces

The following `describe-network-interfaces` example describes all your network interfaces.

```
aws ec2 describe-network-interfaces
```

Output:

```
{
    "NetworkInterfaces": [
        {
            "Status": "in-use",
            "MacAddress": "02:2f:8f:b0:cf:75",

                {
                    "Value": "Prod",
                    "Key": "Purpose"
                }
            ],
            "PrivateIpAddress": "10.0.1.55"
        }
    ]
}
```

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

- For API details, see DescribeNetworkInterfaces in *AWS CLI Command Reference*.

`describe-placement-groups`

The following code example shows how to use `describe-placement-groups`.

AWS CLI

To describe your placement groups

The following `describe-placement-groups` example describes all of your placement groups.

```
aws ec2 describe-placement-groups
```

Output:

```
{
    "PlacementGroups": [
        {
            "GroupName": "my-cluster",
            "State": "available",
            "Strategy": "cluster"
        }
    ]
}
```

For more information, see Placement groups for your Amazon EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see DescribePlacementGroups in *AWS CLI Command Reference*.

`describe-prefix-lists`

The following code example shows how to use `describe-prefix-lists`.

AWS CLI

To describe prefix lists

The following `describe-prefix-lists` example lists all available prefix lists for the region.

```
aws ec2 describe-prefix-lists
```

Output:

```
{
    "PrefixLists": [
        {
            "PrefixListName": "com.amazonaws.us-west-2.s3",
            "Cidrs": [
                "54.231.0.0/17"
            ],
            "PrefixListId": "pl-63a5400a"
        }
    ]
}
```

For more information, see AWS-managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see DescribePrefixLists in *AWS CLI Command Reference*.

`describe-principal-id-format`

The following code example shows how to use `describe-principal-id-format`.

AWS CLI

To describe the ID format for IAM users and roles with long ID format enabled

The following `describe-principal-id-format` example describes the ID format for the root user, all IAM roles, and all IAM users with long ID format enabled.

```
aws ec2 describe-principal-id-format \
    --resources instance
```

Output:

```
{
    "Principals": [
        {
            "Arn": "arn:aws:iam::123456789012:root",
            "Statuses": [
                {
                    "Deadline": "2016-12-15T00:00:00.000Z",
                    "Resource": "reservation",
                    "UseLongIds": true
```

```
                },
                {
                    "Deadline": "2016-12-15T00:00:00.000Z",
                    "Resource": "instance",
                    "UseLongIds": true
                },
                {
                    "Deadline": "2016-12-15T00:00:00.000Z",
                    "Resource": "volume",
                    "UseLongIds": true
                }
            ]
        }
    ]
}
```

For more information, see Manage your Amazon EC2 resources in the *Amazon EC2 User Guide*.

- For API details, see DescribePrincipalIdFormat in *AWS CLI Command Reference*.

`describe-public-ipv4-pools`

The following code example shows how to use `describe-public-ipv4-pools`.

AWS CLI

To describe your public IPv4 address pools

The following `describe-public-ipv4-pools` example displays details about the address pools that were created when you provisioned public IPv4 address ranges using Bring Your Own IP Addresses (BYOIP).

```
aws ec2 describe-public-ipv4-pools
```

Output:

```
{
    "PublicIpv4Pools": [
        {
            "PoolId": "ipv4pool-ec2-1234567890abcdef0",
            "PoolAddressRanges": [
                {
                    "FirstAddress": "203.0.113.0",
```

```
                    "LastAddress": "203.0.113.255",
                    "AddressCount": 256,
                    "AvailableAddressCount": 256
                }
            ],
            "TotalAddressCount": 256,
            "TotalAvailableAddressCount": 256
        }
    ]
}
```

For more information, see Bring your own IP addresses (BYOIP) to Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see DescribePublicIpv4Pools in *AWS CLI Command Reference*.

`describe-regions`

The following code example shows how to use `describe-regions`.

AWS CLI

Example 1: To describe all of your enabled Regions

The following `describe-regions` example describes all of the Regions that are enabled for your account.

```
aws ec2 describe-regions
```

Output:

```
{
    "Regions": [
        {
            "Endpoint": "ec2.eu-north-1.amazonaws.com",
            "RegionName": "eu-north-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-south-1.amazonaws.com",
            "RegionName": "ap-south-1",
            "OptInStatus": "opt-in-not-required"
        },
```

```
        {
            "Endpoint": "ec2.eu-west-3.amazonaws.com",
            "RegionName": "eu-west-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-2.amazonaws.com",
            "RegionName": "eu-west-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-1.amazonaws.com",
            "RegionName": "eu-west-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
            "RegionName": "ap-northeast-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
            "RegionName": "ap-northeast-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
            "RegionName": "ap-northeast-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.sa-east-1.amazonaws.com",
            "RegionName": "sa-east-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ca-central-1.amazonaws.com",
            "RegionName": "ca-central-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
            "RegionName": "ap-southeast-1",
            "OptInStatus": "opt-in-not-required"
```

```
        },
        {
            "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
            "RegionName": "ap-southeast-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-central-1.amazonaws.com",
            "RegionName": "eu-central-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-east-1.amazonaws.com",
            "RegionName": "us-east-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-east-2.amazonaws.com",
            "RegionName": "us-east-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-west-1.amazonaws.com",
            "RegionName": "us-west-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-west-2.amazonaws.com",
            "RegionName": "us-west-2",
            "OptInStatus": "opt-in-not-required"
        }
    ]
}
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

Example 2: To describe enabled Regions with an endpoint whose name contains a specific string

The following `describe-regions` example describes all Regions that you have enabled that have the string "us" in the endpoint.

```
aws ec2 describe-regions \
```

```
    --filters "Name=endpoint,Values=*us*"
```

Output:

```
{
    "Regions": [
        {
            "Endpoint": "ec2.us-east-1.amazonaws.com",
            "RegionName": "us-east-1"
        },
        {
            "Endpoint": "ec2.us-east-2.amazonaws.com",
            "RegionName": "us-east-2"
        },
        {
            "Endpoint": "ec2.us-west-1.amazonaws.com",
            "RegionName": "us-west-1"
        },
        {
            "Endpoint": "ec2.us-west-2.amazonaws.com",
            "RegionName": "us-west-2"
        }
    ]
}
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

Example 3: To describe all Regions

The following `describe-regions` example describes all available Regions, including Regions that are disabled.

```
aws ec2 describe-regions \
    --all-regions
```

Output:

```
{
    "Regions": [
        {
            "Endpoint": "ec2.eu-north-1.amazonaws.com",
            "RegionName": "eu-north-1",
            "OptInStatus": "opt-in-not-required"
```

```
        },
        {
            "Endpoint": "ec2.ap-south-1.amazonaws.com",
            "RegionName": "ap-south-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-3.amazonaws.com",
            "RegionName": "eu-west-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-2.amazonaws.com",
            "RegionName": "eu-west-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-1.amazonaws.com",
            "RegionName": "eu-west-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
            "RegionName": "ap-northeast-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.me-south-1.amazonaws.com",
            "RegionName": "me-south-1",
            "OptInStatus": "not-opted-in"
        },
        {
            "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
            "RegionName": "ap-northeast-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
            "RegionName": "ap-northeast-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.sa-east-1.amazonaws.com",
            "RegionName": "sa-east-1",
```

```
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ca-central-1.amazonaws.com",
            "RegionName": "ca-central-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-east-1.amazonaws.com",
            "RegionName": "ap-east-1",
            "OptInStatus": "not-opted-in"
        },
        {
            "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
            "RegionName": "ap-southeast-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
            "RegionName": "ap-southeast-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-central-1.amazonaws.com",
            "RegionName": "eu-central-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-east-1.amazonaws.com",
            "RegionName": "us-east-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-east-2.amazonaws.com",
            "RegionName": "us-east-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-west-1.amazonaws.com",
            "RegionName": "us-west-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-west-2.amazonaws.com",
```

```
            "RegionName": "us-west-2",
            "OptInStatus": "opt-in-not-required"
        }
    ]
}
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

Example 4: To list the Region names only

The following `describe-regions` example uses the `--query` parameter to filter the output and return only the names of the Regions as text.

```
aws ec2 describe-regions \
    --all-regions \
    --query "Regions[].{Name:RegionName}" \
    --output text
```

Output:

```
eu-north-1
ap-south-1
eu-west-3
eu-west-2
eu-west-1
ap-northeast-3
ap-northeast-2
me-south-1
ap-northeast-1
sa-east-1
ca-central-1
ap-east-1
ap-southeast-1
ap-southeast-2
eu-central-1
us-east-1
us-east-2
us-west-1
us-west-2
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

- For API details, see DescribeRegions in *AWS CLI Command Reference*.

describe-replace-root-volume-tasks

The following code example shows how to use `describe-replace-root-volume-tasks`.

AWS CLI

Example 1: To view information about a specific root volume replacement task

The following `describe-replace-root-volume-tasks` example describes root volume replacement task replacevol-0111122223333abcd.

```
aws ec2 describe-replace-root-volume-tasks \
    --replace-root-volume-task-ids replacevol-0111122223333abcd
```

Output:

```
{
    "ReplaceRootVolumeTasks": [
        {
            "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
            "Tags": [],
            "InstanceId": "i-0123456789abcdefa",
            "TaskState": "succeeded",
            "StartTime": "2022-03-14T15:16:28Z",
            "CompleteTime": "2022-03-14T15:16:52Z"
        }
    ]
}
```

For more information, see Replace a root volume in the *Amazon Elastic Compute Cloud User Guide*.

Example 2: To view information about all root volume replacement tasks for a specific instance

The following `describe-replace-root-volume-tasks` example describes all of the root volume replacement tasks for instance i-0123456789abcdefa.

```
aws ec2 describe-replace-root-volume-tasks \
    --filters Name=instance-id,Values=i-0123456789abcdefa
```

Output:

```
{
    "ReplaceRootVolumeTasks": [
        {
            "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
            "Tags": [],
            "InstanceId": "i-0123456789abcdefa",
            "TaskState": "succeeded",
            "StartTime": "2022-03-14T15:06:38Z",
            "CompleteTime": "2022-03-14T15:07:03Z"
        },
        {
            "ReplaceRootVolumeTaskId": "replacevol-0444455555555abcd",
            "Tags": [],
            "InstanceId": "i-0123456789abcdefa",
            "TaskState": "succeeded",
            "StartTime": "2022-03-14T15:16:28Z",
            "CompleteTime": "2022-03-14T15:16:52Z"
        }
    ]
}
```

For more information, see Replace a root volume in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see DescribeReplaceRootVolumeTasks in *AWS CLI Command Reference*.

`describe-reserved-instances-listings`

The following code example shows how to use `describe-reserved-instances-listings`.

AWS CLI

To describe a Reserved Instance listing

The following `describe-reserved-instances-listings` example retrieves information about the specified Reserved Instance listing.

```
aws ec2 describe-reserved-instances-listings \
    --reserved-instances-listing-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Sell Reserved Instances for Amazon EC2 in the Reserved Instance Marketplace in the *Amazon EC2 User Guide*.

- For API details, see DescribeReservedInstancesListings in *AWS CLI Command Reference*.

`describe-reserved-instances-modifications`

The following code example shows how to use `describe-reserved-instances-modifications`.

AWS CLI

To describe Reserved Instances modifications

The following `describe-reserved-instances-modifications` example describes all the Reserved Instances modification requests that have been submitted for your account.

```
aws ec2 describe-reserved-instances-modifications
```

Output:

```
{
    "ReservedInstancesModifications": [
        {
            "Status": "fulfilled",
            "ModificationResults": [
                {
                    "ReservedInstancesId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                    "TargetConfiguration": {
                        "AvailabilityZone": "us-west-2b",
                        "InstanceType": "m1.large",
                        "InstanceCount": 3
                    }
                },
                {
                    "ReservedInstancesId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
                    "TargetConfiguration": {
                        "AvailabilityZone": "us-west-2d",
                        "InstanceType": "m1.xlarge",
                        "InstanceCount": 1
```

```
                    }
                }
            ],
            "EffectiveDate": "2015-08-12T17:00:00.000Z",
            "CreateDate": "2015-08-12T17:52:52.630Z",
            "UpdateDate": "2015-08-12T18:08:06.698Z",
            "ClientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-
ab31-0f13aaf46687",
            "ReservedInstancesIds": [
                {
                    "ReservedInstancesId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
                }
            ]
        }
    ]
}
```

For more information, see Modify Reserved Instances in the *Amazon EC2 User Guide*.

- For API details, see DescribeReservedInstancesModifications in *AWS CLI Command Reference*.

`describe-reserved-instances-offerings`

The following code example shows how to use `describe-reserved-instances-offerings`.

AWS CLI

Example 1: To describe Reserved Instances offerings

The following `describe-reserved-instances-offerings` example describes all Reserved Instances available for purchase in the region.

```
aws ec2 describe-reserved-instances-offerings
```

Output:

```
{
    "ReservedInstancesOfferings": [
        {
            "OfferingType": "Partial Upfront",
            "AvailabilityZone": "us-west-2b",
            "InstanceTenancy": "default",
```

```
            "PricingDetails": [],
            "ProductDescription": "Red Hat Enterprise Linux",
            "UsagePrice": 0.0,
            "RecurringCharges": [
                {

        }
    ]
}
```

For more information, see Buy Reserved Instances for Amazon EC2 in the *Amazon EC2 User Guide*.

Example 2: To describe your Reserved Instances offerings using options

The following `describe-reserved-instances-offerings` example lists Reserved Instances offered by AWS with the following specifications: t1.micro instance types, Windows (Amazon VPC) product, and No Upfront offerings.

```
aws ec2 describe-reserved-instances-offerings \
    --no-include-marketplace \
    --instance-type "t1.micro" \
    --product-description "Windows (Amazon VPC)" \
    --offering-type "no upfront"
```

Output:

```
{
    "ReservedInstancesOfferings": [
        {
            "OfferingType": "No Upfront",
            "AvailabilityZone": "us-west-2b",
            "InstanceTenancy": "default",
            "PricingDetails": [],
            "ProductDescription": "Windows",
            "UsagePrice": 0.0,
            "RecurringCharges": [
                {
                    "Amount": 0.015,
                    "Frequency": "Hourly"
                }
            ],
            "Marketplace": false,
            "CurrencyCode": "USD",
            "FixedPrice": 0.0,
            "Duration": 31536000,
            "ReservedInstancesOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "InstanceType": "t1.micro"
        },
        {
            "OfferingType": "No Upfront",
            "AvailabilityZone": "us-west-2d",
            "InstanceTenancy": "default",
            "PricingDetails": [],
            "ProductDescription": "Windows (Amazon VPC)",
            "UsagePrice": 0.0,
            "RecurringCharges": [
                {
```

```
                    "Amount": 0.015,
                    "Frequency": "Hourly"
                }
            ],
            "Marketplace": false,
            "CurrencyCode": "USD",
            "FixedPrice": 0.0,
            "Duration": 31536000,
            "ReservedInstancesOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "InstanceType": "t1.micro"
        }
    ]
}
```

For more information, see Buy Reserved Instances for Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see DescribeReservedInstancesOfferings in *AWS CLI Command Reference*.

`describe-reserved-instances`

The following code example shows how to use `describe-reserved-instances`.

AWS CLI

Example 1: To describe your Reserved Instances

The following `describe-reserved-instances` example describes the Reserved Instances that you own.

```
aws ec2 describe-reserved-instances
```

Output:

```
{
    "ReservedInstances": [
        {
            "ReservedInstancesId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "OfferingType": "No Upfront",
            "AvailabilityZone": "us-west-2c",
            "End": "2016-08-14T21:34:34.000Z",
            "ProductDescription": "Linux/UNIX",
            "UsagePrice": 0.00,
```

```
            "RecurringCharges": [
                {
                    "Amount": 0.104,
                    "Frequency": "Hourly"
                }
            ],
            "Start": "2015-08-15T21:34:35.086Z",
            "State": "active",
            "FixedPrice": 0.0,
            "CurrencyCode": "USD",
            "Duration": 31536000,
            "InstanceTenancy": "default",
            "InstanceType": "m3.medium",
            "InstanceCount": 2
        }
    ]
}
```

For more information, see Reserved Instances for Amazon EC2 overview in the *Amazon EC2 User Guide*.

Example 2: To describe your Reserved Instances using filters

The following `describe-reserved-instances` example filters the response to include only three-year, t2.micro Linux/UNIX Reserved Instances in us-west-2c.

```
aws ec2 describe-reserved-instances \
    --filters Name=duration,Values=94608000 Name=instance-
type,Values=t2.micro Name=product-description,Values=Linux/UNIX Name=availability-
zone,Values=us-west-2c
```

Output:

```
{
    "ReservedInstances": [
        {
            "ReservedInstancesId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "OfferingType": "All Upfront",
            "AvailabilityZone": "us-west-2c",
            "End": "2018-03-26T21:34:34.000Z",
            "ProductDescription": "Linux/UNIX",
            "UsagePrice": 0.00,
            "RecurringCharges": [],
```

```
            "Start": "2015-03-27T21:34:35.848Z",
            "State": "active",
            "FixedPrice": 151.0,
            "CurrencyCode": "USD",
            "Duration": 94608000,
            "InstanceTenancy": "default",
            "InstanceType": "t2.micro",
            "InstanceCount": 1
        }
    ]
}
```

For more information, see Reserved Instances for Amazon EC2 overview in the *Amazon EC2 User Guide*.

- For API details, see DescribeReservedInstances in *AWS CLI Command Reference*.

`describe-route-tables`

The following code example shows how to use `describe-route-tables`.

AWS CLI

To describe your route tables

The following `describe-route-tables` example retrieves the details about your route tables.

```
aws ec2 describe-route-tables
```

Output:

```
{
    "RouteTables": [
        {
            "Associations": [
                {
                    "Main": true,
                    "RouteTableAssociationId": "rtbassoc-0df3f54e06EXAMPLE",
                    "RouteTableId": "rtb-09ba434c1bEXAMPLE"
                }
            ],
            "PropagatingVgws": [],
```

```
            "RouteTableId": "rtb-09ba434c1bEXAMPLE",
            "Routes": [
                {

                }
            ],
            "Tags": [],
            "VpcId": "vpc-0065acced4EXAMPLE",
            "OwnerId": "123456789012"
        }
    ]
}
```

For more information, see Working with Route Tables in the *AWS VPC User Guide*.

- For API details, see DescribeRouteTables in *AWS CLI Command Reference*.

`describe-scheduled-instance-availability`

The following code example shows how to use `describe-scheduled-instance-availability`.

AWS CLI

To describe an available schedule

The following `describe-scheduled-instance-availability` example describes a schedule that occurs every week on Sunday, starting on the specified date.

```
aws ec2 describe-scheduled-instance-availability \
    --recurrence Frequency=Weekly,Interval=1,OccurrenceDays=[1] \
    --first-slot-start-time-
range EarliestTime=2016-01-31T00:00:00Z,LatestTime=2016-01-31T04:00:00Z
```

Output:

```
{
    "ScheduledInstanceAvailabilitySet": [
        {
            "AvailabilityZone": "us-west-2b",
            "TotalScheduledInstanceHours": 1219,
            "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",
            "MinTermDurationInDays": 366,
            "AvailableInstanceCount": 20,
            "Recurrence": {
                "OccurrenceDaySet": [
                    1
                ],
                "Interval": 1,
                "Frequency": "Weekly",
                "OccurrenceRelativeToEnd": false
            },
            "Platform": "Linux/UNIX",
            "FirstSlotStartTime": "2016-01-31T00:00:00Z",
            "MaxTermDurationInDays": 366,
            "SlotDurationInHours": 23,
            "NetworkPlatform": "EC2-VPC",
            "InstanceType": "c4.large",
            "HourlyPrice": "0.095"
        }
    ]
}
```

To narrow the results, you can add filters that specify the operating system, network, and instance type.

Command:

--filters Name=platform,Values=Linux/UNIX Name=network-platform,Values=EC2-VPC Name=instance-type,Values=c4.large

For more information, see Amazon EC2 billing and purchasing options in the *Amazon EC2 User Guide*.

- For API details, see DescribeScheduledInstanceAvailability in *AWS CLI Command Reference*.

`describe-scheduled-instances`

The following code example shows how to use `describe-scheduled-instances`.

AWS CLI

To describe your Scheduled Instances

The following `describe-scheduled-instances` example describes the specified Scheduled Instance.

```
aws ec2 describe-scheduled-instances \
    --scheduled-instance-ids sci-1234-1234-1234-1234-123456789012
```

Output:

```
{
    "ScheduledInstanceSet": [
        {
            "AvailabilityZone": "us-west-2b",
            "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
            "HourlyPrice": "0.095",
            "CreateDate": "2016-01-25T21:43:38.612Z",
            "Recurrence": {
                "OccurrenceDaySet": [
                    1
                ],
                "Interval": 1,
                "Frequency": "Weekly",
                "OccurrenceRelativeToEnd": false,
                "OccurrenceUnit": ""
            },
```

```
            "Platform": "Linux/UNIX",
            "TermEndDate": "2017-01-31T09:00:00Z",
            "InstanceCount": 1,
            "SlotDurationInHours": 32,
            "TermStartDate": "2016-01-31T09:00:00Z",
            "NetworkPlatform": "EC2-VPC",
            "TotalScheduledInstanceHours": 1696,
            "NextSlotStartTime": "2016-01-31T09:00:00Z",
            "InstanceType": "c4.large"
        }
    ]
}
```

The following `describe-scheduled-instances` example describes all your Scheduled Instances.

```
aws ec2 describe-scheduled-instances
```

For more information, see Amazon EC2 billing and purchasing options in the *Amazon EC2 User Guide*.

- For API details, see DescribeScheduledInstances in *AWS CLI Command Reference*.

`describe-security-group-references`

The following code example shows how to use `describe-security-group-references`.

AWS CLI

To describe security group references

The following `describe-security-group-references` example describes the security group references for `sg-bbbbb22222`. The response indicates that security group `sg-bbbbb22222` is being referenced by a security group in VPC `vpc-aaaaaaaa`.

```
aws ec2 describe-security-group-references \
    --group-id sg-bbbbb22222
```

Output:

```
{
```

```
    "SecurityGroupReferenceSet": [
        {
            "ReferencingVpcId": "vpc-aaaaaaaa ",
            "GroupId": "sg-bbbbb22222",
            "VpcPeeringConnectionId": "pcx-b04deed9"
        }
    ]
}
```

For more information, see Identify your referenced security groups in the *Amazon VPC Peering Guide*.

- For API details, see DescribeSecurityGroupReferences in *AWS CLI Command Reference*.

`describe-security-group-rules`

The following code example shows how to use `describe-security-group-rules`.

AWS CLI

Example 1: To describe the security group rules for a security group

The following `describe-security-group-rules` example describes the security group rules of a specified security group. Use the `filters` option to scope the results to a specific security group.

```
aws ec2 describe-security-group-rules \
    --filters Name="group-id",Values="sg-1234567890abcdef0"
```

Output:

```
{
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-abcdef01234567890",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "-1",
            "FromPort": -1,
            "ToPort": -1,
            "ReferencedGroupInfo": {
```

```
                "GroupId": "sg-1234567890abcdef0",
                "UserId": "123456789012"
            },
            "Tags": []
        },
        {
            "SecurityGroupRuleId": "sgr-bcdef01234567890a",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": true,
            "IpProtocol": "-1",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv6": "::/0",
            "Tags": []
        },
        {
            "SecurityGroupRuleId": "sgr-cdef01234567890ab",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": true,
            "IpProtocol": "-1",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv4": "0.0.0.0/0",
            "Tags": []
        }
    ]
}
```

Example 2: To describe a security group rule

The following `describe-security-group-rules` example describes the specified security group rule.

```
aws ec2 describe-security-group-rules \
    --security-group-rule-ids sgr-cdef01234567890ab
```

Output:

```
{
    "SecurityGroupRules": [
        {
```

```
            "SecurityGroupRuleId": "sgr-cdef01234567890ab",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": true,
            "IpProtocol": "-1",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv4": "0.0.0.0/0",
            "Tags": []
        }
    ]
}
```

For more information, see Security group rules in the *Amazon VPC User Guide*.

- For API details, see DescribeSecurityGroupRules in *AWS CLI Command Reference*.

`describe-security-group-vpc-associations`

The following code example shows how to use `describe-security-group-vpc-associations`.

AWS CLI

To describe VPC associations

The following `describe-security-group-vpc-associations` example describes the VPC associations for the specified security group.

```
aws ec2 describe-security-group-vpc-associations \
    --filters Name=group-id,Values=sg-04dbb43907d3f8a78
```

Output:

```
{
    "SecurityGroupVpcAssociations": [
        {
            "GroupId": "sg-04dbb43907d3f8a78",
            "VpcId": "vpc-0bf4c2739bc05a694",
            "VpcOwnerId": "123456789012",
            "State": "associated"
        }
```

```
    ]
}
```

For more information, see Associate security groups with multiple VPCs in the *Amazon VPC User Guide*.

- For API details, see DescribeSecurityGroupVpcAssociations in *AWS CLI Command Reference*.

`describe-security-groups`

The following code example shows how to use `describe-security-groups`.

AWS CLI

Example 1: To describe a security group

The following `describe-security-groups` example describes the specified security group.

```
aws ec2 describe-security-groups \
    --group-ids sg-903004f8
```

Output:

```
{
    "SecurityGroups": [
        {
            "IpPermissionsEgress": [
                {
                    "IpProtocol": "-1",
                    "IpRanges": [
                        {
                            "CidrIp": "0.0.0.0/0"
                        }
                    ],
                    "UserIdGroupPairs": [],
                    "PrefixListIds": []
                }
            ],
            "Description": "My security group",
            "Tags": [
                {
                    "Value": "SG1",
```

```
                    "Key": "Name"
                }
            ],
            "IpPermissions": [
                {
                    "IpProtocol": "-1",
                    "IpRanges": [],
                    "UserIdGroupPairs": [
                        {
                            "UserId": "123456789012",
                            "GroupId": "sg-903004f8"
                        }
                    ],
                    "PrefixListIds": []
                },
                {
                    "PrefixListIds": [],
                    "FromPort": 22,
                    "IpRanges": [
                        {
                            "Description": "Access from NY office",
                            "CidrIp": "203.0.113.0/24"
                        }
                    ],
                    "ToPort": 22,
                    "IpProtocol": "tcp",
                    "UserIdGroupPairs": []
                }
            ],
            "GroupName": "MySecurityGroup",
            "VpcId": "vpc-1a2b3c4d",
            "OwnerId": "123456789012",
            "GroupId": "sg-903004f8"
        }
    ]
}
```

Example 2: To describe security groups that have specific rules

The following `describe-security-groups` example uses filters to scope the results to security groups that have a rule that allows SSH traffic (port 22) and a rule that allows traffic from all addresses (`0.0.0.0/0`). The example uses the `--query` parameter to display only the names of the security groups. Security groups must match all filters to be returned in the

results; however, a single rule does not have to match all filters. For example, the output returns a security group with a rule that allows SSH traffic from a specific IP address and another rule that allows HTTP traffic from all addresses.

```
aws ec2 describe-security-groups \
    --filters Name=ip-permission.from-port,Values=22 Name=ip-permission.to-
port,Values=22 Name=ip-permission.cidr,Values='0.0.0.0/0' \
    --query "SecurityGroups[*].[GroupName]"
```

Output:

```
[
    [
        "default"
    ],
    [
        "my-security-group"
    ],
    [
        "web-servers"
    ],
    [
        "launch-wizard-1"
    ]
]
```

Example 3: To describe security groups based on tags

The following `describe-security-groups` example uses filters to scope the results to security groups that include `test` in the security group name, and that have the tag `Test=To-delete`. The example uses the `--query` parameter to display only the names and IDs of the security groups.

```
aws ec2 describe-security-groups \
    --filters Name=group-name,Values=*test* Name=tag:Test,Values=To-delete \
    --query "SecurityGroups[*].{Name:GroupName,ID:GroupId}"
```

Output:

```
[
    {
```

```
        "Name": "testfornewinstance",
        "ID": "sg-33bb22aa"
    },
    {
        "Name": "newgrouptest",
        "ID": "sg-1a2b3c4d"
    }
]
```

For additional examples using tag filters, see Working with tags in the *Amazon EC2 User Guide*.

- For API details, see DescribeSecurityGroups in *AWS CLI Command Reference*.

`describe-snapshot-attribute`

The following code example shows how to use `describe-snapshot-attribute`.

AWS CLI

To describe the snapshot attributes for a snapshot

The following `describe-snapshot-attribute` example lists the accounts with which a snapshot is shared.

```
aws ec2 describe-snapshot-attribute \
    --snapshot-id snap-01234567890abcedf \
    --attribute createVolumePermission
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "CreateVolumePermissions": [
        {
            "UserId": "123456789012"
        }
    ]
}
```

For more information, see Share an Amazon EBS snapshot in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see DescribeSnapshotAttribute in *AWS CLI Command Reference*.

`describe-snapshot-tier-status`

The following code example shows how to use `describe-snapshot-tier-status`.

AWS CLI

To view archival information about an archived snapshot

The following `describe-snapshot-tier-status` example provides archival information about an archived snapshot.

```
aws ec2 describe-snapshot-tier-status \
    --filters "Name=snapshot-id, Values=snap-01234567890abcedf"
```

Output:

```
{
    "SnapshotTierStatuses": [
        {
            "Status": "completed",
            "ArchivalCompleteTime": "2021-09-15T17:33:16.147Z",
            "LastTieringProgress": 100,
            "Tags": [],
            "VolumeId": "vol-01234567890abcedf",
            "LastTieringOperationStatus": "archival-completed",
            "StorageTier": "archive",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-01234567890abcedf",
            "LastTieringStartTime": "2021-09-15T16:44:37.574Z"
        }
    ]
}
```

For more information, see View archived Amazon EBS snapshots in the *Amazon EBS User Guide*.

- For API details, see DescribeSnapshotTierStatus in *AWS CLI Command Reference*.

`describe-snapshots`

The following code example shows how to use `describe-snapshots`.

AWS CLI

Example 1: To describe a snapshot

The following `describe-snapshots` example describes the specified snapshot.

```
aws ec2 describe-snapshots \
    --snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "This is my snapshot",
            "Encrypted": false,
            "VolumeId": "vol-049df61146c4d7901",
            "State": "completed",
            "VolumeSize": 8,
            "StartTime": "2019-02-28T21:28:32.000Z",
            "Progress": "100%",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-01234567890abcdef",
            "Tags": [
                {
                    "Key": "Stack",
                    "Value": "test"
                }
            ]
        }
    ]
}
```

For more information, see Amazon EBS snapshots in the *Amazon EC2 User Guide*.

Example 2: To describe snapshots based on filters

The following `describe-snapshots` example uses filters to scope the results to snapshots owned by your AWS account that are in the `pending` state. The example uses the `--query` parameter to display only the snapshot IDs and the time the snapshot was started.

```
aws ec2 describe-snapshots \
```

```
    --owner-ids self \
    --filters Name=status,Values=pending \
    --query "Snapshots[*].{ID:SnapshotId,Time:StartTime}"
```

Output:

```
[
    {
        "ID": "snap-1234567890abcdef0",
        "Time": "2019-08-04T12:48:18.000Z"
    },
    {
        "ID": "snap-0a1b2c3d4e5f6a7b8",
        "Time": "2019-08-04T02:45:16.000Z"
    }
]
```

The following `describe-snapshots` example uses filters to scope the results to snapshots created from the specified volume. The example uses the `--query` parameter to display only the snapshot IDs.

```
aws ec2 describe-snapshots \
    --filters Name=volume-id,Values=049df61146c4d7901 \
    --query "Snapshots[*].[SnapshotId]" \
    --output text
```

Output:

```
[
    [
        "snap-1234567890abcdef0"
    ],
    [
        "snap-08637175a712c3fb9"
    ],
    ...
]
```

For additional examples using filters, see Listing and filtering your resources in the *Amazon EC2 User Guide*.

Example 3: To describe snapshots based on tags

The following `describe-snapshots` example uses tag filters to scope the results to snapshots that have the tag `Stack=Prod`.

```
aws ec2 describe-snapshots \
    --filters Name=tag:Stack,Values=prod
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "This is my prod snapshot",
            "Encrypted": false,
            "VolumeId": "vol-049df61146c4d7901",
            "State": "completed",
            "VolumeSize": 8,
            "StartTime": "2019-02-28T21:28:32.000Z",
            "Progress": "100%",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-0abcdef1234567890",
            "Tags": [
                {
                    "Key": "Stack",
                    "Value": "prod"
                }
            ]
        }
    ]
}
```

For additional examples using tag filters, see Working with tags in the *Amazon EC2 User Guide*.

Example 4: To describe snapshots based on age

The following `describe-snapshots` example uses JMESPath expressions to describe all snapshots created by your AWS account before the specified date. It displays only the snapshot IDs.

```
aws ec2 describe-snapshots \
```

```
    --owner-ids 123456789012 \
    --query "Snapshots[?(StartTime<='2020-03-31')].[SnapshotId]"
```

Output:

```
[
    [
        "snap-1234567890abcdef0"
    ],
    [
        "snap-08637175a712c3fb9"
    ]
]
```

For additional examples using filters, see Listing and filtering your resources in the *Amazon EC2 User Guide*.

Example 5: To view only archived snapshots

The following `describe-snapshots` example lists only snapshots that are stored in the archive tier.

```
aws ec2 describe-snapshots \
    --filters "Name=storage-tier,Values=archive"
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "Snap A",
            "Encrypted": false,
            "VolumeId": "vol-01234567890aaaaaa",
            "State": "completed",
            "VolumeSize": 8,
            "StartTime": "2021-09-07T21:00:00.000Z",
            "Progress": "100%",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-01234567890aaaaaa",
            "StorageTier": "archive",
            "Tags": []
```

```
        }
    ]
}
```

For more information, see View archived Amazon EBS snapshots in the *Amazon EBS User Guide*.

- For API details, see DescribeSnapshots in *AWS CLI Command Reference*.

`describe-spot-datafeed-subscription`

The following code example shows how to use `describe-spot-datafeed-subscription`.

AWS CLI

To describe Spot Instance datafeed subscription for an account

The following `describe-spot-datafeed-subscription` example describes the data feed for the account.

```
aws ec2 describe-spot-datafeed-subscription
```

Output:

```
{
    "SpotDatafeedSubscription": {
        "OwnerId": "123456789012",
        "Prefix": "spotdata",
        "Bucket": "amzn-s3-demo-bucket",
        "State": "Active"
    }
}
```

For more information, see Track your Spot Instance costs using the Spot Instance data feed in the *Amazon EC2 User Guide*.

- For API details, see DescribeSpotDatafeedSubscription in *AWS CLI Command Reference*.

`describe-spot-fleet-instances`

The following code example shows how to use `describe-spot-fleet-instances`.

AWS CLI

To describe the Spot Instances associated with a Spot fleet

The following `describe-spot-fleet-instances` example lists the Spot instances associated with the specified Spot fleet.

```
aws ec2 describe-spot-fleet-instances \
    --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
    "ActiveInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "InstanceType": "m3.medium",
            "SpotInstanceRequestId": "sir-08b93456"
        }
    ],
    "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

For more information, see Describe a Spot Fleet request, its instances, and event history in the *Amazon EC2 User Guide*.

- For API details, see DescribeSpotFleetInstances in *AWS CLI Command Reference*.

`describe-spot-fleet-request-history`

The following code example shows how to use `describe-spot-fleet-request-history`.

AWS CLI

To describe Spot fleet history

The following `describe-spot-fleet-request-history` example returns the history for the specified Spot fleet starting at the specified time.

```
aws ec2 describe-spot-fleet-request-history \
    --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --start-time 2015-05-26T00:00:00Z
```

The following example output shows the successful launches of two Spot Instances for the Spot fleet.

Output:

```
{
    "HistoryRecords": [
        {
            "Timestamp": "2015-05-26T23:17:20.697Z",
            "EventInformation": {
                "EventSubType": "submitted"
            },
            "EventType": "fleetRequestChange"
        },
        {
            "Timestamp": "2015-05-26T23:17:20.873Z",
            "EventInformation": {
                "EventSubType": "active"
            },
            "EventType": "fleetRequestChange"
        },
        {
            "Timestamp": "2015-05-26T23:21:21.712Z",
            "EventInformation": {
                "InstanceId": "i-1234567890abcdef0",
                "EventSubType": "launched"
            },
            "EventType": "instanceChange"
        },
        {
            "Timestamp": "2015-05-26T23:21:21.816Z",
            "EventInformation": {
                "InstanceId": "i-1234567890abcdef1",
                "EventSubType": "launched"
            },
            "EventType": "instanceChange"
        }
    ],
    "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
    "NextToken": "CpHNsscimcV5oH7bSbub03CI2Qms5+ypNpNm

    "StartTime": "2015-05-26T00:00:00Z"
```

```
}
```

For more information, see Describe a Spot Fleet request, its instances, and event history in the *Amazon EC2 User Guide*.

- For API details, see DescribeSpotFleetRequestHistory in *AWS CLI Command Reference*.

`describe-spot-fleet-requests`

The following code example shows how to use `describe-spot-fleet-requests`.

AWS CLI

Example 1: To describe your Spot fleet requests

The following `describe-spot-fleet-requests` example describes all of your Spot fleet requests.

```
aws ec2 describe-spot-fleet-requests
```

Output:

```
{
    "SpotFleetRequestConfigs": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "SpotFleetRequestConfig": {
                "TargetCapacity": 20,
                "LaunchSpecifications": [
                    {
                        "EbsOptimized": false,
                        "NetworkInterfaces": [
                            {
                                "SubnetId": "subnet-a61dafcf",
                                "DeviceIndex": 0,

`describe-spot-instance-requests`

The following code example shows how to use `describe-spot-instance-requests`.

AWS CLI

Example 1: To describe a Spot Instance request

The following `describe-spot-instance-requests` example describes the specified Spot Instance request.

```
aws ec2 describe-spot-instance-requests \
    --spot-instance-request-ids sir-08b93456
```

Output:

```
{
    "SpotInstanceRequests": [
        {
            "CreateTime": "2018-04-30T18:14:55.000Z",
```

```
            "InstanceId": "i-1234567890abcdef1",
            "LaunchSpecification": {
                "InstanceType": "t2.micro",
                "ImageId": "ami-003634241a8fcdec0",
                "KeyName": "my-key-pair",
                "SecurityGroups": [
                    {
                        "GroupName": "default",
                        "GroupId": "sg-e38f24a7"
                    }
                ],
                "BlockDeviceMappings": [
                    {
                        "DeviceName": "/dev/sda1",
                        "Ebs": {
                            "DeleteOnTermination": true,
                            "SnapshotId": "snap-0e54a519c999adbbd",
                            "VolumeSize": 8,
                            "VolumeType": "standard",
                            "Encrypted": false
                        }
                    }
                ],
                "NetworkInterfaces": [
                    {
                        "DeleteOnTermination": true,
                        "DeviceIndex": 0,
                        "SubnetId": "subnet-049df61146c4d7901"
                    }
                ],
                "Placement": {
                    "AvailabilityZone": "us-west-2b",
                    "Tenancy": "default"
                },
                "Monitoring": {
                    "Enabled": false
                }
            },
            "LaunchedAvailabilityZone": "us-west-2b",
            "ProductDescription": "Linux/UNIX",
            "SpotInstanceRequestId": "sir-08b93456",
            "SpotPrice": "0.010000",
            "State": "active",
            "Status": {
```

```
                "Code": "fulfilled",
                "Message": "Your Spot request is fulfilled.",
                "UpdateTime": "2018-04-30T18:16:21.000Z"
            },
            "Tags": [],
            "Type": "one-time",
            "InstanceInterruptionBehavior": "terminate"
        }
    ]
}
```

Example 2: To describe Spot Instance requests based on filters

The following `describe-spot-instance-requests` example uses filters to scope the results to Spot Instance requests with the specified instance type in the specified Availability Zone. The example uses the `--query` parameter to display only the instance IDs.

```
aws ec2 describe-spot-instance-requests \
    --filters Name=launch.instance-type,Values=m3.medium Name=launched-availability-zone,Values=us-west-2a \
    --query "SpotInstanceRequests[*].[InstanceId]" \
    --output text
```

Output:

```
[
    [
        "i-057750d42936e468a"
    ],
    [
        "i-001efd250faaa6ffa"
    ],
    [
        "i-027552a73f021f3bd"
    ],
    ...
]
```

For additional examples using filters, see Listing and filtering your resources in the *Amazon Elastic Compute Cloud User Guide*.

Example 3: To describe Spot Instance requests based on tags

The following `describe-spot-instance-requests` example uses tag filters to scope the results to Spot Instance requests that have the tag `cost-center=cc123`.

```
aws ec2 describe-spot-instance-requests \
    --filters Name=tag:cost-center,Values=cc123
```

Output:

```
{
    "SpotInstanceRequests": [
        {
            "CreateTime": "2018-04-30T18:14:55.000Z",
            "InstanceId": "i-1234567890abcdef2",
            "LaunchSpecification": {
                "InstanceType": "t2.micro",
                "ImageId": "ami-003634241a8fcdec0",
                "KeyName": "my-key-pair",
                "SecurityGroups": [
                    {
                        "GroupName": "default",
                        "GroupId": "sg-e38f24a7"
                    }
                ],
                "Placement": {
                    "AvailabilityZone": "us-west-2b",
                    "Tenancy": "default"
                },
                "Monitoring": {
                    "Enabled": false
                }
            },
            "LaunchedAvailabilityZone": "us-west-2b",
            "ProductDescription": "Linux/UNIX",
            "SpotInstanceRequestId": "sir-0a1b2c3d",
            "SpotPrice": "0.010000",
            "State": "active",
            "Status": {
                "Code": "fulfilled",
                "Message": "Your Spot request is fulfilled.",
                "UpdateTime": "2018-04-30T18:16:21.000Z"
            },
            "Tags": [
                {
```

```
                    "Key": "cost-center",
                    "Value": "cc123"
                }
            ],
            "Type": "one-time",
            "InstanceInterruptionBehavior": "terminate"
        }
    ]
}
```

For additional examples using tag filters, see Working with tags in the *Amazon EC2 User Guide*.

- For API details, see DescribeSpotInstanceRequests in *AWS CLI Command Reference*.

`describe-spot-price-history`

The following code example shows how to use `describe-spot-price-history`.

AWS CLI

Example 1: To describe Spot price history

The following `describe-spot-price-history` example returns the Spot Price history for m1.xlarge instances for a particular day in January.

```
aws ec2 describe-spot-price-history \
    --instance-types m1.xlarge \
    --start-time 2014-01-06T07:08:09 \
    --end-time 2014-01-06T08:09:10
```

Output:

```
{
    "SpotPriceHistory": [
        {
            "Timestamp": "2014-01-06T07:10:55.000Z",
            "ProductDescription": "SUSE Linux",
            "InstanceType": "m1.xlarge",
            "SpotPrice": "0.087000",
            "AvailabilityZone": "us-west-2b"
        },
        {
```

```
            "Timestamp": "2014-01-06T07:10:55.000Z",
            "ProductDescription": "SUSE Linux",
            "InstanceType": "m1.xlarge",
            "SpotPrice": "0.087000",
            "AvailabilityZone": "us-west-2c"
        },
        {
            "Timestamp": "2014-01-06T05:42:36.000Z",
            "ProductDescription": "SUSE Linux (Amazon VPC)",
            "InstanceType": "m1.xlarge",
            "SpotPrice": "0.087000",
            "AvailabilityZone": "us-west-2a"
        }
    ]
}
```

For more information, see View Spot Instance pricing history in the *Amazon EC2 User Guide*.

Example 2: To describe Spot price history for Linux/UNIX Amazon VPC

The following `describe-spot-price-history` example returns the Spot Price history for m1.xlarge, Linux/UNIX Amazon VPC instances for a particular day in January.

```
aws ec2 describe-spot-price-history \
    --instance-types m1.xlarge \
    --product-descriptions "Linux/UNIX (Amazon VPC)" \
    --start-time 2014-01-06T07:08:09 \
    --end-time 2014-01-06T08:09:10
```

Output:

```
{
    "SpotPriceHistory": [
        {
            "Timestamp": "2014-01-06T04:32:53.000Z",
            "ProductDescription": "Linux/UNIX (Amazon VPC)",
            "InstanceType": "m1.xlarge",
            "SpotPrice": "0.080000",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "Timestamp": "2014-01-05T11:28:26.000Z",
```

```
            "ProductDescription": "Linux/UNIX (Amazon VPC)",
            "InstanceType": "m1.xlarge",
            "SpotPrice": "0.080000",
            "AvailabilityZone": "us-west-2c"
        }
    ]
}
```

For more information, see View Spot Instance pricing history in the *Amazon EC2 User Guide*.

- For API details, see DescribeSpotPriceHistory in *AWS CLI Command Reference*.

`describe-stale-security-groups`

The following code example shows how to use `describe-stale-security-groups`.

AWS CLI

To describe stale security groups

The following `describe-stale-security-groups` example describes stale security group rules for `vpc-11223344`. The response shows that `sg-5fa68d3a` in your account has a stale ingress SSH rule that references `sg-279ab042` in the peer VPC, and that `sg-fe6fba9a` in your account has a stale egress SSH rule that references `sg-ef6fba8b` in the peer VPC.

```
aws ec2 describe-stale-security-groups \
    --vpc-id vpc-11223344
```

Output:

```
{
    "StaleSecurityGroupSet": [
        {
            "VpcId": "vpc-11223344",
            "StaleIpPermissionsEgress": [
                {
                    "ToPort": 22,
                    "FromPort": 22,
                    "UserIdGroupPairs": [
                        {
                            "VpcId": "vpc-7a20e51f",
```

```
                            "GroupId": "sg-ef6fba8b",
                            "VpcPeeringConnectionId": "pcx-b04deed9",
                            "PeeringStatus": "active"
                        }
                    ],
                    "IpProtocol": "tcp"
                }
            ],
            "GroupName": "MySG1",

            "Description": "MySG2"
        }
    ]
}
```

For more information, see View and delete with stale security group rules in the *Amazon VPC Peering Guide*.

- For API details, see DescribeStaleSecurityGroups in *AWS CLI Command Reference*.

`describe-store-image-tasks`

The following code example shows how to use `describe-store-image-tasks`.

AWS CLI

To describe the progress of an AMI store task

The following `describe-store-image-tasks` example describes the progress of an AMI store task.

```
aws ec2 describe-store-image-tasks
```

Output:

```
{
    "StoreImageTaskResults": [
        {
            "AmiId": "ami-1234567890abcdef0",
            "Bucket": "amzn-s3-demo-bucket",
            "ProgressPercentage": 17,
            "S3objectKey": "ami-1234567890abcdef0.bin",
            "StoreTaskState": "InProgress",
            "StoreTaskFailureReason": null,
            "TaskStartTime": "2022-01-01T01:01:01.001Z"
        }
    ]
}
```

For more information, see Store and restore an AMI using S3 in the *Amazon EC2 User Guide*.

- For API details, see DescribeStoreImageTasks in *AWS CLI Command Reference*.

`describe-subnets`

The following code example shows how to use `describe-subnets`.

AWS CLI

Example 1: To describe all your subnets

The following `describe-subnets` example displays the details of your subnets.

```
aws ec2 describe-subnets
```

Output:

```
{
    "Subnets": [
        {
            "AvailabilityZone": "us-west-2d",
            "AvailabilityZoneId": "use1-az2",
            "AvailableIpAddressCount": 4089,
            "CidrBlock": "172.31.80.0/20",
            "DefaultForAz": true,
            "MapPublicIpOnLaunch": false,
            "MapCustomerOwnedIpOnLaunch": true,
            "State": "available",
            "SubnetId": "subnet-0bb1c79de3EXAMPLE",
            "VpcId": "vpc-0ee975135dEXAMPLE",
            "OwnerId": "123456789012",
            "AssignIpv6AddressOnCreation": false,
            "Ipv6CidrBlockAssociationSet": [],
            "CustomerOwnedIpv4Pool": "pool-2EXAMPLE",
            "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0bb1c79de3EXAMPLE",
            "EnableDns64": false,
            "Ipv6Native": false,
            "PrivateDnsNameOptionsOnLaunch": {
                "HostnameType": "ip-name",
                "EnableResourceNameDnsARecord": false,
                "EnableResourceNameDnsAAAARecord": false
            }
        },
        {
            "AvailabilityZone": "us-west-2d",
            "AvailabilityZoneId": "use1-az2",
            "AvailableIpAddressCount": 4089,
            "CidrBlock": "172.31.80.0/20",
            "DefaultForAz": true,
            "MapPublicIpOnLaunch": true,
            "MapCustomerOwnedIpOnLaunch": false,
            "State": "available",
            "SubnetId": "subnet-8EXAMPLE",
            "VpcId": "vpc-3EXAMPLE",
            "OwnerId": "1111222233333",
```

```
            "AssignIpv6AddressOnCreation": false,
            "Ipv6CidrBlockAssociationSet": [],
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "MySubnet"
                }
            ],
            "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-8EXAMPLE",
            "EnableDns64": false,
            "Ipv6Native": false,
            "PrivateDnsNameOptionsOnLaunch": {
                "HostnameType": "ip-name",
                "EnableResourceNameDnsARecord": false,
                "EnableResourceNameDnsAAAARecord": false
            }
        }
    ]
}
```

For more information, see Working with VPCs and Subnets in the *AWS VPC User Guide*.

Example 2: To describe the subnets of a specific VPC

The following `describe-subnets` example uses a filter to retrieve details for the subnets of the specified VPC.

```
aws ec2 describe-subnets \
    --filters "Name=vpc-id,Values=vpc-3EXAMPLE"
```

Output:

```
{
    "Subnets": [
        {
            "AvailabilityZone": "us-west-2d",
            "AvailabilityZoneId": "use1-az2",
            "AvailableIpAddressCount": 4089,
            "CidrBlock": "172.31.80.0/20",
            "DefaultForAz": true,
            "MapPublicIpOnLaunch": true,
            "MapCustomerOwnedIpOnLaunch": false,
```

```
            "State": "available",
            "SubnetId": "subnet-8EXAMPLE",
            "VpcId": "vpc-3EXAMPLE",
            "OwnerId": "1111222233333",
            "AssignIpv6AddressOnCreation": false,
            "Ipv6CidrBlockAssociationSet": [],
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "MySubnet"
                }
            ],
            "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-8EXAMPLE",
            "EnableDns64": false,
            "Ipv6Native": false,
            "PrivateDnsNameOptionsOnLaunch": {
                "HostnameType": "ip-name",
                "EnableResourceNameDnsARecord": false,
                "EnableResourceNameDnsAAAARecord": false
            }
        }
    ]
}
```

For more information, see Working with VPCs and Subnets in the *AWS VPC User Guide*.

Example 3: To describe the subnets with a specific tag

The following `describe-subnets` example uses a filter to retrieve the details of those subnets with the tag `CostCenter=123` and the `--query` parameter to display the subnet IDs of the subnets with this tag.

```
aws ec2 describe-subnets \
    --filters "Name=tag:CostCenter,Values=123" \
    --query "Subnets[*].SubnetId"
```

Output:

```
[
    "subnet-0987a87c8b37348ef",
    "subnet-02a95061c45f372ee",
    "subnet-03f720e7de2788d73"
```

```
]
```

For more information, see Working with VPCs and Subnets in the *Amazon VPC User Guide*.

- For API details, see DescribeSubnets in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

Example 1: To describe all tags for a single resource

The following `describe-tags` example describes the tags for the specified instance.

```
aws ec2 describe-tags \
    --filters "Name=resource-id,Values=i-1234567890abcdef8"
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Test",
            "Key": "Stack"
        },
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Beta Server",
            "Key": "Name"
        }
    ]
}
```

For more information, see Tag your Amazon EC2 resources in the *Amazon EC2 User Guide*.

Example 2: To describe all tags for a resource type

The following `describe-tags` example describes the tags for your volumes.

```
aws ec2 describe-tags \
    --filters "Name=resource-type,Values=volume"
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "volume",
            "ResourceId": "vol-1234567890abcdef0",
            "Value": "Project1",
            "Key": "Purpose"
        },
        {
            "ResourceType": "volume",
            "ResourceId": "vol-049df61146c4d7901",
            "Value": "Logs",
            "Key": "Purpose"
        }
    ]
}
```

For more information, see Tag your Amazon EC2 resources in the *Amazon EC2 User Guide*.

Example 3: To describe all your tags

The following `describe-tags` example describes the tags for all your resources.

```
aws ec2 describe-tags
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Test",
            "Key": "Stack"
        },
        {
            "ResourceType": "instance",
```

```
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Beta Server",
            "Key": "Name"
        },
        {
            "ResourceType": "volume",
            "ResourceId": "vol-049df61146c4d7901",
            "Value": "Logs",
            "Key": "Purpose"
        }
    ]
}
```

For more information, see Tag your Amazon EC2 resources in the *Amazon EC2 User Guide*.

Example 4: To describe the tags for your resources based on a tag key

The following `describe-tags` example describes the tags for your resources that have a tag with the key `Stack`.

```
aws ec2 describe-tags \
    --filters Name=key,Values=Stack
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "volume",
            "ResourceId": "vol-027552a73f021f3b",
            "Value": "Production",
            "Key": "Stack"
        },
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Test",
            "Key": "Stack"
        }
    ]
}
```

For more information, see Tag your Amazon EC2 resources in the *Amazon EC2 User Guide*.

Example 5: To describe the tags for your resources based on a tag key and tag value

The following `describe-tags` example describes the tags for your resources that have the tag `Stack=Test`.

```
aws ec2 describe-tags \
    --filters Name=key,Values=Stack Name=value,Values=Test
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "image",
            "ResourceId": "ami-3ac336533f021f3bd",
            "Value": "Test",
            "Key": "Stack"
        },
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Test",
            "Key": "Stack"
        }
    ]
}
```

The following `describe-tags` example uses alternate syntax to describe resources with the tag `Stack=Test`.

```
aws ec2 describe-tags \
    --filters "Name=tag:Stack,Values=Test"
```

The following `describe-tags` example describes the tags for all your instances that have a tag with the key `Purpose` and no value.

```
aws ec2 describe-tags \
    --filters "Name=resource-
type,Values=instance" "Name=key,Values=Purpose" "Name=value,Values="
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef5",
            "Value": "",
            "Key": "Purpose"
        }
    ]
}
```

For more information, see Tag your Amazon EC2 resources in the *Amazon EC2 User Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`describe-traffic-mirror-filters`

The following code example shows how to use `describe-traffic-mirror-filters`.

AWS CLI

To view your traffic mirror filters

The following `describe-traffic-mirror-filters` example displays details for all of your traffic mirror filters.

```
aws ec2 describe-traffic-mirror-filters
```

Output:

```
{
    "TrafficMirrorFilters": [
        {
            "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
            "IngressFilterRules": [
                {
                    "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
                    "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
                    "TrafficDirection": "ingress",
                    "RuleNumber": 100,
                    "RuleAction": "accept",
                    "Protocol": 6,
```

```
                    "DestinationCidrBlock": "10.0.0.0/24",
                    "SourceCidrBlock": "10.0.0.0/24",
                    "Description": "TCP Rule"
                }
            ],
            "EgressFilterRules": [],
            "NetworkServices": [],
            "Description": "Example filter",
            "Tags": []
        }
    ]
}
```

For more information, see Create, modify, or delete a traffic mirror filter in the *Traffic Mirroring Guide*.

- For API details, see DescribeTrafficMirrorFilters in *AWS CLI Command Reference*.

`describe-traffic-mirror-sessions`

The following code example shows how to use `describe-traffic-mirror-sessions`.

AWS CLI

To describe a Traffic Mirror Session

The following `describe-traffic-mirror-sessions` example displays details of the your Traffic Mirror sessions.

```
aws ec2 describe-traffic-mirror-sessions
```

Output:

```
{
    "TrafficMirrorSessions": [
        {
            "Tags": [],
            "VirtualNetworkId": 42,
            "OwnerId": "123456789012",
            "Description": "TCP Session",
            "NetworkInterfaceId": "eni-0a471a5cf3EXAMPLE",
            "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
            "TrafficMirrorFilterId": "tmf-083e18f985EXAMPLE",
```

```
            "PacketLength": 20,
            "SessionNumber": 1,
            "TrafficMirrorSessionId": "tms-0567a4c684EXAMPLE"
        },
        {
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "tag test"
                }
            ],
            "VirtualNetworkId": 13314501,
            "OwnerId": "123456789012",
            "Description": "TCP Session",
            "NetworkInterfaceId": "eni-0a471a5cf3EXAMPLE",
            "TrafficMirrorTargetId": "tmt-03665551cbEXAMPLE",
            "TrafficMirrorFilterId": "tmf-06c787846cEXAMPLE",
            "SessionNumber": 2,
            "TrafficMirrorSessionId": "tms-0060101cf8EXAMPLE"
        }
    ]
}
```

For more information, see Create, modify, or delete a traffic mirror session in the *AWS Traffic Mirroring Guide*.

- For API details, see DescribeTrafficMirrorSessions in *AWS CLI Command Reference*.

`describe-traffic-mirror-targets`

The following code example shows how to use `describe-traffic-mirror-targets`.

AWS CLI

To describe a traffic mirror target

The following `describe-traffic-mirror-targets` example displays information about the specified traffic mirror target.

```
aws ec2 describe-traffic-mirror-targets \
    --traffic-mirror-target-ids tmt-0dabe9b0a6EXAMPLE
```

Output:

```
{
    "TrafficMirrorTargets": [
        {
            "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
            "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/NLB/7cdec873fEXAMPLE",
            "Type": "network-load-balancer",
            "Description": "Example Network Load Balancer target",
            "OwnerId": "123456789012",
            "Tags": []
        }
    ]
}
```

For more information, see View traffic mirror targets and modify target tags in the *Amazon VPC Traffic Mirroring Guide*.

- For API details, see DescribeTrafficMirrorTargets in *AWS CLI Command Reference*.

`describe-transit-gateway-attachments`

The following code example shows how to use `describe-transit-gateway-attachments`.

AWS CLI

To view your transit gateway attachments

The following `describe-transit-gateway-attachments` example displays details for your transit gateway attachments.

```
aws ec2 describe-transit-gateway-attachments
```

Output:

```
{
    "TransitGatewayAttachments": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
            "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
            "TransitGatewayOwnerId": "123456789012",
            "ResourceOwnerId": "123456789012",
            "ResourceType": "vpc",
```

```
            "ResourceId": "vpc-3EXAMPLE",
            "State": "available",
            "Association": {
                "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
                "State": "associated"
            },
            "CreationTime": "2019-08-26T14:59:25.000Z",
            "Tags": [
                {
                    "Key": "Name",

            "State": "available",
            "CreationTime": "2021-03-09T19:59:17+00:00",
            "Options": {
                "Protocol": "gre"
            },
            "Tags": []
        }
    ]
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the *Transit Gateways Guide*.

- For API details, see DescribeTransitGatewayConnects in *AWS CLI Command Reference*.

`describe-transit-gateway-multicast-domains`

The following code example shows how to use `describe-transit-gateway-multicast-domains`.

AWS CLI

To describe your transit gateway multicast domains

The following `describe-transit-gateway-multicast-domains` example displays details for all of your transit gateway multicast domains.

```
aws ec2 describe-transit-gateway-multicast-domains
```

Output:

```
{

    "TransitGatewayMulticastDomains": [
        {
            "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
            "TransitGatewayId": "tgw-0bf0bffefaEXAMPLE",
            "TransitGatewayMulticastDomainArn": "arn:aws:ec2:us-
west-2:123456789012:transit-gateway-multicast-domain/tgw-mcast-
domain-000fb24d04EXAMPLE",
            "OwnerId": "123456789012",
            "Options": {
                "Igmpv2Support": "disable",
                "StaticSourcesSupport": "enable",
                "AutoAcceptSharedAssociations": "disable"
            },
            "State": "available",
            "CreationTime": "2019-12-10T18:32:50+00:00",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "mc1"
                }
            ]
        }
    ]
}
```

For more information, see Multicast domains in AWS Transit Gateway in the *Transit Gateways Guide*.

- For API details, see DescribeTransitGatewayMulticastDomains in *AWS CLI Command Reference*.

`describe-transit-gateway-peering-attachments`

The following code example shows how to use `describe-transit-gateway-peering-attachments`.

AWS CLI

To describe your transit gateway peering attachments

The following `describe-transit-gateway-peering-attachments` example displays details for all of your transit gateway peering attachments.

```
aws ec2 describe-transit-gateway-peering-attachments
```

Output:

```
{
    "TransitGatewayPeeringAttachments": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
            "RequesterTgwInfo": {
                "TransitGatewayId": "tgw-123abc05e04123abc",
                "OwnerId": "123456789012",
                "Region": "us-west-2"
            },
            "AccepterTgwInfo": {
                "TransitGatewayId": "tgw-11223344aabbcc112",
                "OwnerId": "123456789012",
                "Region": "us-east-2"
            },
            "State": "pendingAcceptance",
            "CreationTime": "2019-12-09T11:38:05.000Z",
            "Tags": []
        }
    ]
}
```

For more information, see Transit Gateway Peering Attachments in the *Transit Gateways Guide*.

- For API details, see DescribeTransitGatewayPeeringAttachments in *AWS CLI Command Reference*.

`describe-transit-gateway-policy-tables`

The following code example shows how to use `describe-transit-gateway-policy-tables`.

AWS CLI

To describe a transit gateway policy table

The following `describe-transit-gateway-policy-tables` example describes the specified transit gateway policy table.

```
aws ec2 describe-transit-gateway-policy-tables \
    --transit-gateway-policy-table-ids tgw-ptb-0a16f134b78668a81
```

Output:

```
{
    "TransitGatewayPolicyTables": [
        {
            "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
            "TransitGatewayId": "tgw-067f8505c18f0bd6e",
            "State": "available",
            "CreationTime": "2023-11-28T16:36:43+00:00",
            "Tags": []
        }
    ]
}
```

For more information, see Transit gateway policy tables in the *Transit Gateway User Guide*.

- For API details, see DescribeTransitGatewayPolicyTables in *AWS CLI Command Reference*.

`describe-transit-gateway-route-tables`

The following code example shows how to use `describe-transit-gateway-route-tables`.

AWS CLI

To describe your transit gateway route tables

The following `describe-transit-gateway-route-tables` example displays details for your transit gateway route tables.

```
aws ec2 describe-transit-gateway-route-tables
```

Output:

```
{
    "TransitGatewayRouteTables": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0ca78a549EXAMPLE",
            "TransitGatewayId": "tgw-0bc994abffEXAMPLE",
            "State": "available",
            "DefaultAssociationRouteTable": true,
            "DefaultPropagationRouteTable": true,
            "CreationTime": "2018-11-28T14:24:49.000Z",
            "Tags": []
        },
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0e8f48f148EXAMPLE",
            "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
            "State": "available",
            "DefaultAssociationRouteTable": true,
            "DefaultPropagationRouteTable": true,
            "CreationTime": "2018-11-28T14:24:00.000Z",
            "Tags": []
        }
    ]
}
```

For more information, see View transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see DescribeTransitGatewayRouteTables in *AWS CLI Command Reference*.

`describe-transit-gateway-vpc-attachments`

The following code example shows how to use `describe-transit-gateway-vpc-attachments`.

AWS CLI

To describe your transit gateway VPC attachments

The following `describe-transit-gateway-vpc-attachments` example displays details for your transit gateway VPC attachments.

```
aws ec2 describe-transit-gateway-vpc-attachments
```

Output:

```
{
    "TransitGatewayVpcAttachments": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-0a08e88308EXAMPLE",
            "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
            "VpcId": "vpc-0f501f7ee8EXAMPLE",

                    "Value": "attachment name"
                }
            ]
        }
    ]
}
```

For more information, see View your VPC attachments in the *Transit Gateways Guide*.

- For API details, see DescribeTransitGatewayVpcAttachments in *AWS CLI Command Reference*.

`describe-transit-gateways`

The following code example shows how to use `describe-transit-gateways`.

AWS CLI

To describe your transit gateways

The following `describe-transit-gateways` example retrieves details about your transit gateways.

```
aws ec2 describe-transit-gateways
```

Output:

```
{
    "TransitGateways": [
        {
            "TransitGatewayId": "tgw-0262a0e521EXAMPLE",

                }
            ]
        }
    ]
}
```

For more information, see Verified Access endpoints in the *AWS Verified Access User Guide*.

- For API details, see DescribeVerifiedAccessEndpoints in *AWS CLI Command Reference*.

`describe-verified-access-groups`

The following code example shows how to use `describe-verified-access-groups`.

AWS CLI

To describe a Verified Access group

The following `describe-verified-access-groups` example describes the specified Verified Access group.

```
aws ec2 describe-verified-access-groups \
```

```
    --verified-access-group-ids vagr-0dbe967baf14b7235
```

Output:

```
{
    "VerifiedAccessGroups": [
        {
            "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",

                }
            ]
        }
    ]
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see DescribeVerifiedAccessGroups in *AWS CLI Command Reference*.

`describe-verified-access-instance-logging-configurations`

The following code example shows how to use `describe-verified-access-instance-logging-configurations`.

AWS CLI

To describe the logging configuration for a Verified Access instance

The following `describe-verified-access-instance-logging-configurations` example describes the logging configuration for the specified Verified Access instance.

```
aws ec2 describe-verified-access-instance-logging-configurations \
```

```
    --verified-access-instance-ids vai-0ce000c0b7643abea
```

Output:

```
{
    "LoggingConfigurations": [
        {
            "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
            "AccessLogs": {
                "S3": {
                    "Enabled": false
                },
                "CloudWatchLogs": {
                    "Enabled": true,
                    "DeliveryStatus": {
                        "Code": "success"
                    },
                    "LogGroup": "my-log-group"
                },
                "KinesisDataFirehose": {
                    "Enabled": false
                },
                "LogVersion": "ocsf-1.0.0-rc.2",
                "IncludeTrustContext": false
            }
        }
    ]
}
```

For more information, see Verified Access logs in the *AWS Verified Access User Guide*.

- For API details, see DescribeVerifiedAccessInstanceLoggingConfigurations in *AWS CLI Command Reference*.

`describe-verified-access-instances`

The following code example shows how to use `describe-verified-access-instances`.

AWS CLI

To describe a Verified Access instance

The following `describe-verified-access-instances` example describes the specified Verified Access instance.

```
aws ec2 describe-verified-access-instances \
    --verified-access-instance-ids vai-0ce000c0b7643abea
```

Output:

```
{
    "VerifiedAccessInstances": [
        {
            "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
            "Description": "Testing Verified Access",
            "VerifiedAccessTrustProviders": [
                {
                    "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
                    "TrustProviderType": "user",
                    "UserTrustProviderType": "iam-identity-center"
                }
            ],
            "CreationTime": "2023-08-25T18:27:56",
            "LastUpdatedTime": "2023-08-25T19:03:32",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-ava-instance"
                }
            ]
        }
    ]
}
```

For more information, see Verified Access instances in the *AWS Verified Access User Guide*.

- For API details, see DescribeVerifiedAccessInstances in *AWS CLI Command Reference*.

`describe-verified-access-trust-providers`

The following code example shows how to use `describe-verified-access-trust-providers`.

AWS CLI

To describe a Verified Access trust provider

The following `describe-verified-access-trust-providers` example describes the specified Verified Access trust provider.

```
aws ec2 describe-verified-access-trust-providers \
    --verified-access-trust-provider-ids vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProviders": [
        {
            "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
            "Description": "Testing Verified Access",
            "TrustProviderType": "user",
            "UserTrustProviderType": "iam-identity-center",
            "PolicyReferenceName": "idc",
            "CreationTime": "2023-08-25T19:00:38",
            "LastUpdatedTime": "2023-08-25T19:03:32",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-va-trust-provider"
                }
            ]
        }
    ]
}
```

For more information, see Trust providers for Verified Access in the *AWS Verified Access User Guide*.

- For API details, see DescribeVerifiedAccessTrustProviders in *AWS CLI Command Reference*.

`describe-volume-attribute`

The following code example shows how to use `describe-volume-attribute`.

AWS CLI

To describe a volume attribute

The following `describe-volume-attribute` example describes the `autoEnableIo` attribute of the volume with the ID `vol-049df61146c4d7901`.

```
aws ec2 describe-volume-attribute \
    --volume-id vol-049df61146c4d7901 \
    --attribute autoEnableIO
```

Output:

```
{
    "AutoEnableIO": {
        "Value": false
    },
    "VolumeId": "vol-049df61146c4d7901"
}
```

For more information, see Amazon EBS volume status checks in the *Amazon EBS User Guide*.

- For API details, see DescribeVolumeAttribute in *AWS CLI Command Reference*.

`describe-volume-status`

The following code example shows how to use `describe-volume-status`.

AWS CLI

Example 1: To describe the status of a single volume

The following `describe-volume-status` example describes the status for the volume `vol-1234567890abcdef0`.

```
aws ec2 describe-volume-status \
    --volume-ids vol-1234567890abcdef0
```

Output:

```
{
```

```
    "VolumeStatuses": [
        {
            "VolumeStatus": {
                "Status": "ok",
                "Details": [
                    {
                        "Status": "passed",
                        "Name": "io-enabled"
                    },
                    {
                        "Status": "not-applicable",
                        "Name": "io-performance"
                    }
                ]
            },
            "AvailabilityZone": "us-west-2a",
            "VolumeId": "vol-1234567890abcdef0",
            "Actions": [],
            "Events": []
        }
    ]
}
```

For more information, see Amazon EBS volume status checks in the *Amazon EBS User Guide*.

Example 2: To describe the status of impaired volumes

The following `describe-volume-status` example describes the status for all volumes that are impaired. In this example output, there are no impaired volumes.

```
aws ec2 describe-volume-status \
    --filters Name=volume-status.status,Values=impaired
```

Output:

```
{
    "VolumeStatuses": []
}
```

For more information, see Work with an impaired Amazon EBS volume in the *Amazon EBS User Guide*.

- For API details, see DescribeVolumeStatus in *AWS CLI Command Reference*.

`describe-volumes-modifications`

The following code example shows how to use `describe-volumes-modifications`.

AWS CLI

To describe the modification status for a volume

The following `describe-volumes-modifications` example describes the volume modification status of the specified volume.

```
aws ec2 describe-volumes-modifications \
    --volume-ids vol-1234567890abcdef0
```

Output:

```
{
    "VolumesModifications": [
        {
            "TargetSize": 150,
            "TargetVolumeType": "io1",
            "ModificationState": "optimizing",
            "VolumeId": " vol-1234567890abcdef0",
            "TargetIops": 100,
            "StartTime": "2019-05-17T11:27:19.000Z",
            "Progress": 70,
            "OriginalVolumeType": "io1",
            "OriginalIops": 100,
            "OriginalSize": 100
        }
    ]
}
```

For more information, see Monitor the progress of Amazon EBS volume modifications in the *Amazon EBS User Guide*.

- For API details, see DescribeVolumesModifications in *AWS CLI Command Reference*.

`describe-volumes`

The following code example shows how to use `describe-volumes`.

AWS CLI

Example 1: To describe a volume

The following `describe-volumes` example describes the specified volumes in the current Region.

```
aws ec2 describe-volumes \
    --volume-ids vol-049df61146c4d7901 vol-1234567890abcdef0
```

Output:

```
{
    "Volumes": [
        {
            "AvailabilityZone": "us-west-2a",
            "Attachments": [
                {
                    "AttachTime": "2013-12-18T22:35:00.000Z",
                    "InstanceId": "i-1234567890abcdef0",
                    "VolumeId": "vol-049df61146c4d7901",
                    "State": "attached",
                    "DeleteOnTermination": true,
                    "Device": "/dev/sda1"
                }
            ],
            "Encrypted": true,
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "VolumeType": "gp2",
            "VolumeId": "vol-049df61146c4d7901",
            "State": "in-use",
            "Iops": 100,
            "SnapshotId": "snap-1234567890abcdef0",
            "CreateTime": "2019-12-18T22:35:00.084Z",
            "Size": 8
        },
        {
            "AvailabilityZone": "us-west-2a",
            "Attachments": [],
            "Encrypted": false,
            "VolumeType": "gp2",
            "VolumeId": "vol-1234567890abcdef0",
```

```
            "State": "available",
            "Iops": 300,
            "SnapshotId": "",
            "CreateTime": "2020-02-27T00:02:41.791Z",
            "Size": 100
        }
    ]
}
```

Example 2: To describe volumes that are attached to a specific instance

The following `describe-volumes` example describes all volumes that are both attached to the specified instance and set to delete when the instance terminates.

```
aws ec2 describe-volumes \
    --filters Name=attachment.instance-
id,Values=i-1234567890abcdef0 Name=attachment.delete-on-termination,Values=true
```

Output:

```
{
    "Volumes": [
        {
            "AvailabilityZone": "us-west-2a",
            "Attachments": [
                {
                    "AttachTime": "2013-12-18T22:35:00.000Z",
                    "InstanceId": "i-1234567890abcdef0",
                    "VolumeId": "vol-049df61146c4d7901",
                    "State": "attached",
                    "DeleteOnTermination": true,
                    "Device": "/dev/sda1"
                }
            ],
            "Encrypted": true,
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "VolumeType": "gp2",
            "VolumeId": "vol-049df61146c4d7901",
            "State": "in-use",
            "Iops": 100,
            "SnapshotId": "snap-1234567890abcdef0",
            "CreateTime": "2019-12-18T22:35:00.084Z",
```

```
            "Size": 8
        }
    ]
}
```

Example 3: To describe available volumes in a specific Availability Zone

The following `describe-volumes` example describes all volumes that have a status of `available` and are in the specified Availability Zone.

```
aws ec2 describe-volumes \
    --filters Name=status,Values=available Name=availability-zone,Values=us-west-2a
```

Output:

```
{
    "Volumes": [
        {
            "AvailabilityZone": "us-west-2a",
            "Attachments": [],
            "Encrypted": false,
            "VolumeType": "gp2",
            "VolumeId": "vol-1234567890abcdef0",
            "State": "available",
            "Iops": 300,
            "SnapshotId": "",
            "CreateTime": "2020-02-27T00:02:41.791Z",
            "Size": 100
        }
    ]
}
```

Example 4: To describe volumes based on tags

The following `describe-volumes` example describes all volumes that have the tag key `Name` and a value that begins with `Test`. The output is then filtered with a query that displays only the tags and IDs of the volumes.

```
aws ec2 describe-volumes \
    --filters Name=tag:Name,Values=Test* \
    --query "Volumes[*].{ID:VolumeId,Tag:Tags}"
```

Output:

```
[
    {
        "Tag": [
            {
                "Value": "Test2",
                "Key": "Name"
            }
        ],
        "ID": "vol-1234567890abcdef0"
    },
    {
        "Tag": [
            {
                "Value": "Test1",
                "Key": "Name"
            }
        ],
        "ID": "vol-049df61146c4d7901"
    }
]
```

For additional examples using tag filters, see Working with tags in the *Amazon EC2 User Guide*.

- For API details, see DescribeVolumes in *AWS CLI Command Reference*.

`describe-vpc-attribute`

The following code example shows how to use `describe-vpc-attribute`.

AWS CLI

Example 1: To describe the enableDnsSupport attribute

The following `describe-vpc-attribute` example describes the `enableDnsSupport` attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is `true`, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not.

```
aws ec2 describe-vpc-attribute \
    --vpc-id vpc-a01106c2 \
```

```
    --attribute enableDnsSupport
```

Output:

```
{
    "VpcId": "vpc-a01106c2",
    "EnableDnsSupport": {
        "Value": true
    }
}
```

For more information, see DNS attributes for your VPC in the *Amazon VPC User Guide*.

Example 2: To describe the enableDnsHostnames attribute

The following `describe-vpc-attribute` example describes the `enableDnsHostnames` attribute. This attribute indicates whether the instances launched in the VPC get DNS hostnames. If this attribute is `true`, instances in the VPC get DNS hostnames; otherwise, they do not.

```
aws ec2 describe-vpc-attribute \
    --vpc-id vpc-a01106c2 \
    --attribute enableDnsHostnames
```

Output:

```
{
    "VpcId": "vpc-a01106c2",
    "EnableDnsHostnames": {
        "Value": true
    }
}
```

For more information, see DNS attributes for your VPC in the *Amazon VPC User Guide*.

- For API details, see DescribeVpcAttribute in *AWS CLI Command Reference*.

`describe-vpc-classic-link-dns-support`

The following code example shows how to use `describe-vpc-classic-link-dns-support`.

AWS CLI

To describe ClassicLink DNS support for your VPCs

The following `describe-vpc-classic-link-dns-support` example describes the ClassicLink DNS support status of all of your VPCs.

```
aws ec2 describe-vpc-classic-link-dns-support
```

Output:

```
{
    "Vpcs": [
        {
            "VpcId": "vpc-88888888",
            "ClassicLinkDnsSupported": true
        },
        {
            "VpcId": "vpc-1a2b3c4d",
            "ClassicLinkDnsSupported": false
        }
    ]
}
```

- For API details, see DescribeVpcClassicLinkDnsSupport in *AWS CLI Command Reference*.

`describe-vpc-classic-link`

The following code example shows how to use `describe-vpc-classic-link`.

AWS CLI

To describe the ClassicLink status of your VPCs

The following `describe-vpc-classic-link` example lists the ClassicLink status of vpc-88888888.

```
aws ec2 describe-vpc-classic-link \
    --vpc-ids vpc-88888888
```

Output:

```
{
    "Vpcs": [
        {
            "ClassicLinkEnabled": true,
            "VpcId": "vpc-88888888",
            "Tags": [
                {
                    "Value": "classiclinkvpc",
                    "Key": "Name"
                }
            ]
        }
    ]
}
```

The following `describe-vpc-classic-link` example lists only VPCs that are enabled for ClassicLink (the filter value of `is-classic-link-enabled` is set to `true`).

```
aws ec2 describe-vpc-classic-link \
    --filters "Name=is-classic-link-enabled,Values=true"
```

- For API details, see DescribeVpcClassicLink in *AWS CLI Command Reference*.

`describe-vpc-endpoint-associations`

The following code example shows how to use `describe-vpc-endpoint-associations`.

AWS CLI

To describe VPC endpoint associations

The following `describe-vpc-endpoint-associations` example describes your VPC endpoint associations.

```
aws ec2 describe-vpc-endpoint-associations
```

Output:

```
{
    "VpcEndpointAssociations": [
        {
```

```
            "Id": "vpce-rsc-asc-0a810ca6ac8866bf9",
            "VpcEndpointId": "vpce-019b90d6f16d4f958",
            "AssociatedResourceAccessibility": "Accessible",
            "DnsEntry": {
                "DnsName":
 "vpce-019b90d6f16d4f958.rcfg-07129f3acded87625.4232ccc.vpc-lattice-rsc.us-
west-2.on.aws",
                "HostedZoneId": "Z03265862FOUNWMZOKUF4"
            },
            "AssociatedResourceArn": "arn:aws:vpc-lattice:us-
west-2:123456789012:resourceconfiguration/rcfg-07129f3acded87625"
        }
    ]
}
```

For more information, see Manage VPC endpoint associations in the *AWS PrivateLink User Guide*.

- For API details, see DescribeVpcEndpointAssociations in *AWS CLI Command Reference*.

`describe-vpc-endpoint-connection-notifications`

The following code example shows how to use `describe-vpc-endpoint-connection-notifications`.

AWS CLI

To describe endpoint connection notifications

The following `describe-vpc-endpoint-connection-notifications` example describes all of your endpoint connection notifications.

```
aws ec2 describe-vpc-endpoint-connection-notifications
```

Output:

```
{
    "ConnectionNotificationSet": [
        {
            "ConnectionNotificationState": "Enabled",
            "ConnectionNotificationType": "Topic",
            "ConnectionEvents": [
                "Accept",
```

```
                "Reject",
                "Delete",
                "Connect"
            ],
            "ConnectionNotificationId": "vpce-nfn-04bcb952bc8af7abc",
            "ConnectionNotificationArn": "arn:aws:sns:us-
west-2:123456789012:VpceNotification",
            "VpcEndpointId": "vpce-0324151a02f327123"
        }
    ]
}
```

For more information, see Receive alerts for endpoint service events in the *AWS PrivateLink User Guide*.

- For API details, see DescribeVpcEndpointConnectionNotifications in *AWS CLI Command Reference*.

`describe-vpc-endpoint-connections`

The following code example shows how to use `describe-vpc-endpoint-connections`.

AWS CLI

To describe VPC endpoint connections

The following `describe-vpc-endpoint-connections` example describes the interface endpoint connections to your endpoint service and filters the results to display endpoints that are `PendingAcceptance`.

```
aws ec2 describe-vpc-endpoint-connections \
    --filters Name=vpc-endpoint-state,Values=pendingAcceptance
```

Output:

```
{
    "VpcEndpointConnections": [
        {
            "VpcEndpointId": "vpce-0abed31004e618123",
            "ServiceId": "vpce-svc-0abced088d20def56",
            "CreationTimestamp": "2017-11-30T10:00:24.350Z",
            "VpcEndpointState": "pendingAcceptance",
```

```
            "VpcEndpointOwner": "123456789012"
        }
    ]
}
```

For more information, see Accept or reject connection requests in the *AWS PrivateLink User Guide*.

- For API details, see DescribeVpcEndpointConnections in *AWS CLI Command Reference*.

`describe-vpc-endpoint-service-configurations`

The following code example shows how to use `describe-vpc-endpoint-service-configurations`.

AWS CLI

To describe endpoint service configurations

The following `describe-vpc-endpoint-service-configurations` example describes your endpoint service configurations.

```
aws ec2 describe-vpc-endpoint-service-configurations
```

Output:

```
{
    "ServiceConfigurations": [
        {
            "ServiceType": [
                {
                    "ServiceType": "GatewayLoadBalancer"
                }
            ],
            "ServiceId": "vpce-svc-012d33a1c4321cabc",
            "ServiceName": "com.amazonaws.vpce.us-west-2.vpce-
svc-012d33a1c4321cabc",
            "ServiceState": "Available",
            "AvailabilityZones": [
                "us-west-2d"
            ],
            "AcceptanceRequired": false,
```

```
            "ManagesVpcEndpoints": false,
            "GatewayLoadBalancerArns": [
                "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
gwy/GWLBService/123210844e429123"
            ],
            "Tags": []
        },
        {
            "ServiceType": [
                {
                    "ServiceType": "Interface"
                }
            ],
            "ServiceId": "vpce-svc-123cabc125efa123",
            "ServiceName": "com.amazonaws.vpce.us-west-2.vpce-svc-123cabc125efa123",
            "ServiceState": "Available",
            "AvailabilityZones": [
                "us-west-2a"
            ],
            "AcceptanceRequired": true,
            "ManagesVpcEndpoints": false,
            "NetworkLoadBalancerArns": [
                "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/

            ],
            "BaseEndpointDnsNames": [
                "vpce-svc-123cabc125efa123.us-west-2.vpce.amazonaws.com"
            ],
            "PrivateDnsName": "example.com",
            "PrivateDnsNameConfiguration": {
                "State": "failed",
                "Type": "TXT",
                "Value": "vpce:qUAth3FdeABCApUiXabc",
                "Name": "_1d367jvbg34znqvyefrj"
            },
            "Tags": []
        }
    ]
}
```

For more information, see Concepts in the *AWS PrivateLink User Guide*.

- For API details, see DescribeVpcEndpointServiceConfigurations in *AWS CLI Command Reference*.

`describe-vpc-endpoint-service-permissions`

The following code example shows how to use `describe-vpc-endpoint-service-permissions`.

AWS CLI

To describe endpoint service permissions

The following `describe-vpc-endpoint-service-permissions` example describes the permissions for the specified endpoint service.

```
aws ec2 describe-vpc-endpoint-service-permissions \
    --service-id vpce-svc-03d5ebb7d9579a2b3
```

Output:

```
{
    "AllowedPrincipals": [
        {
            "PrincipalType": "Account",
            "Principal": "arn:aws:iam::123456789012:root"
        }
    ]
}
```

For more information, see Manage permissions in the *AWS PrivateLink User Guide*.

- For API details, see DescribeVpcEndpointServicePermissions in *AWS CLI Command Reference*.

`describe-vpc-endpoint-services`

The following code example shows how to use `describe-vpc-endpoint-services`.

AWS CLI

Example 1: To describe all VPC endpoint services

The following `describe-vpc-endpoint-services` example lists all VPC endpoint services for an AWS Region.

```
aws ec2 describe-vpc-endpoint-services
```

Output:

```
{
    "ServiceDetails": [
        {
            "ServiceType": [
                {
                    "ServiceType": "Gateway"
                }
            ],
            "AcceptanceRequired": false,
            "ServiceName": "com.amazonaws.us-west-2.dynamodb",
            "VpcEndpointPolicySupported": true,
            "Owner": "amazon",
            "AvailabilityZones": [
                "us-west-2a",
                "us-west-2b",

                "us-west-2a",
                "us-west-2b",
                "us-west-2c",
                "us-west-2d"
            ],
            "AcceptanceRequired": false,
```

```
            "BaseEndpointDnsNames": [
                "ec2.us-west-2.vpce.amazonaws.com"
            ]
        },
        {
            "ServiceType": [
                {
                    "ServiceType": "Interface"
                }
            ],
            "PrivateDnsName": "ssm.us-west-2.amazonaws.com",
            "ServiceName": "com.amazonaws.us-west-2.ssm",
            "VpcEndpointPolicySupported": true,
            "Owner": "amazon",
            "AvailabilityZones": [
                "us-west-2a",
                "us-west-2b",
                "us-west-2c",
                "us-west-2d"
            ],
            "AcceptanceRequired": false,
            "BaseEndpointDnsNames": [
                "ssm.us-west-2.vpce.amazonaws.com"
            ]
        }
    ],
    "ServiceNames": [
        "com.amazonaws.us-west-2.dynamodb",
        "com.amazonaws.us-west-2.ec2",
        "com.amazonaws.us-west-2.ec2messages",
        "com.amazonaws.us-west-2.elasticloadbalancing",
        "com.amazonaws.us-west-2.kinesis-streams",
        "com.amazonaws.us-west-2.s3",
        "com.amazonaws.us-west-2.ssm"
    ]
}
```

Example 2: To describe the details about an endpoint service

The following `describe-vpc-endpoint-services` example lists the details of the Amazon S3 interface endpoint service.

```
aws ec2 describe-vpc-endpoint-services \
```

```
    --filters 'Name=service-type,Values=Interface' Name=service-
name,Values=com.amazonaws.us-west-2.s3
```

Output:

```
{
    "ServiceDetails": [
        {
            "ServiceName": "com.amazonaws.us-west-2.s3",
            "ServiceId": "vpce-svc-081d84efcdEXAMPLE",
            "ServiceType": [
                {
                    "ServiceType": "Interface"
                }
            ],
            "AvailabilityZones": [
                "us-west-2a",
                "us-west-2b",
                "us-west-2c",
                "us-west-2d"
            ],
            "Owner": "amazon",
            "BaseEndpointDnsNames": [
                "s3.us-west-2.vpce.amazonaws.com"
            ],
            "VpcEndpointPolicySupported": true,
            "AcceptanceRequired": false,
            "ManagesVpcEndpoints": false,
            "Tags": []
        }
    ],
    "ServiceNames": [
        "com.amazonaws.us-west-2.s3"
    ]
}
```

For more information, see View available AWS service names in the *AWS PrivateLink User Guide*.

- For API details, see DescribeVpcEndpointServices in *AWS CLI Command Reference*.

`describe-vpc-endpoints`

The following code example shows how to use `describe-vpc-endpoints`.

AWS CLI

To describe your VPC endpoints

The following `describe-vpc-endpoints` example displays details for all of your VPC endpoints.

```
aws ec2 describe-vpc-endpoints
```

Output:

```
{
    "VpcEndpoints": [
        {
            "PolicyDocument": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Principal\":\"*\",\"Action\":\"*\",\"Resource\":\"*\"}]}",
            "VpcId": "vpc-aabb1122",
            "NetworkInterfaceIds": [],
            "SubnetIds": [],
            "PrivateDnsEnabled": true,
            "State": "available",
            "ServiceName": "com.amazonaws.us-west-2.dynamodb",

            }
        }
    ]
}
```

For more information, see VPC peering connections in the *Amazon VPC Peering Guide*.

Example 2: To describe specific VPC peering connections

The following `describe-vpc-peering-connections` example describes all of your VPC peering connections that are in the pending-acceptance state.

```
aws ec2 describe-vpc-peering-connections \
    --filters Name=status-code,Values=pending-acceptance
```

Output:

```
{
    "VpcPeeringConnections": [
        {
            "Status": {
                "Message": "Pending Acceptance by 123456789222",
                "Code": "pending-acceptance"
            },
            "Tags": [],
            "RequesterVpcInfo": {
                "PeeringOptions": {
                    "AllowEgressFromLocalVpcToRemoteClassicLink": false,
                    "AllowEgressFromLocalClassicLinkToRemoteVpc": false
                },
                "OwnerId": "123456789222",
                "VpcId": "vpc-11aa22bb",
                "CidrBlock": "10.0.0.0/28"
            },
            "VpcPeeringConnectionId": "pcx-abababab",
            "ExpirationTime": "2014-04-03T09:12:43.000Z",
            "AccepterVpcInfo": {
                "OwnerId": "123456789222",
                "VpcId": "vpc-33cc44dd"
            }
        }
    ]
}
```

The following `describe-vpc-peering-connections` example describes all of your VPC peering connections that have the tag Owner=Finance.

```
aws ec2 describe-vpc-peering-connections \
    --filters Name=tag:Owner,Values=Finance
```

Output:

```
{
    "VpcPeeringConnections": [
        {
            "Status": {
                "Message": "Active",
                "Code": "active"
            },
            "Tags": [
                {
                    "Value": "Finance",
                    "Key": "Owner"
                }
            ],
            "AccepterVpcInfo": {
                "OwnerId": "123456789222",
                "VpcId": "vpc-44dd55ee",
                "CidrBlock": "10.1.0.0/16"
            },
            "VpcPeeringConnectionId": "pcx-cdcdcdcd",
            "RequesterVpcInfo": {
                "PeeringOptions": {
                    "AllowEgressFromLocalVpcToRemoteClassicLink": false,
                    "AllowEgressFromLocalClassicLinkToRemoteVpc": false
                },
                "OwnerId": "123456789222",
                "VpcId": "vpc-123abc45",
                "CidrBlock": "192.168.0.0/16"
            }
        }
    ]
}
```

The following `describe-vpc-peering-connections` example describes all of the VPC peering connections you requested for the specified VPC, vpc-1a2b3c4d.

```
aws ec2 describe-vpc-peering-connections \
    --filters Name=requester-vpc-info.vpc-id,Values=vpc-1a2b3c4d
```

Output:

```
{
    "VpcPeeringConnections": [
```

```
        {
            "Status": {
                "Message": "Active",
                "Code": "active"
            },
            "Tags": [],
            "AccepterVpcInfo": {
                "OwnerId": "123456789222",
                "VpcId": "vpc-55ee66ff",
                "CidrBlock": "172.31.0.0/16"
            },
            "VpcPeeringConnectionId": "pcx-efefefef",
            "RequesterVpcInfo": {
                "PeeringOptions": {
                    "AllowEgressFromLocalVpcToRemoteClassicLink": false,
                    "AllowEgressFromLocalClassicLinkToRemoteVpc": false
                },
                "OwnerId": "123456789111",
                "VpcId": "vpc-1a2b3c4d",
                "CidrBlock": "10.0.1.0/28"
            }
        }
    ]
}
```

For more information, see VPC peering connections in the *Amazon VPC Peering Guide*.

- For API details, see DescribeVpcPeeringConnections in *AWS CLI Command Reference*.

`describe-vpcs`

The following code example shows how to use `describe-vpcs`.

AWS CLI

Example 1: To describe all of your VPCs

The following `describe-vpcs` example retrieves details about your VPCs.

```
aws ec2 describe-vpcs
```

Output:

```
{
    "Vpcs": [
        {
            "CidrBlock": "30.1.0.0/16",
            "DhcpOptionsId": "dopt-19edf471",
            "State": "available",
            "VpcId": "vpc-0e9801d129EXAMPLE",
            "OwnerId": "123456789012",
            "InstanceTenancy": "default",
            "CidrBlockAssociationSet": [
                {
                    "AssociationId": "vpc-cidr-assoc-062c64cfafEXAMPLE",
                    "CidrBlock": "30.1.0.0/16",
                    "CidrBlockState": {
                        "State": "associated"
                    }
                }
            ],
            "IsDefault": false,
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "Not Shared"
                }
            ]
        },
        {
            "CidrBlock": "10.0.0.0/16",
            "DhcpOptionsId": "dopt-19edf471",
            "State": "available",
            "VpcId": "vpc-06e4ab6c6cEXAMPLE",
            "OwnerId": "123456789111",
            "InstanceTenancy": "default",
            "CidrBlockAssociationSet": [
                {
                    "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
                    "CidrBlock": "10.0.0.0/16",
                    "CidrBlockState": {
                        "State": "associated"
                    }
                }
            ],
            "IsDefault": false,
```

```
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "Shared VPC"
                }
            ]
        }
    ]
}
```

For more information, see Configure a virtual private cloud in the *Amazon VPC User Guide*.

Example 2: To describe a specified VPC

The following `describe-vpcs` example retrieves details for the specified VPC.

```
aws ec2 describe-vpcs \
    --vpc-ids vpc-06e4ab6c6cEXAMPLE
```

Output:

```
{
    "Vpcs": [
        {
            "CidrBlock": "10.0.0.0/16",
            "DhcpOptionsId": "dopt-19edf471",
            "State": "available",
            "VpcId": "vpc-06e4ab6c6cEXAMPLE",
            "OwnerId": "123456789012",
            "InstanceTenancy": "default",
            "CidrBlockAssociationSet": [
                {
                    "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
                    "CidrBlock": "10.0.0.0/16",
                    "CidrBlockState": {
                        "State": "associated"
                    }
                }
            ],
            "IsDefault": false,
            "Tags": [
                {
                    "Key": "Name",
```

```
                    "Value": "Shared VPC"
                }
            ]
        }
    ]
}
```

For more information, see Configure a virtual private cloud in the *Amazon VPC User Guide*.

- For API details, see DescribeVpcs in *AWS CLI Command Reference*.

`describe-vpn-connections`

The following code example shows how to use `describe-vpn-connections`.

AWS CLI

Example 1: To describe your VPN connections

The following `describe-vpn-connections` example describes all of your Site-to-Site VPN connections.

```
aws ec2 describe-vpn-connections
```

Output:

```
{
    "VpnConnections": [
        {
            "CustomerGatewayConfiguration": "...configuration information...",
            "CustomerGatewayId": "cgw-01234567abcde1234",
            "Category": "VPN",
            "State": "available",
            "Type": "ipsec.1",
            "VpnConnectionId": "vpn-1122334455aabbccd",
            "TransitGatewayId": "tgw-00112233445566aab",
            "Options": {
                "EnableAcceleration": false,
                "StaticRoutesOnly": true,
                "LocalIpv4NetworkCidr": "0.0.0.0/0",
                "RemoteIpv4NetworkCidr": "0.0.0.0/0",
                "TunnelInsideIpVersion": "ipv4"
            },
```

```
            "Routes": [],
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "CanadaVPN"
                }
            ],
            "VgwTelemetry": [
                {
                    "AcceptedRouteCount": 0,
                    "LastStatusChange": "2020-07-29T10:35:11.000Z",
                    "OutsideIpAddress": "203.0.113.3",
                    "Status": "DOWN",
                    "StatusMessage": ""
                },
                {
                    "AcceptedRouteCount": 0,
                    "LastStatusChange": "2020-09-02T09:09:33.000Z",
                    "OutsideIpAddress": "203.0.113.5",
                    "Status": "UP",
                    "StatusMessage": ""
                }
            ]
        }
    ]
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

Example 2: To describe your available VPN connections

The following `describe-vpn-connections` example describes your Site-to-Site VPN connections with a state of `available`.

```
aws ec2 describe-vpn-connections \
    --filters "Name=state,Values=available"
```

Output:

```
{
    "VpnConnections": [
        {
```

```
            "CustomerGatewayConfiguration": "...configuration information...",
            "CustomerGatewayId": "cgw-01234567abcde1234",
            "Category": "VPN",
            "State": "available",
            "Type": "ipsec.1",
            "VpnConnectionId": "vpn-1122334455aabbccd",
            "TransitGatewayId": "tgw-00112233445566aab",
            "Options": {
                "EnableAcceleration": false,
                "StaticRoutesOnly": true,
                "LocalIpv4NetworkCidr": "0.0.0.0/0",
                "RemoteIpv4NetworkCidr": "0.0.0.0/0",
                "TunnelInsideIpVersion": "ipv4"
            },
            "Routes": [],
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "CanadaVPN"
                }
            ],
            "VgwTelemetry": [
                {
                    "AcceptedRouteCount": 0,
                    "LastStatusChange": "2020-07-29T10:35:11.000Z",
                    "OutsideIpAddress": "203.0.113.3",
                    "Status": "DOWN",
                    "StatusMessage": ""
                },
                {
                    "AcceptedRouteCount": 0,
                    "LastStatusChange": "2020-09-02T09:09:33.000Z",
                    "OutsideIpAddress": "203.0.113.5",
                    "Status": "UP",
                    "StatusMessage": ""
                }
            ]
        }
    ]
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

- For API details, see DescribeVpnConnections in *AWS CLI Command Reference*.

`describe-vpn-gateways`

The following code example shows how to use `describe-vpn-gateways`.

AWS CLI

To describe your virtual private gateways

The following `describe-vpn-gateways` example describes your virtual private gateways.

```
aws ec2 describe-vpn-gateways
```

Output:

```
{
    "VpnGateways": [
        {
            "State": "available",
            "Type": "ipsec.1",
            "VpnGatewayId": "vgw-f211f09b",
            "VpcAttachments": [
                {
                    "State": "attached",
                    "VpcId": "vpc-98eb5ef5"
                }
            ]
        },
        {
            "State": "available",
            "Type": "ipsec.1",
            "VpnGatewayId": "vgw-9a4cacf3",
            "VpcAttachments": [
                {
                    "State": "attaching",
                    "VpcId": "vpc-a01106c2"
                }
            ]
        }
    ]
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

- For API details, see DescribeVpnGateways in *AWS CLI Command Reference*.

`detach-classic-link-vpc`

The following code example shows how to use `detach-classic-link-vpc`.

AWS CLI

To unlink (detach) an EC2-Classic instance from a VPC

The following `detach-classic-link-vpc` example unlinks instance i-0598c7d356eba48d7 from VPC vpc-88888888.

```
aws ec2 detach-classic-link-vpc \
    --instance-id i-0598c7d356eba48d7 \
    --vpc-id vpc-88888888
```

Output:

```
{
    "Return": true
}
```

- For API details, see DetachClassicLinkVpc in *AWS CLI Command Reference*.

`detach-internet-gateway`

The following code example shows how to use `detach-internet-gateway`.

AWS CLI

To detach an internet gateway from your VPC

The following `detach-internet-gateway` example detaches the specified internet gateway from the specific VPC.

```
aws ec2 detach-internet-gateway \
    --internet-gateway-id igw-0d0fb496b3EXAMPLE \
```

```
    --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see Internet gateways in the *Amazon VPC User Guide*.

- For API details, see DetachInternetGateway in *AWS CLI Command Reference*.

`detach-network-interface`

The following code example shows how to use `detach-network-interface`.

AWS CLI

To detach a network interface from your instance

The following `detach-network-interface` example detaches the specified network interface from the specified instance.

```
aws ec2 detach-network-interface \
    --attachment-id eni-attach-66c4350a
```

This command produces no output.

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

- For API details, see DetachNetworkInterface in *AWS CLI Command Reference*.

`detach-verified-access-trust-provider`

The following code example shows how to use `detach-verified-access-trust-provider`.

AWS CLI

To detach a trust provider from an instance

The following `detach-verified-access-trust-provider` example detaches the specified Verified Access trust provider from the specified Verified Access instance.

```
aws ec2 detach-verified-access-trust-provider \
    --verified-access-instance-id vai-0ce000c0b7643abea \
```

```
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:00:38"
    },
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "VerifiedAccessTrustProviders": [],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-25T18:27:56"
    }
}
```

For more information, see Verified Access instances in the *AWS Verified Access User Guide*.

- For API details, see DetachVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

`detach-volume`

The following code example shows how to use `detach-volume`.

AWS CLI

To detach a volume from an instance

The following `detach-volume` example detaches the volume (`vol-049df61146c4d7901`) from the instance it is attached to.

```
aws ec2 detach-volume \
    --volume-id vol-049df61146c4d7901
```

Output:

```
{
    "AttachTime": "2014-02-27T19:23:06.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "VolumeId": "vol-049df61146c4d7901",
    "State": "detaching",
    "Device": "/dev/sdb"
}
```

For more information, see Detach an Amazon EBS volume from an Amazon EC2 instance in the *Amazon EBS User Guide*.

- For API details, see DetachVolume in *AWS CLI Command Reference*.

`detach-vpn-gateway`

The following code example shows how to use `detach-vpn-gateway`.

AWS CLI

To detach a virtual private gateway from your VPC

The following `detach-vpn-gateway` example detaches the specified virtual private gateway from the specified VPC.

```
aws ec2 detach-vpn-gateway \
    --vpn-gateway-id vgw-9a4cacf3 \
    --vpc-id vpc-a01106c2
```

This command produces no output.

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

- For API details, see DetachVpnGateway in *AWS CLI Command Reference*.

`disable-address-transfer`

The following code example shows how to use `disable-address-transfer`.

AWS CLI

To disable an Elastic IP address transfer

The following `disable-address-transfer` example disables Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 disable-address-transfer \
    --allocation-id eipalloc-09ad461b0d03f6aaf
```

Output:

```
{
    "AddressTransfer": {
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
        "AddressTransferStatus": "disabled"
    }
}
```

For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

- For API details, see DisableAddressTransfer in *AWS CLI Command Reference*.

`disable-aws-network-performance-metric-subscription`

The following code example shows how to use `disable-aws-network-performance-metric-subscription`.

AWS CLI

To disable a metric subscription

The following `disable-aws-network-performance-metric-subscription` example disables the monitoring of aggregate network latency between the specified source and destination Regions.

```
aws ec2 disable-aws-network-performance-metric-subscription \
    --source us-east-1 \
    --destination eu-west-1 \
    --metric aggregate-latency \
    --statistic p50
```

Output:

```
{
    "Output": true
}
```

For more information, see Manage CloudWatch subscriptions using the CLI in the *Infrastructure Performance User Guide*.

- For API details, see DisableAwsNetworkPerformanceMetricSubscription in *AWS CLI Command Reference*.

`disable-ebs-encryption-by-default`

The following code example shows how to use `disable-ebs-encryption-by-default`.

AWS CLI

To disable EBS encryption by default

The following `disable-ebs-encryption-by-default` example disables EBS encryption by default for your AWS account in the current Region.

```
aws ec2 disable-ebs-encryption-by-default
```

Output:

```
{
    "EbsEncryptionByDefault": false
}
```

For more information, see Enable Amazon EBS encryption by default in the *Amazon EBS User Guide*.

- For API details, see DisableEbsEncryptionByDefault in *AWS CLI Command Reference*.

`disable-fast-launch`

The following code example shows how to use `disable-fast-launch`.

AWS CLI

To discontinue fast launching for an image

The following `disable-fast-launch` example discontinues Fast Launch for the specified AMI, and cleans up existing pre-provisioned snapshots.

```
aws ec2 disable-fast-launch \
    --image-id ami-01234567890abcedf
```

Output:

```
{
    "ImageId": "ami-01234567890abcedf",
    "ResourceType": "snapshot",
    "SnapshotConfiguration": {},
    "LaunchTemplate": {
        "LaunchTemplateId": "lt-01234567890abcedf",
        "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-
a8c6215d-94e6-441b-9272-dbd1f87b07e2",
        "Version": "1"
    },
    "MaxParallelLaunches": 6,
    "OwnerId": "0123456789123",
    "State": "disabling",
    "StateTransitionReason": "Client.UserInitiated",
    "StateTransitionTime": "2022-01-27T22:47:29.265000+00:00"
}
```

For more information, see Configure EC2 Fast Launch settings for your Windows AMI in the *Amazon EC2 User Guide*.

- For API details, see DisableFastLaunch in *AWS CLI Command Reference*.

`disable-fast-snapshot-restores`

The following code example shows how to use `disable-fast-snapshot-restores`.

AWS CLI

To disable fast snapshot restore

The following `disable-fast-snapshot-restores` example disables fast snapshot restore for the specified snapshot in the specified Availability Zone.

```
aws ec2 disable-fast-snapshot-restores \
```

```
    --availability-zones us-west-2a \
    --source-snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
    "Successful": [
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-west-2a",
            "State": "disabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.602Z"
        }
    ],
    "Unsuccessful": []
}
```

For more information, see Amazon EBS fast snapshot restore in the *Amazon EBS User Guide*.

- For API details, see DisableFastSnapshotRestores in *AWS CLI Command Reference*.

`disable-image-block-public-access`

The following code example shows how to use `disable-image-block-public-access`.

AWS CLI

To disable block public access for AMIs in the current Region

The following `disable-image-block-public-access` example disables block public access for AMIs at the account level in the current Region.

```
aws ec2 disable-image-block-public-access
```

Output:

```
{
    "ImageBlockPublicAccessState": "unblocked"
}
```

For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.

- For API details, see DisableImageBlockPublicAccess in *AWS CLI Command Reference*.

`disable-image-deprecation`

The following code example shows how to use `disable-image-deprecation`.

AWS CLI

To cancel the deprecation of an AMI

The following `disable-image-deprecation` example cancels the deprecation of an AMI, which removes the `DeprecationTime` field from the `describe-images` output. You must be the AMI owner to perform this procedure.

```
aws ec2 disable-image-deprecation \
    --image-id ami-1234567890abcdef0
```

Output:

```
{
    "Return": true
}
```

For more information, see Deprecate an AMI in the *Amazon EC2 User Guide*.

- For API details, see DisableImageDeprecation in *AWS CLI Command Reference*.

`disable-image-deregistration-protection`

The following code example shows how to use `disable-image-deregistration-protection`.

AWS CLI

To disable deregistration protection

The following `disable-image-deregistration-protection` example disables deregistration protection for the specified image.

```
aws ec2 disable-image-deregistration-protection \
```

```
    --image-id ami-0b1a928a144a74ec9
```

Output:

```
{
    "Return": "disabled"
}
```

For more information, see Protect an AMI from deregistration in the *Amazon EC2 User Guide*.

- For API details, see DisableImageDeregistrationProtection in *AWS CLI Command Reference*.

`disable-image`

The following code example shows how to use `disable-image`.

AWS CLI

To disable an AMI

The following `disable-image` example disables the specified AMI.

```
aws ec2 disable-image \
    --image-id ami-1234567890abcdef0
```

Output:

```
{
    "Return": true
}
```

For more information, see Disable an AMI in the *Amazon EC2 User Guide*.

- For API details, see DisableImage in *AWS CLI Command Reference*.

`disable-ipam-organization-admin-account`

The following code example shows how to use `disable-ipam-organization-admin-account`.

AWS CLI

To disable the delegated IPAM admin

The following `disable-ipam-organization-admin-account` example disables the delegated IPAM admin in your AWS account.

In certain scenarios, you'll integrate IPAM with AWS Organizations. When you do that, the AWS Organizations management account delegates an AWS Organizations member account as the IPAM admin.

In this example, you are the AWS Organizations management account that delegated the IPAM admin account and you want to disable that account from being the IPAM admin.

You can use any AWS Region when making this request. You don't have to use the Region where you originally delegated the admin, where the IPAM was created, or an IPAM operating Region. If you disable the delegated admin account, you can re-enable it at any time or delegate a new account as IPAM admin.

aws ec2 disable-ipam-organization-admin-account --delegated-admin-account-id 123456789012

Output:

```
{
    "Success": true
}
```

For more information, see Integrate IPAM with accounts in an AWS Organization in the *Amazon VPC IPAM User Guide*.

- For API details, see DisableIpamOrganizationAdminAccount in *AWS CLI Command Reference*.

`disable-serial-console-access`

The following code example shows how to use `disable-serial-console-access`.

AWS CLI

To disable access to the EC2 serial console for your account

The following `disable-serial-console-access` example disables account access to the serial console.

```
aws ec2 disable-serial-console-access
```

Output:

```
{
    "SerialConsoleAccessEnabled": false
}
```

For more information, see EC2 Serial Console in the *Amazon EC2 User Guide*.

- For API details, see DisableSerialConsoleAccess in *AWS CLI Command Reference*.

`disable-snapshot-block-public-access`

The following code example shows how to use `disable-snapshot-block-public-access`.

AWS CLI

To disable block public access for snapshots

The following `disable-snapshot-block-public-access` example disables block public access for snapshots to allow public sharing of your snapshots.

```
aws ec2 disable-snapshot-block-public-access
```

Output:

```
{
    "State": "unblocked"
}
```

For more information, see Block public access for snapshots in the *Amazon EBS User Guide*.

- For API details, see DisableSnapshotBlockPublicAccess in *AWS CLI Command Reference*.

`disable-transit-gateway-route-table-propagation`

The following code example shows how to use `disable-transit-gateway-route-table-propagation`.

AWS CLI

To disable a transit gateway attachment to propagate routes to the specified propagation route table

The following `disable-transit-gateway-route-table-propagation` example disables the specified attachment to propagate routes to the specified propagation route table.

```
aws ec2 disable-transit-gateway-route-table-propagation \
    --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE \
    --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```
{
    "Propagation": {
        "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
        "ResourceId": "vpc-4d7de228",
        "ResourceType": "vpc",
        "TransitGatewayRouteTableId": "tgw-rtb-0a823edbdeEXAMPLE",
        "State": "disabled"
    }
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see DisableTransitGatewayRouteTablePropagation in *AWS CLI Command Reference*.

`disable-vgw-route-propagation`

The following code example shows how to use `disable-vgw-route-propagation`.

AWS CLI

To disable route propagation

The following `disable-vgw-route-propagation` example disables the specified virtual private gateway from propagating static routes to the specified route table.

```
aws ec2 disable-vgw-route-propagation \
    --route-table-id rtb-22574640 \
    --gateway-id vgw-9a4cacf3
```

This command produces no output.

For more information, see Enable or disable route propagation in the *Amazon VPC User Guide*.

- For API details, see DisableVgwRoutePropagation in *AWS CLI Command Reference*.

`disable-vpc-classic-link-dns-support`

The following code example shows how to use `disable-vpc-classic-link-dns-support`.

AWS CLI

To disable ClassicLink DNS support for a VPC

The following `disable-vpc-classic-link-dns-support` example disables ClassicLink DNS support for `vpc-88888888`.

```
aws ec2 disable-vpc-classic-link-dns-support \
    --vpc-id vpc-88888888
```

Output:

```
{
    "Return": true
}
```

- For API details, see DisableVpcClassicLinkDnsSupport in *AWS CLI Command Reference*.

`disable-vpc-classic-link`

The following code example shows how to use `disable-vpc-classic-link`.

AWS CLI

To disable ClassicLink for a VPC

The following `disable-vpc-classic-link` example disables ClassicLink for `vpc-88888888`.

```
aws ec2 disable-vpc-classic-link \
    --vpc-id vpc-88888888
```

Output:

```
{
    "Return": true
}
```

- For API details, see DisableVpcClassicLink in *AWS CLI Command Reference*.

`disassociate-address`

The following code example shows how to use `disassociate-address`.

AWS CLI

Example 1: To disassociate an Elastic IP address in EC2-Classic

The following `disassociate-address` example disassociates an Elastic IP address from an instance in EC2-Classic.

```
aws ec2 disassociate-address \
    --public-ip 198.51.100.0
```

This command produces no output.

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 2: To disassociate an Elastic IP address in EC2-VPC

The following `disassociate-address` example disassociates an Elastic IP address from an instance in a VPC.

```
aws ec2 disassociate-address \
    --association-id eipassoc-2bebb745
```

This command produces no output.

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

- For API details, see DisassociateAddress in *AWS CLI Command Reference*.

`disassociate-client-vpn-target-network`

The following code example shows how to use `disassociate-client-vpn-target-network`.

AWS CLI

To disassociate a network from a Client VPN endpoint

The following `disassociate-client-vpn-target-network` example disassociates the target network that's associated with the `cvpn-assoc-12312312312312312` association ID for the specified Client VPN endpoint.

```
aws ec2 disassociate-client-vpn-target-network \
    --client-vpn-endpoint-id cvpn-endpoint-123456789012abcde \
    --association-id cvpn-assoc-12312312312312312
```

Output:

```
{
    "AssociationId": "cvpn-assoc-12312312312312312",
    "Status": {
        "Code": "disassociating"
    }
}
```

For more information, see Target Networks in the *AWS Client VPN Administrator Guide*.

- For API details, see DisassociateClientVpnTargetNetwork in *AWS CLI Command Reference*.

`disassociate-iam-instance-profile`

The following code example shows how to use `disassociate-iam-instance-profile`.

AWS CLI

To disassociate an IAM instance profile

The following `disassociate-iam-instance-profile` example disassociates an IAM instance profile with the association ID `iip-assoc-05020b59952902f5f`.

```
aws ec2 disassociate-iam-instance-profile \
    --association-id iip-assoc-05020b59952902f5f
```

Output:

```
{
    "IamInstanceProfileAssociation": {
        "InstanceId": "i-123456789abcde123",
        "State": "disassociating",
        "AssociationId": "iip-assoc-05020b59952902f5f",
        "IamInstanceProfile": {
            "Id": "AIPAI5IVIHMFFYY2DKV5Y",
            "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
        }
    }
}
```

For more information, see IAM roles for Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see DisassociateIamInstanceProfile in *AWS CLI Command Reference*.

`disassociate-instance-event-window`

The following code example shows how to use `disassociate-instance-event-window`.

AWS CLI

Example 1: To disassociate one or more instances from an event window

The following `disassociate-instance-event-window` example disassociates one or more instances from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate instances, specify the `association-target` parameter, and for the parameter values, specify one or more instance IDs.

```
aws ec2 disassociate-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
```

```
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

For more information about event window constraints, see Considerations in the *Amazon EC2 User Guide*.

Example 2: To disassociate instance tags from an event window

The following `disassociate-instance-event-window` example disassociates instance tags from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate instance tags, specify the `association-target` parameter, and for the parameter values, specify one or more tags.

```
aws ec2 disassociate-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

For more information about event window constraints, see Considerations in the *Amazon EC2 User Guide*.

Example 3: To disassociate a Dedicated Host from an event window

The following `disassociate-instance-event-window` example disassociates a Dedicated Host from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate a Dedicated Host, specify the `association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 disassociate-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target DedicatedHostIds=h-029fa35a02b99801d
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

For more information about event window constraints, see Considerations in the *Amazon EC2 User Guide*.

- For API details, see DisassociateInstanceEventWindow in *AWS CLI Command Reference*.

`disassociate-ipam-resource-discovery`

The following code example shows how to use `disassociate-ipam-resource-discovery`.

AWS CLI

To disassociate a resource discovery from an IPAM

The following `disassociate-ipam-resource-discovery` example disassociates an IPAM resource discovery in your AWS account. In this example, you are an IPAM delegated admin account and you want to disassociate an IPAM resource discovery from your IPAM. You ran the

describe command and noticed that the "ResourceDiscoveryStatus": "not-found" and you want to disassociate it from your IPAM to make room for other associations.

```
aws ec2 disassociate-ipam-resource-discovery \
    --ipam-resource-discovery-association-id ipam-res-disco-assoc-04382a6346357cf82
```

Output:

```
{
    "IpamResourceDiscoveryAssociation": {
        "OwnerId": "123456789012",
        "IpamResourceDiscoveryAssociationId": "ipam-res-disco-
assoc-04382a6346357cf82",
        "IpamResourceDiscoveryAssociationArn":
 "arn:aws:ec2::123456789012:ipam-resource-discovery-association/ipam-res-disco-
assoc-04382a6346357cf82",
        "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
        "IpamId": "ipam-005f921c17ebd5107",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-005f921c17ebd5107",
        "IpamRegion": "us-west-2",
        "IsDefault": false,
        "ResourceDiscoveryStatus": "not-found",
        "State": "disassociate-in-progress"
    }
}
```

For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see DisassociateIpamResourceDiscovery in *AWS CLI Command Reference*.

`disassociate-nat-gateway-address`

The following code example shows how to use `disassociate-nat-gateway-address`.

AWS CLI

To disassociate an Elastic IP address from a public NAT gateway

The following `disassociate-nat-gateway-address` example disassociates the specified Elastic IP address from the specified public NAT gateway.

```
aws ec2 disassociate-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \
    --association-ids eipassoc-0f96bdca17EXAMPLE
```

Output:

```
{
    "NatGatewayId": "nat-1234567890abcdef0",
    "NatGatewayAddresses": [
        {
            "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
            "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
            "PrivateIp": "10.0.0.74",
            "PublicIp": "3.211.231.218",
            "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
            "IsPrimary": false,
            "Status": "disassociating"
        }
    ]
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see DisassociateNatGatewayAddress in *AWS CLI Command Reference*.

`disassociate-route-table`

The following code example shows how to use `disassociate-route-table`.

AWS CLI

To disassociate a route table

The following `disassociate-route-table` example disassociates the specified route table from the specified subnet.

```
aws ec2 disassociate-route-table \
    --association-id rtbassoc-781d0d1a
```

This command produces no output.

For more information, see Change the route table for a subnet in the *Amazon VPC User Guide*.

- For API details, see DisassociateRouteTable in *AWS CLI Command Reference*.

`disassociate-security-group-vpc`

The following code example shows how to use `disassociate-security-group-vpc`.

AWS CLI

To disassociate a security group from a VPC

The following `disassociate-security-group-vpc` example disassociates the specified security group from the specified VPC.

```
aws ec2 disassociate-security-group-vpc \
    --group-id sg-04dbb43907d3f8a78 \
    --vpc-id vpc-0bf4c2739bc05a694
```

Output:

```
{
    "State": "disassociating"
}
```

For more information, see Associate security groups with multiple VPCs in the *Amazon VPC User Guide*.

- For API details, see DisassociateSecurityGroupVpc in *AWS CLI Command Reference*.

`disassociate-subnet-cidr-block`

The following code example shows how to use `disassociate-subnet-cidr-block`.

AWS CLI

To disassociate an IPv6 CIDR block from a subnet

The following `disassociate-subnet-cidr-block` example disassociates an IPv6 CIDR block from a subnet using the association ID for the CIDR block.

```
aws ec2 disassociate-subnet-cidr-block \
```

```
    --association-id subnet-cidr-assoc-3aa54053
```

Output:

```
{
    "SubnetId": "subnet-5f46ec3b",
    "Ipv6CidrBlockAssociation": {
        "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
        "AssociationId": "subnet-cidr-assoc-3aa54053",
        "Ipv6CidrBlockState": {
            "State": "disassociating"
        }
    }
}
```

For more information, see Add or remove an IPv6 CIDR block from your subnet in the *Amazon VPC User Guide*.

- For API details, see DisassociateSubnetCidrBlock in *AWS CLI Command Reference*.

`disassociate-transit-gateway-multicast-domain`

The following code example shows how to use `disassociate-transit-gateway-multicast-domain`.

AWS CLI

To disassociate subnets from a multicast domain

The following `disassociate-transit-gateway-multicast-domain` example disassociates a subnet from the specified multicast domain.

```
aws ec2 disassociate-transit-gateway-multicast-domain \
    --transit-gateway-attachment-id tgw-attach-070e571cd1EXAMPLE \
    --subnet-ids subnet-000de86e3bEXAMPLE \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
    "Associations": {
```

```
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
        "ResourceId": "vpc-7EXAMPLE",
        "ResourceType": "vpc",
        "Subnets": [
            {
                "SubnetId": "subnet-000de86e3bEXAMPLE",
                "State": "disassociating"
            }
        ]
    }
}
```

For more information, see Multicast domains in the *Transit Gateways Guide*.

- For API details, see DisassociateTransitGatewayMulticastDomain in *AWS CLI Command Reference*.

`disassociate-transit-gateway-route-table`

The following code example shows how to use `disassociate-transit-gateway-route-table`.

AWS CLI

To disassociate a transit gateway route table from a resource attachment

The following `disassociate-transit-gateway-route-table` example disassociates the specified attachment from the transit gateway route table.

```
aws ec2 disassociate-transit-gateway-route-table \
    --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \
    --transit-gateway-attachment-id tgw-attach-08e0bc912cEXAMPLE
```

Output:

```
{
    "Association": {
        "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
        "ResourceId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "ResourceType": "direct-connect-gateway",
```

```
        "State": "disassociating"
    }
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see DisassociateTransitGatewayRouteTable in *AWS CLI Command Reference*.

`disassociate-vpc-cidr-block`

The following code example shows how to use `disassociate-vpc-cidr-block`.

AWS CLI

Example 1: To disassociate an IPv6 CIDR block from a VPC

The following `disassociate-vpc-cidr-block` example disassociates an IPv6 CIDR block from a VPC using the association ID for the CIDR block.

```
aws ec2 disassociate-vpc-cidr-block \
    --association-id vpc-cidr-assoc-eca54085
```

Output:

```
{
    "Ipv6CidrBlockAssociation": {
        "Ipv6CidrBlock": "2001:db8:1234:1a00::/56",
        "AssociationId": "vpc-cidr-assoc-eca54085",
        "Ipv6CidrBlockState": {
            "State": "disassociating"
        }
    },
    "VpcId": "vpc-a034d6c4"
}
```

For more information, see Add or remove a CIDR block from your VPC in the *Amazon VPC User Guide*.

Example 2: To disassociate an IPv4 CIDR block from a VPC

The following `disassociate-vpc-cidr-block` example disassociates an IPv4 CIDR block from a VPC.

```
aws ec2 disassociate-vpc-cidr-block \
    --association-id vpc-cidr-assoc-0287ac6b
```

Output:

```
{
    "CidrBlockAssociation": {
        "AssociationId": "vpc-cidr-assoc-0287ac6b",
        "CidrBlock": "172.18.0.0/16",
        "CidrBlockState": {
            "State": "disassociating"
        }
    },
    "VpcId": "vpc-27621243"
}
```

For more information, see Add or remove a CIDR block from your VPC in the *Amazon VPC User Guide*.

- For API details, see DisassociateVpcCidrBlock in *AWS CLI Command Reference*.

`enable-address-transfer`

The following code example shows how to use `enable-address-transfer`.

AWS CLI

To enable an Elastic IP address transfer

The following `enable-address-transfer` example enables Elastic IP address transfer for the specified Elastic IP address to the specified account.

```
aws ec2 enable-address-transfer \
    --allocation-id eipalloc-09ad461b0d03f6aaf \
    --transfer-account-id 123456789012
```

Output:

```
{
    "AddressTransfer": {
```

```
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
        "TransferAccountId": "123456789012",
        "TransferOfferExpirationTimestamp": "2023-02-22T20:51:01.000Z",
        "AddressTransferStatus": "pending"
    }
}
```

For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

- For API details, see EnableAddressTransfer in *AWS CLI Command Reference*.

`enable-aws-network-performance-metric-subscription`

The following code example shows how to use `enable-aws-network-performance-metric-subscription`.

AWS CLI

To enable a metric subscription

The following `enable-aws-network-performance-metric-subscription` example enables the monitoring of aggregate network latency between the specified source and destination Regions.

```
aws ec2 enable-aws-network-performance-metric-subscription \
    --source us-east-1 \
    --destination eu-west-1 \
    --metric aggregate-latency \
    --statistic p50
```

Output:

```
{
    "Output": true
}
```

For more information, see Manage subscriptions in the *Infrastructure Performance User Guide*.

- For API details, see EnableAwsNetworkPerformanceMetricSubscription in *AWS CLI Command Reference*.

`enable-ebs-encryption-by-default`

The following code example shows how to use `enable-ebs-encryption-by-default`.

AWS CLI

To enable EBS encryption by default

The following `enable-ebs-encryption-by-default` example enables EBS encryption by default for your AWS account in the current Region.

```
aws ec2 enable-ebs-encryption-by-default
```

Output:

```
{
    "EbsEncryptionByDefault": true
}
```

For more information, see Enable Amazon EBS encryption by default in the *Amazon EBS User Guide*.

- For API details, see EnableEbsEncryptionByDefault in *AWS CLI Command Reference*.

`enable-fast-launch`

The following code example shows how to use `enable-fast-launch`.

AWS CLI

To start fast launching for an image

The following `enable-fast-launch` example configures the specified AMI for Fast Launch and sets the maximum number of parallel instances to launch to 6. The type of resource to use to pre-provision the AMI is set to `snapshot`, which is also the default value.

```
aws ec2 enable-fast-launch \
    --image-id ami-01234567890abcedf \
    --max-parallel-launches 6 \
    --resource-type snapshot
```

Output:

```
{
    "ImageId": "ami-01234567890abcedf",
    "ResourceType": "snapshot",
    "SnapshotConfiguration": {
        "TargetResourceCount": 10
    },
    "LaunchTemplate": {},
    "MaxParallelLaunches": 6,
    "OwnerId": "0123456789123",
    "State": "enabling",
    "StateTransitionReason": "Client.UserInitiated",
    "StateTransitionTime": "2022-01-27T22:16:03.199000+00:00"
}
```

For more information, see Configure EC2 Fast Launch settings for your Windows AMI in the *Amazon EC2 User Guide*.

- For API details, see EnableFastLaunch in *AWS CLI Command Reference*.

`enable-fast-snapshot-restores`

The following code example shows how to use `enable-fast-snapshot-restores`.

AWS CLI

To enable fast snapshot restore

The following `enable-fast-snapshot-restores` example enables fast snapshot restore for the specified snapshot in the specified Availability Zones.

```
aws ec2 enable-fast-snapshot-restores \
    --availability-zones us-west-2a us-west-2b \
    --source-snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
    "Successful": [
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-west-2a",
```

```
            "State": "enabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.602Z"
        },
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-west-2b",
            "State": "enabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.596Z"
        }
    ],
    "Unsuccessful": []
}
```

For more information, see Amazon EBS fast snapshot restore in the *Amazon EBS User Guide*.

- For API details, see EnableFastSnapshotRestores in *AWS CLI Command Reference*.

`enable-image-block-public-access`

The following code example shows how to use `enable-image-block-public-access`.

AWS CLI

To enable block public access for AMIs in the current Region

The following `enable-image-block-public-access` example enables block public access for AMIs at the account level in the current Region.

```
aws ec2 enable-image-block-public-access \
    --image-block-public-access-state block-new-sharing
```

Output:

```
{
    "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.

- For API details, see EnableImageBlockPublicAccess in *AWS CLI Command Reference*.

`enable-image-deprecation`

The following code example shows how to use `enable-image-deprecation`.

AWS CLI

To deprecate an AMI

The following `enable-image-deprecation` example deprecates an AMI on a specific date and time. If you specify a value for seconds, Amazon EC2 rounds the seconds to the nearest minute. You must be the AMI owner to perform this procedure.

```
aws ec2 enable-image-deprecation \
    --image-id ami-1234567890abcdef0 \
    --deprecate-at '2022-10-15T13:17:12.000Z'
```

Output:

```
{
    "Return": true
}
```

For more information, see Deprecate an AMI in the *Amazon EC2 User Guide*.

- For API details, see EnableImageDeprecation in *AWS CLI Command Reference*.

`enable-image-deregistration-protection`

The following code example shows how to use `enable-image-deregistration-protection`.

AWS CLI

To enable deregistration protection

The following `enable-image-deregistration-protection` example enables deregistration protection for the specified image.

```
aws ec2 enable-image-deregistration-protection \
    --image-id ami-0b1a928a144a74ec9
```

Output:

```
{
    "Return": "enabled-without-cooldown"
}
```

For more information, see Protect an EC2 AMI from deregistration in the *Amazon EC2 User Guide*.

- For API details, see EnableImageDeregistrationProtection in *AWS CLI Command Reference*.

`enable-image`

The following code example shows how to use `enable-image`.

AWS CLI

To enable an AMI

The following `enable-image` example enables the specified AMI.

```
aws ec2 enable-image \
    --image-id ami-1234567890abcdef0
```

Output:

```
{
    "Return": true
}
```

For more information, see Disable an AMI in the *Amazon EC2 User Guide*.

- For API details, see EnableImage in *AWS CLI Command Reference*.

`enable-ipam-organization-admin-account`

The following code example shows how to use `enable-ipam-organization-admin-account`.

AWS CLI

To integrate with AWS Organizations and delegate a member account as the IPAM account

The following `enable-ipam-organization-admin-account` example integrates IPAM with AWS Organizations and delegates a member account as the IPAM account.

```
aws ec2 enable-ipam-organization-admin-account \
    --delegated-admin-account-id 123456789012
```

Output:

```
{
    "Success": true
}
```

For more information, see Integrate IPAM with AWS Organizations in the *Amazon VPC IPAM User Guide*.

- For API details, see EnableIpamOrganizationAdminAccount in *AWS CLI Command Reference*.

`enable-reachability-analyzer-organization-sharing`

The following code example shows how to use `enable-reachability-analyzer-organization-sharing`.

AWS CLI

To enable trusted access for Reachability Analyzer

The following `enable-reachability-analyzer-organization-sharing` example enables trusted access for Reachability Analyzer.

```
aws ec2 enable-reachability-analyzer-organization-sharing
```

This command produces no output.

For more information, see Cross-account analyses in the *Reachability Analyzer User Guide*.

- For API details, see EnableReachabilityAnalyzerOrganizationSharing in *AWS CLI Command Reference*.

`enable-serial-console-access`

The following code example shows how to use `enable-serial-console-access`.

AWS CLI

To enable access to the serial console for your account

The following `enable-serial-console-access` example enables account access to the serial console.

```
aws ec2 enable-serial-console-access
```

Output:

```
{
    "SerialConsoleAccessEnabled": true
}
```

For more information, see EC2 Serial Console in the *Amazon EC2 User Guide*.

- For API details, see EnableSerialConsoleAccess in *AWS CLI Command Reference*.

`enable-snapshot-block-public-access`

The following code example shows how to use `enable-snapshot-block-public-access`.

AWS CLI

To enable block public access for snapshots

The following `enable-snapshot-block-public-access` example blocks all public sharing of your snapshots.

```
aws ec2 enable-snapshot-block-public-access \
    --state block-all-sharing
```

Output:

```
{
    "State": "block-all-sharing"
}
```

For more information, see Block public access for snapshots in the *Amazon EBS User Guide*.

- For API details, see EnableSnapshotBlockPublicAccess in *AWS CLI Command Reference*.

`enable-transit-gateway-route-table-propagation`

The following code example shows how to use `enable-transit-gateway-route-table-propagation`.

AWS CLI

To enable a transit gateway attachment to propagate routes to the specified propagation route table

The following `enable-transit-gateway-route-table-propagation` example enables the specified attachment to propagate routes to the specified propagation route table.

```
aws ec2 enable-transit-gateway-route-table-propagation \
    --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE \
    --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```
{
    "Propagation": {
        "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
        "ResourceId": "vpc-4d7de228",
        "ResourceType": "vpc",
        "TransitGatewayRouteTableId": "tgw-rtb-0a823edbdeEXAMPLE",
        "State": "disabled"
    }
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see EnableTransitGatewayRouteTablePropagation in *AWS CLI Command Reference*.

`enable-vgw-route-propagation`

The following code example shows how to use `enable-vgw-route-propagation`.

AWS CLI

To enable route propagation

The following `enable-vgw-route-propagation` example enables the specified virtual private gateway to propagate static routes to the specified route table.

```
aws ec2 enable-vgw-route-propagation \
    --route-table-id rtb-22574640 \
    --gateway-id vgw-9a4cacf3
```

This command produces no output.

For more information, see Manage subnet route tables in the *Amazon VPC User Guide*.

- For API details, see EnableVgwRoutePropagation in *AWS CLI Command Reference*.

`enable-volume-io`

The following code example shows how to use `enable-volume-io`.

AWS CLI

To enable I/O for a volume

The following `enable-volume-io` example enables I/O on volume `vol-1234567890abcdef0`.

```
aws ec2 enable-volume-io \
    --volume-id vol-1234567890abcdef0
```

This command produces no output.

For more information, see Work with an impaired Amazon EBS volume in the *Amazon EBS User Guide*.

- For API details, see EnableVolumeIo in *AWS CLI Command Reference*.

`enable-vpc-classic-link-dns-support`

The following code example shows how to use `enable-vpc-classic-link-dns-support`.

AWS CLI

To enable ClassicLink DNS support for a VPC

The following `enable-vpc-classic-link-dns-support` example enables ClassicLink DNS support for `vpc-88888888`.

```
aws ec2 enable-vpc-classic-link-dns-support \
    --vpc-id vpc-88888888
```

Output:

```
{
    "Return": true
}
```

- For API details, see EnableVpcClassicLinkDnsSupport in *AWS CLI Command Reference*.

`enable-vpc-classic-link`

The following code example shows how to use `enable-vpc-classic-link`.

AWS CLI

To enable a VPC for ClassicLink

The following `enable-vpc-classic-link` example enables `vpc-88888888` for ClassicLink.

```
aws ec2 enable-vpc-classic-link \
    --vpc-id vpc-88888888
```

Output:

```
{
    "Return": true
}
```

- For API details, see EnableVpcClassicLink in *AWS CLI Command Reference*.

`export-client-vpn-client-certificate-revocation-list`

The following code example shows how to use `export-client-vpn-client-certificate-revocation-list`.

AWS CLI

To export a client certificate revocation list

The following `export-client-vpn-client-certificate-revocation-list` example exports the client certificate revocation list for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-certificate-revocation-list \
    --client-vpn-endpoint-id cvpn-endpoint-123456789012abcde \
    --output text
```

Output:

```

For more information, see Client Certificate Revocation Lists in the *AWS Client VPN Administrator Guide*.

- For API details, see ExportClientVpnClientCertificateRevocationList in *AWS CLI Command Reference*.

`export-client-vpn-client-configuration`

The following code example shows how to use `export-client-vpn-client-configuration`.

AWS CLI

To export the client configuration

The following `export-client-vpn-client-configuration` example exports the client configuration for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-configuration \
    --client-vpn-endpoint-id cvpn-endpoint-123456789012abcde \
    --output text
```

Output:

For more information, see Client VPN endpoint configuration file export in the *AWS Client VPN Administrator Guide*.

- For API details, see ExportClientVpnClientConfiguration in *AWS CLI Command Reference*.

`export-image`

The following code example shows how to use `export-image`.

AWS CLI

To export a VM from an AMI

The following `export-image` example exports the specified AMI to the specified bucket in the specified format.

```
aws ec2 export-image \
    --image-id ami-1234567890abcdef0 \
    --disk-image-format VMDK \
    --s3-export-location S3Bucket=my-export-bucket,S3Prefix=exports/
```

Output:

```
{
    "DiskImageFormat": "vmdk",
    "ExportImageTaskId": "export-ami-1234567890abcdef0",
    "ImageId": "ami-1234567890abcdef0",
    "RoleName": "vmimport",
    "Progress": "0",
    "S3ExportLocation": {
        "S3Bucket": "my-export-bucket",
        "S3Prefix": "exports/"
    },
    "Status": "active",
    "StatusMessage": "validating"
}
```

For more information, see Export a VM from an Amazon Machine Image (AMI) using VM Import/Export in the *VM Import/Export User Guide*.

- For API details, see ExportImage in *AWS CLI Command Reference*.

`get-associated-ipv6-pool-cidrs`

The following code example shows how to use `get-associated-ipv6-pool-cidrs`.

AWS CLI

To get the associations for an IPv6 address pool

The following `get-associated-ipv6-pool-cidrs` example gets the associations for the specified IPv6 address pool.

```
aws ec2 get-associated-ipv6-pool-cidrs \
    --pool-id ipv6pool-ec2-012345abc12345abc
```

Output:

```
{
    "Ipv6CidrAssociations": [
        {
            "Ipv6Cidr": "2001:db8:1234:1a00::/56",
            "AssociatedResource": "vpc-11111222222333ab"
        }
    ]
}
```

For more information, see Bring your own IP addresses (BYOIP) to Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see GetAssociatedIpv6PoolCidrs in *AWS CLI Command Reference*.

`get-aws-network-performance-data`

The following code example shows how to use `get-aws-network-performance-data`.

AWS CLI

To get network performance data

The following `get-aws-network-performance-data` example retrieves data about the network performance between the specified Regions in the specified time period.

```
aws ec2 get-aws-network-performance-data \
    --start-time 2022-10-26T12:00:00.000Z \
    --end-time 2022-10-26T12:30:00.000Z \
    --data-queries Id=my-query,Source=us-east-1,Destination=eu-
west-1,Metric=aggregate-latency,Statistic=p50,Period=five-minutes
```

Output:

```
{
    "DataResponses": [
        {
            "Id": "my-query",
            "Source": "us-east-1",
            "Destination": "eu-west-1",
            "Metric": "aggregate-latency",
            "Statistic": "p50",
            "Period": "five-minutes",
            "MetricPoints": [
                {
                    "StartDate": "2022-10-26T12:00:00+00:00",
                    "EndDate": "2022-10-26T12:05:00+00:00",
                    "Value": 62.44349,
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:05:00+00:00",
                    "EndDate": "2022-10-26T12:10:00+00:00",
                    "Value": 62.483498,
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:10:00+00:00",
                    "EndDate": "2022-10-26T12:15:00+00:00",
                    "Value": 62.51248,
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:15:00+00:00",
                    "EndDate": "2022-10-26T12:20:00+00:00",
                    "Value": 62.635475,
                    "Status": "OK"
                },
                {
```

```
                    "StartDate": "2022-10-26T12:20:00+00:00",
                    "EndDate": "2022-10-26T12:25:00+00:00",
                    "Value": 62.733974,
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:25:00+00:00",
                    "EndDate": "2022-10-26T12:30:00+00:00",
                    "Value": 62.773975,
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:30:00+00:00",
                    "EndDate": "2022-10-26T12:35:00+00:00",
                    "Value": 62.75349,
                    "Status": "OK"
                }
            ]
        }
    ]
}
```

For more information, see Monitor network performance in the *Infrastructure Performance User Guide*.

- For API details, see GetAwsNetworkPerformanceData in *AWS CLI Command Reference*.

`get-capacity-reservation-usage`

The following code example shows how to use `get-capacity-reservation-usage`.

AWS CLI

To view capacity reservation usage across AWS accounts

The following `get-capacity-reservation-usage` example displays usage information for the specified capacity reservation.

```
aws ec2 get-capacity-reservation-usage \
    --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```
{
    "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
    "InstanceUsages": [
        {
            "UsedInstanceCount": 1,
            "AccountId": "123456789012"
        }
    ],
    "AvailableInstanceCount": 4,
    "TotalInstanceCount": 5,
    "State": "active",
    "InstanceType": "t2.medium"
}
```

For more information, see Shared Capacity Reservations in the *Amazon EC2 User Guide*.

- For API details, see GetCapacityReservationUsage in *AWS CLI Command Reference*.

`get-coip-pool-usage`

The following code example shows how to use `get-coip-pool-usage`.

AWS CLI

To get customer-owned IP address pool usage

The following `get-coip-pool-usage` example gets the usage details for the specified customer-owned IP address pool.

```
aws ec2 get-coip-pool-usage \
    --pool-id ipv4pool-coip-123a45678bEXAMPLE
```

Output:

```
{
    "CoipPoolId": "ipv4pool-coip-123a45678bEXAMPLE",
    "CoipAddressUsages": [
        {
            "CoIp": "0.0.0.0"
        },
        {
            "AllocationId": "eipalloc-123ab45c6dEXAMPLE",
```

```
            "AwsAccountId": "123456789012",
            "CoIp": "0.0.0.0"
        },
        {
            "AllocationId": "eipalloc-123ab45c6dEXAMPLE",
            "AwsAccountId": "123456789111",
            "CoIp": "0.0.0.0"
        }
    ],
    "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.

- For API details, see GetCoipPoolUsage in *AWS CLI Command Reference*.

`get-console-output`

The following code example shows how to use `get-console-output`.

AWS CLI

Example 1: To get the console output

The following `get-console-output` example gets the console output for the specified Linux instance.

```
aws ec2 get-console-output \
    --instance-id i-1234567890abcdef0
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "Timestamp": "2013-07-25T21:23:53.000Z",
    "Output": "..."
}
```

For more information, see Instance console output in the *Amazon EC2 User Guide*.

Example 2: To get the latest console output

The following `get-console-output` example gets the latest console output for the specified Linux instance.

```
aws ec2 get-console-output \
    --instance-id i-1234567890abcdef0 \
    --latest \
    --output text
```

Output:

```
i-1234567890abcdef0 [    0.000000] Command line: root=LABEL=/ console=tty1
 console=ttyS0 selinux=0 nvme_core.io_timeout=4294967295

```

For more information, see Instance console output in the *Amazon EC2 User Guide*.

- For API details, see GetConsoleOutput in *AWS CLI Command Reference*.

`get-console-screenshot`

The following code example shows how to use `get-console-screenshot`.

AWS CLI

To retrieve a screenshot of a running instance

The following `get-console-screenshot` example retrieves a screenshot of the specified instance in .jpg format. The screenshot is returned as a Base64-encoded string.

```
aws ec2 get-console-screenshot \
    --instance-id i-1234567890abcdef0
```

Output:

```
{
    "ImageData": "997987/8kgj49ikjhewkwwe0008084EXAMPLE",
    "InstanceId": "i-1234567890abcdef0"
}
```

For more information, see Troubleshoot an unreachable Amazon EC2 instance in the *Amazon EC2 User Guide*.

- For API details, see GetConsoleScreenshot in *AWS CLI Command Reference*.

`get-default-credit-specification`

The following code example shows how to use `get-default-credit-specification`.

AWS CLI

To describe the default credit option

The following `get-default-credit-specification` example describes the default credit option for T2 instances.

```
aws ec2 get-default-credit-specification \
    --instance-family t2
```

Output:

```
{
    "InstanceFamilyCreditSpecification": {
        "InstanceFamily": "t2",
        "CpuCredits": "standard"
    }
}
```

For more information, see Configure burstable performance instances in the *Amazon EC2 User Guide*.

- For API details, see GetDefaultCreditSpecification in *AWS CLI Command Reference*.

`get-ebs-default-kms-key-id`

The following code example shows how to use `get-ebs-default-kms-key-id`.

AWS CLI

To describe your default CMK for EBS encryption

The following `get-ebs-default-kms-key-id` example describes the default CMK for EBS encryption for your AWS account.

```
aws ec2 get-ebs-default-kms-key-id
```

Output:

```
{
    "KmsKeyId": "alias/aws/ebs"
}
```

The preceding output shows the default CMK for EBS encryption, which is an AWS managed CMK with the alias `alias/aws/ebs`.

The following output shows a custom CMK for EBS encryption.

```
{
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

- For API details, see GetEbsDefaultKmsKeyId in *AWS CLI Command Reference*.

`get-ebs-encryption-by-default`

The following code example shows how to use `get-ebs-encryption-by-default`.

AWS CLI

To describe whether EBS encryption by default is enabled

The following `get-ebs-encryption-by-default` example indicates whether EBS encryption by default is enabled for your AWS account in the current Region.

```
aws ec2 get-ebs-encryption-by-default
```

Output:

```
{
    "EbsEncryptionByDefault": false
}
```

The preceding output indicates that EBS encryption by default is disabled.

The following output indicates that EBS encryption by default is enabled.

```
{
    "EbsEncryptionByDefault": true
}
```

For more information, see Enable Amazon EBS encryption by default in the *Amazon EBS User Guide*.

- For API details, see GetEbsEncryptionByDefault in *AWS CLI Command Reference*.

`get-flow-logs-integration-template`

The following code example shows how to use `get-flow-logs-integration-template`.

AWS CLI

To create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena

The following `get-flow-logs-integration-template` examples create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena.

Linux command.

```
aws ec2 get-flow-logs-integration-template \
    --flow-log-id fl-1234567890abcdef0 \
    --config-delivery-s3-destination-arn arn:aws:s3:::amzn-s3-demo-bucket \
    --integrate-services
 AthenaIntegrations='[{IntegrationResultS3DestinationArn=arn:aws:s3:::amzn-s3-demo-
bucket,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
{IntegrationResultS3DestinationArn=arn:aws:s3:::amzn-s3-demo-
bucket,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
```

Windows command.

```
aws ec2 get-flow-logs-integration-template ^
    --flow-log-id fl-1234567890abcdef0 ^
    --config-delivery-s3-destination-arn arn:aws:s3:::amzn-s3-demo-bucket ^
    --integrate-
services AthenaIntegrations=[{IntegrationResultS3DestinationArn=arn:aws:s3:::amzn-
s3-demo-
bucket,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
{IntegrationResultS3DestinationArn=arn:aws:s3:::amzn-s3-demo-
bucket,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
```

Output:

```
{
    "Result": "https://amzn-s3-demo-bucket.s3.us-west-2.amazonaws.com/
VPCFlowLogsIntegrationTemplate_fl-1234567890abcdef0_Wed%20Jul
%2021%2000%3A57%3A56%20UTC%202021.yml"
}
```

For information on using CloudFormation templates, see Working with AWS CloudFormation templates in the *AWS CloudFormation User Guide*.

For information on using Amazon Athena and flow logs, see Query flow logs using Amazon Athena in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see GetFlowLogsIntegrationTemplate in *AWS CLI Command Reference*.

`get-groups-for-capacity-reservation`

The following code example shows how to use `get-groups-for-capacity-reservation`.

AWS CLI

To list the resource groups with a Capacity Reservation

The following `get-groups-for-capacity-reservation` example lists the resource groups to which the specified Capacity Reservation was added.

```
aws ec2 get-groups-for-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```
{
    "CapacityReservationGroups": [
        {
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/my-
resource-group",
            "OwnerId": "123456789012"
        }
    ]
}
```

For more information, see Capacity Reservation groups in the *Amazon EC2 User Guide*.

- For API details, see GetGroupsForCapacityReservation in *AWS CLI Command Reference*.

`get-host-reservation-purchase-preview`

The following code example shows how to use `get-host-reservation-purchase-preview`.

AWS CLI

To get a purchase preview for a Dedicated Host Reservation

The following `get-host-reservation-purchase-preview` example provides a preview of the costs for a specified Dedicated Host Reservation for the specified Dedicated Host in your account.

```
aws ec2 get-host-reservation-purchase-preview \
    --offering-id hro-03f707bf363b6b324 \
    --host-id-set h-013abcd2a00cbd123
```

Output:

```
{
    "TotalHourlyPrice": "1.499",
    "Purchase": [
        {
            "HourlyPrice": "1.499",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "HostIdSet": [
```

```
                "h-013abcd2a00cbd123"
            ],
            "UpfrontPrice": "0.000",
            "Duration": 31536000
        }
    ],
    "TotalUpfrontPrice": "0.000"
}
```

For more information, see Amazon EC2 Dedicated Host pricing and billing in the *Amazon EC2 User Guide*.

- For API details, see GetHostReservationPurchasePreview in *AWS CLI Command Reference*.

`get-image-block-public-access-state`

The following code example shows how to use `get-image-block-public-access-state`.

AWS CLI

To get the block public access state for AMIs in the current Region

The following `get-image-block-public-access-state` example gets the block public access state for AMIs at the account level in the current Region.

```
aws ec2 get-image-block-public-access-state
```

Output:

```
{
    "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.

- For API details, see GetImageBlockPublicAccessState in *AWS CLI Command Reference*.

`get-instance-types-from-instance-requirements`

The following code example shows how to use `get-instance-types-from-instance-requirements`.

AWS CLI

To preview the instance types that match specified attributes

The following `get-instance-types-from-instance-requirements` example first generates a list of all of the possible attributes that can be specified using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to customize the attributes for which to preview matched instance types.

To generate all possible attributes and save the output directly to a JSON file, use the following command.

```
aws ec2 get-instance-types-from-instance-requirements \
    --generate-cli-skeleton input > attributes.json
```

Output:

```
{
    "DryRun": true,
    "ArchitectureTypes": [
        "x86_64_mac"
    ],
    "VirtualizationTypes": [
        "paravirtual"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 0,
            "Max": 0
        },
        "MemoryMiB": {
            "Min": 0,
            "Max": 0
        },
        "CpuManufacturers": [
            "intel"
        ],
        "MemoryGiBPerVCpu": {
            "Min": 0.0,
            "Max": 0.0
        },
        "ExcludedInstanceTypes": [
            ""
```

```
        ],
        "InstanceGenerations": [
            "current"
        ],
        "SpotMaxPricePercentageOverLowestPrice": 0,
        "OnDemandMaxPricePercentageOverLowestPrice": 0,
        "BareMetal": "included",
        "BurstablePerformance": "excluded",
        "RequireHibernateSupport": true,
        "NetworkInterfaceCount": {
            "Min": 0,
            "Max": 0
        },
        "LocalStorage": "required",
        "LocalStorageTypes": [
            "hdd"
        ],
        "TotalLocalStorageGB": {
            "Min": 0.0,
            "Max": 0.0
        },
        "BaselineEbsBandwidthMbps": {
            "Min": 0,
            "Max": 0
        },
        "AcceleratorTypes": [
            "inference"
        ],
        "AcceleratorCount": {
            "Min": 0,
            "Max": 0
        },
        "AcceleratorManufacturers": [
            "xilinx"
        ],
        "AcceleratorNames": [
            "t4"
        ],
        "AcceleratorTotalMemoryMiB": {
            "Min": 0,
            "Max": 0
        }
    },
    "MaxResults": 0,
```

```
    "NextToken": ""
}
```

Configure the JSON file. You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. You can omit the other attributes. When omitted, default values are used. For a description of each attribute and their default values, see get-instance-types-from-instance-requirements <https://docs.aws.amazon.com/cli/latest/reference/ec2/get-instance-types-from-instance-requirements.html>.

Preview the instance types that have the attributes specified in `attributes.json`. Specify the name and path to your JSON file by using the `--cli-input-json` parameter. In the following request, the output is formatted as a table.

```
aws ec2 get-instance-types-from-instance-requirements \
    --cli-input-json file://attributes.json \
    --output table
```

Contents of `attributes.json`:

```
{
    "ArchitectureTypes": [
        "x86_64"
    ],
    "VirtualizationTypes": [
        "hvm"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 4,
            "Max": 6
        },
        "MemoryMiB": {
            "Min": 2048
        },
        "InstanceGenerations": [
            "current"
        ]
    }
}
```

Output:

```
----------------------------------------
|GetInstanceTypesFromInstanceRequirements|
+---------------------------------------+
||             InstanceTypes             ||
|+-------------------------------------+|
||             InstanceType              ||
|+-------------------------------------+|
||  c4.xlarge                          ||
||  c5.xlarge                          ||
||  c5a.xlarge                         ||

```

For more information about attribute-based instance type selection, see How attribute-based instance type selection works in the *Amazon EC2 User Guide*.

- For API details, see GetInstanceTypesFromInstanceRequirements in *AWS CLI Command Reference*.

`get-instance-uefi-data`

The following code example shows how to use `get-instance-uefi-data`.

AWS CLI

To retrieve UEFI data from an instance

The following `get-instance-uefi-data` example retrieves UEFI data from an instance. If the output is empty, the instance does not contain UEFI data.

```
aws ec2 get-instance-uefi-data \
    --instance-id i-0123456789example
```

Output:

```
{
    "InstanceId": "i-0123456789example",
    "UefiData": "QU1aTlVFRkkf+uLXAAAAAHj5a7fZ9+3dBzxXb/
AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAD4L/J/AODshho="
```

```
}
```

For more information, see UEFI Secure Boot in the *Amazon EC2 User Guide*.

- For API details, see GetInstanceUefiData in *AWS CLI Command Reference*.

`get-ipam-address-history`

The following code example shows how to use `get-ipam-address-history`.

AWS CLI

To get the history of a CIDR

The following `get-ipam-address-history` example gets the history of a CIDR.

Linux command.

```
aws ec2 get-ipam-address-history \
    --cidr 10.0.0.0/16 \
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
    --start-time 2021-12-08T01:00:00.000Z \
    --end-time 2021-12-10T01:00:00.000Z
```

Windows command.

```
aws ec2 get-ipam-address-history ^
    --cidr 10.0.0.0/16 ^
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
    --start-time 2021-12-08T01:00:00.000Z ^
    --end-time 2021-12-10T01:00:00.000Z
```

Output:

```
{
    "HistoryRecords": [
        {
            "ResourceOwnerId": "123456789012",
            "ResourceRegion": "us-west-2",
            "ResourceType": "vpc",
            "ResourceId": "vpc-06cbefa9ee907e1c0",
            "ResourceCidr": "10.0.0.0/16",
            "ResourceName": "Demo",
```

```
            "ResourceComplianceStatus": "unmanaged",
            "ResourceOverlapStatus": "overlapping",

            "ResourceName": "tester",
            "ResourceComplianceStatus": "unmanaged",
            "ResourceOverlapStatus": "overlapping",
            "VpcId": "vpc-042b8a44f64267d67",
            "SampledStartTime": "2021-12-08T19:54:59.019000+00:00"
        }
    ]
}
```

For more information, see View the history of IP addresses in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamAddressHistory in *AWS CLI Command Reference*.

`get-ipam-discovered-accounts`

The following code example shows how to use `get-ipam-discovered-accounts`.

AWS CLI

To view the accounts discovered by an IPAM

The following `get-ipam-discovered-accounts` example lists the AWS accounts that own resources that the IPAM is discovering. In this scenario, you're an IPAM delegated admin.

The `--discovery-region` is the IPAM operating Region you want to view the monitored account statuses in. For example, if you have three IPAM operating Regions, you may want to make this request three times to view the timestamps specific to discovery in each of those particular Regions.

```
aws ec2 get-ipam-discovered-accounts \
    --ipam-resource-discovery-id ipam-res-disco-0365d2977fc1672fe \
    --discovery-region us-west-2
```

Output:

```
{
    "IpamDiscoveredAccounts": [
        {
            "AccountId": "123456789012",
            "DiscoveryRegion": "us-west-2",
            "LastAttemptedDiscoveryTime": "2024-02-09T19:04:31.379000+00:00",
            "LastSuccessfulDiscoveryTime": "2024-02-09T19:04:31.379000+00:00"
        }
    ]
}
```

For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamDiscoveredAccounts in *AWS CLI Command Reference*.

`get-ipam-discovered-public-addresses`

The following code example shows how to use `get-ipam-discovered-public-addresses`.

AWS CLI

To view discovered public IP addresses

The following `get-ipam-discovered-public-addresses` example shows the discovered public IP addresses for a resource discovery. In this example, you are an IPAM delegated admin

and you want to view the IP addresses of resources discovered by IPAM. You can get the resource discovery ID with describe-ipam-resource-discoveries.

```
aws ec2 get-ipam-discovered-public-addresses \
    --ipam-resource-discovery-id ipam-res-disco-0f4ef577a9f37a162 \
    --address-region us-west-2
```

Output:

```
{
    "IpamDiscoveredPublicAddresses": [
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
            "AddressRegion": "us-west-2",
            "Address": "54.208.155.7",
            "AddressOwnerId": "123456789012",
            "AssociationStatus": "associated",
            "AddressType": "ec2-public-ip",
            "VpcId": "vpc-073b294916198ce49",
            "SubnetId": "subnet-0b6c8a8839e9a4f15",
            "NetworkInterfaceId": "eni-081c446b5284a5e06",
            "NetworkInterfaceDescription": "",
            "InstanceId": "i-07459a6fca5b35823",
            "Tags": {},
            "NetworkBorderGroup": "us-west-2c",
            "SecurityGroups": [
                {
                    "GroupName": "launch-wizard-2",
                    "GroupId": "sg-0a489dd6a65c244ce"
                }
            ],
            "SampleTime": "2024-04-05T15:13:59.228000+00:00"
        },
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
            "AddressRegion": "us-west-2",
            "Address": "44.201.251.218",
            "AddressOwnerId": "123456789111",
            "AssociationStatus": "associated",
            "AddressType": "ec2-public-ip",
            "VpcId": "vpc-6c31a611",
            "SubnetId": "subnet-062f47608b99834b1",
            "NetworkInterfaceId": "eni-024845359c2c3ae9b",
```

```
            "NetworkInterfaceDescription": "",
            "InstanceId": "i-04ef786d9c4e03f41",
            "Tags": {},
            "NetworkBorderGroup": "us-west-2a",
            "SecurityGroups": [
                {
                    "GroupName": "launch-wizard-32",
                    "GroupId": "sg-0ed1a426e96a68374"
                }
            ],
            "SampleTime": "2024-04-05T15:13:59.145000+00:00"
        }
    ]
}
```

For more information, see View public IP insights in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamDiscoveredPublicAddresses in *AWS CLI Command Reference*.

`get-ipam-discovered-resource-cidrs`

The following code example shows how to use `get-ipam-discovered-resource-cidrs`.

AWS CLI

To view the IP address CIDRs discovered by an IPAM

The following `get-ipam-discovered-resource-cidrs` example lists the IP addresses for resources that the IPAM is discovering. In this example, you're an IPAM delegated admin who wants to view details related to these IP address CIDRs.

To complete this request, the resource discovery you choose must be associated with the IPAM, and the `--resource-region` is the AWS Region where the resource was created.

```
aws ec2 get-ipam-discovered-resource-cidrs \
    --ipam-resource-discovery-id ipam-res-disco-0365d2977fc1672fe \
    --resource-region us-west-2
```

Output:

```
{
```

```
    "IpamDiscoveredResourceCidrs": [
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
            "ResourceRegion": "us-west-2",
            "ResourceId": "vpc-0c974c95ca7ceef4a",
            "ResourceOwnerId": "123456789012",
            "ResourceCidr": "172.31.0.0/16",
            "ResourceType": "vpc",
            "ResourceTags": [],
            "IpUsage": 0.375,
            "VpcId": "vpc-0c974c95ca7ceef4a",
            "SampleTime": "2024-02-09T19:15:16.529000+00:00"
        },
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
            "ResourceRegion": "us-west-2",
            "ResourceId": "subnet-07fe028119082a8c1",
            "ResourceOwnerId": "123456789012",
            "ResourceCidr": "172.31.0.0/20",
            "ResourceType": "subnet",
            "ResourceTags": [],
            "IpUsage": 0.0012,
            "VpcId": "vpc-0c974c95ca7ceef4a",
            "SampleTime": "2024-02-09T19:15:16.529000+00:00"
        },
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
            "ResourceRegion": "us-west-2",
            "ResourceId": "subnet-0a96893763984cc4e",
            "ResourceOwnerId": "123456789012",
            "ResourceCidr": "172.31.64.0/20",
            "ResourceType": "subnet",
            "ResourceTags": [],
            "IpUsage": 0.0012,
            "VpcId": "vpc-0c974c95ca7ceef4a",
            "SampleTime": "2024-02-09T19:15:16.529000+00:00"
        }
    ]
}
```

For more information, see Monitor CIDR usage by resource in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamDiscoveredResourceCidrs in *AWS CLI Command Reference*.

`get-ipam-pool-allocations`

The following code example shows how to use `get-ipam-pool-allocations`.

AWS CLI

To get the CIDRs allocated from an IPAM pool

The following `get-ipam-pool-allocations` example gets the CIDRs allocated from an IPAM pool.

Linux command.

```
aws ec2 get-ipam-pool-allocations \
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --filters Name=ipam-pool-allocation-id,Values=ipam-pool-
alloc-0e6186d73999e47389266a5d6991e6220
```

Windows command.

```
aws ec2 get-ipam-pool-allocations ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --filters Name=ipam-pool-allocation-id,Values=ipam-pool-
alloc-0e6186d73999e47389266a5d6991e6220
```

Output:

```
{
    "IpamPoolAllocations": [
        {
            "Cidr": "10.0.0.0/16",
            "IpamPoolAllocationId": "ipam-pool-
alloc-0e6186d73999e47389266a5d6991e6220",
            "ResourceType": "custom",
            "ResourceOwner": "123456789012"
        }
    ]
}
```

For more information, see View IPAM pool allocations in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamPoolAllocations in *AWS CLI Command Reference*.

`get-ipam-pool-cidrs`

The following code example shows how to use `get-ipam-pool-cidrs`.

AWS CLI

To get the CIDRs provisioned to an IPAM pool

The following `get-ipam-pool-cidrs` example gets the CIDRs provisioned to an IPAM pool.

Linux command.

```
aws ec2 get-ipam-pool-cidrs \
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --filters 'Name=cidr,Values=10.*'
```

Windows command.

```
aws ec2 get-ipam-pool-cidrs ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --filters Name=cidr,Values=10.*
```

Output:

```
{
    "IpamPoolCidrs": [
        {
            "Cidr": "10.0.0.0/24",
            "State": "provisioned"
        }
    ]
}
```

For more information, see Provision CIDRs to a pool in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamPoolCidrs in *AWS CLI Command Reference*.

`get-ipam-resource-cidrs`

The following code example shows how to use `get-ipam-resource-cidrs`.

AWS CLI

To get the CIDRs allocated to a resource

The following `get-ipam-resource-cidrs` example gets the CIDRs allocated to a resource.

Linux command.

```
aws ec2 get-ipam-resource-cidrs \
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
    --filters Name=management-state,Values=unmanaged
```

Windows command.

```
aws ec2 get-ipam-resource-cidrs ^
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
    --filters Name=management-state,Values=unmanaged
```

Output:

```
{
    "IpamResourceCidrs": [
        {
            "IpamId": "ipam-08440e7a3acde3908",
            "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
            "ResourceRegion": "us-west-2",
            "ResourceOwnerId": "123456789012",
            "ResourceId": "vpc-621b8709",
            "ResourceName": "Default AWS VPC",
            "ResourceCidr": "172.33.0.0/16",
            "ResourceType": "vpc",
            "ResourceTags": [
                {
                    "Key": "Environment",
                    "Value": "Test"
                },
                {
                    "Key": "Name",
                    "Value": "Default AWS VPC"
                }
            ],
            "IpUsage": 0.0039,
```

```
            "ComplianceStatus": "unmanaged",
            "ManagementState": "unmanaged",
            "OverlapStatus": "nonoverlapping",
            "VpcId": "vpc-621b8709"
        }
    ]
}
```

For more information, see Monitor CIDR usage by resource in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamResourceCidrs in *AWS CLI Command Reference*.

`get-launch-template-data`

The following code example shows how to use `get-launch-template-data`.

AWS CLI

To get instance data for a launch template

The following `get-launch-template-data` example gets data about the specified instance and uses the `--query` option to return the contents in `LaunchTemplateData`. You can use the output as a base to create a new launch template or launch template version.

```
aws ec2 get-launch-template-data \
    --instance-id i-0123d646e8048babc \
    --query 'LaunchTemplateData'
```

Output:

```
{
    "Monitoring": {},
    "ImageId": "ami-8c1be5f6",
    "BlockDeviceMappings": [
        {
            "DeviceName": "/dev/xvda",
            "Ebs": {
                "DeleteOnTermination": true
            }
        }
    ],
```

```
    "EbsOptimized": false,
    "Placement": {
        "Tenancy": "default",
        "GroupName": "",
        "AvailabilityZone": "us-west-2a"
    },
    "InstanceType": "t2.micro",
    "NetworkInterfaces": [
        {
            "Description": "",
            "NetworkInterfaceId": "eni-35306abc",
            "PrivateIpAddresses": [
                {
                    "Primary": true,
                    "PrivateIpAddress": "10.0.0.72"
                }
            ],
            "SubnetId": "subnet-7b16de0c",
            "Groups": [
                "sg-7c227019"
            ],
            "Ipv6Addresses": [
                {
                    "Ipv6Address": "2001:db8:1234:1a00::123"
                }
            ],
            "PrivateIpAddress": "10.0.0.72"
        }
    ]
}
```

For more information, see Create an Amazon EC2 launch template in the *Amazon EC2 User Guide*.

- For API details, see GetLaunchTemplateData in *AWS CLI Command Reference*.

`get-managed-prefix-list-associations`

The following code example shows how to use `get-managed-prefix-list-associations`.

AWS CLI

To get prefix list associations

The following `get-managed-prefix-list-associations` example gets the resources that are associated with the specified prefix list.

```
aws ec2 get-managed-prefix-list-associations \
    --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
    "PrefixListAssociations": [
        {
            "ResourceId": "sg-0abc123456abc12345",
            "ResourceOwner": "123456789012"
        }
    ]
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see GetManagedPrefixListAssociations in *AWS CLI Command Reference*.

`get-managed-prefix-list-entries`

The following code example shows how to use `get-managed-prefix-list-entries`.

AWS CLI

To get the entries for a prefix list

The following `get-managed-prefix-list-entries` example gets the entries for the specified prefix list.

```
aws ec2 get-managed-prefix-list-entries \
    --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
    "Entries": [
        {
```

```
            "Cidr": "10.0.0.0/16",
            "Description": "vpc-a"
        },
        {
            "Cidr": "10.2.0.0/16",
            "Description": "vpc-b"
        }
    ]
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see GetManagedPrefixListEntries in *AWS CLI Command Reference*.

`get-network-insights-access-scope-analysis-findings`

The following code example shows how to use `get-network-insights-access-scope-analysis-findings`.

AWS CLI

To get the findings of Network Insights access scope analysis

The following `get-network-insights-access-scope-analysis-findings` example gets the selected scope analysis findings in your AWS account.

```
aws ec2 get-network-insights-access-scope-analysis-findings \
    --network-insights-access-scope-analysis-id nisa-123456789222
```

Output:

```
{
    "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
    "AnalysisFindings": [
        {
            "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
            "NetworkInsightsAccessScopeId": "nis-123456789111",
            "FindingComponents": [
                {
                    "SequenceNumber": 1,
                    "Component": {
```

```
                        "Id": "eni-02e3d42d5cceca67d",
                        "Arn": "arn:aws:ec2:us-west-2:123456789012:network-
interface/eni-02e3d32d9cceca17d"
                    },
                    "OutboundHeader": {
                        "DestinationAddresses": [
                            "0.0.0.0/5",
                            "11.0.0.0/8",
                            "12.0.0.0/6",
                            "128.0.0.0/3",
                            "16.0.0.0/4",
                            "160.0.0.0/5",
                            "168.0.0.0/6",
                            "172.0.0.0/12",
                            "8.0.0.0/7"
                        ],
                        "DestinationPortRanges": [
                            {
                                "From": 0,
                                "To": 65535
                            }
                        ],
                        "Protocol": "6",
                        "SourceAddresses": [
                            "10.0.2.253/32"
                        ],
                        "SourcePortRanges": [
                            {
                                "From": 0,
                                "To": 65535
                            }
                        ]
                    }
                }
            ]
        }
    ]
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see GetNetworkInsightsAccessScopeAnalysisFindings in *AWS CLI Command Reference*.

`get-network-insights-access-scope-content`

The following code example shows how to use `get-network-insights-access-scope-content`.

AWS CLI

To get Network Insights access scope content

The following `get-network-insights-access-scope-content` example gets the content of the selected scope analysis ID in your AWS account.

```
aws ec2 get-network-insights-access-scope-content \
    --network-insights-access-scope-id nis-123456789222
```

Output:

```
{
    "NetworkInsightsAccessScopeContent": {
        "NetworkInsightsAccessScopeId": "nis-123456789222",
        "MatchPaths": [
            {
                "Source": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::NetworkInterface"
                        ]
                    }
                },
                "Destination": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::InternetGateway"
                        ]
                    }
                }
            }
        ]
    }
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see GetNetworkInsightsAccessScopeContent in *AWS CLI Command Reference*.

`get-password-data`

The following code example shows how to use `get-password-data`.

AWS CLI

Example 1: To get the encrypted password

The following `get-password-data` example gets the encrypted password.

```
aws ec2 get-password-data \
    --instance-id i-1234567890abcdef0
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "Timestamp": "2013-08-07T22:18:38.000Z",
    "PasswordData": "gSlJFq+VpcZXqy+iktxMF6NyxQ4qCrT4+gaOuNOenX1MmgXPTj7XEXAMPLEUQ
+YeFfb+L1U4C4AKv652Ux1iRB3CPTYP7WmU3TUnhsuBd+p6LVk7T2lKUml6OXbk6WPW1VYYm/

+4RSyi8NUsVWnKZ4aEZffuDPGzKrF5yLlf3etP2L4ZR6CvG7K1hx7VKOQVN32Dajw=="
}
```

For more information, see Connect to your Windows instance using RDP in the *Amazon EC2 User Guide*.

Example 2: To get the decrypted password

The following `get-password-data` example gets the decrypted password.

```
aws ec2 get-password-data \
    --instance-id i-1234567890abcdef0 \
    --priv-launch-key C:\Keys\MyKeyPair.pem
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
```

```
    "Timestamp": "2013-08-30T23:18:05.000Z",
    "PasswordData": "&ViJ652e*u"
}
```

For more information, see Connect to your Windows instance using RDP in the *Amazon EC2 User Guide*.

- For API details, see GetPasswordData in *AWS CLI Command Reference*.

`get-reserved-instances-exchange-quote`

The following code example shows how to use `get-reserved-instances-exchange-quote`.

AWS CLI

To get a quote for exchanging a Convertible Reserved Instance

The following `get-reserved-instances-exchange-quote` example gets the exchange information for the specified Convertible Reserved Instances.

```
aws ec2 get-reserved-instances-exchange-quote \
    --reserved-instance-ids a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --target-configurations OfferingId=6fea5434-b379-434c-b07b-a7abexample
```

Output:

```
{
    "CurrencyCode": "USD",
    "ReservedInstanceValueSet": [
        {
            "ReservedInstanceId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ReservationValue": {
                "RemainingUpfrontValue": "0.000000",
                "HourlyPrice": "0.027800",
                "RemainingTotalValue": "730.556200"
            }
        }
    ],
    "PaymentDue": "424.983828",
    "TargetConfigurationValueSet": [
        {
            "TargetConfiguration": {
                "InstanceCount": 5,
```

```
                "OfferingId": "6fea5434-b379-434c-b07b-a7abexample"
            },
            "ReservationValue": {
                "RemainingUpfrontValue": "424.983828",
                "HourlyPrice": "0.016000",
                "RemainingTotalValue": "845.447828"
            }
        }
    ],
    "IsValidExchange": true,
    "OutputReservedInstancesWillExpireAt": "2020-10-01T13:03:39Z",
    "ReservedInstanceValueRollup": {
        "RemainingUpfrontValue": "0.000000",
        "HourlyPrice": "0.027800",
        "RemainingTotalValue": "730.556200"
    },
    "TargetConfigurationValueRollup": {
        "RemainingUpfrontValue": "424.983828",
        "HourlyPrice": "0.016000",
        "RemainingTotalValue": "845.447828"
    }
}
```

For more information, see Exchange Convertible Reserved Instances in the *Amazon EC2 User Guide*.

- For API details, see GetReservedInstancesExchangeQuote in *AWS CLI Command Reference*.

`get-security-groups-for-vpc`

The following code example shows how to use `get-security-groups-for-vpc`.

AWS CLI

To view security groups that can be associated with network interfaces in a specified VPC.

The following `get-security-groups-for-vpc` example shows the security groups that can be associated with network interfaces in the VPC.

```
aws ec2 get-security-groups-for-vpc \
    --vpc-id vpc-6c31a611
```

Output:

```
{
    "SecurityGroupForVpcs": [
        {
            "Description": "launch-wizard-36 created 2022-08-29T15:59:35.338Z",
            "GroupName": "launch-wizard-36",
            "OwnerId": "123456789012",
            "GroupId": "sg-007e0c3027ee885f5",
            "Tags": [],
            "PrimaryVpcId": "vpc-6c31a611"
        },
        {
            "Description": "launch-wizard-18 created 2024-01-19T20:22:27.527Z",
            "GroupName": "launch-wizard-18",
            "OwnerId": "123456789012",
            "GroupId": "sg-0147193bef51c9eef",
            "Tags": [],
            "PrimaryVpcId": "vpc-6c31a611"
        }
    ]
}
```

For more information, see Associate security groups with multiple VPCs in the *Amazon VPC User Guide*.

- For API details, see GetSecurityGroupsForVpc in *AWS CLI Command Reference*.

`get-serial-console-access-status`

The following code example shows how to use `get-serial-console-access-status`.

AWS CLI

To view the status of account access to the serial console

The following `get-serial-console-access-status` example determines whether serial console access is enabled for your account.

```
aws ec2 get-serial-console-access-status
```

Output:

```
{
```

```
    "SerialConsoleAccessEnabled": true
}
```

For more information, see EC2 Serial Console in the *Amazon EC2 User Guide*.

- For API details, see GetSerialConsoleAccessStatus in *AWS CLI Command Reference*.

`get-snapshot-block-public-access-state`

The following code example shows how to use `get-snapshot-block-public-access-state`.

AWS CLI

To get the current state of block public access for snapshots

The following `get-snapshot-block-public-access-state` example gets the current state of block public access for snapshots.

```
aws ec2 get-snapshot-block-public-access-state
```

Output:

```
{
    "State": "block-all-sharing"
}
```

For more information, see Block public access for snapshots in the *Amazon EBS User Guide*.

- For API details, see GetSnapshotBlockPublicAccessState in *AWS CLI Command Reference*.

`get-spot-placement-scores`

The following code example shows how to use `get-spot-placement-scores`.

AWS CLI

To calculate the Spot placement score for specified requirements

The following `get-spot-placement-scores` example first generates a list of all of the possible parameters that can be specified for the Spot placement score configuration using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to configure the requirements to use to calculate the Spot placement score.

To generate all possible parameters that can be specified for the Spot placement score configuration, and save the output directly to a JSON file.

```
aws ec2 get-spot-placement-scores \
    --generate-cli-skeleton input > attributes.json
```

Output:

```
{
    "InstanceTypes": [
        ""
    ],
    "TargetCapacity": 0,
    "TargetCapacityUnitType": "vcpu",
    "SingleAvailabilityZone": true,
    "RegionNames": [
        ""
    ],
    "InstanceRequirementsWithMetadata": {
        "ArchitectureTypes": [
            "x86_64_mac"
        ],
        "VirtualizationTypes": [
            "hvm"
        ],

            ],
            "AcceleratorTotalMemoryMiB": {
                "Min": 0,
                "Max": 0
            }
        }
    },
```

```
    "DryRun": true,
    "MaxResults": 0,
    "NextToken": ""
}
```

Configure the JSON file. You must provide a value for `TargetCapacity`. For a description of each parameter and their default values, see Calculate the Spot placement score (AWS CLI) <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-placement-score.html#calculate-sps-cli>.

Calculate the Spot placement score for the requirements specified in `attributes.json`. Specify the name and path to your JSON file by using the `--cli-input-json` parameter.

```
aws ec2 get-spot-placement-scores \
    --cli-input-json file://attributes.json
```

Contents of `attributes.json`:

```
{
    "TargetCapacity": 500,
    "TargetCapacityUnitType": "vcpu",
    "RegionNames": [
        "us-east-1",
        "us-west-1"
    ],
    "InstanceRequirementsWithMetadata": {
        "ArchitectureTypes": [
            "x86_64"
        ],
        "VirtualizationTypes": [
            "hvm"
        ],
        "InstanceRequirements": {
            "VCpuCount": {
                "Min": 4,
                "Max": 6
            },
            "MemoryMiB": {
                "Min": 2048
            }
        }
    }
```

```
}
```

Output if `SingleAvailabilityZone` is set to `false` or omitted (if omitted, it defaults to `false`). A scored list of Regions is returned.

```
"Recommendation": [
    {
        "Region": "us-east-1",
        "Score": 7
    },
    {
        "Region": "us-west-1",
        "Score": 5
    },
   ...
```

Output if `SingleAvailabilityZone` is set to `true`. A scored list of SingleAvailability Zones is returned.

```
"Recommendation": [
    {
        "Region": "us-east-1",
        "AvailabilityZoneId": "use1-az1"
        "Score": 8
    },
    {
        "Region": "us-east-1",
        "AvailabilityZoneId": "usw2-az3"
        "Score": 6
    },
   ...
```

For more information about calculating a Spot placement score, and for example configurations, see Calculate a Spot placement score in the *Amazon EC2 User Guide*.

- For API details, see GetSpotPlacementScores in *AWS CLI Command Reference*.

`get-subnet-cidr-reservations`

The following code example shows how to use `get-subnet-cidr-reservations`.

AWS CLI

To get information about a subnet CIDR reservation

The following `get-subnet-cidr-reservations` example displays information about the specified subnet CIDR reservation.

```
aws ec2 get-subnet-cidr-reservations \
    --subnet-id subnet-03c51e2e6cEXAMPLE
```

Output:

```
{
    "SubnetIpv4CidrReservations": [
        {
            "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
            "SubnetId": "subnet-03c51e2e6cEXAMPLE",
            "Cidr": "10.1.0.16/28",
            "ReservationType": "prefix",
            "OwnerId": "123456789012"
        }
    ],
    "SubnetIpv6CidrReservations": []
}
```

For more information, see Subnet CIDR reservations in the *Amazon VPC User Guide*.

- For API details, see GetSubnetCidrReservations in *AWS CLI Command Reference*.

`get-transit-gateway-attachment-propagations`

The following code example shows how to use `get-transit-gateway-attachment-propagations`.

AWS CLI

To list the route tables to which the specified resource attachment propagates routes

The following `get-transit-gateway-attachment-propagations` example lists the route table to which the specified resource attachment propagates routes.

```
aws ec2 get-transit-gateway-attachment-propagations \
```

```
    --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE
```

Output:

```
{
    "TransitGatewayAttachmentPropagations": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0882c61b97EXAMPLE",
            "State": "enabled"
        }
    ]
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see GetTransitGatewayAttachmentPropagations in *AWS CLI Command Reference*.

`get-transit-gateway-multicast-domain-associations`

The following code example shows how to use `get-transit-gateway-multicast-domain-associations`.

AWS CLI

To view the information about the transit gateway multicast domain associations

The following `get-transit-gateway-multicast-domain-associations` example returns the associations for the specified multicast domain.

```
aws ec2 get-transit-gateway-multicast-domain-associations \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
    "MulticastDomainAssociations": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8EXAMPLE",
            "ResourceId": "vpc-01128d2c24EXAMPLE",
            "ResourceType": "vpc",
            "Subnet": {
```

```
                "SubnetId": "subnet-000de86e3bEXAMPLE",
                "State": "associated"
            }
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
            "ResourceId": "vpc-7EXAMPLE",
            "ResourceType": "vpc",
            "Subnet": {
                "SubnetId": "subnet-4EXAMPLE",
                "State": "associated"
            }
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
            "ResourceId": "vpc-7EXAMPLE",
            "ResourceType": "vpc",
            "Subnet": {
                "SubnetId": "subnet-5EXAMPLE",
                "State": "associated"
            }
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
            "ResourceId": "vpc-7EXAMPLE",
            "ResourceType": "vpc",
            "Subnet": {
                "SubnetId": "subnet-aEXAMPLE",
                "State": "associated"
            }
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
            "ResourceId": "vpc-7EXAMPLE",
            "ResourceType": "vpc",
            "Subnet": {
                "SubnetId": "subnet-fEXAMPLE",
                "State": "associated"
            }
        }
    ]
}
```

For more information, see Multicast domains in the *Transit Gateways Guide*.

- For API details, see GetTransitGatewayMulticastDomainAssociations in *AWS CLI Command Reference*.

`get-transit-gateway-prefix-list-references`

The following code example shows how to use `get-transit-gateway-prefix-list-references`.

AWS CLI

To get prefix list references in a transit gateway route table

The following `get-transit-gateway-prefix-list-references` example gets the prefix list references for the specified transit gateway route table, and filters by the ID of a specific prefix list.

```
aws ec2 get-transit-gateway-prefix-list-references \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --filters Name=prefix-list-id,Values=pl-11111122222222333
```

Output:

```
{
    "TransitGatewayPrefixListReferences": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
            "PrefixListId": "pl-11111122222222333",
            "PrefixListOwnerId": "123456789012",
            "State": "available",
            "Blackhole": false,
            "TransitGatewayAttachment": {
                "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",
                "ResourceType": "vpc",
                "ResourceId": "vpc-1234567890abcdef0"
            }
        }
    ]
}
```

For more information, see Prefix list references in the *Transit Gateways Guide*.

- For API details, see GetTransitGatewayPrefixListReferences in *AWS CLI Command Reference*.

`get-transit-gateway-route-table-associations`

The following code example shows how to use `get-transit-gateway-route-table-associations`.

AWS CLI

To get information about the associations for the specified transit gateway route table

The following `get-transit-gateway-route-table-associations` example displays information about the associations for the specified transit gateway route table.

```
aws ec2 get-transit-gateway-route-table-associations \
    --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE
```

Output:

```
{
    "Associations": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
            "ResourceId": "vpc-4d7de228",
            "ResourceType": "vpc",
            "State": "associating"
        }
    ]
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see GetTransitGatewayRouteTableAssociations in *AWS CLI Command Reference*.

`get-transit-gateway-route-table-propagations`

The following code example shows how to use `get-transit-gateway-route-table-propagations`.

AWS CLI

To display information about the route table propagations for the specified transit gateway route table

The following `get-transit-gateway-route-table-propagations` example returns the route table propagations for the specified route table.

```
aws ec2 get-transit-gateway-route-table-propagations \
    --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE
```

Output:

```
{
    "TransitGatewayRouteTablePropagations": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
            "ResourceId": "vpc-3EXAMPLE",
            "ResourceType": "vpc",
            "State": "enabled"
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
            "ResourceId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ResourceType": "direct-connect-gateway",
            "State": "enabled"
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
            "ResourceId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ResourceType": "direct-connect-gateway",
            "State": "enabled"
        }
    ]
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see GetTransitGatewayRouteTablePropagations in *AWS CLI Command Reference*.

`get-verified-access-endpoint-policy`

The following code example shows how to use `get-verified-access-endpoint-policy`.

AWS CLI

To get the Verified Access policy of an endpoint

The following `get-verified-access-endpoint-policy` example gets the Verified Access policy of the specified endpoint.

```
aws ec2 get-verified-access-endpoint-policy \
    --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen
 {\n    context.identity.groups.contains(\"finance\") &&\n
 context.identity.email_verified == true\n};"
}
```

For more information, see Verified Access policies in the *AWS Verified Access User Guide*.

- For API details, see GetVerifiedAccessEndpointPolicy in *AWS CLI Command Reference*.

`get-verified-access-group-policy`

The following code example shows how to use `get-verified-access-group-policy`.

AWS CLI

To get the Verified Access policy of a group

The following `get-verified-access-group-policy` example gets the Verified Access policy of the specified group.

```
